AN ENTIRE

Body of Philoſophy,

According to the

PRINCIPLES

Of the Famous

RENATE DES CARTES,

In Three Books:

I. The INSTITUTION, in X. Parts; 1. *Logick.* 2. *Natural Theology.* 3. *Dæmonology,* or of *Created Spirits.* 4. *General Phyſicks,* or *Natural Philoſophy,* generally conſidered. 5. *Special Natural Philoſophy,* of the *World* and *Heaven.* 6. The Four Great Bodies, *Earth, Water, Air* and *Fire,* and what have their riſe from them; where, of *Metals* and *Meteors.* 7. Of *Living Things* in general, and in particular of *Plants* and *Animals.* 8. *Man,* in reſpect to his *Body.* 9. *Man,* as to his *Mind* or *Soul.* And, 10. *Ethicks,* or *Moral Philoſophy,* treating of *Man*'s right Ordering his Life.

II. The HISTORY of NATURE, which Illuſtrates the *Inſtitution,* and conſiſts of great Variety of *Experiments* relating thereto, and explained by the ſame *Principles,* in IX. Parts, 1. Of *Bodies.* 2. Of *Qualities.* 3. Of the *Earth* and *Heaven.* 4. Of the *Earth, Water, Fire* and *Air.* 5. Of *Things* dug out of the *Earth.* 6. Of *Meteors.* 7. Of *Plants.* 8. Of *Animals.* And, 9. Of *Man.*

III. A Diſſertation of the Want of SENSE and KNOWLEDGE in BRUTE ANIMALS, in II. Parts, giving a *Mechanical Account* of their Operations.

Written Originally in Latin by the Learned

ANTHONY LE GRAND.

Now carefully Tranſlated from the laſt Corrections, Alterations, and large Additions of the Author, never yet Publiſhed.

The Whole WORK Illuſtrated with almoſt an Hundred

SCULPTURES

Diſperſed to ſuch places as beſt admit thereof: All deſigned, Drawn and Engraven *Hiſtorically* by good Artiſts. Beſides the FIGURES or SCHEMES for the Explanation of the *Philoſophical Parts* that require the ſame.

Endeavoured to be ſo done, that it may be of Uſe and Delight to the Ingenious of both Sexes.

By RICHARD BLOME

LONDON:

Printed by *Samuel Roycroft,* and Sold by the Undertaker *Richard Blome,* dwelling in *New Weld-ſtreet,* at the *Green Pales,* near *Clare-Market:* And at theſe Bookſellers following; Mr. *Horn* and Mr. *Southby* by the *Royal Exchange*; Mr. *Chiſwell,* Mr. *Clavell* and Mr. *Brome,* in S. *Pauls Church-yard*; Mr. *Tonſon,* in *Fleetſtreet*; Mr. *Saunders,* in the *New Exchange*; Mr. *Gilliflower,* in *Weſtminſter-Hall*; and Mr. *Richards,* at the *Bible,* the Corner of *Eſſex-Street,* againſt S. *Clements* Church. AN ENTIRE

Body of Philosophy,

According to the

PRINCIPLES

Of the Famous

RENATE DES CARTES,

In Three Books:

WELLCOME HISTORICAL MEDICAL LIBRARY

TO THE

Right Honourable, and Truly Noble,

HENRY

Lord Viſcount *Sydney* of *Shepey*,

Baron *Milton*, Lord Lieutenant of *Kent*, Conſtable of *Dover Caſtle*, Lord Warden of the *Cinque Ports*, Maſter General of Their Majeſties *Ordnance*, Colonel of Their Majeſties Firſt Regiment of Foot Guards, one of the Gentlemen of His Majeſties Bedchamber, and one of the Lords of Their Majeſties Moſt Honourable Privy Council, *&c.*

My Lord,

I *Am not unſenſible that ſome part of the* World, *when they ſhall ſee your* Lordſhips Name *affixt to this* Book, *will be apt to ſay, That my inducements for laying it at your* Honours Feet, *are thoſe generally made uſe of by* Authors; *to wit, the neceſſity of an* Illuſtrious Patronage *to defend the* Work *againſt the aſſaults of* Envy *and* Ignorance: *But I muſt beg leave to aſſure your* Lordſhip *and the* World, *that the true* Reaſon *for this my* Dedication, *ariſeth from a well-grounded Belief, and the general concurrence of the* Learned *Part of this* Nation, *that your* Honour *is the propereſt* Perſon *to* patroniſe *a* Work *of this* Nature, *having by all the* Actions *of your* Admired Life *fully convinced the* World, *that you only are the* abſolute Maſter *of the whole* Body *of* PHILOSOPHY; *and I my ſelf have ever held it as a reaſonable* Poſition, *That the* Works *of the* Learned, *like the* Actions *of the* Noble, *ought only to be judged by their* Peers; *nor can I think your* Lordſhip, *or any* Learned Perſon *will ſay, that a* virtuous deſire *of* Knowledge (*and ſuch I humbly conceive is* Philoſophy) *needs or wants a* Protection *from any, ſince 'tis an experienced* Truth, *That* Virtue *carries her own* Safeguard, *as well as her own* Reward.

But as to the Subject Matter *of this* Book, *and the method of handling it, I ſhall not ſay any thing, but refer your* Lordſhip *to the* Book *it ſelf, of which your* Honour *is ſo great a* Judge; *having in my* memory, *the admonition of* Apelles *to* Alexander the Great, *ſpeaking improperly of the* Noble Art of Painting; *In things you underſtand not, ſays that Great* Artiſt, *be alwaies* ſilent, *leſt by* ſpeaking, *you betray a want*

of Judgment. *But as for the* Deſigning *and* Engraving *the* SCULPTURES *which Imbelliſhes this* Work, *things more properly mine, than any other part of the* Book, *and in which through* Practice *and* Experience *I may be allowed to have ſome* knowledge; *I muſt beg leave to aſſure your* Lordſhip, *that they are, if not* accurately, *at leaſt* elaborately *done; and had I not been therein concern'd, might have ventured to have ſaid, they are the beſt ever made* publick *in this* Nature *and* Nation. *And if they be ſo happy as to contribute in the leaſt to your* Honours Satisfaction, *or* Entertainment, *I ſhall thereby be abundantly rewarded for all my* Care, Charge *and* Trouble; *for the very* White *at which I aimed, both in* publiſhing *this* Book, *and* writing *this* Epiſtle, *was to have it in my power to declare to your* Lordſhip, *that the ultimate of my Ambition is to ſerve you whilſt I* Live, *and when* Dead, *to be recommended to* Poſterity *under this deſirable* Character, *That I had the happineſs to be known to your* Honour, *who is allowed by all the* Judicious, *to be the Glory of the* Age *you live in, and to excel all that have gone before you, and to ſtand a Great, Noble, and hardly to be pattern'd* Example *to thoſe that ſhall ſucceed. And of You, moſt Noble* Sir, *'tis with more* Truth *than* Complement *ſaid, that* HENRY *Lord* SYDNEY *doth abundantly ſurpaſs both in* Wiſdom *and* Heroick Performances, *the ſo much famed Sir* PHILIP SYDNEY (*whom, the Age he lived in, thought worthy to be a King*) *and that in times to come they will mention his* Alliance *to you, to aggrandize his* Character. *Nor are theſe, my* Lord, *half the* Hecatombs *of* Praiſe *offered up to your great* Merit, *by the* grateful *and* underſtanding *part of* Mankind; *nor one third of what I might juſtly ſay: But ſuch is your* Lordſhips *great* Modeſty, *to be equalled by nothing but your* Courage, *that you always decline* hearing *a recital of your Illuſtrious* Actions, *tho' you never omit any opportunity of* performing *them: And therefore I ſhall only beg leave to tell your* Honour, *with all due Deference to your* Exalted Station; *that there is no part of the* World *which You have graced with Your* Preſence, *and obliged with Your* Goodneſs, *is, or can be more truly ſenſible of what they owe You, or more willing entirely to* ſacrifice *their* All *to your* Lordſhips Service, *than the* Publiſher *of this* Work; *who is, may it pleaſe your* Honour, *with the moſt profound Reſpect imaginable,*

My Lord,

Your Honours

moſt Obliged, and moſt Humble Servant,

Richard Blome.

THE

THE EPISTLE TO THE READER.

BY my indefatigable *Labour* for theſe twenty Years, I have employed my time, with no ſmall *Expences* in the *Printing* of ſeveral *Volumes*, not only *Uſeful*, but *Honourable* to this *Nation*, which have met with a kind Reception from the *Nobility* and *Gentry*, ſome of which I ſhall here give the *Reader* a ſhort account of, as having a ſmall quantity of each remaining, which the Curious may be accommodated with. And this their *Encouragement* has emboldned me to undertake this Great Work in *Engliſh*, which of all *Subjects*, is the moſt wanting; and the rather, becauſe appearing in our *Native Tongue*, 'tis thereby more uſeful for the *Publick Good*, and of more univerſal *Benefit*. For it ſeems a kind of *Illnatur'd Retrenchment* upon the common *Freedom* of *Mankind* to lock up all Ingenious *Arts* and *Sciences* from them, unleſs they are *Maſters* of a *Greek* or *Latin Key* to open 'em. The *Travel* into PHILOSOPHY and true *Wiſdom*, like the *Commerce* into the Rich *Indies*, ſhould be declared *Free*, and of equal *Right* to all the *Subjects* of *England*, without incurring the *Premunire* of *Interlopers*.

Tongues and *Languages*, I confeſs are a fine and ſumptuous *Portico*; but then they are no more than a *Portico*. The *Sciences* to which they introduce, are the *Main Maſs* and *Body* of true *Learning*; and 'tis ſomewhat of the hardeſt, that ſo fair a *Pile* ſhould have that only *Gate* to enter at: Beſides, not to inſtance how many, otherwiſe very ingenious *Men*, are hereby debarr'd the *Study* of *Wiſdom* and *Virtue*, whilſt couch'd only in a *Language*, which poſſibly their *Education*, or want of *Leiſure* has not made them *Maſters* of: Here's a perfect *Turkiſh* piece of *Cruelty*; for we thus make *Learning* an abſolute *Mahometan Moſque*, whilſt the whole Fair *Sex* are at once excluded from any part of their *Devotion* in it. And let me tell you, the moſt complaiſant *French Authors* generally *Print* their *Philoſophical Books* in their own *Language*, by which the *French Ladies*, to the Glory of their *Sex*, have arrived to a great perfection of *Knowledge*; in which extraordinary *Accompliſhments*, being able to *diſcourſe* of the *Heavens*, the *Motion* of the *Planets*, and the *Nature* and *Cauſes* of *Mundane Things*, &c. beſide the Improvement of *Virtue*, they have elevated their *Converſation* above the Common Rate of *Feminine Eloquence*, ſuch as their deſcant upon *Commodes*, *New Faſhions*, or the little Vanities, and have added no little *Charm* and *Grace* to many Profeſt *Virtuoſo's*. And truly tho' we have at preſent ſet up our *Standard* againſt *France*, yet I could wiſh we might ſtill continue one piece of *Friendſhip*, *viz.* our old *Cuſtom* of following the *Mode* of *France*, in bringing that one *French Faſhion* up, of making our *Learning* ſpeak *Engliſh* to inſtruct both ours, and the Fair *Sex*.

And altho' this *Volume* of PHILOSOPHY has been ſo well received in *Latin* by the Sale of ſeveral *Impreſſions*, yet for the making it more exact and perfect, I contracted with the *Author* Mr. *Le Grand* to make *Additions* thereunto; ſo that by his large *Additions* and great *Alterations* throughout, it may be boldly ſaid to be a *New Book*, and the beſt yet extant in any *Language*.

My

The Epiſtle.

My next buſineſs was to employ an able *Tranſlator* and *Superviſor*, which with the care of the ſaid Mr. *Le Grand*, every thing throughout is rendred ſo facile, and adapted to the *Engliſh Dreſs*, as to be of *Uſe* and *Delight* to all *Perſons*. I have alſo *Engraven* the SCHEMES *or* FIGURES that were formerly in *Wood*, now on *Copper*: And for the adornment of the ſaid WORK, have *illuſtrated* it with above 90 SCULPTURES, *Hiſtorically* and *Poetically Deſigned*, and *Engraven* by good *Artiſts*, relating to the ſeveral *Subjects* that beſt admit thereof: And have added an *Explanatory* INDEX or TABLE of the ſeveral SCULPTURES, that the *Reader* may the better know the meaning thereof.

The SCHEMES *or* FIGURES are *Engraven* on three *Copper Plates*, two for thoſe in the *Inſtitution*, and one for thoſe in the *Hiſtory* of *Nature*, all numbred 1, 2, 3, 4, and ſo on as in the *Plates*, with reference to the *Book* by the *Folio*, and the ſaid number in the *Margent*; which ſaid *Plates* of *Schemes* are to be placed at the beginning of the *Book* next the *Preface* of Mr. *Le Grand*, which gives you an account of the *Work*, and the *Arms* of the *Benefactors* to follow the *Schemes*.

Richard Blome.

An Account of ſome Volumes *which the* Curious *may be accommodated with by me.*

The **Gentleman's Recreation**, in Two Parts, in large Folio. The firſt, of the *Liberal* and *Mathematical Sciences*; which in a brief and clear Method treats of the *Doctrin* and *General Parts* of each *Art*, with *Eliptical Tables* engraven on *Copper Plates*, for the better comprehending the ſame. The Second Part at large treats of **Horſemanſhip, Hawking, Hunting, Fowling, Fiſhing** and **Agriculture**; all being Collected from the moſt Authentick *Authors*, and the many groſs Errors therein Corrected, with great *Enlargements* made by thoſe well Experienced therein. And for the better Explanation thereof great variety of uſeful *Sculptures*, as *Nets*, *Engins*, *Traps*, &c. are added, for the taking of *Beaſts*, *Fowl* and *Fiſh*, not publiſhed by any: Nothing material being omitted for the rendring them Compleat. The whole Illuſtrated with about 86 Ornamental *Copper Plates*; in Folio.

The *Hiſtory* of the **Old** and **New Teſtament**, treating of the moſt remarkable Tranſactions therein, with good and uſeful *Morals*, for the better government of our Actions in all Conditions. To which is added, the *Travels*, *Voyages* and *Lives* of the *Apoſtles*; with a large **Hiſtorical Chronology** of ſuch Matters of Note that are related in the *Bible*: *Collected* and *Tranſlated* by good *Hands*, from Authentick *Authors*. The whole Illuſtrated with about 240 **Sculptures**, of the moſt remarkable Paſſages, performed by good *Artiſts*, far ſurpaſſing any *Collection* hitherto done, to the end it may be the more acceptable to the Curious. This *Work* is Printed in Two *Volumes* in large Folio, of a fair Print, and chiefly deſigned for the Curious.

The ſaid *Work* is likewiſe Printed in large *Octavo*, with all the *Sculptures*, as deſigned for a more general Sale, for *Youth*, to Inſtruct them in the *Hiſtorical* parts of the *Bible*: *Sculptures* being lively *Emblems*, to imprint the ſame in their *Memories*.

A uſeful *Volume* of **Coſmography** and **Geography**, in Two Parts, in Folio. The Firſt, of the Arts of *Coſmography* and *Geography*, being a *Tranſlation* of the much Eſteemed *VARENIUS*. The Second Part is a *Geographical* Deſcription of the *World*, from the *Works* of the Famous Monſieur *SANSON*; with about a 100 *Geographical* Tables of the *Kingdoms* and *Iſles* in the *World*, with their Chief Places, drawn from the Maps of the ſeveral *Kingdoms*, which illuſtrates this *Work*. And to this *Impreſſion* are added the *County Maps* of *England*, drawn from thoſe of *Speed*'s in a ſmaller *Scale*.

THE

THE PREFACE.

SECTION I.

Of the *Nature, Principles, Object, Use, Rise* and *Progress* of PHILOSOPHY.

PHILOSOPHY, *according to its Etymology, is the* love *and* ſtudy *of* Wiſdom; *where by* Wiſdom *we underſtand ſuch a diſpoſition of the* Mind, *by which Man is firmly inclined to have right Sentiments of the* Things *that occur to his perception, and to make a juſt Examination of the* Actions *that belong to his* Life. *For* Wiſdom *doth not only direct the* Underſtanding, *and guide the* Mind *in the Contemplation of* Truth; *but alſo inclines it to* Honeſty, *and aſſiſts the* Will *in the proſecution of* Vertue: *So that* Wiſdom *is indeed nothing elſe but a perfect Knowledge of all thoſe things which it is poſſible for* Man *to know, and which may be both a* Rule *to his* Life, *and a* Help *to the Inventing of all* Arts *whatſoever.* What *PHILOSOPHY* is.

Whence PHILOSOPHY may be defined a Habit *of the* Mind, *acquired by Study and Exerciſe from Inborn* Idea's *and ſelf evident* Principles, *enlightning the* Underſtanding *into the knowledge of neceſſary things, and perfecting the* Will *by Honeſt and Vertuous* Actions. How it is defined.

Now to the end this Science *may have theſe* Effects, *it is neceſſary that it be deduced from* firſt Cauſes; *ſo that whoſoever deſires to be* Maſter *of it, muſt begin with an enquiry into theſe* Cauſes: *Becauſe this is the firſt property of the* Principles *of* Things, *to be ſo clear and evident as not to ſtand in need of any proof of their Certainty, and to be raiſed beyond the reach of Doubting; ſo that whoſoever minds them, can't doubt of their* Truth. *Secondly, They are ſuch on which other things depend, and without the knowledge whereof nothing of* Certainty *can be had. Wherefore tho' the* firſt Cauſes *of Things may be known, tho' the* Things *themſelves be unknown; yet it is impoſſible, but that when theſe are known, thoſe muſt be likewiſe known; becauſe the* Truth *of theſe depends on the evidence of their* firſt Cauſes. *And accordingly whatſoever is demonſtrated concerning them, without a ſelf-evident* Principle *muſt needs be dark and uncertain. For as* DESCARTES *ſaith*; No *Concluſions* deduced from an unevident *Principle*, can be evident, tho' they ſhould be deduced thence with the greateſt Evidence imaginable. Of what kind the Principles of Philoſophy are to be.

It is not only one Genus, *or general Head of things, that is the Object of PHILOSOPHY; but ſhe extends her ſelf to all things which the* Mind *of* Man *is capable of knowing. And therefore* Plato, *as* Ammonius *tells us, called it* The knowledge of things Human and Divine; *foraſmuch as it doth not only conſider* Corporeal Things, *but alſo contemplates the* Supream Cauſe *and* Intelligences *void of Matter, and enquires into their* Attributes *and* Perfections. *For* this is it (*ſaith* Cicero) which diſpels all dimneſs from the Eye of the Soul, and enableth us to ſee all things, whether Superior or Inferior, firſt, laſt, or middlemoſt. What is the Object of Philoſophy.

From whence we may gather the true Uſe of PHILOSOPHY, and how many Advantages it affords us. For, firſt it helps the Soul *to contemn thoſe* Tranſitory *and* Temporal things, *to which from its* Childhood *it has been too much addicted, and raiſes its* deſires *to things* Heavenly *and* Eternal. *Secondly, It aſſiſts us in the thorough ſearch into our own* Natures, *in the knowledge of our* Creator, *and the attentive Conſideration of his* Works. *Thirdly, Whilſt it evidenceth* Truth *to us by clear and indubitable* Demonſtrations, *it affords us extraordinary pleaſure and delight, as diſplaying thoſe things in a full light to us, which are hid from the greateſt part of* Mankind. *Fourthly, It removes* Wonder, *which ever is the Companion of* Ignorance, *and gives us a clear Light, whereby to diſcern Great things from Small, and to eſteem things according to their true Value. Fifthly, By the Exerciſe hereof we are prepared to know the ſeveral* Objects *we meet with more diſtinctly, and to judge of them with more Caution and Exactneſs; for by the long continued* Study *of* Philoſophy *we become more prudent and cautious in paſſing Sentence concerning things.* What is the Uſe of Philoſophy.

Whence Philosophy had its rise.

PYTHAGORAS was the first amongst the Ancients *who assumed the Name of* Philosopher, *by way of Modesty, as condemning the Pride and Arrogance of others who would be called* Sophi, *that is,* Wise Men. *For this discreet Person was so sensible of our Ignorance, that he thought that* that Title *did beseem* God *alone, and could not deservedly be given to any* Mortal. *But because the Original of* Wisdom *and* Philosophy *is one and the same, which was many Ages before* Pythagoras, *we must look for it long before his time: Which if we do, we shall find that it could not proceed from any one else but* God, *the* Father of Lights, *from whom every* perfect Good *comes, and the* Truth *of all things is derived. Hence it is the* Poets *tell us, That* Pallas *or* Minerva, *the* Goddess *of* Wisdom, *was the birth of* Jupiter's Brain; *intimating thereby that all* Knowledge *comes from* GOD, *and takes its rise from his* Understanding. *For it is certain that* Adam, *the first of Mankind, was a* wise Man, *forasmuch as he gave* Names *to* Things, *and taught his* Sons *the knowledge of the* Stars, *which he could never have done, if he had not been endued with* Wisdom, *and understood the Nature and Property of* Things.

How Philosophy has been transmitted to us from *Adam*.

It is probable that this most excellent Gift of God, *was handed from* Adam *by* Methusalem *to* Noah, *and from him, his* Sons *and* Grandchildren, *to the* Chaldeans *and* Hebrews, *who were famous for their Knowledge of many things, and from them to the* Egyptians; *from the* Egyptians *to the* Grecians, *and from them to the* Romans; *from whom, in process of time, the same was derived to the* Northern *and* Western Nations.

How some think it had its rise according to the Nature or scituation of Countries.

Some that begin not the Pedigree *of PHILOSOPHY so high as we do, tell us, That it had its* rise *according to the Nature or Scituation of the* Countries *where those lived who had the first Knowledge of it*: Necessity, *which is usually the first* Mistress *of* Sciences, *having taught them what were proper for their Needs. 'Twas thus, say they, that the EGYPTIANS began to observe the Increase and Decrease of the* Nile, *and to make every Year a* Prognostick *of the Fruitfulness or Sterility of their* Lands. *And to part, with the more facility their* Harvest, *among those particular Persons who were to have their Shares thereof, they learnt the first Principles of* Geometry. *The ASSYRIANS, who inhabited vast and unclouded* Countries, *having nothing to hinder them from contemplating the* Stars, *were the first that observed their* Motion; *and the CHALDEANS, who were amongst these People a kind of* Philosophers, *found from this Speculation an* Art *of* Foretelling things to come. *In fine, The PHÆNICIANS, who were Neighbours to the* Sea, *drew another Benefit from the Knowledge of the* Stars, *and addicted themselves to observe those which might be useful to* Navigation; *in which they succeeded so well, that they found out that there was a fixed* Point *towards the* Pole, *the observation of which might be a Guide to* Pilots.

SECTION II.

The Chief and most Celebrated PHILOSOPHERS.

THALES. *Amongst those who are most Celebrated for* Philosophy, *THALES the* Milesian, *so called from* Miletus *the Capital City of* Ionia, *in which 'tis said he was born, 639 years before* Christ, *is accounted the first. He was a great* Astronomer, *and the first that observed the* Solstices *and* Equinoxes. *His Opinion was, That* Water *was the* Principle *of all* Things.

ANAXIMANDER. *The Successor of* Thales *was ANAXIMANDER, who was also Born at* Miletus, *and the first Founder of the* Ionick Sect. *He distinguished the* Four Elements, *placed the* Earth *in the* Center, *and by the scituation he gave them, was the first that erected a kind of* System *of the* World. Strabo *and* Laertius *assure us, that he was the first also that made* Maps. *He never determined, as* Thales, *which of the* Elements *was the* Principle *of* Natural things, *but concluded it to be* Immense.

ANAXIMINES. ANAXAGORAS. ARCHELAUS. HERACLITUS DEMOCRITUS. *ANAXIMINES followed* Anaximander, *being also Born in the same* City. *He owned* Infinite Air *to be the* Principle *of all* Things. *His* Disciple *was ANAXAGORAS of* Clazomene, *who was the first that brought* Philosophy *from* Ionia *to* Athens. *He declared* Matter *and* Spirit *to be the* first Principles; *that at the* Beginning *all Things were in* Confusion, *and that it was the* Spirit *that separated, distinguished and establish'd them in that beautiful Order wherein we see them.* Anxagoras *his Scholar was ARCHELAUS the* Athenian, *who was the Asserter of* Similar Parts, *and held* Heat *and* Cold *to be the* Principles *of all* Things. *To these also may be added, HERACLITUS the* Athenian, *who maintained that the* first Principle *was* Fire. *And DEMOCRITUS the* Abderite, *who would have it to be* Atoms. *These were of the* Ionick Sect.

PYTHAGORAS. *PYTHAGORAS of* Samos, *flourished in the Year 571 before* Christ, *and was the first that Instituted the* Italick Sect, *in that part of* Italy *commonly called* Great Greece, *now* Calabria. *He took a different course from his Predecessors, vailing his* Natural *and* Divine Philosophy *under*

Philosopheris

G. Freman. Inv. I. Kip Scul.

To the Right Noble Frances Dowager of the High borne of Richmond and Lenox, Darnley, Baron of Leighton, and Metheuen; Hereditary L.d High Admirall of Scotland, &c.a of Spaine and Knight of the

Teresa Stuart, Dutchess Prince, Charles Stuart Duke Earle of March, Litchfield, & Bromswold, Newbury, Torbolton, L.d High Chamberlaine, and L.d of Aubigny in France, Grandee most Noble Order of the Garter &c.

This Plate is humbly Dedicated by Richard Blome

the secret Science of Numbers, *and was full of* Symbolical *and* Figurative Expressions, *being perswaded that it was to profane the* Truth, *to expose it naked to the Eyes of the People. His* Disciples *were not permitted to speak of the* Mysteries *he taught them, till after five Years continual* Silence. *It was his Fundamental* Maxim, *that* Unity *was the* Principle *of the Generation of all* Things, *and that* Plurality *was the* Corruption *of them. To these Numbers he added a certain* Harmony, *by which he explained the* Perfection *of all* Things. Vertue (*according to him*) Health, *the* Soul, *and* God *himself is nothing but an* Harmony, *and there is nothing more known than the* Harmony *which this* Philosopher *imagin'd to Rule the* Celestial Orbs. *He held the* Transmigration *of* Souls, *discovered the* Qualities *of each* Element, *the* figure *of their* Bodies, *the* roundness *of the* Earth, *and the* Antipodes. *He distinguished the* Seasons, *observed the different* Course *the* Sun *makes* daily *and* yearly, *and how the* Moon *receives her* Light *from it.*

SOCRATES, who was Born at Athens 468 *years before* Christ, *leaving the Study of* Natural Philosophy, *wholly addicted himself to* Ethicks. *Accordingly* Tully, *in the* Third Book *of his* Tusculan Questions, *tells us,* That all that *Philosophy* which undertakes the Conduct of *Life* and *Manners,* was derived from *Socrates; and therefore saith,* That he had called down *Philosophy* from *Heaven,* to take up its abode in *Cities* and *Houses.* *SOCRATES.*

PLATO, an Athenian, *was born in the year* 427 *before* Christ, *and for his extraordinary* Learning *and wonderful* Sagacity *in the searching out of* Truth, *had the Name of the* Divine Philosopher *bestowed upon him. His* School *set about with* Trees *was in the Suburbs of* Athens, *first called* Ecademia, *from one* Ecademus *the Possessor of it, and afterwards* Academia, *which gave the Name to his* Sect. *He concluded* God, Idea *and* Matter, *to be the* Principles *of all* Things. *Concerning his* Opinion *of these* Idea's, *the* Learned *are much divided. Some would have him hold that they are* Eternal Substances, Forms *existing from themselves, and distinct from the* Knowledge *of* God, *as Models quite separated from him, and such as upon which he forms the* Ground *of his* Work. *But others are of another* Judgment, *declaring that in his* Doctrin *the* Idea *of the* World *is no other thing than the* Image *the* Creator *has formed. As for* Matter, *he suppos'd it to be void of all* Form, *and that before the* Creation *of the* World *it was a kind of* Chaos, *yet capable of all* Forms: *And forasmuch as it hath a Disposition whereby it may be distinguished into divers* Bodies, *which* disposition *he makes to be nothing else than a* Pyramidal, Cubical, *or other kind of Figuration, of the least and invisible* Particles *of which the* Elements *are compounded; He consequently asserts, that* Pyramidal volatile Particles *constitute* Fire; *that* Cubical *and* subsiding Particles *make* Earth; Octahedrical *or* Eight corner'd, Air; *and* Eicosahedrical *or* Twenty corner'd, Water. *PLATO.*

ARISTOTLE, the Son of Nichomachus, *Born at* Stagyra *in* Macedonia 383 *years before the Birth of* Christ, *differed much in his Sentiments of* Philosophy *from his Master* Plato, *who therefore compared him to a* Colt *kicking his own* Dam. *He had the* Liceum *for his* School, *a House near* Athens, *which had been* Apollo's Temple, *built by a certain one called* Licus. *Here his* Disciples *Disputed* Walking, *from whence that place, according to the Greek word for it, was called PIRAPATUS, and they themselves PERIPATETICKS. This* Philosopher *became Famous by being the* Præceptor *of* Alexander the Great, *as well as by his sharp* Wit, *and the great number of his* Writings. *He held* Matter, Form *and* Privation *to be the* Principles *of all* Natural Beings. *ARISTOTLE.*

ARCESILAUS of Sardis *in* Lydia, *flourish'd in the Year* 297 *before* Christ, *and Taught at* Athens, *where he was the Author of a* Sect *called in after Times the* Middle Academy, *to distinguish it from the* Old Academy, *which begun with* Plato; *and from the* New, *which was instituted by* Lacides *of* Cyrene, *as will be presently declared. He asserted that there was no* Certainty, *but only a bare* Probability *in the* Knowledge *of* Things; *so that he thought we might equally hold* Pro *and* Con *upon all* Subjects, *and therefore would never determine, but always suspended his* Judgment. *ARCESILAUS.*

LACIDES the Cyrenean, *newly mention'd, Taught in the same* School *some years after* Arcesilaus, *and was the* Head (*as I said*) *of the* Sect *which was called the* New Academy. *He acknowledged that something was highly* probable, *at least that one thing was more* probable *than another, and accordingly determin'd; but was not sure that any thing was absolutely True.* *LACIDES.*

PYRRHO of Elæa, *was also the* Founder *of a* New Sect, *that is, a* New manner of Philosophizing; *for he had no* Dogma's *at all, as believing that nothing was* true *or* likely, *that is, so much as* probable. *He went beyond the* Academicians: *For whereas they comprehended, that* Nothing *could be comprehended, he did not comprehend that. His* Followers *were called EPHECTICI, from their* withholding their Assents: *SCEPTICI, from their* Considering *and* Canvasing: *ZETETICI, or* Seekers, *from their* Search *and* Enquiry: *And APOZETICI, from the continual* Doubts *and* Difficulties *they were used to object to the* Dogmatical Philosophers. *PYRRHO.*

ZENO. *ZENO the* Citian *had his* School *at* Athens *in a Painted* Gallery *called* Stoa, *whence his Diſciples had the name of* Stoicks. Vertue *was the Sovereign* Good *in his* Morals, *and he is famous for that* Conſtancy *he inſpired into his* Followers *in the extremity of* Affairs. *They would never confeſs* Pain *to be an* Evil. *He held the* firſt Matter *to be deſtitute of all* Qualities, *as of* Heat, Cold,&c. *as alſo without any* Form,Shape, *or* Figure. *He ſuppoſed that beſides the* World, *there was a certain infinite Space altogether void and empty, in which the* World *after its* Conflagration *might be reſolved. He aſſerted two* Principles, *viz.* God *and* Matter, *without which nothing could ſubſiſt.*

EPICURUS. *EPICURUS was Born at* Athens 257 *years before* Chriſt. *He kept his* School *in ſome* Gardens *in that* City, *and was the Author of a peculiar* Sect. *He Taught, as well as* ZENO, *the love of* Vertue; *but that only for the Pleaſure of it, and in that Pleaſure he comprehends that of* Senſe, *as well as that of the* Soul; *maintaining,* That a Wiſe Man could not be happy, if he enjoyed not all *Pleaſures Mankind* was capable of. *In this he did not ſo well explain himſelf, but that he gave occaſion of raiſing* Doubts *concerning his true* Conceptions; *ſome believing them to be* Innocent, *whilſt others, and thoſe the moſt numerous, think otherwiſe; inſomuch that the* Epicureans *are now generally look'd upon as too* Senſual. *The reſt of his* Morals, *concerning* God, Providence, *and the* Soul, *are alſo much blamed. He took from* DEMOCRITUS *the* Principle *of his* Phyſick, *adding thereto the declenſion of* Atoms, *with a motion of* Weight. *His* Opinions *were, That nothing was without* Beginning *or* End, *but* Atoms *and empty* Space: *That the* Univerſe *always abides unchangeable in the Whole, tho' as to its Parts it be variouſly altered. He endeavours to prove the neceſſity of an* Empty Space *from* Motion, *and aſſerts, that the* World *ſhall ſome time or other be* diſſolved *by the force of* Nature.

GASSENDUS. *The Famous PETRUS GASSENDUS,* Mathematick Profeſſor *in the* Univerſity *of* Paris, *Born in* Anno 1592, *hath endeavoured to Amend and Perfect the* Epicurean Philoſophy, *eſpecially by refuting its Errors concerning* God, Providence, *the* Souls Immortality, &c. *and by a cautious Explication of ſuch of his* Opinions *in* Natural Philoſophy, *which tho' not utterly condemned, yet not being ſufficiently proved, but Doubtful and Slippery, might be an occaſion of falling into* Error.

DES CARTES. *After all theſe was Born RENATUS DESCARTES, at* la Haye *in* France, *of a Noble and Ancient Family, in the year of our* Lord 1597, *who by a Method, before his Time but imperfectly known, reſtored* Philoſophy *from the very Foundations, opening a ſure and ſolid Way to* Mankind *into the inmoſt Receſſes of* Nature. *He was of ſuch a ſingular* Genius, *that he alone diſcovered more* Philoſophical Truths, *than ever were diſcovered in all foregoing* Ages. *We do not go about here to give any Inſtances of his* Philoſophical Sentiments, *ſince this whole* Work *contains nothing elſe, but his* Opinions, *or what may clearly and diſtinctly be deduced from them.*

SECTION III.

The Parts of *PHILOSOPHY*, and the Deſign of this whole Work.

Of the Parts of *PHILOSOPHY.* *PHILOSOPHY is commonly divided into* Three Parts, *viz. Firſt, Into METAPHYSICKS, or NATURAL THEOLOGY, which proves the* Being *of a* God, *or* Firſt Cauſe, *on whoſe exiſtence all* Truths *depend, and without the knowledge of whom no* Science *can be had. Secondly, Into PHYSIOLOGY, or NATURAL PHILOSOPHY, which comprehends the* Principles *of* Material Things, *conſiders the Original of the* World, *and enquires into the* Parts *whereof it doth conſiſt; and afterwards deſcends to conſider the* Form, *and* Qualifications *of the* Sun, Stars *and* Planets; *the* force *and* vertue *of the* Air, Water, Fire, Foſſils, *or things dug out of the* Earth, *as* Metals, &c. *And laſtly, Enquires into the* Nature *of* Plants *and* Animals, *and more eſpecially of* Man, *who is a Compendium of the* Univerſe; *and laſtly into MORAL PHILOSOPHY, or ETHICKS, which ſearches into the Nature of* Good; *diſcovers what* Manners *are honeſt and becoming, and directs and governs all our voluntary* Actions, *according to the* Rule *of* Right Reaſon. *But to the end that in the handling of* Philoſophy *the* Modus (*that is, the Natural Way and Order*) *of* Science *may be obſerved, I have rather thought fit to diſtinguiſh* Philoſophy *into* Ten Parts, *that by this* Diviſion *my* Diſcourſe *might be more* Methodical, *and avoid the* Confuſion *which is incident to the former* Partition.

LOGICK, the Firſt Part of *Philoſophy.* *I thought fit therefore to make LOGICK the Firſt Part of my* Diſcourſe, *it being the* Organ *or* Inſtrument *of all PHILOSOPHY, and very neceſſary to the attaining of all* Sciences. *Becauſe I never eſteemed any thing more valuable in* Man, *than a good* Mind *or*

Under-

Understanding, *whereby he is enabled to unfold the* Natures *of* Things, *and to discern* Truth *from* Falshood. *For all other* Gifts *of the* Mind *have their* Bounds, *and are only determin'd to some particular* Offices: *But the Rectitude of the* Understanding *is conducive to all the Uses of* Life; *and is not only profitable in the dispatch of* Business, *but for the attaining of* Arts *and* Sciences. *For this Reason it is that I have begun this* Philosophical Treatise *with* LOGICK, *which is the* Art *that Teaches the right use of* Reason, *and how* Man *ought to manage his* Thoughts *in the* knowing *and* judging *of* Things. *And forasmuch as the* Mind *of* Man *is subject to many* Errors, *and is biast for those* Opinions *it has embrac'd during* Childhood, *having premised something of the Usefulness of* LOGICK, *I take occasion to advise every one carefully to avoid the* Prejudices *of* Infancy, *and not to admit any thing for* Truth, *but what clear and distinct* Perception *hath manifested to be such. For he* judgeth *wrong who doth not give heed to his* Conceptions, *and compriseth more in the* Conclusion, *than he had perceived in the* Premisses.

For the avoiding of this Præcipitancy, *I first examin the* simple Terms *of* Things, *and briefly enumerate those* Notions *of which our* Thoughts *are compounded; afterwards I set down a* Scheme *of* Substance, *and its* Attributes, *by which it is more distinctly understood and distinguish'd from the* Modes *that belong to it. To this end it will be of great use attentively to consider the* Genealogy *of* Things *and* Modes; *as also the* Imposition, Signification, Definition *and* Use *of* Names. *But because it is not sufficient to have* Idea's *of* Things, *except we know also whether they be* simple, *or* resolvable *into other* Parts: *I have added the* Chapter *of* Definition *and* Division, *by which means all* Confusion *may be removed, and the* Nature *of every thing, and its* distinction *from others more clearly known.*

After the clear Perception *of* Things, *I come to the* Judgment *we are to make of every* Thing; *and in so doing, I proceed from* simple Things *to those that are* Compound, *and as it were from the first Step of* Logick *to the second. The Sum whereof is this, That in our search of* Truth, *we never give our* Assent *to any thing which doth not exactly answer to our* Perception: *For it is not enough that* Truth *be in this or the other thing, except the same do appear to us, and we be fully convinc'd of its Certainty. For I take him to know nothing at all, who relies only upon the* Authority *of others, and is led by their* Judgment, *without hearkning to his own.*

After this, I proceed to the Explication *of a* Syllogism, *which is made up of divers* Judgments *that are found of them. Now whether* Syllogisms *are of so great use towards the acquiring of* Sciences, *as in the* Schools *they are boasted to be, I dare not assert, seeing that the greatest part of those* Errors *Men fall into are much more caused by their using of* false Principles, *than by their not observing the* Rules *of* Good Reasoning. *However, they must be acknowledged to have their* Use, *as being very helpful for the exercise of* Wit, *and more especially for those, who through overmuch Subtilty, or want of due Attention, suffer themselves to be deceived by* false Consequences, *and to be led into* Error.

That which concludes this Part *of* PHILOSOPHY, *is* METHOD, *which is the chiefest Part of* Logick, *and without all Controversie the most useful. For it being that* Judgment *of the* Mind, *by means of which whatsoever belongs to a whole* Science *is fitly and rightly disposed and digested; it is extreamly conducive to the discovering any* Truths *we are ignorant of, or to the convincing of others of those we know already. This* Method *in particular is either* Genetical *or* Analytical, *in both which the true Practice of* Logick *is perfected.*

The Second Part, is of GOD.

But forasmuch as all our Knowledge *is uncertain, as long as the most* perfect Being, *from whom all others do proceed, is not known to exist; therefore I begin the* Second Part *of this* Treatise *with the* Existence of GOD. *This I evince from the* Idea *we have of him which represents a* Being absolutely perfect, wise, *and* powerful. *For 'tis a Contradiction, that that which includes all* Perfection *should not be necessarily* Existent, *seeing that* Existence *is a vow'd* Perfection, *which therefore can't be absent from a* Being *absolutely Perfect. And therefore as we clearly understand, that in the* Idea *of a* Triangle *is contain'd, that its* three Angles *are equal to* two right ones; *so we find, that in the* Conception *of* GOD *is involved Necessary and Eternal* Existence. *From hence we duly infer, that* GOD *is the* Creator *of all things, not only in respect of their* Existence, *but also of their* Essence: *So that even the* Propositions *of* Eternal Truth *do depend on this first* Truth, *and are no farther True than as they are determined thereby. The* Existence *of* GOD *being demonstrated* à priori, *I proceed to lay open his* Attributes, *which by necessary consequence follow from it; since it is impossible but the* supream Being *must include* Unity, Eternity, Omnipotence, Immensity, Beneficence, Providence, &c.

The Third Part; Of *Intelligences* and *Dæmons.*

Having thus examined the Nature *of* GOD, *and inquired into his* Perfections *according to the measure of our* weak Understanding, *the next in order to be considered, are the* INTELLIGENCES *and* DÆMONS, *whose* Existence, *as far as it can be reached by* Natural Light, *I have endeavoured to* demonstrate: *And afterwards proceeding to their* Faculties, *have shewed*

them to be endowed with Understanding *and* Will: *And because there is no small* Dispute *betwixt our* Divines *and the* Talmudists, *concerning their* Number, Distinction *and* Subordination, *I have barely set down their* Opinions *without adding any thing of my own. Thence I pass to the* Power *they have to assume* Bodies; *and add something concerning the Care and Concern they have for* Mankind, *which I briefly confirm from* Texts *of* Scripture *and* Reasons *deduced from their* Natures.

The Fourth Part; Of Natural Philosophy in general.

It being proved *that there is a GOD, by whose* Power *the* Angels *and all* Things *are produc'd, and that it is repugnant to his* Nature *to deceive us: We are sure that we can't be mistaken in those things which are clearly and distinctly known by us; and therefore seeing we have clear and distinct* Idea's *of* Bodily Things, *which we are not the Causes of, as being often represented to us whether we will or no; I thence infer, they must needs proceed from* Objects *without us, which really and actually exist in the* World. *For otherwise, if GOD should immediately impress such* Idea's *on our* Minds, *or cause them to be conveigh'd from* Objects *in which there was nothing of* Extension, Motion, *or* Figure, *it would follow that he did impose upon us; and therefore we must conclude, that there is a* Substance *extended in* length, breadth *and* depth, *or* thickness, *which we call* Body, *and is the* Object *of this* Fourth Part. *For all things that are handled in* Physiology *belong to* Body, *as its* Forms *or* Affections.

Let not any one wonder that I exclude all substantial Forms *from a* Body, *or extended* Matter, *since they are so obscure that they can't be explain'd, no nor so much as conceived by those very* Men *who are the great* Patrons *of them. Whereas on the other hand, nothing is more obvious and agreeable to our* Senses, *than to assign the* Effects *of* Nature *to the different* Magnitude, Figure, Position, Motion, *and the* Rest *of* Bodies. *Who is so stupid as not to apprehend these* Principles? *Is it not better to explain* Things *by* Causes *known and obvious to all, than to have recourse to some* Principles, *which none understand, and which are as dark and difficult to those that* teach, *as to those that* learn *them? It is folly to admit any thing in PHILOSOPHY which no Body could ever yet comprehend, no, nor I dare boldly say, ever will be comprehended.*

If we admit that Material Substance *consists in a Threefold* Dimension, *and that it can't be distinguished from* Extension, *save only by* Reason *or a* Mental separation; *it will be easie to demonstrate, that it is impossible for any* Vacuum *to be in* Nature: *That* Rarefaction *is only made by the intervening of* New Matter: *That the* World *is not circumscribed by any* Bounds: *That the* Internal place *of a* Body, *doth not at all differ from the* Body *it self; and that the* Heavenly Matter *is of the very same* Nature *with the* Inferior *and* Sublunary. *Forasmuch as that which the* Philosophers *call* Quantity, *is not the precise* extension *of the* Body, *but only its* extension *as such; that is, with respect to its being* commensurate *to such a number of* Inches, Feet, Yards, &c. *it being apparent that a* Body *retaining the self same* quantity, *may be further extended in* length *and* less *in* breadth, *or on the contrary. As* Matter *hath some* Essential properties, *viz.* Divisibility, Figure, Mensurability, *and* Impenetrability; *so likewise it has some* common Accidents, *viz.* Rarefaction, Local Motion, Heaviness, Lightness, Hardness, Softness, &c. *which are not in it, as so many distinct things; but only as* Modes, *which can't be separated from the* Body; *and if they could, they would be no longer called* Modes, *but* Substances, *whose peculiar* property *it is to exist by themselves, and independent of any* Subject. *And seeing that as all the diversification of* Matter, *or the variety of its* Forms, *depends on* Motion, *by which the* Matter *is divided into* Sensible *and* Insensible parts, *I clearly make out, that the* Three Elements *of the* World *had their rise thence. Then having shewed that a* Body *hath no* power *to* move *it self, I make it appear, that all those* Motions, *which by the* Peripateticks *are commonly* attributed *to the prevention of a* Vacuum, *are occasioned, because all* Motion *of* Bodies *is in a manner* circular, *one succeeding in the* place *of another. Then I proceed to the* determination *of* Motion, *whether* simple *or* compound, *treat of* Reflection *and* Refraction, *of the* Acting *and* Resisting power *in* Bodies, *and wherein it consists. Afterwards of the* state *of* Bodies, *as to their* Hardness, Fluidity, Rarity *or* Looseness of Parts, Closeness, Roughness *and* Smoothness, &c. *where I shew, that there are* Pores *as well in* fluid, *as in* hard Bodies; *and last of all give a hint, that the* Ends *of GOD are not to be searched into in* Physiology, *because it is an Argument of* Rashness *and* Arrogance. *And as for TIME, under which we consider the* Existence *of* Created things, *it is improperly said to be an* Affection *belonging to them, since indeed it is a meer* Mode *of* Thinking, *serving only to explain* Duration, *and distinguish the* Parts *of it.*

The Fifth Part; Of the *World* and *Heaven.*

Having thus laid those Foundations *of NATURAL PHILOSOPHY, I proceed to consider the* Unity *and* Perfection *of the* World, *and endeavour first to shew, that the* Creation *of it may be discovered by* Natural Reason: *That its* Extension *is* immense, *or rather* indetermin'd, *so as not to be* circumscribed *by any* Figure, *or* Bounds: *That the Matter of* Heavenly *and* Earthly Bodies *is one and the same; and enquire at large what is the* Form *of the* World,

whether

whether it be the Soul, *that is, the* Spirit *of* Nature, *or the beſt* diſpoſition *of* Parts: *And in the next place aſſert, That* GOD *hath communicated to the* Matter *whereof the* World *is made, a* determinate Meaſure *of* Motion, *and doth preſerve the ſame* quantity *in the ſame. Then paſs on to examine the* Action *of* Bodies, *and the* communication *of* Motion, *and add ſome* Rules *by which we may know, what muſt of neceſſity happen in the* meeting *of* Bodies. *Then follow the Three noted* Syſtems *of the* World, *viz. The* Ptolomaick, Tychonick, *and* Copernican, *and after having rejected the two former, I with* Deſcartes *embrace the latter, as being more ſimple and better agreeing with the ſeveral* Phænomena *of the* World. *Then ſhewing the* Heavens *to be* fluid, *I go on to Evidence how they were diſpoſed or rank'd at the beginning, and of what manner their* Motions *were, and what is the* Action *of the* Heavenly Matter. *And for a better underſtanding of the* Celeſtial Motions, *I deſcribe the* Heavenly Globe *with all its* Circles, *and their ſeveral* Uſes. *Then examin the* Nature *of the* Sun, *the* Adjuncts *of* Light *and* Luminoſity. *How* Spots *are* generated *about the* Sun *and the* fix'd Stars, *and vaniſh again. What* Comets *are, and how it comes to paſs that* fixed Stars *are changed into* Comets.

Next to the Comets *are the* Planets, *whoſe* riſe *is ſhewed, together with the* Principle *of their* Motion, *and how they become* Direct, Retrograde, *and* Stationary. *Then the* Moons motion *is conſidered, with its various* Appearances, *and the* Eclipſes *of it, as well as of the* Sun. *Next follows the* Nature *of the* fix'd Stars, *their* Number *and* Conſtellations, *and concerning their* Influences, *as well as of the other* Stars, *and what* Judgment *we are to make of* Judicial Aſtrology.

The Sixth Part; Concerning the Four Bodies.

Having thus taken ſome Turns in the Heavens, *we return again to the* Earth, *to take a more exact Account of its* Original parts *and* Figure, *and the manner of its being* moved *in the* fluid Heaven; *demonſtrate alſo its* Motion *by Reaſon, and Anſwer the* Objections *made againſt it; and then diſcover all the* Viciſſitudes *of* Night *and* Day, *and the ſeveral* Seaſons *of the* Year, *which proceed from the* Diurnal *and* Annual motion *of the* Earth. *Then take notice of the* Five Zones, *invented by* Geographers, *to diſtinguiſh the Variety of* Heat *and* Cold *in the ſeveral Parts of the* Earth, *occaſioned by the* nearneſs *or* diſtance *of the* Sun; *and the* Climates *made uſe of, for a more diſtinct* Explication *of the ſeveral* Tracts *and* Regions *of the* Earth. *Then proceed to the* diſcovery *of thoſe Things which are* generated *in the* Bowels *of the* Earth; *as* Fountains, Metals *and* Minerals, Stones, Gems, *the* Load-ſtone, *and* Electrical Bodies. *After, ſpeak of the* Water, *the* Flux *and* Reflux *of the* Sea: *Of the* Air, *and its* Elaſtick virtue. *Then of the* Meteors *in general, and particular; as of* Winds, Clouds, Miſts, Rain, Dew, Hoar-froſt, Cool *of the* Evening, Snow, Hail, Thunder, Lightning, Coruſcations, *the* Rain-Bow, Circles *formed about* Stars, *and* Mock-Suns. *Then unfold the* Nature *of* Fire, Heat *and* Cold: *The moſt remarkable* Effects *of* Fire, *as the Effervеſcence of ſome* Bodies, *and the Turning of others into a* Calx *or* Aſhes, Earthquakes, Fermentation, &c. *and laſt of all conſider the* Mixtion, Generation, Corruption, Alteration, Augmentation, *and* Diminution *of* Bodies.

The Seventh Part; Of Living Creatures.

Having thus largely enough handled (as I ſuppoſe) Inanimate things, *I proceed to thoſe that are* Living, *and having premiſed their* Diſtinction *from* Things *without* Life, *I aſſert their* Life *to conſiſt in a due Temperament of* Heat *and* Moiſture, *and conſequently that their* Death *proceeds from the contrary* Cauſes *of* Cold *and* Dryneſs. *Next I enquire into the* Cauſe *of the* Hardneſs *which is obſerved in the* Outſide *of them, and of the* difference *of this* Vital Heat *in* Living Creatures, *and why the ſame is weaker in ſome, and more ſtrong and durable in others. Then diſcover the* Nature *and* Virtue *of the* Aliment *or* Food *wherewith* Living Creatures *are Nouriſhed, and how* Living Things *come to be* changed *by the diverſity of* Place *and* Time; *and then come down to* Plants, *and having explained their Parts,* Original Nutrition, Growth, Difference *and* Propagation, *I enquire into the* Cauſes *of their different* Colour, Taſte *and* Smell; *as likewiſe of their* Periſhing *or* Death. *Laſtly, I lay open the* Nature *of* Animals, *what the* Souls *of* Beaſts *are, and then examin in particular the* Nature *of* Fourfooted Beaſts, Creeping Things, Birds, Fiſh *and* Inſects, *and wherein the* Death *of theſe conſiſts.*

The Eighth Part; Of *MAN.*

After having taken a View of this Great World, *I proceed to the Conſideration of the* Leſſer World *MAN, who may be defined a* Compound *of a* finite Mind, *and* rightly diſpoſed Body. *But foraſmuch as theſe* two Parts *are wholly of a diſtinct Nature, without any* Analogy *between them, I thought fitting to conſider them each apart, and handle them diſtinctly, that the ſeveral* Proprieties *of each might be the better known. Wherefore I ſet down the* deſcription *of the moſt principal* Parts *of* Mans Body, *both* Internal *and* External; *give an Account of the* Formation *of the* Birth *in the* Womb, *and of its* Animation; *as likewiſe of* Nutrition, *the* motion *of the* Heart, Arteries *and* Muſcles, *and of the* Circulation *of the* Blood. *Then follows* Reſpiration, *and how the ſame is performed in* Man; *and laſtly, ſome things are added of the* Increaſe *and* Decreaſe *of* Mans Body, *its* Temperaments, *and different* Ages. *And foraſmuch as the* Senſes *do chiefly belong to* Man, *I treat firſt of the* Senſes *in common, and ſhew that they are the Effect of*

the

the Nerves, *and that the* Soul *of* Man *feels only, foraſmuch as it reſides in the* Brain: *Then I ſpeak of the* Senſes *in particular*, viz. *of* Feeling, Taſting, Smelling, Hearing, *and laſtly having ſaid ſomething concerning the* Eye *and its* Object, *I Diſcourſe concerning* Sight, *the moſt Noble of all the* Senſes, *and of the* manner *how it is performed, and ſhew how the* Scituation, Diſtance, Magnitude *and* Figure *of* Bodies *are thereby diſcerned; and then add ſome* Chapters *of* Waking, Sleep *and* Dreams; *the* Appetite *of* Hunger *and* Thirſt; *of the* Common Senſe, Imagination *and* Memory; *of* Health *and* Sickneſs; *and laſtly, of* Medicaments *in general, and their* Operation.

The Ninth Part; Of the *Mind*, or *Soul* of Man.

I look upon the Rational Soul *as the Chief Part of* Man, *which excelleth the* Body *in its* Nature *and* Functions; *I evince that the ſame is more evidently perceived by us than the* Body, *ſince we cannot doubt of its* exiſtence *even at the very inſtant we are doubting of it: For it is a* Thinking Being, *not only* potentially, *as ſome conceive, but* actually; *becauſe* Thinking *can't be ſeparated from it without the* deſtruction *of its* Nature; *whence I* Argue, *that it is* eſſentially diſtinct *from* Material things, *which conſiſt in* extenſion, *and conſequently that it is* Spiritual *and* Immortal. *Now as to the* manner *of the Union of theſe* two Subſtances *in* Man, *I briefly aſſert, that the ſame conſiſts in this, that the* Functions *of the* Body *depend on the* Cogitations *of the* Mind, *and they again on the* Motions *of the* Body, *which* Miracle *is the work of the* All-wiſe *and* Omnipotent *GOD alone, as the* Immortality *and* Eternal duration *of the Soul is the effect of his* Good pleaſure. *I prove that there are* inborn Idea's *in the Mind of* Man, *eſpecially of GOD, a* Thing, Subſtance, general Maxims *of* Truth, Good, Equity, &c. *and explain the* four Faculties *of the* Mind *of* Man, *viz.* Underſtanding, Imagination, Will *and* Memory; *not as Things really diſtinct from it, but only as ſo many* Modes, *whereby it* Underſtands, Imagins, Wills *and* Remembers.

And becauſe the Affections *and* Paſſions *are the conſequence of the cloſe Union there is between the* Soul *and* Body, *I ſhall in the next place handle them, and endeavour to lay down in ſhort their* Nature, Cauſes *and* Effects; *and tho' there be many of them, and according to the variety of their* Objects, *are called by ſeveral* Names, *yet they have all of them but one and the ſame* common Principle, *to wit, the* Animal Spirits, *by the Motion whereof they are produced and ſtrengthned. For all of them* (*if we except* Admiration) *are conveighed to the* Brain, *and are always accompanied with a peculiar dilatation of the* Blood. *I enquire alſo in what part of the* Body *the* Soul *entertains its* Paſſions; *what* Love *is, what* Hatred, *what* Joy, *and what* Sorrow. *Laſtly, I undertake to aſſign the Cauſe of thoſe* Inclinations *which are peculiar to certain Perſons, and to which ſome give the Names of* Sympathy *and* Antipathy, *which I deduce from thoſe* Motions, *that by ſome external Cauſe are excited in the* Body *from its firſt* Infancy, *and are apt afterwards to awaken the ſame Thoughts in the* Soul; *as on the other hand likewiſe the ſame recurring Thoughts produce the ſame Motions in the* Body.

The Tenth and laſt Part; Concerning the right Conduct of *Life*.

Laſt of all, this PHILOSOPHY is concluded with a Diſcourſe of the right ordering and guidance of Life, *the* Happineſs *whereof doth not conſiſt in* Bodily pleaſures, *the* Goods *of* Fortune, *or the* Gifts *of the* Mind; *but in a firm* unſhaken purpoſe *and reſolution of* well-doing, *and in the* ſatisfaction *which thence ariſeth. And becauſe no Body can be ſaid to* do well, *but he that acts according to* Vertue, *I proceed to the Explication of VERTUE in general, and unfold its* Eſſence, *ſhewing that it doth not conſiſt in a* Mean *of the* Affections, *but in a* conſtant purſuit *of what ſeems beſt to* Right Reaſon; *and then paſs on to the ſeveral* Species *of it*, viz. Prudence, Temperance, Fortitude *and* Juſtice, *which are ſo many Foundations of* Human Happineſs. *I have not thought it any Crime in the handling of them, to depart from the received Cuſtom of the* Schools, *and to Exhort my* Readers *rather to* Doing *than* Talking, *as knowing that* Vertues *are not acquired by* Queſtions *or* Diviſions, *but by* Precepts *or* Rules *for the Forming of our* Manners. *I have alſo added ſome* Articles *concerning the* uſe *of the* Paſſions, *which I conceive to be of no ſmall Advantage to the obtaining of* Human Felicity, *as long as they continue under the Guidance of* Reaſon, *and without Tranſgreſſing any of its* Laws. *And foraſmuch as all* Vertue *would be in vain, in caſe* Man *were deprived of* Free-will, *I endeavour to prove, that* Man *was created Free by* God, *and that his* Præſcience *and* Power, *is no hindrance to* Human Liberty, *and that notwithſtanding the ſame, a Man may exert* Actions *worthy of* praiſe *or* reproach.

But becauſe theſe ETHICKS might appear defective without ſaying ſomething concerning Human Actions, *I thought fit to add a few things concerning the* Duties, *or* Offices *of* Man *in general, and of a* good Citizen *in particular; wherein I firſt* diſcourſe *largely enough concerning the* Rules *of* Human Actions, *whether they reſpect GOD, our SELVES, or our NEIGHBOUR, and tho' in theſe Three all* Human Obligations *ſeem to conſiſt, yet have I not thought much to ſuperadd to theſe ſome other* Laws *of* Humanity, *and* Rules *of* Covenants *and* Contracts, *whereby all* Perſons, *whether they be in a publick or private* Station, *may be informed what they are bound to do, and which be the* Offices *and* Duties *of* Human Life.

Altho'

Of the Means and Helps which conduce to *Philosophizing*.

Altho' throughout this whole Philosophical Work *I have endeavoured to observe a due Order, and to deduce subsequent* Truths *with all possible clearness from those that precede, yet I thought it would not be besides the Matter, if I should subjoyn some* Rules *for New Beginners in PHILOSOPHY to observe, in order to the Securing them from* Error, *and for the right conduct and guidance of their* Reason.

First Rule.

First RULE, That they lay aside all the Prejudices of their Infancy, *and admit nothing for* Truth, *which they have not first discust and examin'd anew.*

Second Rule.

Second RULE, That they be not rash in their Judgments, *but always abstain from* Judging, *as long as they have no clear and distinct* Perceptions; *and that they neither* affirm *or* deny *any thing, except it be of* Things *that are clearly and distinctly known by them.*

Third Rule.

Third RULE, That they give great heed to the Question *propounded, and warily consider, whether what they suppose themselves to have* perceived, *do necessarily follow from those* Truths, *which by a new Examination or Scrutiny they have found out.*

Fourth Rule.

Fourth RULE, To distribute the Difficulty *they undertake to Examin into so many* Parts, *as is fitting for the more easie and commodious* resolving *of it.*

Fifth Rule.

Fifth RULE, So to dispose the Members *of this* Division, *as to begin with those that are most* simple *and* easie *to be known; observing therein the Order of* Nature, *as far as may be, and so by degrees proceed to the* knowledge *of such as are more* difficult *and* compound.

Sixth Rule.

Sixth RULE, To examine all the Parts *singly by themselves, with so much Attention and Exactness, that they may be assured of having omitted none; and especially minding, whether they do not oppose and contradict those* first Truths *and* primitive Notions *they have already discovered, and clearly perceived.*

The Design of the *HISTORY of NATURE*.

Thus having gone through the Book *of the INSTITUTION, next follows the HISTORY OF NATURE. For seeing that the* Truth *of the* Principles *of any* Science *is made manifest by the Evidence of its* Deductions, *and that their* Certainty *is look'd upon as Indubitable, if those* Things *that are Inferr'd from them, do wholly depend upon the* knowledge *of them; I was desirous to try, whether the several* Appearances *of* Nature, *or all those* Things *which our* Senses *perceive to be in* Bodies, *did comport with the* Principles *laid in my INSTITUTION OF PHILOSOPHY, and whether there be such a Connection between them, as that tho' the* latter *may be Apprehended without the* former, *yet the* former *can never be Understood without the* latter.

For tho' the Principles *I make use of in the Explaining of* Things Natural *seem to be very plain, as being nothing else but the* Magnitude, Figure, Motion, Rest, *and* Position *of* Bodily Things; *nevertheless I dare affirm, that in this NATURAL HISTORY I have had recourse to no other* Principles; *and that I have not only explain'd all those* Effects, *which by the* Peripateticks *are commonly look'd upon as the* Miracles *of* Nature, *without the* Auxiliaries *of* Sympathy *and* Antipathy, *or the assistance of* occult Qualities; *but have also given a true and Natural* Reason *of them, so as to leave no room for* doubting *of their* Certainty, *especially if it be considered, how many* Things *concerning* Bodies, Qualities, Metals, Animals, &c. *are unfolded and cleared from so few and such simple* Principles, *which certainly could never so well cohere together, except they were* true, *and out of the reach of* doubting.

I confess I have chiefly taken upon me to explain the common Phœnomena, *and such as most frequently occur; yet must it not be thence inferr'd, that I can't with the same ease render a* Reason *of the more extraordinary, which do seldom happen; since the Cause of all* Effects *is alike, and forasmuch as whatsoever we meet with in the* World *hath its* Use *and* End *from the same* Principles. *Wherefore I have generally forbore mentioning such as those, lest I should seem to stand in need of* strange *and* uncommon things, *to demonstrate the* Certainty *of my* Principles, *or to have recourse to* Monsters *and* Prodigies *to be my* Witnesses *of their Evidence.*

My Design *therefore in this* Work *was, not to describe the whole HISTORY of NATURE, or to comprehend in One* Book *all the* Phœnomena *of the* Universe, *since that would be an infinite Task; but only to make out, that all the Things we see do perfectly well agree with the* Principles *I have establish'd in my INSTITUTION of PHILOSOPHY; and that nothing is handled by the* Philosophers *of any* Sects *whatsoever, which is not accommodately, yea, more distinctly and clearly explained by these* Principles.

The First Part is, Of the Nature of a BODY.

The First Part *therefore I begin with is the* Nature *of a BODY, and at the very beginning endeavour to prove against EPICURUS and the most Famous GASSENDUS, that there is no empty* Space *to be found between the* Parts *of* Matter: *That the* Arguments *and* Experiments *which they alledge for the proving of a* Vacuum *are to no purpose, and wrongly applied. And in the next place proceed to the* Affections *of* Bodies; *where, after I have asserted the indefinite* Divisibility *of a* Body, *I lay down several* Experiments *of* Bodies, Thin *and* Close, Hard *and* Fluid, Rough *and* Smooth, Transparent *and* Dark, Bended *and* Compress, *assigning the true Reason of their several* differences.

And

The Second Part is of *Qualities.*

And forasmuch as Qualities *do always accompany* Material Substance, *and affect and determine the same in whatsoever* State *the same may be*; *I was willing to demonstrate the* true Nature *of them by* Experiments, *shewing that they consist in* Quantity, Motion, Figure, *and* Position *of* Parts; *which afterwards I make manifest by the Examples of* Heat *and* Cold, Heaviness *and* Lightness; Taste, Smell, Sound, Colour *and other* Affections *of* Bodies *which strike our* Senses. *Which done, I discover those* Effects *which are commonly attributed to unknown* Qualities, *which they term* Occult, *and declare the* Causes *of them.*

The Third Part is, of the *World* and *Heaven.*

Afterwards I proceed to the History *of the* WORLD *and* HEAVEN, *taking my rise from the Beginning of the* World, *which is followed by the* Generation *of* Things, *and the Ordering of the several* Parts *of the* World, *with the end that threatens it from the* Generation *and* Corruption *of* Things: *After these come the* Phænomena *of the* HEAVEN, SUN, *and* FIXT STARS, *and the* Spots *that appear in their* Bodies: *And next to these the* PLANETS *and* COMETS: *And then from various* Examples *enquire, whether they have any* Power *upon us, or* Inferior Bodies, *or* Foretel *any thing with* Certainty, *and declare what we ought to judge of these kind of* Predictions.

The Fourth Part is, of the Four Bodies.

The Fourth Part *is taken up by the* Four great Bodies: *First, The* EARTH, *which is almost to be look'd upon as nothing, if compared with the* Universe: *Next, the* WATER, *with its various* Properties: *Then the* Rivers *and* Fountains, *whose* rise *is discovered; and after those the* Sea, *with the Cause of its* Ebbing *and* Flowing: *These being the* Things *that have not only troubled the Heads of the* Philosophers *of this* Age, *but also those of the* Ancients, *and forced them to betake their refuge to* occult Qualities. *Next to the* Water, *the* Phænomena *of the* FIRE *are discovered, the Effects whereof are very different, as* Earthquakes (*which don't affect the* whole Globe, *but only some part of it*) Glass *and* Coals, *which are produced by its* Operations; *and many other Things are Explained, not only of those which are* generated *here with us on the* Surface, *but also in the inward Parts of the* Earth. *And lastly, the* AIR *brings up the Rear of the* Elements, *whose* power *and* efficacy *appears as well in* Natural *as* Artificial Things.

The Fifth Part is, of *Fossils.*

And forasmuch as the Earth *doth hide many Things in its* Bowels, *which deserve our Consideration, I have added something concerning* FOSSILS, *viz.* Things *dug out of the* Earth *in* general: *And first of* Quicksilver, Brimstone, Salt, Gold, Silver, Tin, Lead, Brass, Iron, *and other* Minerals, *whose* Generation *is no less wonderful than their* Operations *and* Effects. *This done, I proceed to the* Stones, *and having discussed their various* generations, *I examine their* distinction *and different* Constitution: *And lastly, consider the* LOAD-STONE, *which tho' it be reckon'd amongst* common Stones, *and hath nothing of* lustre, *yet has very singular* effects, *and such as are astonishing to those, who do not own the* Striate *or* Screw-like Matter *to be the Cause of them.*

The Sixth Part is, of *Meteors.*

After this, I proceed to the discovering of the Phænomena *of* METEORS, *whose place as it is between the* Earth *and the* Stars, *so they seem to participate of both their* Natures. *First, I open the* Nature *of* Vapours *and* Exhalations, *and what goes to the* forming *of them: Then speak of the* WINDS, *which like* wandring Travellers *never rest. These are followed by* Rain, Hail, Snow, Dew *and* Honey; *and then I declare the* rise *and* effects *of* TEMPESTS *and* THUNDER; *also why* LIGHTNING *is so fierce, and why it seizeth* hard Bodies *without touching those that are* soft. *Amongst* Meteors, *the* RAINBOW *challengeth the first place, and other* Fires *kindled in the* Air, *which as they do more closely or loosly stick to their* Matter, *so they vanish sooner or later.*

The Seventh Part is, of *Plants.*

After these comes the Seventh Part, *concerning* PLANTS, *whose variety is almost infinite; where first I discourse of their* Parts, Virtues *and* Qualities, *whether hid or manifest, that are common to every* Plant. *Then I explain the* Sympathy *and* Antipathy *of some of them, adding something of their* rise, nutrition, germination *and* decay, *as much as may seem sufficient not only to understand their* Phænomena, *but also their whole* Nature.

The Eighth Part is, of *Animals.*

I begin my Treatise *of* ANIMALS *with those that are begot of themselves, or as others will have it,* begot *of* putrefaction, *and from them proceed to* Animals *that are produced from* Seed. *And having enquired into the Cause of* MONSTERS, *I speak concerning their different* Time *in bringing forth; and then passing over to their* Affections, *I search into the Causes of* HUNGER *and* THIRST, *and of the* CIRCULATION *of the* BLOOD; *and then consider what it is in them that is the* Principle *of such various* Operations, *and make out that they are performed in them* Mechanically, *without any* perception *or* knowledge; *why some of them* hate, *and others* love *one another; and lastly, why some* sleep *more, and others less; and why they are subject to different* Diseases.

The Ninth Part is, of *MAN.*

This whole History *is concluded with* MAN, *who in the becoming* Form *of his* Body *excells all other* Creatures *of the* World, *as well as he exceeds them by his* Reason, Understanding, *and his* Soul *or* Mind: *For tho' he makes use of the same* Organs *of the* Senses, *with other* Animals; *yet he doth not perceive the* Objects *of them as they do, since* Sensation *is a kind of* Cogitation *in him,*

him, which is not compatible to Brutes. *And thus having explained ſome* Experiments *concerning* Feeling, Taſting, Smelling, Hearing *and* Seeing; *I proceed to* Imagination *and* Memory, *and lay open the Cauſe of* Sleep *and* Dreams. *And laſtly, having deſcribed the Cauſes of* Paſſions *that outwardly appear, I Conclude this my* Natural Hiſtory, *with the peculiar* Natural propenſions *and* averſions *of ſome* Perſons, *the Original whereof tho' of long time hid, is now made plain and perſpicuous.*

The Deſign of the Diſcourſe, concerning the want of *Senſe* and *Knowledge* in *Beaſts.*

The Third *and* Laſt Book, *is of the want of SENSE and KNOWLEDGE in BEASTS; where, tho' from the Beginning of the* World *it hath been the Common received* Opinion, *that* Brute Beaſts *are endowed with* Senſe *and* Knowledge, *and conſequently that they are but gradually diſtinguiſh'd from* Men, *yet I make no ſcruple in this* Diſcourſe, *to deprive them of thoſe* Operations, *and to render them meer* Machins, *which by the furniture of* Organs *they are provided with, exert their ſeveral* Actions, *and perform all thoſe* wonderful things *which moſt* Men *think can't be done without* Knowledge. *For ſeeing that* Senſe *and* Knowledge *do include an immediate Conſciouſneſs of* Perceptions, *which it is Contradictory to ſuppoſe in the moſt* ſubtil *or* refin'd Body *that may be, I think that* Beaſts *ought to be deprived of them both, and that they are neither more nor leſs than meer* Engins *or* Machins. *But what will ſome ſay; Have not the* Beaſts *then any* Senſes *or* Appetites? *Yes, they have; but without* underſtanding *or* knowing *what they do ſo* feel *or* deſire: *For this is the peculiar Excellency of MAN, whereby he exceeds* Beaſts. *For in them is nothing to be met with beſides ſeveral* Motions, *which may as well be found in an* Artificial Machin, *as has been ſeen in the Flight of an* Artificial Fly, *and in that* Iron-Statue, *which after many* Turnings *and* Windings *preſented it ſelf before the* Emperour *of* Morocco, kneeled down, delivered a Petition, *and then* riſing again, *returned the* ſame way it came, *as* Hiſtorians *aſſure us. Accordingly it will appear, that all thoſe* Motions *which we perceive in* Beaſts, *are only determined by the* Animal Spirits, *with the help of the* Nerves *and* Muſcles, *and are performed in the ſame manner, as in us, when we do any thing without* minding *or* knowing *what we do: For indeed tho' ſuch* Actions *be done in us, yet they are not properly done by us; wherefore I allow no* Soul *in* Beaſts, *beſides the* Blood, *which being a* fluid Body, *and ſwiftly moved, its more* ſubtil part, *which we call* Spirit, *and continually is carried by* Arteries *to the* Brain, *and from thence into the* Nerves *and* Muſcles, *moves the whole* Body, *as I have fully here demonſtrated.*

This Work in all its Parts, more Compleat and Perfect than hitherto Publiſh'd.

Here is nothing more to be ſaid, unleſs it be to acquaint the Reader, *That tho' the* Three Treatiſes *contain'd in this* Volume, *have been well received in their former* Dreſſes, *both at* home *and* abroad, *having been often* Printed *here in* England *and in* Foreign Countries, *the laſt having been alſo* Tranſlated *into* French *by* Monſieur De VILLEMESMES, *then* Counſellor *to the preſent* French King. *Yet to make them more uſeful to all* Perſons, *I have now carefully* Reviewed, Altered, *and* Enlarged *them all; ſo that this whole* Work, *in all its* Parts, *is more Compleat and Perfect, than what has hitherto been Publiſhed in any* Language.

Anthony Le Grand.

THE

The PREFACE.

The Third and last Book, is of the nature of SENSE and KNOWLEDGE in BEASTS; the Difficulty of concerning the want of Sense and Knowledge in Beasts.

Here is nothing more to be said, unless it be to acquaint the Reader, That tho' the Three Treatises contain'd in this Volume, have been well received in their former Dresses, both at home and abroad, having been often Printed here in England and in Foreign Countries, the last having been all Translated into French by Monsieur De VILLEMESMES, then Counsellor to the present French King. Yet to make them more stylish to all Persons, I have more carefully Reviewed, Altered, and Enlarged them all; so that this whole Work, in all its Parts, is more Compleat and Perfect, than what has hitherto been Published in any Language.

This Work is all its Parts, more Compleat and Perfect than hitherto Publish'd.

Anthony Le Grand.

THE

THE CONTENTS OF EACH CHAPTER In each Part of the INSTITUTION of PHILOSOPHY.

The first Part concerning LOGIC, in 23 Chapters.

INtroduction *of the Nature and Constitution of* Logick, Folio 1

Of the true use of Logick, *shewing that* Logick *is useful and necessary to the conduct of a Rational Life*, 2

The first part of Logick; of the clear and distinct perception of the Mind.

What the hindrances of Science *are, and how to be removed*, 4

Some Rules *for the attainment of* Truth, 5

Concerning the various Modes *of* Perception, *viz. pure* Intellection, Imagination *and* Sense, 9

Of the 5 Universals, *or* Predicables, 10

Universals singly examined, *as to their* Nature, Properties *and* Use, 11

Of Substance, *and its* Affections *and* Modes, 14

Of the Common Attributes *of* Substance, 15

How the name of Substance *agrees to* God, *and the* Creatures, 17

The Genealogy *of* Things *and* Modes, 18

Of the Whole *and* Parts, Causes *and* Effects, Subject *and* Adjunct, 20

Concerning the distinctions, whence the nature and difference of Idea's *is deduced*, 22

Of the Imposition, Signification, Definition *and use of* Names, 23

The Second Part of Logick.

Concerning the right judgment of the Mind, *or* Proposition, 26

Of Judgment, *absolute and compared*, ibid.

What a Proposition *is, and how manifold, with the several* Rules, 27

Concerning the Truth *and* Falshood *of* Propositions, *with the* Rules, 29

Of Division *and* Definition, *with the Rules*, 31

The Third Part of Logick.

Concerng the Minds Ratiocination, Syllogism, 33

Of Reasoning, or Argumentation, ibid.

Of simple Syllogisms, *and those either* Complex, *or* Incomplex, 34

Of Conjoin'd or Compound Syllogisms, 37

Of Imperfect Arguments, 38

Of Demonstration, *a* Topical Sylogism *and* Sophistical, 39

The places whence the Middle Term is fetcht, 41

The Fourth Part of Logick.

Concerning Method, or Orderly Disposition of our Thoughts, 42

Of the General Method of Knowing, ibid.

Concerning special Method; and first of that which is called Analitical, 44

Of the Method of Composing, 46

Rules of Definitions. *Rules of* Axioms, 47

Most General Axioms. *Special Logical* Axioms: *from the* Genus: *from the* Species: *from the* Forms *or* Differences: *from the* Property: *from the* Definition: *from* Division. 48,49,50

From the Cause: *from the* Effect: *from the* Subjunct, *and* Adjunct: *from the* Whole: *from the* Parts: *from* Like *and* Unlike: *from* Contraries: *from* Privative Opposites: *from* Contradictories: *from* Parity *or* Equality: *from the* Greater: *from the* Lesser: *from* Divine Authority: *from* Human Authority. *Rules of* Demonstration, 51

Of General Method, 52

The Second Part, *viz.* Natural Theology. in 16 Chapters.

An Introductory Discourse *of the Definition of* Natural Theology, *and its certainty*, 53

What God *is, and how he may be reached by us*, 54

By the Inborn Idea *that is in us, we know that* God *exists*, 56

That it belongs to the Nature of God *to exist*, 58

The Contemplation *of the* World *proves* God's existence, 59

Concerning Fate *and* Will, *or the* Divine Decree, 62

How God *is said to be the* Cause *of* Propositions *of* Eternal Truth, 63

Concerning the Divine Attributes, *and first of the* Unity *of* God, 64

That God *is Eternal, or without beginning or end*, 65

That God *is Infinite, and how we are to understand, that he is circumscribed to no place*, 66

That God *is the most Simple Being*, 67

God *is true, and as he can't be deceiv'd so he cannot deceive*, 68

That God *is the most highly Intelligent, or Omniscient*, 69

That God *is Good, and doth Good*, 70

Of the Omnipotence of God, 71

That God *is the Creator of all things*, 73

Concerning God's *Government of the* World, *and* Providence, 74

The Third Part, *viz.* of Dæmonology, or of Intelligences and Created Spirits, in 11 Chapters.

A Prefatory Discourse, of the Division of Created Things; *the Definition of* Pneumaticks, *or the*

The Contents.

Doctrin of Spirits, *and its certainty*, 76
Of the Nature of Angels, 77
Whether the existence *of* Angels *be demonstrable by the light of* Nature, *and how the same may be evinced*, 79
Of the Faculties of Angels, *and of their* Understanding, *and its* Object, 80
Of the Wills *of* Angels, 81
The Power *of* Angels, *as to their moving, and producing of* Bodies, 82
Of the Number, Distinction and Subordination of Angels, 83
Whether Angels *be in a place*, 85
How Speech *is attributed to* Angels, 86
How Angels *assume* Bodies, *and what Actions they exert in them*, 87
Whether there be any Order amongst Devils, *and of what kind*, 88
Of the care of Angels *as to* Man, *and the things here below*, 89
The Fourth Part, *viz.* General Natural Philosophy. In 25 Chapters.
Of the Essence and certainty of Natural Philosophy, 91
The Existence of Material Things, proved, 93
Of the Nature and Constitution of Matter, 94
Of the properties of extended Substance, *viz.* Mensurability, Divisibility *and* Impenetrability, 96
Of the Division of Matter *into sensible and insensible parts*, 98
Of the threefold kind of Matter, *and that there are but three* Elements *in the* World, 99
No Substantial Forms *really distinct from* Bodies, 102
No Qualities *or real* Accidents *distinct from* Substance, 104
What Intelligible Forms *may be attributed to Natural Things*, 106
What Rarefaction *is, and how performed*, 108
Of heavineſs and lightneſs of Bodies, 109
Concerning Place, 111
The supposing a Vacuum *in* Nature, *implies a contradiction*, 113
Of the Vulgar and Philosophical definition of Motion, 114
Of the Principles of Local Motion, 116
A Body *can neither move it self nor another* Body, 119
Of those Motions *which are ascribed to* Natures *avoiding of a* Vacuum, 120
Of the determination of Motion, *both simple and compound*, 122
Of Reflexion *and* Refraction, 123
Of the force of Acting *and* Resisting, 125
Of the state of Bodies, *viz. hard, fluid, frangible, friable, soft, ductile, and such as may be cut or slit*, 127
What loose and close, rough and smooth, contiguous and continuous Bodies *are*, 129
Pores *in hard* Bodies, *as well as in fluid or soft*, ibid.
Concerning Duration *and its* Species, Time *and* Eternity, 131
The ends of God *are not to be enquired after in* Natural Philosophy, 132
The Fifth Part, *viz.* of Special Natural Philosophy, concerning the World and Heaven. In 24 Chap.
Of the Unity and Perfection of the World, 134
The Creation of the World *proved by Natural Reason*, 136
The World *is not circumscribed by any Figure or Bounds*, 137
The Matter of Heavenly and Earthly Bodies, *is one and the same*, 138
What the form of the World *is, whether it be the* Soul, *that is, the* Spirit *of* Nature, *or the most excellent disposition of its parts*, 139
That God, *as he is the efficient and conserving cause of* Matter, *so of* Motion, 141
Of the Actions of Bodies, *and the Communication of* Motion, 143
Of the Platonick, Copernican *and* Tychonick *System of the* World, 146
Of the true System of the Universe, 148
The Heavens *are* fluid Bodies, 150
How the Heavens *were disposed at first, and of their divers* Motions, 151
Concerning the Action and Motion of the Heavenly Matter, 153
Of the Heavenly Sphere *and its Circles*, 155
Of the Sun, 157
Of Light, 158
How Spots come to be generated about the Sun *and fix'd* Stars, *and how they vanish again*, 161
Concerning Comets, 162
Of the Nature, Original and Affections of Planets, 164
Concerning the principle of the Planets Motion, *and of their Direction, Station and Retrogradation*, 166
The Motion of the Moon, *and its various Appearances*, 168
Of the Eclipses of the Sun *and* Moon, 170
Of the Fixed Stars, 172
Of Asterisms *and* Constellations, 174
Of the Influences of the Stars, *and of* Judicial Astrology, 177
The Sixth Part, *viz.* the four Great Bodies, the Earth, Water, Air and Fire, and of the mixt and compound Bodies, which arise from them; as also of Metals and Meteors. In 24 Chapters.
Concerning the Original of the Earth, *its Parts and Figure*, 179
The Earth *is moved by the* Fluid Heavens, *that encompass it round*, 182
The Earths *Motion established by other Arguments*, 183
The Objections *answer'd, which by* Aristole *and others are framed against the Motion of the* Earth, 185
Concerning Day *and* Night, *and the vicissitudes of* Seasons, 187
Of the Zones *and their* Inhabitants, *and of the* Climats, 190
Of things generated in the Earth, *and first of* Fountains, 192
Of Metals *and* Minerals, 194
Of the Generation *of* Stones, *Common and Precious, and of their difference and distinction*, 196
Of the Loadstone, *and* Electrical Bodies, 199
Of the Water, 202
Of the Ebbing and Flowing of the Sea, 204
Of the Air, 207
Of the Elastick force of the Air, 209
Of Meteors *in general*, 210
Of Meteors *in particular, and first of the* Winds, Clouds *and* Mists, 211
Of Rain, Dew, Hoar-frost, *and the Cool Evening* Air, 214
Of Snow *and* Hail, 215
Of Thunder, Lightning, *and* Flashes, 217
Of the Rainbow, *circles about the* Sun *and* Moon, *and of* Mock-Suns *and* Mock-Moons, 218
Of Fire, 221
Of the Nature of Heat *and* Cold, 223
Of the various effects of Fire, 225

Of

The Contents.

Of the Mixion of Bodies, *as likewise of their changes, converſion, generation, corruption, alteration, augmentation and diminution*, 227

The Seventh Part, *viz.* Living Creatures in General; and ſpecially of Plants and Animals. *In* 23 Chapters.

Introduction of the Diviſion of Living Creatures, 229

How Living Bodies *differ from thoſe that are* Inanimate, *and deſtitute of* Life, 231

The Life *of* Bodily Things *conſiſts in* Moiſture *and* Heat, 232

The death of Living Things *proceeds from contrary Principles*, viz. *from* Cold *and* Drineſs, 233

What is the cauſe of that hardneſs, *which is obſerved on the outſide of* Living Bodies, 234

Of the different degrees of Heat *in* Living Bodies, 235

The Virtue and Nature of Aliments *remain in the* Bodies *that are fed and nouriſhed by them*, 236

Living Things *vary according to the difference of Place and Time*, 237

Of Plants, *and firſt of their ſeveral parts*, 238

Of the Original of Plants, 240

Of the nouriſhment and growth of Plants, 241

Of the diviſion and difference of Plants, 243

Of the propagation of Plants, 245

Of the colours of Plants, 247

The Contents.

How many ways the Obligation *arising from* Covenants, *may be dissolved*, 391
Of the Laws *that concern* Speaking *and* Swearing, 392
Of Dominion, *and the* Duties *thence arising*, 393
Of the Duties *of* Married Persons, 395
Of the Duties *of* Parents *and* Children, 396
Of the Duties *of* Masters *and* Servants, 397
Of the Right of Sovereign Dominion, *and the different Forms thereof.* 398
Of the Duties *of* Sovereign *Princes*, 399
Of the Duties *of* Citizens, 401

The Contents of each Chapter in each Part of the HISTORY of NATURE.

The First Part, *viz.* of Bodies. In 9 Chapters.

Of a Body extended, 1
The Arguments of Epicurus *answered, about empty Spaces interspersed between* Bodies, 3
Gassendus *his* Experiments *examined, whereby he endeavours to prove* Vacuities *in* Bodies, 4
Of the Divisibility of Bodies, 7
Of loose and close Bodies, 9
Of hard and fluid Bodies, 11
Of rough and smooth Bodies, 14
Of transparent and opake or dark Bodies, 15
Of Bodies *bent and prest together*, 17

The Second Part, *viz.* of Qualities. In 10 Chapters.

Of Qualities *in general*, 21
Of Heat, 22
Of Cold, 25
Of Heaviness *and* Lightness, 28
Of Taste, 33
Of Smelling, 35
Of Sound, 38
Of Light, 43
Of Colours, 45
Of Occult Qualities, 50

The Third Part, *viz.* of the World and Heaven. In 14 Chapters.

Of the beginning of the World, 54
Of the Creation *of* Things, *and of the ranging of the several parts of the* World, 56
Of the end of the World, 58
Of the Generation *and* Corruption *of* Things, 59
Of the Heaven, *or most subtile* Æther, 61
Of the Sun, 62
Of the Fixed Stars, 65
Of the Moon, 67
Of the Planets, Mercury, Venus, Jupiter *and* Saturn, 70
Of the Spots *about the* Sun, *and the fixt* Stars, 72
Of Spots *that appear in the* Orb *of the* Moon, 73
Of Comets, 75
Of the Production *of the* Stars, 77
Of the Predictions *of* Astrologers, 79

The Fourth Part, *viz.* of Earth, Water, Fire *and* Air. In 11 Chapters.

Of the Globe *of the* Earth, 81
Of Water, 83
Of the wonderful properties of some sorts of Water, 85
Of Fountains *and* Rivers, 88
Of the Sea, 90
Of the Ebbing and Flowing of the Sea, 97
Of Fire, 99
Of Earthquakes, *and* Subterranean Fires, 103
Of Ashes *and* Coals, 105
Of Glass, 107
Of the Air, 108

The Fifth Part, *viz.* of Things dug out of the Earth. In 10 Chapters.

Of Metals *in general*, 113
Of Quicksilver *and* Brimstone, 114
Of Salt, 117
Of Gold, 119
Of Silver *and* Tin, 121
Of Lead *and* Copper, 123
Of Iron *and* Steel, 124
Of the various generation of Stones, 126
Of Pearls *and* Precious Stones, 128
Of the Magnet, *or* Loadstone, 131

The Sixth Part, *viz.* of Meteors. In 11 Chapters.

Of Vapours *and* Exhalations, 134
Of Winds, 136
Of Clouds *and* Mists, 139
Of Rain, 141
Of Hail *and* Snow, 143
Of the Dew, Hoar-frost, Honey *and* Manna, 145
Of Storms *and* Thunder. 147
Of Lightning *and* Thunderbolts, 149
Of the Rainbow, 151
Of Fires *kindled in the* Air, 153
Of Circles *about the* Sun *or* Moon, *and of* Mock-Suns, 154

The Seventh Part, *viz.* of Plants. In 9 Chapters.

Of the parts of Plants, 156
Of the Virtues and Efficacy of Plants, 158
Of the obvious, or known qualities of Plants, 160
Of the occult qualities of Plants, 162
Of the Sympathy and Antipathy of Plants, 164
Of the Original of Plants, 166
Of the Nourishment of Plants, 169
Of the Germination, Sprouting or Budding of Vegetables, 171
Of the Decay and Death of Vegetables, 172

The Eighth Part, *viz.* of Animals. In 10 Chapters.

Of Animals, *commonly supposed to be of a* Spontaneous Birth, 175
Of Animals *produced of* Seed, 178
Of Monsters, 181
Of the Birth of Animals, 183
Of Hunger *and* Thirst, 185
Of the motion of the Heart, *and circulation of the* Blood, 188
Of the actions of Animals, 190
Of the aversion and affections of Animals, 193
Of Sleep *and* Waking, 195
Of the Diseases and Death of Animals, 198

The Ninth Part, *viz.* of Man. In 10 Chapters.

Of the Sense of Touching *or* Feeling, 202
Of Taste, 204
Of Smelling, 206
Of Hearing, 207
Of Sight, 209
Of Imagination, 214
Of Memory, 216
Of Slumber *and* Dreams, 218
Of External Passions, 220
Of some Persons Natural Inclinations and Aversions, 222

The Third Part.

A Dissertation *of want of* Sense *and* Knowledge *in* Brute Animals, 225

The *Contents* of which *Discourse* appears according to the several Articles printed in the Margent, to which the *Reader* is referred.

An Explanation of the Sculptures in this Work.

First in the INSTITUTION *of* PHILOSOPHY

THE *Title*, represented by the *Figure* of *Fidelity*, sitting on a *Chair* ascended by three *Steps*, which Steps are Emblems of those three Parts of *Philosophy*, over which we must pass, before we can arrive at the perfection of *Truth*; her *Eagle* denotes her quick-sightedness, by which she is able to *read* the *Book*, held at that distance, *clare & distincte* (plainly and distinctly) as is therein written, whilst the *Sun* that seems to enlighten the *Book*, is an Emblem of that assistance *Heaven* freely affords us in our virtuous persuit of *Learning* and *Knowledge*: The *Figure* with its Foot on the first Step of the ascent, as likewise that with the *Globe*, and the other behind are Emblems of some *Proficients* in *Philosophy*, their particular progression in that noble Study being denoted by *precedency* of order.

In the *Preface*, the *Sculpture* represents the several *Pourtraitures* of those *Philosophers*, cited by the *Author* in his *prefatory Discourse*; those standing on the fore-ground, are *Descartes*, *Gassendus*, *Epicurus* and *Zeno*, the fittest to have the first place in this *Sculpture*, since by their *Works* they contributed most to the *building* this *Body* of *Philosophy*; which Emblem may likewise teach us not to be forgetful of those from whom we have received Benefits.

LOGICK, *Part* 1. *Chap.* 1. *fol.* 1. Represented by a *Woman* sitting in a Chair, holding in her Right Hand a two *pointed Sword*, and in her Left a *Serpent*, who *twists* about her *Arm*; on her *Head*, a *Helmet* surmounted by an *Eagle*; beneath her Feet are *Books*, *Swords* and *Garlands*, with *Boys*, having *Keys* and *Locks* in motion; at a distance two *Philosophers* discoursing: Her *Swords* are her most proper Emblems, *Logick* being *pugnatio Verborum* (a Word-fight); her *Snakes* denote her subtilty, her *Helmet* her strength, and her *Eagle* her discerning faculty; the *Locks* and *Keys* denote her power to lay open or conceal; the *Garlands* on the *Pedestals* of the *Pillars*, are the Trophies of her Victories gained over other parts of Learning, which Victory is represented by her having *Books*, *Swords* and *Garlands* laid at her Feet; the *Sword* occuping her Right Hand, and the *Snakes* her Left, denotes Powers, being nobler than cunning: The building in prospect, is the School of Learning dedicated to the Goddess *Minerva*.

LOGICK with *Truth* and *Falshood*, *Part* 1. *Chap.* 2. *fol.* 3. The *Figure* which seems just risen from her Chair is *Logick*, as appears by her usual Emblems, (treated of before) the *Figure* whom she seems to court, is *Truth*, represented with a *Glory* round her *Head*, having a loose *Garment* cast about her; the *Glory* denotes her Excellence, and her regardless *Robe* shews that *Truth* needs no Ornament, nor ought to be covered, tho' with the most pleasing and becoming pretences: The *Figure* next her, represents *Falshood*, being a *Syren* with a *Mask* and *Mirror*, the proper Emblems of that Vice, it being reported of that Creature, that she destroys with her Voice all that give ear to her; her *Mirror* denotes the double dealing of Falseness, and her *Mask* the disguises she is forced to make use of (for as it is said of *Virtue*, that could Men see her Naked, they would be most passionately enamoured of her,) so on the contrary, could they see *Falsity* undrest of her Masks and Disguises, they would flee from her, as the ugliest and most dangerous Monster. The Building behind, represents the Palace of *Logick*, being the School of Learning.

LOGICK discovering *Falshood*, *Part.* 1. *Chap.* 2. *Rule* 1. *fol.* 5. The representation of *Logick* as before, viewing intently the *Syren*, who has covered her Face with a Mask, under which appearance she endeavours to pass for *Truth*; but her lower parts being her badge of distinction, are uncovered by a little Boy, and so she is detected; which shews that the best maskt *Falshood* is discoverable by *Truth* and *Innocence*, tho' in its Childhood.

LOGICK embracing Truth, *Part* 1. *Chap.* 2. *Rule* 4. *fol.* 8. The *Sculpture* represents a *Garden*, in which the *Figure* of *Logick* appears together with *Truth*, both emblemis'd as before; the seeming Imbraces of *Logick* given to *Truth*, denote the acceptableneness of it to Learning; they being placed in a *Garden*, is to shew the Pleasures and Sweets that attend them both.

JUDGMENT, *Part.* 1. *Chap.* 11. *fol.* 26. Represented by an elderly *Man* sitting on a *Rainbow* in the *Clouds*, having *Books* and a Scrole of *Parchment* under his Left Foot, on his Right Knee a *Book* opened; the *Figure* standing by *Judgment*, is *Logick*, and points towards the opened *Book*: The Building is the prospect of a *Theatre*, the *Books* and *Serpents* under, are the Emblems of *Learning* and *Wisdom*, the inseparable Companions of *True Judgment*, who is represented elderly, as a Badge of Experience, and placed in the *Clouds* to shew his inspection of all Human Affairs; and the various Colours of the *Rainbow* he sits on, denote the various Methods he makes use of to be informed, and the brightness of its *Rays*, the clearness of his apprehension, and the seeming information given him by *Logicks*, pointing to the *Book*, shews the necessity of Learning, to enable us to make a true Judgment.

REASONING, *Part* 1. *Chap.* 15. *fol.* 33. Represented by an elderly *Woman*, sitting on a *Pedestal*, leaning her *Head* on her Left *Hand*, with *Books* under her Left Foot and Elbow, in her Right Hand a *Book* a little opened, her Forefinger therein, and a *Scrowl* hanging from below the *Book*, with this Motto, *in perfecto quiescit*; the *Figure*

ſtanding in a *Glory*, incircled with *Clouds*; and on which *Reaſoning* ſeems to have her Eye, repreſents *Truth* holding a *Book* in her Right Hand, and a Branch of *Palm* in her Left, having the *Globe* of the *Earth* under her Foot: On the Fore-ground are *Boys* and *Books*. The Motive for repreſenting *Reaſoning* by theſe *Figures*, are theſe, 'tis repreſented by a *Woman*, to denote its productive Faculty, right *Reaſoning* being the common *Mother* of every great *Good* and wiſe *Action*; the *Books* under her Foot, denote ſome doubts ſhe hath long ſince overcome; and thoſe under her Elbow, ſome doubts juſt removed; her melancholy *Poſture* and *Air*, ſhew the neceſſity of ſeriouſneſs in *Reaſoning*; the *Book* in her Right Hand, ſeems to contain (and more eſpecially that part which ſhe engageth with her Forefinger) what is expreſt in the *Scrole* that hangs from it, which is, that by the help of *Reaſoning* we may bring all our undertaking to that perfection as will afford the means of being at reſt: The placing *Truth*, as in the deſcription, is to ſhew, that *Reaſoning* hath always *Truth* in view, that being the End ſhe aimeth at; the *Glory* incircled with *Clouds*, expreſs the inward Beauties of *Truth*, tho' ſometime vail'd with *Clouds* of Ignorance; the *Book* and *Palm* which occupy her Hands, are Emblems of thoſe *Goods* ſhe gives her Poſſeſſors, Peace and Knowledge; and her Foot being placed upon the Terreſtrial *Globe*, denotes her excellence above all earthly things.

CONTEMPLATION Part 2. *Introduction, fol.* 53. The *Sculpture* repreſents a *Woman* kneeling at her Devotion, having beneath her the *Globe* of the *Earth*, with Eyes covered, holding a *Scepter* in her Right Hand, and on the ſame ſide, the *Sun* in *Glory*; and on her left ſide the *Moon* and *Stars*, which ſhe ſeems to inſpect with care; above in the *Clouds*, the *Glory* of the Supream *Deity*, with the word *Jehovah*, environ'd with Bleſſed *Spirits* in poſtures of *Adoration*: She is placed above the *World*, to ſhew that thoſe who ſeriouſly contemplate the *Glory* of *GOD*, muſt be contemners of the *World*, and have their Eyes, like hers, vail'd to all its Inducements, flattering Joys and Temptations; her *Scepter* denotes the power of heavenly Contemplation, we being thereby made more than *Kings* and *Conquerors* (according to the Scriptures;) her contemplating the *Sun*, *Moon* and *Stars*, ſhews that whoſoever ſoberly conſiders the wonderful Creation of thoſe *Glorious Bodies*, will think their time beſt imploy'd in contemplating with Gratitude and Wonder the Excellence and Power of that *GOD* who made them.

FATE and *WILL Part* 2. *Chap.* 5. *fol.* 62. The *Figure* on the Right Side with folded Hands, and clad in a full Garment, is *Fate*; his folded Hands are Emblems of Unchangableneſs, and his full Garment reſembles his Amplitude; the Golden Chain which ſeems to fall from the *Star* in Glory, on which *Fate* looks, and with which both he and the other *Figure* who repreſents *Will*, are incircled, ſhews the neceſſity of the *Wills* complying with *Fate*, being bound thereto with a Chain of Cœleſtial Cauſes; the Wings of *Will* are Emblems of her ſwiftneſs; and her extended and erected Hands and Head towards Heaven, ſhews we *will* every thing under the appearance of *Good*.

PROVIDENCE, Part 2. *Chap.* 16. *fol.* 74. Repreſented by a *Woman* ſitting on a Pedeſtal, her Right Arm leaning on a Wheat-ſheaf, and on her Left a Boy winged, bringing her a *Cornucopia* of Fruits and Flowers, as ſhewing the great *goodneſs* of *Providence*, who gives not only on the Right, Corn to ſupport the neceſſity of Nature, but alſo on the Left, Fruits and Flowers to recreate and cheriſh it: At a diſtance in proſpect is a Corn-field, in reaping time, brought to its maturity by that *Eye* of *Providence*, which from out of a *Glory* inſpects it, and thereby demonſtrates that *GOD* in his *Providence* vouchſafes to look down from his all *Glorious Throne* of *Heaven* to bleſs the *Goods* of the *Earth* to Mans uſe, which ought to draw from us returns of *Praiſe* and *Thanſgiving*.

SPIRITS, Part 3. *Introduction, fol.* 76. In the *Clouds* are repreſented *Choirs* of bleſſed *Angels* playing on *Muſical Inſtruments*, and *ſinging* and *praiſing GOD*. In a *Cavern* below, are repreſented the *Infernal Spirits*, ſeeming to utter hideous *Cries* and *Groans*, the effects of the anguiſh they ſuffer in themſelves, and that raiſed in them by their enviouſly beholding the happineſs of the *Bleſſed* above; for true Happineſs is by nothing ſo much expreſt as by *praiſing GOD*.

NATURE of ANGELS, Part 3. *Chap.* 1. *fol.* 77. In the *Clouds* appears a *glory* of *Angels* and *Cherubims* contemplating with *deſire* and *joy*, the Glory of *GOD* which appears above, half veild by a *dark Cloud*; it being the Nature not only of *Angels*, but of all good Men to behold with *Praiſes* and *Adoration* that *GOD* who made them for that end.

MOTION of ANGELS Part 3. *Chap.* 5. *fol.* 82. Repreſented by ſeveral *Angels*, occupying themſelves in doing the ſervice acceptable to their *Creator*, as bringing *Peace* and *Reward* to the *Good* on *Earth*, which is ſhewn by thoſe two, who bear a *Coronet* and *Branch* of *Palm* downwards, as likewiſe in carrying the *Actions* and *Prayers* of the *Juſt* to *Heaven*, ſhewn by that *Angel* who bears the *Pot* of *Incenſe* towards the *Sky*; and by the other who is uncovering the Monument of *King Charles* the Second, to lay, as it were, open the good *Actions* of that beſt of *Princes*, to that *GOD* who will reward them.

ORDER NUMBER and DISTINCTION of ANGELS, Part 3. *Chap.* 6. *fol.* 83. The *Sculpture* repreſents the three *Hierarchy* of *Angels*, and in each *Hierarchy* the three *Orders*; the *1ſt.* containing *Seraphims Cherubims* and *Thrones*, the *2d. Dominions, Virtues* and *Powers*; the *3d. Principalities*, *Arch-Angels*, and *Angels* with *Palms*, *Swords* and *Crowns*, denoting their *Offices* of *Peace*, *Power* and *Glory*, given them by that *GOD*, who is repreſented above them, and who made, ordered, numbred and diſtinguiſhed them for his *Service* and *Glory*.

DÆMONS, Part 3. *Chap.* 10. *fol.* 88. In a *gloomy Cavern* are repreſented the nine degrees of *Dæmons*, or *Infernal Spirits*, diſtinguiſhed by their monſtrous and ugly variety, and which (according to the Diſcourſe) they are known by: The firſt termed *Belzebub*, generally allowed Sovereign *Emperor* over all the reſt, tho' his Name ſignifies no more than *King* of *Flies*; the *2d. Python*, *3d. Belial*, *4th. Aſmodeus*, *5th. Satan*, *6th. Meririn*, *7th. Apolyon*, *8th. Aſtorath*, and *9th. Mammon*: The *Figures* in the *Air* are *Angels*, bearing up a *Child*

Child, whom they had reſcued from the *Devils*: The reaſon for the precedency of theſe *Devils* to one, the other ariſeth from their greater or leſſer power in doing hurt, and therefore ſome people may wonder why *Mammon*, who is taken for the *Devil* of *Riches*, ſhould be placed laſt, the power of *Gold* in doing ill being the greateſt.

CARE of ANGELS, *Part* 3. *Chap.* 11. *fol.* 89. Repreſented by an *Angel*, reſcuing and protecting a young Man from the fury of the *Devil*, and by two *Angels* driving a *Dæmon* before them, the defending us from the aſſaults and ſnares of the *Devil*, and driving him from us, being their conſtant *employment* and *care*.

PHISICKS, *Part* 4. *Chap.* 1. *fol.* 91. Repreſented by a *Woman* with a *Sphere* and *Books*; on her Right Side an *Eagle*, and on her Left two *Boys*, having a pair of *Compaſſes* and a *Square*; the three *Figures* in proſpect are three *Philoſophers* in conſultation concering the *Planets* and *Stars*, the *Books*, *Mathematical Inſtruments*, and *Eagle* are Emblems of the quickſightedneſs, Learning and Practice requiſit to the true underſtanding of *Phiſicks*.

DURATION and TIME, *Part* 4. *Chap.* 24. *fol.* 131. *Time* is repreſented by *Saturn*, being on Old Man bald Headed except one *Lock*, and ſtanding on Tiptoe with one Foot on a *Rock*, having a *Syth* and *Hourglaſs*: *Saturn* is feigned by the *Poets* to be the Father of the *Gods*, the firſt beginner of *Time*, his *Age* and *Bald-pate* denote his antiquity and duration, and his one *Lock*, the one *punctum* of *Time* preſent, by which we ought to hold; he ſtands on Tiptoe to ſhew he haſtens to be gon; his *Hourglaſs* and *Wings* are Emblems of his never reſting and ſwiftneſs, and the *Syth* the deſtruction and conſumption he makes of all things. The four *Figures* below him, repreſent the four *Seaſons* of the *Year* and parts of *Mans* Life, following one another towards the *Temple* of *Eternity*; our *Childhood* brings *Youth*, *Youth* brings *Manhood*, *Manhood Old Age*, and *Old Age* to that *Eternity* properly deſcribed by the Circle over the *Temple*, and the *Hoop* in the *Boys* Hand, being what are in appearance without end.

The Motion of the PLANETS, *Part* 5. *Chap.* 1. *fol.* 134. Repreſented by *Sybell*, having a *Caſtle* on her *Head*, and ſitting on *Lions*, placed on the *Globe* of the *Earth*; the *Caſtle* and *Lions* denote the ſtrength of the *Earth*, both in reſpect to its *Creatures* and *improvements*, the *Lion* being the ſtrongeſt *Animal* made by Nature, and a *Caſtle* the ſtrongeſt thing made by Art; her having the *Caſtle* on her Head, and the *Lions* below her, ſhew the ſtrength of *Human Art* is greater than the ſtrength of *Beaſts*; the ſeven other ſmall *Figures* are bodily repreſentations of thoſe *Poetical Heathen Gods*, whoſe Names are made uſe of to diſtinguiſh the *Planets* by; that in the midſt and over the *Earth*, is *Apollo*, encircled with Light, as *God* of the *Sun*; his *Bow* and *Arrow* denote the piercing power of his *Rays* and *Sun-beams*: That ſtanding on a *Cloud*, and under the *Earth*, is *Luna*; the *Bow* in her *Hand*, and *Creſſent* on her Head, are Badges of her two-fold *Devinity*; the firſt as ſhe is Goddeſs of *Hunters*, by the Name of *Diana*; the laſt as Goddeſs of the *Moon*, by the Name of *Luna*, as above: The *Figure* over *Apollo*, is *Mercury*, the Wings of his Feet denote his ſwiftneſs in running, as his Staff twiſted with *Snakes* doth his Cunning; thoſe being the peculiar Excellencies given him by the *Poets*, and the Qualifications that rendred him capaple of the great Employments he poſſeſſeth, of being Envoy and Currier in Ordinary to the *Gods*: The *Figure* on the Right Side of *Apollo*, is *Venus*, the *Star* on her Forehead denotes her *Divinity*; her *Doves* are Emblems of *Love*, and properly joined to her who is the *Goddeſs* of *Love*. Over *Mercury* ſtands *Mars*, who bears a *Sword* and *Buckler*, being accounted the *God* of *War*; that on the Left Hand is *Jupiter*, the *Thunderbolts* in his Hand, and the *Eagle* under him are the *Coat Armour* of *Heaven*, of which by the ſame Authority, he is accounted *God*: That on the Right Side is *Saturn*, his Wings denote the fleeting of *Time*, of which he is reported *God*, and the *Syth* in his Hand, ſhews the deſtruction made of all things by this Divinity *Time*.

The SUN in GLORY, *Part* 5. *Chap.* 14. *fol.* 157. Within a *Glory* is repreſented, *Phæbus* in his *Chariot* drawn by white *Horſes*, they being the *Creatures* he is ſaid to have ordered to be offered up to him in *Sacrifice*; beneath lies a *Shepherd* and his *Dog* a ſleeping, who are recovered from their drowſineſs by the brightneſs of his *Rays*, and the warmth of his *Beams*, which cheriſh and enliven all *Human Creatures*.

The MOON, *COMETS*, *&c.* *Part* 5. *Chap.* 17. *fol.* 162. The *Figure* covering his *Eye* with his *Finger*, is *Archimedes* a viewing the *Moon*, *Stars*, and other *Planets*, through a *Teliſcope*; and that *Figure* next him is a *Philoſopher* diſcourſing him about ſome *Planetary Obſervations*; upon and below the Table are ſeveral *Mathematical Inſtruments*, as *Squares*, *Globes*, *&c.*

The EARTH, *Part* 6. *Chap.* 1. *fol.* 179. Repreſented by *Sybell*, drawn by *Lions* in her *Charriot*, having a *Caſtle* on her Head, and the *Globe* of the *Earth* beneath her: The reaſon for repreſenting the *Earth* by this *Figure*, is given before in the Treatiſe of the Motion of the *Planets*: The *Angel* bearing *Fruits* and *Flowers*, as it were from *Earth* to *Heaven*, denotes that the ſweeteſt things of the *Earth* ought to be offered up to the *GOD* of *Heaven*, who made and preſerves the *Earth*.

DAY and NIGHT, *Part* 6. *Chap.* 5. *fol.* 187. The *Figure* of the *Young Man* with Wings holding a lighted *Torch* in his Right Hand, and a *Serpent* in a circular form in his Left, having one Foot on a *Cloud*, and the other on the light part of the *Globe*, repreſents *Day*; his Youth is the *Morning*, and his lighted Torch the *Noon*; his circular Serpent ſhews the motion of *Time*, and his treading on a *Cloud*, that he puts Darkneſs under his Feet; behind the *Globe* on the backſide, ſlipping away as it were, ſtands a *Woman* Winged and Cloathed in a a *Sables Garment*, embroidered with *Stars*, having on her Head a *Crown* of *Poppeys*, repreſenting *Night*; her Poſture ſhews her not to be able to ſtay in preſence of *Light*; her Garment is her proper Emblems, and her *Poppeys* are promoters of *Sleep*, the true buſineſs of the *Night*: The *Element* below her ſpangled with *Stars*, ſhews the deſcending of *Night* at the aſcending of *Day*.

The WATER, *Part.* 6. *Chap.* 11. *fol.* 202. Repreſented by *Thetis*, whom the *Poets* have fain'd to be Goddeſs of the *Sea*; her *Charriot* is drawn by *Dolphins*, accounted the beſt natured and moſt compaſſionate *Fiſh*; and for that reaſon preferred to the

honour

honour of drawing their *Queen*: Over her is the *Figure* of a *Boy*, who pours *Water* out of a *Watering pot*, as intimating that we have *Water* from above in *Rain*, as well as below in *Rivers*.

The AIR, *Part* 6. *Chap.* 13. *fol.* 207. Repreſented by the Goddeſs *Juno*, Wife of *Jupiter*, ſitting in a *Charriot* drawn by *Peacocks*; ſhe is accounted by the *Poets* as Goddeſs of the *Air*, and is drawn by theſe *Birds* as the moſt beautiful *Creatures*, to compleat whoſe beauty, ſhe hath adorned their *Tails* with a hundred refulgent *Eyes*, taken from *Argus*, to whom ſhe had given them, the better to ſee into the Amorous Intreagues of her Huſband *Jupiter*, of whom ſhe was Jealous, but *Argus* being kill'd by *Jupiter*, ſhe reaſſumed her Gift and diſpoſed of them as above.

The WIND, *Part* 6. *Chap.* 16. *fol.* 211. Repreſented by a *Figure* Crown'd and Sceptr'd, being *Æolus*, the *Poetical God*, and *King* of the *Winds*; on each ſide of him are two *Figures*, repreſenting the four *Winds*; the loweſt on the Right Hand is *Boreas*, the *North wind*, depicted like an *Old Man*, with *Bats Wings* and a *Serpents Tail*; his *Bats Wings* denote his blowing moſt in *Evenings* and *Nights*, and the *Serpents Tail* his ſtinging Colds and Blaſts; above is *Eurus* the *East-wind*, repreſented alſo by a *Man* with *Wings*, to ſhew the ſwiftneſs of his motion: The uppermoſt on the Left Hand is *Auſter*, the *South-wind*, repreſented by a *Young Man*, and below him *Zephyr*, the *Weſt-wind*, repreſented by a *Man* pouring out *Water*, as generally bringing *Rain* along with him; they are all blowing out *Winds*, which occaſions a *Tempeſt*, as appears by the foaming and raging Billows of the *Sea*, that ſeem to overwhelm the *Ships* therein.

THUNDER, *Part* 6. *Chap.* 19. *fol.* 217. Repreſented by *Jupiter*, who, as before is ſaid, is accounted the chief *God* of *Heaven*, and the Inventer and Uſer of *Thunderbolts*, having as 'tis ſtoried, been forc'd to contrive this *Weapon* to defend his Cœleſtial Kingdom againſt the aſſaults of the *Giants*, who dared to attempt the Invaſion of it; they are made by *Vulcan*, the Black-Smith in Ordinary to the *Gods*, and accounted as ſuch himſelf, and are of that ſubtile contrivance, that they at once *kill*, *burn* and *aſtoniſh* without being ſeen; for which reaſon there is no Guard to be made againſt them; he is ſet upon an *Eagle*, the Emblem of Quickſight and Power; for as that *Bird* only can gaze on the *Sun* with unmoved *Eyes*, and deſtroy with her *ſtrength* whom ſhe pleaſes of the *Birds*, ſo *Heaven* only has power to diſcern our *Actions*, and to puniſh where it thinks fit: The *Figures* below repreſent two *Men*, covering their Heads for fear of the *Thunder*, and affrighted at its noiſe; the *Houſes* on *Fire*, the *Trees Blaſted* and beaten down are the viſible effects of *Thunder*, and may admoniſh us to beware of offending *Heaven*, who can deſtroy with its Breath.

The FIRE, *Part* 6. *Chap.* 21. *fol.* 221. Repreſented by *Vulcan* ſtanding in his *Charriot*, which is drawn by *Sea-dogs*, at work at an *Anvil*, being furniſhed with Fire from *Mount Ætna*. *Vulcan* is the fam'd Blackſmith to the *Gods*, as is before ſaid, and conſequently a great Dealer in *Fire*; the two *Sea-Dogs* chained to, and drawing his *Charriot*, are Emblems of the predominancy that *Fire* hath over its contrary *Element* the *Water*; and by *Mount Ætna* is ſhewn the power of this hot *Element* even in the *Earth*.

ANIMALS in general, *Part* 7. *Introduction*, *fol.* 229. In the midſt a *Man* contemplating with admiration the variety of *Beaſts* and *Fowls* about him.

GARDNING, *Part* 7. *Chap.* 12. *fol.* 245. The repreſentation of a *Garden*, in which the four *Figures* are *Gardners*, imployed in ſo many ſeveral *Actions* belonging to that Ingenious Art, as *Digging*, *Grafting*, *Inoculating* and *Screening* of *Earth*; in proſpect a Fine Houſe.

ANIMALS, *Part* 7. *Chap.* 17. *fol.* 252. The repreſentation of ſeveral *Animals*, and more particularly thoſe extraordinary in their kind, as the *Horſe*, *Elephant*, *Lion*, *Camel*, *Deer*, *Bear*, *Swine*, *Sheep*, *Dog*, &c.

CREEPING THINGS, *Part* 7. *Chap* 19. *fol.* 256. Repreſented by a *Tortoiſe*, *Crocadile*, *Lyzard*, *Serpent*, *Mole*, &c.

FOWL or FLYING ANIMALS, *Part* 7. *Chap.* 20. *fol.* 257. Repreſented by the *Oſtridge*, *Eagle*, *Peacock*, *Swan*, *Turkey*, *Cock* and other *Birds*.

FISH or SWIMMING ANIMALS, *Part* 7. *Chap.* 21. *fol.* 259. Repreſented by the *Salmon*, *Pike*, *Lobſter*, and other Fiſh; in proſpect ſome Men in *Fiſhing Boats*, and *Nets* a catching *Fiſh*.

INSECTS, *Part* 7. *Chap.* 22. *fol.* 261. Repreſented by ſeveral ſorts of *Butterflies*, ſmall and great *Flies*, *Graſhoppers*, &c.

MAN as to his BODY, *Part* 8. *Chap.* 1. *fol.* 264. The *Figures* repreſent *Man* in his compleat *Body*, compoſed by *Bones*, *Fleſh* and *Skin*: That on a Pedeſtal on the Left, is perfect, the next is the *Muſcular*, having his *Skin* off, and the next an *Anatomy* of *Human Body*; the *Figures* ſeeming to inſpect them, repreſent *Phyſicians* as conſulting.

The five SENSES in general, *Part* 8. *Chap.* 10. *fol.* 283. 1*ſt*. *Smelling*, repreſented by the *Figure* holding a *Flower* to her Noſe. 2*d*. *Hearing*, repreſented by a Young *Woman* playing on an Inſtrument of Muſick. 3*d*. *Taſting*, repreſented by a Young *Woman* filling a Glaſs of Wine, and by her ſide a *Munkey* eating an Apple. 4*th*. *Feeling*, repreſented by a *Woman* pulling a *Snake* from her Hand, and by two *Cocks* fighting. 5*th*. *Seeing*, repreſented by a *Woman* in a Habit of a *Falconer*, having a *Hawk* on her Fiſt, ready to be caſt off at that *Bird* in the *Air* which the ſeems to view.

FEELING, *Part* 8. *Chap.* 12. *fol.* 286. Repreſented by a *Woman* ſeeming to ſnatch her Hand from a *Parrot*, who ſeems to bite it; at the ſame time a *Dog* is pulling her by the Coat; as alſo by that feeling ſtory of the *Monkey* making uſe of the *Cats* Paw to pull the Cheſnut out of the Fire; and by a *Mans* beating a *Dog*, and by the fighting of two *Birds*, all true Emblems of this noble *Senſe*.

TASTING, *Part* 8. *Chap.* 13. *fol.* 288. Repreſented by two *Women* in a Garden, the one ſeated and eating an *Orange*, expreſſing by her gay *Air* the pleaſure afforded her by that noble *Senſe*; the other is the *Figure* of a *Woman* pulling ſome Fruit in order to eat it; there are alſo *Cupids* eating *Oranges*, to ſhew the pleaſures of Love conſiſt chiefly in *Taſting*.

SMELLING, *Part* 8. *Chap.* 14. *fol.* 290. Repreſented by two *Women* in a Flower Garden, and ſmelling the Flowers: By a *Blood-hound* in Scent after his Game; as likewiſe by an *Incenſe Pot* ſmoaking with Perfumes, being the moſt pregnant Emblems of that *Senſe*.

HEARING, *Part* 8. *Chap.* 15. *fol.* 292. Re-

Repreſented by a *Woman* playing on an *Organ*, having two Women ſtanding behind her, with *Muſick-Books* in their Hands, and ſeeming to ſing in conſort; and by a *Cock* pearching on a *Pedeſtal*, being the Creature who hears at a greater diſtance than any other.

SEEING, Part 8. *Chap.* 18. *fol.* 297. Repreſented by a *Man* with a Proſpective in his Hand, ſtanding on a Hill viewing an Ingagement of *Ships* at ſome diſtance, and by a *Figure* lying on the fore-ground, having his Eyes fixt on the *Sea*, which ſeems at a diſtance.

MEDICIN, Part 8. *Chap.* 24. *fol.* 315. Repreſented by the Serpent *Python*, ſurmounted by *Apollo*, the God of the *Sun*. This Serpent is ſaid to *Poiſon* all the *Herbs* and *Graſs* he comes near, and for that reaſon was deſtroyed by *Apollo*, who alſo is the God of *Wiſdom*, and properly Emblemiſeth *Medicin*, there being, in wiſely prepared *Medicins*, a remedy to deſtroy all poiſonous Diſeaſes.

MAN as to his MIND, Part 9. *Chap.* 1. *fol.* 320. The Womaniſh *Figure* holding a *Sphere* in her Right Hand, and a *Glory* deſcending from *Heaven* upon her Head, repreſents a *Human Soul*; the *Sphere* is the Emblem of its *knowledge*, as to *Human Affairs*, the deſcending *Glory*, its Immortality; on her Right Hand ſtands *Knowledge*, repreſented by a *VVoman*, who holds a Torch lighted in her Right Hand, an open *Book* on her *Lap*; and on the Left Hand is the *Figure* of a *Man*, ſitting in a muſing poſture, having Wings on his Back, and repreſents *Thought*; ſhe is thus attended to ſhew that the two nobleſt *Faculties* of the *Soul* are *Knowledge* and *Thinking*.

The FACULTIES of the MIND, Part 9. *Chap.* 5. *fol.* 328. The four *Figures* repreſent the four *Faculties*. *1ſt. Underſtanding*, repreſented by a *Young Man*, to denote the Beauty of it, Robed and Crown'd to ſhew that *Honour* and *Power* attend it; and the Flame encircling the Head, is an Emblem of its alliance to *Heaven*, and the *Eagle* is an Emblem of its quickneſs in perceiving. *2d.* On the Right Hand of *Underſtanding* ſtands *Imagination* repreſented by a *Woman*, to ſhew its productive Power, which is alſo ſhewn by the *Coronet* of ſmall *Figures* ſhe bears on her *Head*; *Imagination* producing more various forms and beings than *Dame Nature* can boaſt of; the Wings on her *Head* denote the ſwiftneſs of that Faculty. The *3d.* is *Memory*, repreſented by a *Woman* with a *Helmet* on her Head, to ſhew the ſtrength of that Faculty; and by her a *Dog* in a Slip; a *Dog* is a proper Emblem of *Memory*, enjoying, as by Experience is found, more than any other Creature, of that noble Faculty. The *4th.* is *Will*, repreſented by a *Young Man* Wing'd and Blindfolded with extended *Arms*, and erected *Head*; the reaſon for repreſenting that Faculty is given before.

ADMIRATION, Part 9. *Chap.* 9. *fol.* 335. Repreſented by a *Woman*, ſeeming to have all her *Faculties* at work, by viewing that admirable Object that lies before her, being a *Lion* and a *Lamb* lovingly enfolded, and by other *Figures*, whoſe Looks ſpake this Paſſion; in proſpect, a Building.

LOVE and Hatred, Part 9. *Chap.* 10. *fol.* 337. Repreſented by *Venus* the Goddeſs of *Love*, ſitting in the *Clouds*, and over her *Cupid* her *Son* and *Meſſenger*; the *Arrow* he holds in his *Hand*, is the *Weapon* that opened the way for the *love* of the Man below, to the *Heart* of that *Lady*, who ſeems to embrace him: The *Figure*, as it were ſtabbing the other with a *Dagger*, repreſents *Hatred*, and the *Devil* behind him ſhews the ugly and damnable qualities of that Vice.

AFFECTIONS or DESIRE, Part 9. *Chap.* 11. *fol.* 338. Repreſented by a *Young Woman*, who in the purſuit of *Honour* and *Riches*, which ſeem to appear to her at a diſtance, is thrown down by the *Figure* of *Will*, (repreſented as uſually) and at the ſame time a *Serpent* bites her by the *Heel*, ſhewing the miſery and pain which attend the deſiring or affecting too much above what we want, to ſuſtain Nature, and the Precipice we are hurl'd from by our *Will*, in placing our *Affections* on thoſe *Goods* of *Fortune* which are not in our reach.

JOY, Part 9. *Chap.* 12. *fol.* 339. Repreſented by a *Young Woman*, in a looſe Garment, having a Bottle of *Wine* in one Hand, and a Glaſs in the other; by her another *Figure* with a Bottle, and on the fore-ground *Boys* playing on *Flutes*: This Paſſion is moſt properly thus emblemiſed, *Women*, *Wine*, and *Muſick* being the Joy *Heaven* gave us to guild this otherwiſe bitter Pill of Life.

SADNESS, Part 9. *Chap.* 13. *fol.* 340. Repreſented by a *Woman* in a *Widows* habit, ſitting on the *ground* in a *melancholy poſture*, leaning her *Head* on her *Hand*; by her a *Boy* a weeping, and below her a *Boy* with an extinguiſhed *Torch*; above, and at ſome diſtance from her, ſtands an *Urn* impaled with *Cyprus Trees*; upon the *Rails* which encompaſs the *Pedeſtal* of the *Urn*, ſtand *Pots* of *Fire* flaming, to the *memory* of him whoſe *aſhes* are contained therein: Theſe *Figures* are the propereſt Emblems of this Paſſion of *Sorrow*, no ſtate being ſo void of *Joy* as hers, who being a fond and virtuous *Wife*, is by death robbed of a deſerving tender *Husband*; the darkn'd *Torch* held near her, ſhews ſhe has no flame, but that which burns to the *Manes* of her departed *Lord*.

ETHICKS, to front Part 10. *fol.* 346. Repreſented by a *Woman*, ſeated in a graceful Poſture on an aſcent, holding a *Lion* bridled in her Left Hand, and in her Right a *Level*; her aſcent and graceful Poſture, ſhew the Majeſty of this Noble part of *Philoſophy*; her bridled *Lion* denote its Power; the force of her Arguments in evincing and clearing, are ſhewn by her *Level*: On her Right Side are the three Cardinal Virtues, *Truth*, *Juſtice* and *Charity*; the firſt repreſented by a naked *Figure*, holding a *Book* and *Palm Branch* in one Hand, and the *Sun* in the other: 'Tis naked, to ſhew *Truth* ought not to be covered; her *Book* and *Palm* are the rewards ſhe gives, which are *Peace and Knowledge*; and the *Sun* is an Emblem of her Brightneſs, *Truth* being as clear as the Noon Day: The *2d.* is repreſented by the *Figure* of a *Woman* vailed, holding a *Scepter*, with an *Eye* upon the top, in her Hand; ſhe is veiled, to ſhew ſhe looketh not on, nor regardeth the Perſon of any, but adminiſters *Juſtice* impartially; her *Scepter* and *Eye* denote her Power and Knowledge: The next is *Charity*, repreſented by a *Woman* comforting *Children*; on the Left Side of *Ethicks* ſtand the four Vices, *Envy*, *Drunkenneſs*, *Laſciviouſneſs* and *Deceit*. The *1ſt. Envy*, is repreſented by an *Old Woman* half naked, having *Snakes* about her Body and Hair; *Age* and *Snakes* are the proper Emblems of this *Vice*, it being as old as the *Devil*, and poyſoning the *Minds* of all that entertain it, as *Snakes* do the Bodies of all that touch 'em. The *2d. Drunkenneſs* is repreſented by a *Man* a *ſpewing*, the true loathſom Emblem of that *Gluttonous Vice*. *3d. Laſciviouſneſs* repreſented by a *Woman* in an immodeſt poſture, that being *Laſciviouſneſs*. *4th. Deceit*, repreſented by a *Woman* holding a Mask, ſhewing the neceſſity that *Vice* hath of being diſguiſed, and of its often appearing under borrowed forms: *Ethicks* is thus attended to ſhew the *Virtues* ſhe poſſeſſeth, and the *Vices* ſhe hath overcome.

The HIGHEST GOOD, Part 10. *Chap.* 3. *fol.* 350. Repreſented by a *Young Man*, cloathed in a ſhort Garment, with his *Eyes* lift up towards *Heaven*, holding in one Hand an *Olive Branch*, and in the other a *burning Heart*, into which his *Tears* ſeem to fall, and on his

Head the *Glory* of *Heaven* descending, as through a *Cloud*: The highest *Good* consists in these three things, peace of *Mind*, the favour of *God*, and a Heart *flaming* with desire of *Heavenly things*; and therefore 'tis properly represented by this *Figure*.

The LAW of NATURE, Part 10. *Chap.*8. *fol.*356. Represented by a *Young Woman* half naked, having her lower parts covered with a *Lamb-skin*, Emblems of that innocence and modesty prescribed by *Natures Law*; she is placed in a pleasant *Garden*, holding a Table on her Knee, and a pair of Compasses in her Hand, measuring two *parallels*, with this Motto *Æqua lance*; behind her a *Woman* holding *Books*, and having other *Books* under her Feet; all which denote how even just and pleasant the Laws of *Nature* are: On her Right Side are the three *Virtues*, *Truth*, *Justice* and *Charity*; and on her Left Side, *Envy*, *Drunkenness*, *Malice* and *Pride*, all properly Emblematis'd as before; by the *Virtues* being on the Right of *Nature*, and the *Vices* on the Left, we are taught that *Virtue* is more acceptable than *Vice* to Nature in her first *Principles*, till she is dabaucht by Custom or Practise.

PRUDENCE, Part 10. *Chap.* 9. *fol.* 359. Represented by a *Woman*, standing in a graceful posture, holding in her Right Hand a *Looking-glass*, and in her Left a *Serpent*; and over her an *Angel* putting an *Helmet* on her Head; on her Right Hand a *Cupid*, holding an *Olive Branch* in one Hand, and a *Palm* in the other; and on her Left Side a *Young Man* with a *Sword* and *Buckler*: The *Looking-glass* in her Right, denotes that every prudent *Person* ought to look into, and know themselves; the *Serpent* is an Emblem of Cunning, and the *Angel* putting the *Helmet* on her Head, expresseth *Heavens aiding* us in all our prudent undertaking: The *Cupid* with Branches, and the *Young Man* Armed, denote that Prudence brings success in *Love*, and Victory in War.

TEMPERANCE, Part 10. *Chap.*10. *fol.*361. Represented by a *VVoman*, holding in her Right hand a Bridle to curb the exorbitant desires of the Flesh, and over her Head an *Angel*, crowning her with *Lawrels*, having a *Palm* in his Hand, thereby shewing that *Heaven* will reward this *Virtue* with *Peace* and *Glory*; on her Right a *Cupid*, pouring out *liquor* in a *Vessel*, and on her Left an *Elephant*, dividing his proportion of *Corn*, denoting thereby that we must use *Temperance* even in *Love*, and that *Beasts* share in that *Virtue* which men must blush to want.

FORTITUDE, Part 10. *Chap.*11. *fol.*363. Represented by a *VVoman*, holding a *Pillar*, and curbing with a *Bridle* a *Lion*, who seems inraged: In the *Air* is represented *Hercules* with his *Club* and *Lions Skin*; the story of *Hercules*, and the reason for his being so adorn'd is so little estranged, that it needs not be here repeated, therefore I shall only add, that the Emblems of *Corporal Fortitude*, as here described, serve only to enable us to judge of the greater *fortitudes* of the Mind discourst of in the Book.

JUSTICE, Part 10. *Chap.* 12. *fol.* 365. Represented by a *VVoman*, holding in her Right Hand a *Sword*, and in her Left a pair of *Scales*; next her a *Boy* bearing the *Fasces* and *Axes* carrying before the *Roman* Victors: The *Figures* of the *Men* represent *Philosophers* contemplating *Justice*, that being the *work* of every wise *Man*; the *Fasces* were *Rods*, with which they used to *chastise Malefactors* for small faults.

MANS DUTY to GOD, Part 10. *Chap.* 23. *fol.*382. Represented by a *Man*, *VVoman* and *Boy*, addressing themselves to *Heaven*, in a becoming posture, and in the *Clouds* two *Angels* with *Trumpets*; 'tis represented by these three, to shew that *Men*, *VVomen* and *Children* are obliged to this Duty; the *Angels* with *Trumpets*, denote the joy the Blessed have in beholding the Righteous Actions of *Men*; the *Angel* below pointing to the *Coronet* and *Cornucopia*, is an Emblem of that *Honour* promised to the Righteous; the Flame three-fold, flaming on the *Womans* Head, denotes by its number the *Trinity*, by its heat, the warmth of her Zeal, and by its light, the brightness of her Faith.

MANS DUTY to HIMSELF, Part 10. *Chap.*24. *fol.* 384. Represented by an *Old Man*, in a becoming posture, holding in his Right Hand a *Staff*, having a *Serpent* twisted about it, his Head Crowned with *Lawrel*; on his Right Side a *Young Man* armed, having on his Head a *Helmet*, in his Right Hand a *Sword*, and in his Left a *Target*; self-preservation is every Mans duty to himself, and therefore provident Nature hath furnish'd the means; to the Old she hath given Cunning to save themselves, emblematis'd by the *Old Mans Staff*, encircled with *Serpents*, the cunningest and most subtile of *Creatures*; to the *Young*, *strength* and *valour*, represented by the *Sword* and *Target*, held in the Young Mans Hand, whilst the *Figure* of *Justice*, who stands before them both, informs us that both Old and Young are obliged to be just, not only to others, but to themselves.

MANS DUTY to his NEIGHBOUR, Part. 10. *Chap.*25. *fol* 385. Represented by two *Men* kindly embracing each other; on their Right Side are *Justice*, *Love* and *Charity*, with their proper Emblems as before described; and on their Left, a *Woman* with a *Cornucopia* of *Fruits* and *Flowers*, the Emblem of *Plenty*; all which denote, that we ought to be friendly in our *carriage*, just in our *dealings*, and charitable (according to our ability, to all that want) and that those who do so, shall have plenty of all the *Fruits* of the *Earth*.

CONTRACTS, Part 10. *Chap.* 27. *fol.*387. Represented by the Platform of a *Custom-house Key*, with *Figures* of several Men, denoting a *Merchant*, a *Chapman* and *Porter*; in a *Barge* a Man stowing some goods, which they seem to have contracted for.

MUTUAL FAITH or MARRIAGE, Part 10. *Chap.* 32. *fol.* 395. Represented by the *Figure* of *Faith*, being a *Woman* almost naked, having a *Glory* about her Head; her nakedness denotes her *innocence*, and the *Glory* is the Emblem of that *Heaven* from whence she sprung; she is placed between a *Man* and *Woman*, joining Hands as in Marriage, to shew that she only can truly perform that *Office*: On the *Mans* side is the *Figure* of *Justice*, an emblem of what he owes to his *Wife*; and on the *Womans*, that of *Constancy*, and a *Cupid* with a lighted *Torch*, denoting that the Duties of a Wife to her Husband are constant Love and Desire towards him; the *Torch* is a Badge of the ancient way of performing that Ceremony of *Marriage*, for on the *Wedding-day* they used to light up a considerable number of them, in honour to *Hymen* the God of *Marriage*; the billing *Turtles* are emblems of that *Love* and *Harmony* which ought to be between *Man* and *Woman*.

DUTY of PARENTS and CHILDREN, Part 10. *Chap.* 33. *fol.* 396. Represented by a *Man* and *Woman*, sitting in a grave and loving posture, having *Children* about them; by their side is the *Figure* of *Justice*, having her Head covered with a *Helmet*, and a *Mound* under her Foot, to denote that the Duty of *Parents* is giving good example to their *Children*, and that their *Justice* ought to take place and surmount all *paternal fondness*; on the Right Side is the *Figure* of a *Woman veil'd*, representing the modesty *Children* must observe in the presence of their *Parents*; the *Stork* by her Side is the emblem of ill *Parents*, it being reported of that *Bird*, that she eats her Young Ones.

DUTY of MASTERS and SERVANTS, Part 10. *Chap.*

Chap. 34. *fol.* 397. Represented by a *Woman*, sitting in a graceful posture in a *Chair*, attended on the Right Hand by a *Woman* holding a *Garland* and *Cornucopia*, representing *Plenty*; and on the Left by a *Woman*, bearing a *Sword* and *Ballance*, the emblem of *Justice*; before the *Chair* stands a *Blackamoor* Lackquey, seeming to receive some *Errant* to go on; beneath the *Figure* of *Plenty* stands a *Maidservant* attending her *Ladies* Commands, all which properly describe that *Masters* and *Mistresses* are bound in duty to do *Justice* to, and provide for their *Servants* plenty, and that the duty of *Servants* is the careful, honest and respectful performance of all their *Masters* or *Mistresses* lawful Commands.

REGAL POWER, *Part* 10. *Chap.* 35. *fol.* 398. Represented by a *Man*, seated on a *Throne*, *Crown'd*, *Rob'd*, *Scepter'd*, with a *Mound* in his Left Hand, attended on by his *Courtiers*, as also by the representations of *Justice*, *Prudence*, *Clemency*, *Fortitude* and *Truth*, as the eternal *Companions* of true *Regal Power*; he being no more properly a *King*, who wants these *Virtues*, than an illiterate *Man* can be a *Judge* of *Learning*.

The Explanation of the Sculptures in the HISTORY *of* NATURE, *Book II.*

THE *FRONTICEPIECE*, represented by a *Woman* looking behind her, and *writing* in a *Book*, which lies on the Back of *Time*, emblematis'd as before; shewing the nature of History, which is the immediate representation of things past; and by another *Figure* reviewing the *Sun*, *Moon*, *Stars*, &c. and surrounded with several *Beasts*, *Birds*, &c. denoting the generality of things treated of by *History*.

No VACUUM, *Part* 1. *Chap.* 1, 2, 3. *fol.* 1. The *Author* having proved it in his *Book*, 'tis thus represented by the *Sculpture*, a *Boy* pouring *Liquor* out of one *Vessel* into another, thereby shewing, that as the *Air* which occupied the lower *Vessel* is drove out by the heavier *Element* of *Water*, it immediately enters into, and fills the upper *Vessel*; as also by the blowing up of a *Mine*, the visible effects of the extension and dilatation of *Air*: The *Figures* seeming to discourse, represents *Philosophers*.

SMELLING, *Part* 2. *Chap.* 6. *fol* 35. Represented by a *Blood-hound* in *scent* after his *Game*; by a *Woman smelling* to a *Nosegay*; by a *Man* who seems offended at some unpleasing *smell*; and by a *Woman* in a *swoon*, supported by two others, and one of them holding a *Box* or *Glass* of some *Scent* to her *Nose*, which seems to recover her: In prospect a *Pack* of *Hounds* in chase of a *Fox*.

SOUND, *Part* 2. *Chap.* 7. *fol.* 38. Represented by several *Musical Instruments* lying on the fore-ground; also by a *Man* ringing a *Bell*, by another sounding a *Trumpet*, by another beating a *Kettle-Drum*, and by a *Woman* tinkling on a *Brass Vessel* to a swarm of *Bees* to hive them, all proper emblems of *Sound*.

OCCULT QUALITIES, *Part* 2. *Chap.* 10. *fol.* 50. Represented by a *Man*, seemingly trembling at the sight of a *Lion*, and hastily running from it; by the terror of a *Sheep* at the sight of a *Wolf*; by the seeming trembling and fear of a *Hen* and *Chickens* at the sight of a *Kite*, and by the hasty flight of a *Dove* from a *Hawk*; all the visible effects of qualities proceeding from a Cause admired, but never known.

The BEGINNING or INFANCY of the WORLD, *Part* 3. *Chap.* 1. *fol.* 54. Represented by the *Figures* of a *Savage Man*, *Woman* and *Children*, who seem to live in those *Huts* placed in the *Woods*, having several *Animals* about them. The Primitive Times supposed to want the conveniencies of *Houses* and *Apparel*, through want of experience.

The SUN, *Part* 3. *Chap.* 6. *fol.* 62. Represented by *Phœbus*, sitting in his *Charriot* in the *Clouds*, drawn by four white *Horses*, for the reasons before given in the description of the *Sun* in *Glory*. The *Figures* on the lower part are representations of several *Men*, *Women* and *Animals*, bathing themselves (as it were) in those brilliant Rays proceeding from this warm *Deity*, *Phœbus*, and may teach us how pleasant and joyful it is to live in the *Sunshine* of *Heaven*.

The MOON, *Part* 3. *Chap.* 8. *fol.* 67. Represented by the Goddess *Diana*, she having a Sovereignity of this seeming Ball of *Fire*, given her by the *Poets*: At her Back are *Dogs* pursuing a *Stag*, the emblem of *Hunting*, of which she is, by the same Authority, Goddess; and underneath is a Landskip with *Deer* therein, the *Victims* offered up to her *Divine Recreation*.

The PLANETS, *Part* 3. *Chap.* 9. *fol.* 70. Represented by the Personal *Figures* of those *Heathen Deities* from whom they borrow their *Names*. As *Luna*, *Mercury*, *Venus*, *Apollo*, *Mars*, *Jupiter*, and *Saturn*. The reason for these *Gods* and *Goddesses* being so adorned, are given in the explanation of the *Sculpture*, representing the motion of the *Planets*: The *Child* in *Saturns* Arms, and which he seems to devour, relates to the Story fathered on him by the *Poets*, that as soon as ever his *Cœlestial Spouse* was brought to Bed, he did *eat* the *Children*, to prevent their dethroning him of his *Kingdom*.

The GLOBE and SPHERE of the Earth and Heavens, *Part* 4. *Chap.* 1. *fol.* 81. Represented by the Personal *Figures* of those two great *Geographers*, *Ptolomy* and *Copernicus*, the one with a pair of *Compasses*, taking seemingly the distances of some places, delineated on the *Globe* of the *Earth*; and the other holding a *Sea-Chart*, having a pair of *Compasses*, and the *Sphere* of the *Heavens* before him: The *Figure* seeming as it were to take an Observation, represents the Learned *Tycho*; on the *Table* are *Charts*, &c.

FOUNTAINS and RIVERS, *Part* 4. *Chap.* 4. *fol.* 88. Represented by the *Figure* of *Thame*, being an *Old Man* lying in the *Reeds* or *Osiers*, having an *Oar* in his Right Hand, and leaning his Left Arm on a *VVater-Pot*; as also by the *Figure Isis*, being a *VVoman* sitting on a *Rock*, having also a *VVater-Pot*. *Thame* and *Isis* are storied to be *Man* and *VVife*, and stand as *Godfather* and *Godmother* to that most ample River, vulgarly, *Thames*, it bearing the name of both, as *Thamesis*; as also by the *Figure* of a *Nymph* of the *Rivers* and *Fountains*, named *Arethusa*, holding a *VVater-Pot* and *Flowers*; and by the *Figure* of a *Young Man* named *Alpheus*, having a *VVater-Pot* and *Cornucopia* of *Flowers*, being the Patron of *Fountains*. The *Figures* are thus coupled, to shew that the Friendly Communication between *Rivers* and *Fountains*, resemble that between *Man* and *VVoman*: The *Figure* in the *Sky*, and seeming to press the *Clouds*, is the emblem of *Rain*.

The SEA, *Part* 4. *Chap.* 5. *fol.* 90. Represented by *Neptune*, God of the *Sea*, drawn in his *Charriot* by *Sea-Horses*, having his *Trident* in his Hand, being his *watry Scepter*, the *Hooks* at the ends of it, are to lay hold on his *subject Fishes*, who fail in their Allegiance: Behind him are the two *Figures*, holding and seeming to *sound* through their *Sea-Shels*, are representations of *Tritons*, *Creatures* formed by the *Poets* to serve his floating *Divinity* in the nature of *Trumpeters*. In prospect the *Sea* with *Ships*, &c.

The FIRE, *Part* 4. *Chap.* 7. *fol.* 99. Represented by *Vulcans Cave*, in which the *Cyclops* (the *Journeymen Blacksmiths* of *Vulcan*) are at *work*, in making *Thunderbolts* for *Jupiter*, who is placed above in the *Clouds*,

Clouds, attended as usually with his *Eagle*, as inspecting the well-making of his *Weapons*; and behind the *Anvil* stands a *Forge* of *Fire*, with a *Figure* seeming to blow it, which causes that *Smoak* that arises from the *Funnel* placed by *Jupiter*; below the *Cyclops* Feet lie *Breast-plates*, *Helmets*, &c. in some measure emblems of *Fire*, as owning their form and make, to his *Power*.

EARTHQUAKES and SUBTERRANEAN FIRES, *Part* 4 *Chap.* 8. *fol.* 103. Represented by the *Figures* of the four *windy Gods*, *Boreas*, *Eolus*, *Auster* and *Zephirus*, each with utmost strength blowing into a *Cavity* of the *Earth*, and heaving up of the *Rocks*, which in several places seem to break forth, and thereby throw down *Trees* and *Buildings*: At a distance the *figures* of *Men*, *Women* and *Children* affrighted, and running to avoid being buried in Graves of Nature, making the *Mountain*, whose top breaths flames of *Fire*, represent *Mount Etna*; these Convulsions of Nature are thus properly emblematis'd, it being the general Opinion that they are caus'd by *Winds*, being incloséd in some cavities of the *Earth*, who are forced to break the surface to find a passage to their proper center.

The AIR, *Part.* 4. *Chap.* 11. *fol.* 108. Represented by *Juno* the Monarches of this *Element*, with all her *Poetical Equipage* about her, and attended by her four *Handmaids*, *Iris*, *Imber*, *Cometa* and *Rugida*, who all have their *Aerial Imployments* under her; as 1*st*. *Iris* takes care of putting out and taking in the *Rainbow*. 2*dly*. *Imber* disposeth the *Rain*. 3*thly*. *Cometa* placeth the *Comets*. And 4*thly*. *Rugida* destributeth the *Dew*; all which employments are expreśt by the emblems that each of them bear.

METALS, *Part* 5. *Chap.* 1. *fol.* 113. Represented by the 7. *Deities*, who according to the *Poets*, patronise the 7. *Metals*; and they are placed in the *Clouds*: That in the midst is *Apollo*, or the *Sun*, holding in his right Hand a *wedge* of *Gold*, being the *Metal* he is said to produce; on his right Hand sits *Luna*, having a *wedge* of *Silver* in her Hand, being the *Metal* that owes its being to her proper bounty; that on the left is *Mercury*, arm'd and crown'd; he is said to produce *Quicksilver* by his celeritous Divinity: The four others that appear behind, are likewise said to produce the four other *Metals*; as *Mars*, *Iron*; *Jupiter*, *Venus* and *Saturn*, *Brass*, *Lead* and *Copper*: In the lower part on the ground, are Directors and Diggers of *Metals*.

The LOADSTONE, *Part* 5. *Chap.* 10. *fol.* 135. Its Virtues and Properties are demonstrated by the three *Figures* representing three *Philosophers*, one of whom holds a *Knife*, with a *Needle* on the *edge*; another having the *Compass* before him, and the other holding a *Loadstone* at a distance: The *Figures* of two other *Philosophers* seemingly discoursing of the *magnetick power* of this wonderful Stone.

The WINDS, *Part* 6. *Chap.* 2. *fol.* 136. In the *Sculpture*, *Apollo* sitting in the *Clouds*, and pointing to the *God* of the *Winds*, *Eolus*, who sits in the *Clouds* below him, adorned as before, commanding the four *Winds* expreśt by the four *Figures* of *Boreas*, *Zephirus*, *Eolus* and *Auster*, with their proper emblems as before, to discharge their Office; their execution of his Commands are visible in the effects of the *Wind* upon the seemingly tost and overwhelm'd *Ships* in the *Sea* below.

The NYMPHS of the *Air*, emblems of *Clouds*, *Mist*, *Snow*, *Hail*, *Rain*, *Dew*, &c. *Part* 6. *Chap.* 3, 4, 5, 6. *fol.* 139. 1*st*. Represented by two *Nymphs* of the *Air* in their proper array, young, beautiful and winged, stretching out their *Arms*, as gathering together and dilating the *Mists*. 2*ly*. The Nymph *Nix*, scattering of *Snow* through a Sieve. 3*dly*. The Nymph *Imber*, pressing the *Clouds* to provide *Rain*. 4*thly*. The *Figure* of a *Man* scattering small *Hail* out of a *Water-Pot*; and underneath three *Figures*, the middlemost representing *Dew*, the 2*d*. *Snow*, and the 3*d*. small *Hail*. In prospect a *Landskip* covered with a cast of each of their Offices to which they are assigned by the *Poets*, and therefore may properly be used in *Sculpture*, it being an attendant of Painting, which is *Poema silens*.

STORMS and THUNDER, *Part* 6. *Chap.* 7. *fol.* 147. *Thunder* is represented by *Jupiter*, preparing to cast his noisie *Bolts*: and the Storms by *Eolus*, the *God* of the *Winds*, commanding the four Heads who breath out *Storms* in their *Stations*, as *Boreas* in the *North*, *Zephirus* in the *West*, *Auster* in the *South*, and *Eolus* in the *East*: Below is the true emblem of a Storm, being *Ships* tost in a rugged *Mountanous Sea*; the *Fires* seeming to blaze on the *Main Yards* of the *Ship* are two *Sea Wills* in the *Wisp*, and made by the *Poets*, tho' not *Gods*, yet *Godlings* of the *Sea*, and Protectors of *Seafaring-Men*, and by them named *Castor* and *Pollux*, the names of two Brothers, reported to have been drown'd.

The RAINBOW, *Part* 6. *Chap.* 9. *fol.* 151. A *Rainbow* proper, surmounted by *Iris* the *Goddess* thereof, the Rays of the *Sun* darting on it; by which, as we conjecture, it receives those beautiful and various Colours: The *Figures* below, represent *Philosophers* as consulting concerning its *Nature*; and about that *Ignis-Fatuus* which appears in the *Fields* of the *Landskips*; the representation of a *Nymph* or beautiful *Virgin*, placed on the *Rainbow*, took its rise from *fancy*, but since hath been attested for reality by a Captain of a Ship, who solemnly asserts his having seen it so.

GARDNING, *Part* 7. *Chap.* 1. *fol.* 156. In the *Sculpture*, the 1*st*. *Figure* is the Goddess *Rea*, Commandress of the *Earth*, seated thereon, as her proper *Throne*, having a *Castle* on her *Head*, and a *Lion* by her Side, emblems of her Strength and Power; next her is *Hebe*, one of *Jupiters* Cup-bearers, pouring out *Wine* on the *Earth*, as the Tyth due to her producing it; the next *Voluntina*, who assists the *Flower* in *budding*; then *Flora*, embracing the *Plantine-Tree*, being consecrated to her, and holding in her Hand a *Flower*, being Goddess thereof; behind *Rea* is *Virtumnus*, holding one *Fruit*, and eating another; on the left side of the *Tree* is *Nodinus*, holding the *Leaves* as it *buds* into *Branches*: Next is *Proserpina*, who hath the care of the *Bud* till it is out of the *Earth*; behind *Nodinus* is *Patelena*, holding a *Leaf* in its full perfection: The reason for thus representing Gardning, arises from the authority of the *Poets*, who have made all these *Gods* and *Godesses* concerned in the preservation of those *Vegteables* that adorn it, tho' I suppose they only meant the *Garden* of the *Muses*, in which none but they and their Successors were to be allowed the liberty of walking: In the upper part of the *Sculpture*, are the representations of *Jupiter*, *Juno*, *Saturn*, *Feronia* and *Luna*, in their proper emblems, relating to their several *Empires*, as before discourśd of, and intimates the necessity of the good will of *Heaven*, and temperate seasonable *Weather* to bring the *Fruits* of the *Earth* to perfection.

NATURE of ANIMALS, *Part* 8. *Chap.* 1. *fol.* 175. For *Animals* begot, they are represented by a *Woman* suckling her *Child*, having a *Cradle* standing by her; their *Thirst* represented by a *Cow* a drinking; their *Hunger* by a *Deer* grazing, their *Action* by two little *Dogs* a playing; their *Sleep* by a *Cat* a sleeping; their *Wakefulness* by a *Cock* sitting on his Pearch, and seeming a Crowing; their *Sickness* by a *Farrier* bleeding of a *Horse*, and their *Death* by a *Horse* lying dead.

IMAGINATION, *Part* 9. *Chap.* 6. *fol.* 214. Represented by a *Woman* in a sendentary posture, having on her *Head* a pair of *Wings*, and a *Coronet* composed of small *Figures*, which *Figures* denote the productive faculty of *Imagination*, and the *Wings* its swiftness: The *Child* standing by the *Figure* of *Imagination*, partly *black* partly *white*, denotes the strength of this *Passion*, being able (as by this Example appears) to perform those things, which neither *Human Wisdom*, nor the common way of *Natures working* could effect: The other *Figure* having *Eyes* vailed, and *Wings* on her *Back*, represents what *Women* call *longing*, 'tis swift as *Wings* to *Desire*, and blinded to *Reason*.

MEMORY, *Part* 9. *Chap.* 7. *fol.* 216. Represented by a *Woman*, having a Steel Cap on her Head, set with Jewels, denoting the Strength and Riches of this *Faculty*; she is putting her *Finger* to her *Ear*, as the proper *Organ* by which this Good is received; and in her *Hand* she holds the Picture of a *Man*, whom she knows, tho' absent, by the means of *Memory*; below are the representation of *Children* conning their *Lessons*, *and* of a *School-Mistress*, who seems awing them with a *Rod*; The Statue on *Horseback* is the representation of King *Charles* II. as the propereśt object to exercise this Noble Faculty of *Memory* upon.

The *Author* having asserted in his *Discourse* of the want of *Sense* and *Knowledge* in *Brute Animals*, that they are nothing more than *Machins*, moving in their several *Stations* by Natures *Clockwork*: His ingenious position is *illustrated* by the *Sculpture* that fronts the said *Tract*. Firśt on the foreground is the *Figure* of a *Woman*, being the representation of *Dædalus* his *Wooden Venus*, which imitated the *Action* of a *Woman*; next in the midst the *Figure* of a *Man*, being that *Iron Statue*, which presented a Petition to the *Emperor* of *Morocco*, as taken notice of in the latter end of that *Authors Preface* to the *Reader*. On the Right Side of this *Figure*, is that of a *Man* with a *Drum*, which artificially beats on it, and at the same time performs several *motions* with his *Head* and *Eyes*; which *Clockwork* was shewn in *London* not long since. Between these aforesaid three *Figures*, is a *Dial* and a *Dog* sitting, which is another piece of *Clockwork*. At a distance on the second ground, is supposed the *Army* of *Maximilian* the Emperour, over whose Head is an *Eagle*, being the representation of the *Norimberg Eagle*, framed by *Athanasius Kirchir*, which flew over his Head, and accompanied him in his return to the *City*. Then on a *Hill*, a *Statue* of a *Man*, which saluted the *Sun* at his rising, with a Hymn *Musically* composed: And to conclude, a *Pidgeon* framed by *Architus* the *Tarentin*, which flew in the *Air* like a living *Bird*; all which the *Author* hath taken notice of, to which I refer the *Reader*.

Benefactors to this Work

Her Royall Highness the Princess Ann of Denmark &c.ª

3

The R.t Noble Frances Teresa Stuart Dutch-ess Dowager of Rich-mond, and Lennox &c.ª

4

The most Honourable Rose Marchioness Dowager of An-trim &c.ª

5

The Right Honourable John Lord Cutts Baron of Gowran &c.ª

6

S.r Thomas Mompesson of Bathampton in Wiltshire Knight.

7

Henry Portman of Orchard in the County of Somer-set Esq.r

8

Ralp.h Macro of Clap-ton in the Parish of Hac-kney in the County of Mid.x D.r in Phisick.

9

John Cooke of the Inner Temple London Esq.r Cheife Prothonotary of the Court of Comon Please Westminster.

10

Thomas Vincent of Fetcham in the County of Surrey Esq.r

11

The Right Honourable Charles Earle of Man-chester, Viscount Mande-vill, Baron of Kim-bolton &c.ª

12

William Edgell of Clapton in the Pa-rish of Hackney in the County of Middlesex Gent.

13

The Right Honourable S.r Henry Goodrick of Rib-ston Park in York shire K.t & Bar.t Leivt. Generall of the Ma.tes Ordinance & of y.e Ll.s of their most Honourable Privy Councell &c.ª

14

S.r Gilbert Gerard Coßein of Brafferton hall in the North Ri-deing of Yorkshire Baronet.

15

Thomas Drax of Sib-sy in Lincolnshire, and of the Island of Barbados in Ame-rica Esq.r

16

Iesfrey Iesfreys of the Priory in Brecknockshire, and of the City of London Esq.r

17

S.r Henry Hobart of Blickling in Norfolk Knight and Baronet.

18

Captaine Richard Cheyney of Hamerton in the Parish of Hack-ney in Middlesex Esq.r

19

The Honourable D.r John Fielding Arch Deacon of Dorset &c.ª

20

Francis Gosfright of the Citty of London Esq.r

21

Phillip Bickerstaffe of Chirton in the County of Nor-thumberland Esq.r

22

Ambrose Pudsey Esq.r of Bolton Hall in the west Rideing of Yorkshire & High Sheriff of the said County Anno 1699.

23

Horenden Walker of London Esq.r Captaine of one of his Majestyes Ships of War.

24

John Ieffreys of Llywell in Brecknock-shire, and of the City of London Esq.r

25

Thomas Raulins of Kilreeg in He-reford shire Esq.r

26

The Right Noble Catherine Dutchess and Countess of Northumberland Viscountess Falmouth and Baroness of Pontefract &c.ª

27

The Honourable John Granville, Second Son to the Right Honourable John Earle of Bath &c.ª

28

S.r Samuel Gerard of Brafferton hall in the North Rideing of York-shire Knight.

29

The R.t Noble Henry Duke of Beauford, Marquiß of Worcester, Baron Herbert of Raglon & Gower, Knight of the most noble order of the Garter &c.ª

30

The Right Honourable William Legge Baron of Dartmouth &c.ª

31

The Right Honour.ble Francis Viscount Newport, Baron of High Arcall in Shropshire &c.ª

32

The Honourable S.r William Wogan Knight their Ma.ties first Sergeant at Law.

33

S.r John Bolles of Scampton in the County of Lincoln Baronet.

34

William Emmerton of the Middle Temple esq.r Am. examiner in Chancery, married to Eliz. Coheyr of S.r John Beale of Farningham in Kent Bar.t

35

John Emmerton of the Middle Temple London Esq.r

36

S.r Richard Haddock Knight, Comptroller of their Majesties Navy Royall

37

S.r Edmund Turnor of Stoke Rochford in Lincolne shire Knight.

38

Daniel Osborn of the Inner Temple London Esq.r

39

William Upton of Lupton in the County of Devon Esq.

40

Andrew Lant of Thorp-underwood in the County of Northampton Esq.r

41

William Benge of Cosely Wood in Wadhurst in the County of Sußex Gentleman

42

Anthony Segar of Twyford in the County of Southampton Gent.

43

John Peeters of the Navy Office in London Gent.

44

William Tempest of the Inner Temple esq.r one of the Prothonotarys of their Majesties Court of Comon Pleas at Westminster.

45

Captaine Thomas Newnam of Iver in the County of Buckingham Gent.

46

John Bennett of Grais Inn Esq.r

47

Gabriel Armiger of North Creak in Norfolk, and of the Inner Temple London Esq.r

48

Nicholas Hookes of the middle Temple London Esq.r

49

The Honourable Admirall Henry Killigrew, of S.t Iuhers in Hertford shire.

50

M.r John Nowell Cittizen and Appothecary of London.

51

The Hon.ble Sr. Ralph Delaval of Seaton Delaval in Northumberland K.t one of ye Comissioners for executing the office of L.d High Admiral of England & joynt & Seperate Admiral of their Ma.ties Fleet

52

Sr. John Wentworth of North Elmes-hall in ye West Rideing of Yorke Shire Baronet

53

Sr. Rowland Gwynne of Lanelveth in ye County of Radnor Knight

54

Sr. Denis Hampson of Taplow in Buckingham-Shire & of Bradwell in Oxford-Shire Baronet

55

Sr. Barkeley Luey of Netley in Hant-Shire Baronet

56

Sr. John Bramston of Screens in ye Parish of Roxwell in Essex Knight of the Bath

57

Phesaunt Crisp of Crosby-Square in London Gent. Eldest Son of Samuel Crisp of Clapham in Surrey Esq.r

58

William Bridgeman of ye Citty of Westminster Esq.r one of ye Clarks of their Majestys most Honourable Privy Councill &c.

59

Francis Forbes of ye Citty of London Gentleman

60

Sr. Iames Edwards of the Citty of Yorke Baronet

61

Sr. Solomon Swale of Swale-Hall in ye North Rideing of Yorke Shire Baronet

62

Martin Folkes of Grais Inn in Middlesex Esq.r

63

Thomas Phillips of Southampton in Hant-shire Esq.r Second Engineer of England &c.a

64

John Berkley of Stoake in Glocester-shire Esq.r

65

John Gilbert of Sr. Martins in the Fields in Middlesex Gent descended of ye Gilberts of Frodley in Staffordshire

66

Reginald Marriott of ye Parish of St. Clements Danes in Middlesex Esq.r

67

Sr. Christopher Greenvile of Preston in Lancashire Knight

68

Thomas Brotherton of Hey in the County Palatine of Lancaster & of Grays-Inn in Middlesex Esq.r

69

Francis Sambrooke of the Middle Temple London Gentleman.

70

Sr. William Holford of Welham in the County of Leicester K.t descended from ye antient family of ye Holfords of Holford in Cheshire

71

Sr. John Morden of Ricklemarsh in ye Parish of Charlton in Kent Baronet.

72

Christopher Parker of Bradkirke in ye County of Lancaster Esq.r

73

Nathaniel Boothe of Mottram Andreve in Cheshire Esq.r

74

Theodore Johnson of ye Citty of London Gentleman.

75

Hallyday Mildmay of Shamford in ye Parish of Twyford in ye County of Southampton Esq.r

76

The R.t Hon.ble Charles Lord Herbert Marquess & Earle of Worcester, eldest son to his Grace Henry Duke of Beaufort &c.a

77

S.r John Leveson = Gower of Trentham in Staffordshire Baronet.

78

Simon Harcourt of the Middle Temple London Esq.r

79

George London of their Majesties Royall Gardner in S.t Iames's Parke Gent. Deputy Superintendant and M.r Gardiner of their Ma.ties Gardens & Plantations in England.

80

Chichester Graham of Wotton Conyers in the North Rideing of York-shire Esq.r

81

S.r William Hooker of Greenwich in Kent and of the Citty of London K.t & L.d May.r thereof Ano Dom. 1673

82

Peter Rycaut of King Stephens Castle in Ospring in Kent Esq.r only Son and heyre of Collonell Philip Rycaut, and Nephew to S.r Paul Rycaut Knight.

83

Ferdinando Gorges of the Citty of Westminster Senio.r Esq.r Grandson of S.r Ferdinando Gorges of Ashton Phillips in Somerset shire Knight.

84

The Honourable S.r Richard Onslow of Clandon in Surrey Baronet.

85

The Right Honourable John Sheffeild, Baronet of Botterwick, Earle of Mulgrave &c.a

86

The Right Honourable Henry Lord Viscount Sydney.

87

Captaine William Wallis of S.t Martins in the Fields in Middlesex.

88

The Hon.ble Samuel Peppys of the Inner Temple Esq.r Secretary of the Admiralty of England to K. Charles and Iames the Second.

89

Henry Gorges of Eye in Herefordshire Esq.r

90

John Pulteney of the Parish of S.t James in Middlesex Esq.r

91

The Right Honourable Edward Lord Raddiffe Son and heyre of the Right Honourable Francis Earle of Darwentwater &c.a

92

S.r Godfrey Kneller of Lubeck in Saxony and of S.t Pauls Covint Garden in Middlesex Knight, Principall Painter to their Ma.ties King Wm. & Q. Mary &c.

93

S.r William Thomson of the Middle Temple K.t their Ma.ties Sergeant at Law &c.a

94

To the Right Honourable William Wentworth Earle of Strafford, Viscount Wentworth, and Baron Wentworth Woodhouse Newmarch Oversley and Raby Knight of the Garter &c.

95

The Right Honourable Elizabeth Countess Dowager of Winchelsea, Viscountis Maidston, and Baroness of Eastwell &c.a

96

John Hervey of Ickworth in the County of Suffolk Esq.r

97

Leivtenant Collonell Andrew Wheler of Datchet in Buckingham shire, one of the Captains of thar Ma.tys First Regiment of foot Guards

98

S.r Robert Clayton of Marden in Surrey and of the Citty of London Knight and Alderman, Lord Major thereof 1680

99

S.r Basil Firebrace Knight Alderman and Sheriff of London Anno Domini 1688.

100

Richard Richardson of the Middle Temple London Esq.r one of the Citty Councell for the Sheriffs Court.

101

S.r James Butler of Lincolns Inn in Middlesex Knight, Steward of his Majestyes Palace and Marshalsea.

102

S.r Charles Kemeys of Kevenmakley in Glamorganshire Baronet.

103

John Harborough late of Emanuel College in Cambridge and now of the Citty of London M.D. descended from the Harboroughs of Winsfarthing in Norfolk, which family descended from the Harboroughs of Leicestershire.

104

S.r Comport Fitch of Eltham and Mount-Mascall in Kent Baronet, son and heyre of S.r Thomas Fitch of the S.d places Knight & Baronet, by Ann Daughter & heyress of Richard Comport of Eltham in Kent Gent. deceased.

105

Thomas Ryves of Ransford in the County of Dorset Esqr.

106

The Right Honourable Charles Earle of Dorset and Middlesex, Baron of Buckhurst and Cranfield, K.t of the Garter, L.d Chamberlaine of his Matyes Household, & one of the Lords of their Mat.yes most Honourable Privy Councell &c.a

107

The R.t Hon.ble Thomas Earle of Pembrock & Montgomery, Baron Herbert of Shurland, Cardiff, Ross of Kendale, Parr, Marmion & S.t Quintin K.t Lieutenant of Wiltshire, one of the L.ds of the Admiralty, L.d Privy Seale, & one of the L.ds of their Mat.yes most Honourable Privy Councell &c.a

108

The Right Honourable John Earle of Exeter, Baron Cæcill of Burleigh &c.a

109

The Right Honourable John Earle of Bristoll, Baron Digby of Sherborne &c.a

110

The Right Reverend Father in God, D.r Thomas Sprat, Lord Bishop of Rochester, Dean of Westminster &c.

111

James Mundy of the Inner Temple Esq.r one of the Judges of the Sheriffs Court London

G. Freman Inv. I. Kip Sculp

To the Right Honourable John Lord Cutts, Baron of Gowran; Captain-Generall and Governour of the Isle of Wight; Constable of Carisbrooke Castle; Brigadieer Generall over all the Infanterie in their Majestyes Service; and Collonell of a Regiment of Foot &c.[a]

Sudore et Sanguine

The First Part:
OF THE
INSTITUTION
OF
PHILOSOPHY.
CONCERNING
LOGICK.

INTRODUCTION.

CHAP. I.

Of the Nature and Constitution of LOGICK.

I. *What we are to understand by the word LOGICK.*

FOrasmuch as the Mind of Man is obnoxious to many Errors, as well in the searching out of *Truth*, as in the pursuit of that which is *Good*, in both which it is frequently mistaken; two *Arts* have been found necessary, whereof the former might direct the *Will* in the choice of the *True Good*, and the latter assist the *Understanding* in the discovery of *Truth*. The first of these, called ETHICKS, is an help to human Infirmity, directing the *Mind* of Man in the prosecution of *Good*, and shewing it what it ought to embrace, and what to avoid; the other called LOGICK, is the *Rule* of Man's *Thoughts*, which he is to observe in the framing of them, and by means whereof he may communicate his *Perceptions* and *Judgments* to others.

II. *The Definition of* Logick.

For LOGICK is nothing else, but the *Art of right Thinking*, or of *using our Reason aright*; where by the word *Thinking* we do not only understand simple Idea's or Notions, but also *Judgments* and *Discourses*: For he who *Reasoneth* or *Judgeth*, thinks as well as he, who only attends to simple Notions. So that *Logick* extends it self to all kind of *Thoughts*, and gives Rules to all the *Actions* of the *Mind*; because *Discoursing*, *Judging* and *Conceiving*, are but so many different Modes of *Thinking*.

III. *Why* Logick *is called the* Art of right Thinking.

It is to be observed, that LOGICK is not simply said to be the *Art of Thinking*, because Thinking is Natural to us, and the spontaneous products of our *Mind*; but the Art of Thinking *aright*. For since *Thinking* may be performed well or ill, there is need of an *Art* that may rightly direct the Actions of the *Mind*, and prescribe Rules for the discerning of *Truth* from *Falshood*. For as the Art of *Husbandry* teaches the convenient ordering and disposing of those *Plants*, which otherwise grow of themselves and at random: So *Logick* furnisheth us with *Rules* to define Things, to sort them under their General Heads, and furnish them with their Adjuncts.

IV. *How* Logick *assists the* Mind.

Wherefore LOGICK may be said to be the *Art of Knowing* each Knowable that can be the Object of Human Understanding: Not that it informs the *Mind* of the Things themselves, for that is the Duty of *Natural Philosophy*; but because it discovers the Ways of *right knowing* in general, and delivers those *Rules* by which the *Mind* of Man may be directed, whilst it endeavours to know any thing, so as not to wander from the Path of right *Reason*.

V. *Four things* roquired to *the use of* right Reason.

Now, that a Man may use *right Reason*, and be able to frame his *Thoughts* aright, and interpret them to others; it is necessary for him to *Perceive aright*, *Judge aright*, *Reason aright*, and *Order aright*.

VI. *First, to Perceive.*

We are said to *perceive* a thing, when we clearly and distinctly conceive the Object offer'd to us: As when we represent to our Thoughts *God*, an *Angel*, a *Circle*, a *Triangle*, and stop there, without forming any Judgment concerning them. And the Form, by the immediate perception whereof we are conscious of our knowing any Object, is called an *Idea*.

VII. *What we are to understand by the word* Idea, *or* Species.

For by the word *Idea* we are not to understand any Representations impress upon our Senses; but those Images of Things, which the *Mind* frames by Thinking. For the easier apprehension whereof we are to observe, that in the *Idea* or Notion of a

Thing two things are to be conſider'd: *Firſt*, That it is a *Modus* inherent in the *Mind*, from whence it proceeds: The *other*, That it ſhews or repreſents ſomething. The former of thoſe proceeds from the *Mind*, as its effective Principle; the latter from the *Object*, or thing apprehended, as from its Exemplary cauſe. So that when we frame the *Species* of any thing by Thinking, that firſt view of our *Mind*, by which it repreſents and conceives the Thing as preſent, is called *Perception*, or in other words, *The firſt operation of the Mind*, or *Simple Apprehenſion*. So that this *Perception* is ſaid to be Simple, not with reference to the *Object*, which often is complex (as when the *Sun* is conſidered as a *Light* or *Lucid Body*;) but with reſpect to the *Modus*, under which the Thing is conceived.

VIII. *The Second, to* Judge. We are ſaid to *Judge*, when we affirm or deny any thing of the ſaid known Objects; or when we by the Action of our Mind joyning two *Idea's*, aſſert the one to be the other; or deny the one of the other. As when conſidering the *Idea* of the *Sun* and that of *Fire*, we affirm the *Sun* to be Fire, or deny the *Sun* to be Fire.

This way of *Thinking* is different from the foregoing, foraſmuch as this is not the Simple apprehenſion of a thing; but a Compound, *viz.* an *Affirmation* or *Negation*, and is commonly called a *Propoſition*, becauſe the *Mind* thereby propounds its Sentiment of Things. It is alſo called *Judgment*; foraſmuch as by this Mode of *Perceiving*, we do not barely apprehend a thing, but alſo judge or determine what it is, or is not.

IX. *The Third, to* Diſcourſe. To *Reaſon* or *Diſcourſe* is that Action of our Mind, which frames a *Judgment* of many others, or which from two *Propoſitions*, or from one, infers another: As for Example, After it hath judged that a *Body* is a Subſtance extended in Length, Breadth and Depth, and that *Heaven* is a *Body*; infers the *Heaven* to conſiſt of three Dimenſions.

So likewiſe obſerving that the *Idea* of a *Man* agrees with that of an *Animal*, but doth not agree with the *Idea* of a *Plant*, concludes, That therefore neither can the Idea of a *Man*, ſuit with that of a *Plant*. Wherefore finding that *Man is an Animal*, and that an *Animal is not a Plant*, it infers this Third *Propoſition*, that *therefore Man is not a Plant*. This way of Thinking is call'd *Diſcourſe*, becauſe by running from one *Propoſition* to another, it comes to a Third.

X. *The Fourth, to* Order. To *Order* is an Action of the *Mind*, whereby many things found in the ſame *Subject*, are diſpoſed in a fit and congruous manner: As when the *Mind*, after it has fram'd ſeveral *Idea's*, *Judgments* and *Argumentations*, digeſts them in the moſt convenient and fit manner, for the ready and diſtinct conceiving of them.

XI. *Of what uſe the obſerving of theſe Rules is.* So that he that would proceed according to *Order*, muſt begin with thoſe things that are more known, paſſing on to ſuch as are leſs; and in the ſame manner proceed all along from one thing to another, ſo as that which goes before may always afford light to what follows.

If any one ſaith, That all theſe things may be done by the conduct of *Nature* only, ſince Experience ſhews, that ſuch Perſons ſometimes perform them more exactly, who are wholly ignorant of the *Rules* of *Logick*, than they who have ſtudied them: We freely grant as much, nor do we pretend this Art to conſiſt, in preſcribing the *Modus* how thoſe *Operations* are to be done, ſince *Nature* alone is ſufficient to make us *Perceive*, *Judge*, *Diſcourſe* and *Methodize*, without any foreign aſſiſtance. Yet is not *Logick* therefore to be judged uſeleſs, becauſe it helps us to examine our Actions, and obſerve thoſe Things which we do by Natural inſtinct.

XII. *The Threefold uſe of* Logick. As, *Firſt*, that we may be aſſur'd that we uſe our *Reaſon* aright. *Secondly*, That we may with more eaſe diſcover the Miſtakes, or ſupply the Defects, that may intervene in our *Mental Operations*. For it oft happens, that by the ſole Light of Nature we are aware of ſome *Falſhood*, and yet are ignorant where that *Falſhood* lurks. As we find that Men ignorant of the Art of *Limning*, are often offended with a Fault they ſee in a Picture; tho' they cannot make out what properly the Defect is wherewith they are diſpleaſed. *Thirdly*, That the Nature of our *Mind* may be the more diſtinctly known by us, whilſt we obſerve and give good heed to thoſe Actions that are proper to it, and which vaſtly raiſe it above all Bodily things. Wherefore ſeeing that the *Mind* ſuffers it ſelf ſometimes to be impos'd upon by falſe Repreſentations, it has been found neceſſary to preſcribe ſome *Rules* by which it might be aſſiſted in its Operations, in order to a more certain reaching of *Truth*. And accordingly the whole aim of *Logick* is to inform us, how we ought to make uſe of our *Reaſon*, and what Evidence we ought to have, before we give our Aſſent or Diſſent to things, which by *Idea's* are preſented to our *Underſtanding*.

XIII. *Logick divided into Four Parts.* Whence follows, that *LOGICK* is to be divided into Four Parts, according to the divers Reflections we have of theſe Four Operations of our Mind. The Firſt, concerning *Idea's*, or the ſimple *Perception* of Things: The Second, of *Judgment*, or of *Propoſitions*, wherein is *Truth* or *Falſhood*: The Third, of *Diſcourſe* or *Syllogiſm*: The Fourth, of *Method*, or the *Orderly digeſting* of our *Thoughts*, by which, as by ſo many Steps, we arrive to the *Modus* or Way of Knowing. Foraſmuch as by the *firſt* we are led from *Inconſiderateneſs* to *Attention*; by the *ſecond* delivered from *Doubts* and *Errors*; by the *third* we are accuſtomed to *Reaſoning*; and by the *laſt*, we infallibly prove ſome *Truth*, or demonſtratively perſuade the ſame to others.

CHAP. II.

Of the true Uſe of LOGICK, ſhewing that Logick *is uſeful and neceſſary to the Conduct of a Rational Life.*

I. *The Opinion of the Ancients, concerning* Logick. LOGICK was always in ſo great eſteem amongſt the Ancients, that ſome of them admir'd it as a thing inſpir'd from Heaven, and look'd upon them as rais'd above the Condition of Men, who underſtood the *Rules* of it, and were dextrous in the practice of them. Wherefore *Cicero* tells us, that the *Contemplation and Knowledge of Nature is, as it were, by a Wall or Rampart ſecured and defended by the way of Reaſoning, by the Judgment of what is True or Falſe; and by a kind of Art of knowing what is agreeable and comporting with every thing, and what is contrary to them.* And for this Reaſon the *Philoſophers* of Old

Old have beſtowed ſeveral Names upon it, and meaſuring the dignity of it by its Neceſſity; have called it, the *Medicine of the Soul*, the *Organ* or Inſtrument *of Sciences*, and *the Eye of the Mind.*

II. *The* Logick *taught in the Schools hath its uſe.*

True it is, that *LOGICK* ſeems to have declined from its primitive Majeſty, ſince it now chiefly conſiders *Forms*, and is in a manner wholly taken up with the Reſolving of unprofitable *Queſtions:* Yet neither is it wholly to be undervalued upon that account, ſince thoſe *Queſtions* exerciſe the Wit of Men, and are not a little conducive to the examining of the Difficulties we meet with in other Sciences. As *Geometricians*, by exerciſing themſelves in the crabbed Queſtions of *Algebra*, which are altogether Abſtracted, and of no uſe for the Conduct of Life, are nevertheleſs thereby diſpoſed for the underſtanding of other difficult *Problems*, that are of great uſe in the Life of Man. In a word, which way ſoever we conſider *Logick*, we ſhall find it to be of uſe, and in that regard not inferiour to other *Arts* or *Sciences.*

III. *As* Phyſick *cures the Body, ſo* Logick *does the Mind.*

This will be evident, if we conſider *Man* in himſelf, and the *Diſeaſes* he is ſubject to. For a Man conſiſts of *Body* and *Soul*, which both of them have their *Infirmities* and *defects.* So that as *Phyſick* takes care of the *Body*, by removing *Sickneſſes* that afflict it; ſo there is need of *Science*, that may aſſiſt the *Mind*, by diſpelling of its *Darkneſs.* Wherefore *Logick* takes care for the *Souls* health, and conſequently is as neceſſary to the *Intellectual Life*, as *Phyſick* is to the *Body:* Nay, and is by ſo much the more excellent and neceſſary, by how much the Nobleneſs of the *Soul* exceeds that of the *Body*, and by how much its *Diſeaſes* are more hidden and more difficult to be cured.

IV. *Why* Phyſicians *are more eſteemed than* Logicians.

Neither is there any great reaſon of Wonder, why *Phyſicians* are ſo much reſpected every where, and favour'd with Honour and Riches; whereas *Logicians* are commonly very deſpicable: For the reaſon of this is, becauſe the Diſeaſes of the *Body* do affect the *Soul*; whereas the Diſorders of the *Mind* do only afflict it ſelf, and communicate little or nothing of their Smart to the *Body*; whence it happens, that in a manner all Mankind chooſe to lead an *Animal Life*, and but very few do follow a *Spiritual* or *Mental Life.* To which may be added, that the greateſt part of Men are little concerned about the Vices of the *Soul*, and being only intent on the Care of their *Bodies*, think themſelves moſt happy as long as they are in *health*; and all this, becauſe they are drowned in the *fleſh*, and wholly addicted to *ſenſe.*

V. *That* Nature *alone is not ſufficient to direct the Operations of the Mind.*

It is Notorious, that we brought no *Science* into the World with us, but that the ſame is acquir'd by *Induſtry*, or received from *Maſters:* But ſeeing there are few that are able to Teach us, and that they who undertake it are frequently deceived themſelves; we muſt find out a *Method*, whereby we our ſelves may correct our Errors, and endeavour to mend our Faults.

VI. *The force of Human Reaſon.*

If you ſay, that our *Reaſon* is ſufficient for this, whoſe property it is to know the *Natures* of Things, and to diſcern *Truth* from *Falſhood.* I anſwer, That indeed *NATURAL LOGICK*, or the very force and ſtrength of *Reaſon*, which we have by *Nature*, doth not a little conduce to the attaining of *Truth:* For it conſults thoſe *Rules* Nature her ſelf has preſcribed, and being informed thereby, examins its Operations and Diſcourſes by them. For to ſpeak truth, we naturally follow almoſt all thoſe *Rules*, which after long ſtudy and great pains taking, *Logicians* have delivered to us; ſo that *Nature* it ſelf ſeems to have taught us the *Art of Reaſoning*; but yet we find, that ſhe is not ſufficient to furniſh us with all neceſſary Knowledge, except ſhe be aſſiſted by *Precepts*, and perfected by *Art.* Who can deny, but that the Faculty of *Painting* is born with *Man*; and yet *Art* is neceſſary for the right forming of *Images.* All Men are endued by *Nature*, with a power of Speaking and framing of *Words*, which yet will never be reduced to *Art* without Uſe and Exerciſe; ſince it is clear beyond doubt, that ſhould an *Infant* from his Birth be left alone, it would continue *Dumb* all its Life, unleſs it were taught to Form *Words* and give them their due Sound.

VII. *The Neceſſity of* Logick, *proved by* Galen.

Thus *Galen* proves the Neceſſity of *Logick* againſt *Eraſiſtratus* by this Argument; *Either every thing follows from every thing, or not:* If you aſſert the former, then it will follow, that *becauſe a Crow is black*, and *a Swan white*, Eraſiſtratus *is a Fool and mad*; if the latter, then you muſt grant there is need of *Art*, that may inform us what follows and what not. For we cannot make out that a *Conſequence* is right, or a *Demonſtration* good, without the aſſiſtance of *Logick.*

VIII. *Natural and Artificial Logick.*

LOGICK therefore is to be diſtinguiſh'd into *Natural* and *Artificial. Natural Logick* is that force of the *Mind*, by which it rangeth its *Thoughts* and reduceth them to order, or elſe Diſcourſeth ſpontaneouſly without obſerving any order. *Artificial Logick* is that which is acquired by Uſe and Practice, and at firſt took its riſe, and increaſe afterwards from various Obſervations taken from the Actions of the *Mind.*

IX. *The Uſe of Artificial Logick.*

Wherefore tho' we bring *Natural Reaſon* along with us into the World, yet is not that ſufficient to direct the Actions of our *Minds:* For we find that notwithſtanding the Uſe of *Reaſon* we fall into many Errors, and labour under the Prejudices of Infancy; and therefore muſt conclude, that *Artificial Logick* is not only uſeful, but neceſſary to cure the Diſeaſes of the *Soul*, and to direct and guide its Operations: Where, by the *Souls* Diſeaſes, I do not mean *Sins* and *Moral delinquencies*, the Cure whereof is endeavoured by *Divines* and *Moraliſts*; but the Weakneſs of our *Mind* in the Perceiving of Things; *viz.* all manner of *Errors*, *Confuſions* and *Obſcurities* of our Conceptions; Falſe and uncertain *Judgments*, and undue Conſequences in our *Reaſonings*, the diſcerning and removing whereof is the whole buſineſs of *Logick.*

X. *Doctrinal and Practical Logick.*

There is another common Diviſion of *LOGICK* into *Doctrinal* and *Practical. Doctrinal Logick* is that which delivers the ſeveral *Rules*, directing us in *Perceiving*, *Judging* and *Reaſoning. Practical*, is that which applies thoſe *Rules* to Uſe and Practice: For which reaſon the Ancients called the former *Abſtracted* or *Separate from Things*; but this latter, *Concrete* or *joyned to the Things* themſelves we are diſcourſing of.

The

The First Part.

Of the Clear and Distinct Perception of the Mind.

SEing it is evident from the foregoing Discourse, that there are Four Parts of *LOGICK*, correspondent to as many distinct *Operations* of the *Soul*, about every *knowable* Object: We will here begin with the First Part of it, which directs the simple Perceptions and Apprehensions of our *Mind*. And to perform this the more effectually, we will endeavour to take out of the way the several Hindrances of *Science*.

CHAP. I.

What the Hindrances of Science *are, and how to be removed.*

I. *The chief Causes of our Mistakes.*

THere are Two things by which we are easily led aside into the By-way of *Error* and *Falshood*, viz. *Prejudice*, which makes us take up any thing for *Truth*; before *sound Reason* hath convinced us of it; and *Slavishness*, by which we are so addicted to the Opinions of others, that we think it a Crime to differ from them.

II. *We are very subject to be seduc'd by the Prejudices of* Infancy.

Wherefore it is no wonder that we find so few Men truly Wise, and who know the Causes of Things aright, seeing they scarce consider any Thing well and duly throughout their whole Life, and do not so much give their assent to Right *Reason*, as to their *Prejudices* and the Testimony of their *Senses*. For the force of *Prejudices* is so prevalent with some, that they cannot admit any thing for *Truth*, which is not grounded on those false Opinions they have suck'd in from their *Cradles*. Wherefore it will be worth our while to shew, how vain the Things are we then know, and that we ought to distrust and suspect whatsoever proceeds from such weak *Causes*. For what did ever any *Infants* perceive, which they did not wholly refer to their *Bodies*, and which they did not desire or dread, according as they fancied them hurtful or grateful to the same? Thus we see they are pleased with the Light and Shining things, because *Refulgency* with its Beauty pleaseth their Eyes; whereas they dread a *Rod*, because with it they are chastis'd and put to pain. Wherefore *Children* judge of things, as they appear to their *Senses*; As that the *Earth* is far bigger than the *Sun*, and the rest of the Heavenly Bodies; because the *Earth* is nearer to them, the other being at a great distance from them. Thus likewise they think, that there is more Matter in *Lead* and other Metals, than there is in *Fire* or *Air*; because they find more Weight and Hardness in the one than the other. And again, because they perceive no more Brightness from the *fix'd Stars* than from the small Light of a *Candle*, they are apt to think that the *Stars* do not exceed the bigness of a *Candle*, and therefore fancy them as so many bright and shining *Studs* fix'd in the Firmament of *Heaven*; whereas there is no *Natural Philosopher* but knows, that the *fix'd Stars* are equal to the *Sun* both in Bigness and Brightness.

III. *The Prejudices of* Childhood *hinder us after we are come to the use of Reason.*

Now these Errors are not only to be found in *Infancy*, but in process of Time they get strength, and become so rooted into Mens *Minds*, that they accompany them the whole course of their Lives. Hence it is that we meet with some that have the Gravity of *Old Age*, but at the same time are subject to the Weakness of *Children*. Which Mistakes arise from hence, because they suppose that the Opinions they have taken in during their *Childhood* and *Youth*, are inborn *Notions*, and common to all Mankind. Whereas they ought to consider, that they have admitted many things for *Truth*, without any sufficient Examination, and that therefore they ought rather to think them to be *false* than *true*. But the case is the same with them, as with those that have Sore-Eyes, who delight in *Darkness* and are offended with the *Light*; for they hug their *Errors*, and are loath to part with them.

IV. *Some only give credit to the report of their Senses.*

Some of the *Philosophers* of Old were not free from this Weakness, who asserted the *Sun* not to be above two Foot over, because they had never seen it greater. And it was to no purpose to persuade them by *Astronomical Arguments*, that it was not only far greater than so, but many times bigger than the *Earth*; because their preconceived Opinion was so rooted in them, that they could no otherwise apprehend it. Thus likewise when they were *Children*, and thought of nothing but what was Bodily, they thought nothing could be Corporeal, but what must be Sensible also, from which Prejudice they concluded afterwards, that there could be no *Insensible parts*. If one argues against this, that such Parts must of necessity be admitted to avoid a *Vacuum* in Nature, and for the Explication of many *Natural Appearances*; they have nothing else to answer, but that they cannot see them, and that they are not certain of any thing, except it fall under their *Senses*. From the same Prejudice it is, that they conceive all *Immaterial things* after the manner of things Sensible, and apprehend the *Mind of Man*, not as a *Thinking Being*, void of all Matter, but like a *Wind* or *Fire* infus'd into the Grosser parts of the *Body*, to which tho' they attribute the Name of *Spirit*, yet conceive of it under a Bodily likeness. Wherefore also they greedily embrace that Maxim of *Aristotle*, That *there is nothing in the Understanding, which was not first in the Senses*.

V. *And therefore assert, that God cannot be known but by sensible things.*

If we go further and tell these Men, That *God* doth not fall under any of our *Senses*, and therefore cannot be conceiv'd of under any sensible Form; yet by reason of their Inveterate Custom of *false Judging*, they rather chuse to frame several Distinctions, than to forsake their beloved Maxim, tho' only supported by *Childish Prejudices*; saying, That *God* is made manifest unto us by his *Effects*, or by some *Signs*, as by his *Creatures* and *Words* that signifie his *Nature* unto us. Which Prejudices do really divert the *Mind* from the *knowledge* of *Things*, and hinder it from ever attaining the true way of *Philosophizing*. For how can we think ever to attain it, if we always Judge after the manner of *Children*, and only believe those Things to be true, which through the *Senses* are conveigh'd to us? How can we ever think to make a right use of our *Reason*, if we only take those things to be good which are of Profit to us? If we think the *Air*, *Cold* and *Heat* to be nothing, when they do not sensibly affect us? Or, if we judge the *World* to end where our Sight is bounded, and innumerable other Things, which the Love of Antiquity, or the Authority of some Men have induced us to maintain.

VI. *Education and Custom lead us into Error.*

Now all these *Prejudices* are much increased, by those Words which are in common use, and which the illiterate Multitude hath imposed; as having more reference to the Use of the *Body*, than to the Contemplation of Things. Moreover *Education*, *Custom*, and *Converse* with other Men, the *Authority* of those we reverence, the *Consent* of Mankind, and many other such like, hinder us from scanning of Things purely and sincerely, and lead us into many Errors. What hath once been prov'd to us, or believed by us, we scarcely ever reject, insomuch that the *Vices* and *Affections* of our Will, do communicate their contagion to our Mind and Understanding.

VII. *Hard and difficult things are apt to please us more than things easie and obvious.*

Sometimes it happens on the contrary, that those Things which are clear and perspicuous of themselves, are suspected by us; because Things obscure and liable to dispute do more affect us. Thus we are apt to contemn Experiments, as being too despicable, and our *Mind* desirous to take a higher flight, and hating to be confin'd to the narrow bounds of an *Experiment*, chooseth rather to please it self with some General Notions, which for the most part are of no use at all; and so prefer swelling *Words* of Vanity, which fill the Fancy, before things real and solid. Hence it is, that the High-flown Expressions of the *Platonists* and *Chymists* do allure so many. Besides, we are apt to suffer our selves to be deceived by the respect we have for *Antiquity* as well as by our affectation of *Novelty*, as if a thing were therefore true, because it is either New or Old, as if True things had not always been so, as if in this old Age of the *World* we might not expect the discovery of many Things heretofore unknown, or as if we might not look for a riper Judgment, and more knowledge from Old Men, that daily Experience many things, than from others.

VIII. *We must first examin our Opinions, before we lend an assent to them.*

We are therefore to examine our *Opinions* by the Standard of *Reason*, before we give our assent to them; and must judge those things to be True, not which the *Authority* of the Ancients, or the *Judgment* of most Men doth approve, but which are evidenc'd to be so by the strength of *Reason*. For the obtaining of which the following *Rules* will be helpful to us, if we seriously mind them, and judge of Things propos'd to us, according to their direction.

CHAP. II.

Some Rules for the Attainment of Truth.

The First Rule.

We are to admit of nothing that involves any thing of Doubtfulness.

I. *Doubts hinder us from the attaining of Truth.*

THe Light of *Nature* assures us, that *Doubting* is an obstacle to *Science*; and that we can never attain it, as long as the thing we apprehend is not clearly and distinctly represented to our *Mind*. Wherefore we shall do well to esteem all *Doubtful Matters*, as if they were false, and despise them as hurtful *Images*, that are apt to lead us into Error. For seeing that all Things that are built on any *Principle*, derive all their Certainty from the same; if that *Principle* be weak and tottering, the superstructure must partake of the same Conditions.

II. *Yet must not this be too scrupulously observ'd in matters of daily business.*

But tho' this *Rule* be of use for the clear knowing of Things, yet must we not extend the same to Human Prudence, or the use of Common Life. *For it often happens, that we are forced to embrace what is least suspected; and to esteem that as Good, which doth least hurt another.* Thus the Laws wink at the Toleration of *Whores*, to prevent the greater Evils of *Rapes* and *Adultery*. Thus in Human Actions we are forc'd to choose that which seems probable, and to leave that which is more true. But in the Search of *Truth*, whatsoever hath the least Doubt in it, is to be rejected, and is no more to be regarded than if it were a thing feigned at pleasure. *For whatsoever doth not conduce to the attaining of* Truth, *must be look'd upon as a straying from it.*

III. *The rejecting of Doubtful, is a help to the attainment of Science.*

Wherefore he that would *Philosophize* in good earnest, must rid himself of all the Prejudices of his Infancy, forasmuch as they have crept into our *Minds*, without any foregoing Examination of *Reason*; and therefore are to be consider'd by us, as *false*, rather than *doubtful*. Hence it is that our *Philosopher* saith, *I have now for some years consider'd how many false things from my first* Childhood, *I have taken up for True; and how uncertain and doubtful all those things are I have built upon them; and therefore that it were best once in my life to overthrow them all; and to begin again from the first Foundations, if ever I would desire to establish any thing in Sciences that might be firm and lasting.*

IV. *There is no danger in this Doubting of things.*

Neither need we to fear, lest by taking all things for *false*, we should be in danger of being deceived; because this Doubting is only indulg'd for to attain to greater certainty, and that we may the more evidently distinguish *Falshood* from *Truth*. For whatsoever includes the least Doubt, destroys *Science*, as hath been said, and leads to *Error* as well as *Falshood* it self. Is it not lawful for the *Philosophers* to suppose many Things, that by this means they may find out what is most certain and easiest to be known? Thus the *Astronomers* imagin an *Æquator*, a *Zodiack*, and other *Circles* in the Heavens, that by the help thereof they may the more accurately describe the *Sun*'s Course. *Geometricians* also make use of the like Suppositions, when with new *Points* they measure *Lines*, and to the *Figures* given add other Lines. Wherefore it will be of advantage to those who search after *Truth*, to reject all things that occur to them, and to give their assent to those things only, which they understand to be Certain and Evident.

V. *The way of Doubting approved by* Aristotle.

This way of Proceeding in the attainment of *Sciences* is not peculiar to *Descartes*, for *Aristotle* himself hath followed the same, as may be seen in the *First Chapter* of his *Third Book* of *Metaphysicks*, which bears this Title; *Of the Usefulness of Doubting, and what things we ought first to doubt of:* Where he speaks thus; *In order to our attaining the Science we desire, it is in the first place needful to take a view of those things we are first to doubt of; now such are all those things about which Men are divided in their Opinions, with other things besides. It being an Industry well worthy the pains of those who desire Knowledge, to Doubt aright.* Wherefore we need not think strange, that our Philosopher begins his Philosophy with *Dubitation*, and requires us to reject all those Opinions wherein we meet with the least cause of Doubting, that by this means we may at last find out a true and unshaken Principle.

The Second Rule of Truth.

We are not to rely too much on our Senses.

I. *The Senses are subject to mistake on several accounts: As,*

Forasmuch as our *Senses* are deceivable, and we are frequently imposed on by them, Common Reason will tell us, that we must not overmuch trust to them, but rather suspect whatsoever they offer to us; for it is a sign of *Rashness* and *Imprudence*, to trust them that have once deceived us. Now how apt our *Senses* are to deceive us, daily Experience teacheth. For it happens often, and for divers Reasons, that things appear otherwise to our *Senses* than they are indeed.

First, By reason of their *Distance*, as when the Object is so far from us, that all the *Reflex Rays* proceeding from it, cannot whole and entire reach us: As for Example, The *Sun*, and a *Square Tower* at a distance seem less, and otherwise figured than indeed they are.

Secondly, By reason of the *Medium*, as when the *Rays* are variously refracted in the same: Thus a *Stick* and other Bodies seen through the *Water*, appear Crooked.

Thirdly, By reason of the *Surface*, which as it appears to the *Senses*, doth not represent the Essential position of the Parts of the *Body* whose Surface it is: Thus the outside or superficies of a *Bean*, which falls under our Senses, represents a Figure very unlike that of a *Plant*; whereas the *Microscope* discovers to us, That it hath the same Essential disposition of Parts with the whole *Plant*, whose Seed it is. So likewise the *Spawn* of *Frogs* appears to our Eye, to be an Unorganical Mass; whereas the said *Magnifying Glasses* assure us, that they are distinguish'd into several Members. And the same may be proved by many more Instances. Neither is it to be doubted, but that there be many *Bodies*; the Essential Constitution of whose Parts were never yet discovered to us by any of our *Senses*, which if they were, we should judge otherwise of them, than the Vulgar do.

Fourthly, By reason of the *Impression* made upon our *Senses*, when the *Vibration* (caus'd by the Object) doth for some time continue; As when the *Sun* appears to our Eye after it is shut; or as when a *Torch* is with great swiftness turn'd round, whereby a *fiery Circle* is represented to the Eye, tho' the *Torch* be not in all the Points of the *Circle*.

Or when the Impression proceeds from something else besides the Objects; as in *Dreams* and strong *Imaginations*, *&c.* or when an Angel (by moving the Organ of *Sight*) doth represent himself to us.

II. *This Rule is not to be extended to the Actions of Life.*

Which deception doth not only frequently happen to our *External Senses*, but even our *Internal Sense* is not free from it. Thus we see, that those who are troubled with the *Vertigo*, think that all the Bodies about them turn round, and suppose the Air to be darkned: Thus likewise *Drunken* Men see all things double. Now when it is said, that we are not to trust the Testimony of our *Senses*, but are to look upon them as if they were false; we are to observe that this *Rule* must not be transferr'd by us to the *Actions* of *Life*. For it is contrary to Reason, not to trust our *Senses* in the conduct of our *Lives*: For by this means we shall make our selves guilty of the Folly of those *Scepticks*, who out of a foolish distrust of their *Senses* were ready to expose themselves to eminent danger of their *Lives*, but that their Friends hindred them. Tho' indeed, when the Question is about the bare knowledge of Things, then it is on the other hand every whit as Irrational, not to reject whatsoever is in the least doubtful, because things that are so, are as opposite to the attaining of *Science*, as those which are altogether false or unknown.

III. *Our Senses having once deceived us, are to be look'd upon as always liable to deceive us.*

And tho' our *Senses* sometimes may represent to us Things as they are, yet must not this hinder us from suspecting their Evidence: For having once deceiv'd us, they may always deceive us; or how can we rely upon them, which have once led us into Error? And therefore *Plato* in his *Phædrus* tells us, *That Men who are desirous of* Science, *know, that* Philosophy *having once undertaken the Care of their* Mind, *does by little and little inform it, and loose it of its Bands; representing to it, how deceiving the Judgment of the* Eyes, Ears, *and other Senses are, perswading it to leave them, as far as absolute Necessity does not oblige us to close with them, and to recall it self, and to recollect within it self, without giving credit to any thing besides it self.*

IV. *Our Senses are of no use, for the discerning of the Objects of Sciences.*

For our *Senses* are not given us by Nature for the searching out of *Truth*, or to contemplate the *Principles* of Things: Because if we take an exact view of the Objects of *Sciences*, we shall find that most of those things that occur to our Mind, are not represented by any Bodily Figure: As for Example, All the Objects of *Metaphysicks* and *Natural Divinity*, which admit nothing of any *Corporeal Form*. For we have in our Mind an *Idea* of *God* himself, whose Authority we believe, and whose Dominion over all we firmly are perswaded of. For how could we demonstrate so many things concerning *God*, if his *Idea* were not inherent in us? But do any of our *Senses* hand this Knowledge of God to us? What Phantasm manifests to us the General Notions of *Entity*, *Unity*, *Truth* and *Goodness*? What Species represents to us the Idea of *Angels*, or our own *Soul*, since there is nothing like them in the whole Universe of *Material Beings*, and with which they have not any thing in common, save only the Name of *Substance*? Wherefore it is very absurd to go about to derive all Knowledge and Idea's from the *Senses*. And if from these we pass to *Physical* or *Natural Beings*, we shall find that not only the Beginning of them are hid from our *Senses*; but that not so much as their Figures are represented to us, such as they are indeed, but very different from what our *Souls* upon enquiry find them to be. Do not we reach the Nature even of those thing that most strongly affect our Senses, as *Light*, *Heat* and *Cold*, far better by our *Understanding* than by *Sense*? And are not many times the most sensible Objects the least perceptible to our Intellectual Sight?

V. *To what end our Senses are given us.*

The *Senses* therefore are bestowed upon us by Nature to discover to us, who consist of *Soul* and *Body*, what things are good or hurtful for us; and we pervert the order of *Nature* when we put them to another use, and apply them to the knowledge of *Truth*, which are only design'd for the Preservation of the Compound. Wherefore also this may be reckon'd amongst the chief Causes of Error, wherewith we are possest from our Childhood, that we are apt to judge of things, not as they are in themselves, but only as they gratifie or offend the *Body*.

If

VI. *Objection, That the Senses inform us of many things.*

If any one object, That we attain to the knowledge of many Things by our *Senses*; that by our *Feeling* we perceive Bodies, as *Stones*, *Wood* and other things that come within the reach of our Hands; by our *Sight*, things at a distance, as the *Sun*, *Moon*, *Stars*, *Heaven*, *&c.* and that without them we could never have any knowledge of these Objects.

VII. *The Senses do only accidentally discover things to us.*

To this I answer, that I do not wholly reject the Service of the Senses; but only assert, that they are insufficient and inadequate for the knowledge of *Truth*. For tho' the *Senses* may inform us that *Bodies* exist; yet cannot they discover to us what those *Bodies* are, or what their Nature and Essence is; because this is not necessary for the Conservation of the Compound. And if ever they inform us what they are in themselves, this is only sometimes and by accident. For seeing that our *Senses* cannot perceive Corporeal things but through the intervening *Medium*, it is evident, that according as that is variously disposed, so their Judgment concerning them must vary accordingly. Thus we see that for this Reason the *Stars* appear to us of various Colours, sometimes more red, and sometimes paler, according as the *Air* that comes between our Sight and them is clearer or thicker. And therefore, as *Lucretius* saith, *Lib.* 4. *we have great reason to suspect, that the Inferences we fetch from our fallible* Senses, *must be false and deceivable.*

VIII. *How our Senses are said to be deceitful.*

But when we say, that our *Senses* are deceitful or subject to Mistake; we must not so understand this, as if there were an Error in the *Motion* it self, or in the affecting of the *Corporeal Organ*, because that is done by a kind of Natural Necessity; but because the *Mind* of Man, by reason of its intimate Union with the *Body*, doth from that Affection or Motion take occasion, to apprehend or judge of the thing amiss. And forasmuch as this precipitancy and inconsiderateness in Judging is commonly attributed to the *Senses*, and not to the *Mind*, the *Senses* are said to deceive us, because our *Judgments* follow those Perceptions that are attributed to our *Senses*.

The Third Rule of Truth.

Whatsoever we Perceive, we perceive with our Minds.

I. *Our Understanding is the searcher out of Truth.*

Forasmuch as *Divine Revelation*, or *Human Tradition*, have no admittance in *Philosophy*, and that according to the fore-going *Rule*, we are to suspect whatsoever comes from the *Senses*; it remains that the *Understanding* alone must be the sole searcher out of *Truth*, whose property it is to investigate the Natures of Things, and so judge of them according to the Attributes that are found in them.

II. *Not only common or general Natures, but particular also, are known by the Understanding.*

Neither is this only to be understood concerning *Essences*, or *Abstract Natures*, as the *Metaphysicians* call them; but of every particular Object that strikes our Senses. For it is the *Mind* alone which *sees*, *hears* and *feels* through the Organs. For *Gold*, by Example, *that is newly dug out of the Mine, doth at first sight look like* Earth, *and before Coagulation is more like* Sand, *than a Metal: But after it is once cast into the Furnace, it loseth the form of* Earth, *its parts run together and shine like a* Star; *and what before lookt so much like* Dirt, *now delights and pleaseth all Men.* So that my Senses at first perceived nothing of the Nature of *Gold*; for whatsoever my Sight or Touch before discovered of it, is quite changed, the substance of *Gold* still remaining.

III. *'Tis by the Mind alone we know Objects.*

Wherefore it is the *Mind* alone that knows the Nature of *Gold*, neither can we discern what it is, but by our Faculty of *Judgment*. We make no scruple to say, we see a *Man*, when we see one walking in the Market, tho' indeed we see nothing but his Cloaths, under which possibly a meer Machin might be conceal'd. It is plain therefore, that we do not make this Judgment by our outward Eyes, but by our *Faculty of Judging*, which is Internal.

IV. *It is by our Understanding alone we know that there are Pores in our Body.*

To explain this by another Example; Our *Skin* appears to us to be a continuous Body, without any Holes in it that our Eyes can perceive; but yet our *Mind*, by the Transpiring Sweat, concludes there must be *Pores* in it, by this way of Reasoning: *The Moisture that is sent forth through my* Skin, *is a Body; now a Body cannot pass from one place to another without passing through a* Medium; *wherefore it must follow that my* Skin *is like a* Sieve *or* Strainer; that is, of such a Texture, as to be full of little Holes, through which the Moisture may pass.

V. *Many things cannot be discovered to us by our Senses.*

This *Rule* is so certain, that whosoever denies it will never be able to attain any thing distinctly or by Reflex knowledge, which is necessary to Science. And though some relying upon *Aristotle*, suppose all our *Idea's* to arise from our Senses, and *that there is nothing in our* Understanding, *which was not first entertain'd in our* Senses; yet it is evident, that this Opinion, tho' common, is directly opposite to *Divinity* and true *Philosophy*. For first, there is nothing we perceive so distinctly as our *Thoughts*, neither is there any Proposition that shews it self to our *Mind* with fuller Evidence than this, *I think therefore I am*; and yet neither of these Idea's of *Cogitation*, or *Being*, were ever discover'd to us by any Sense: Not by our *Sight* or *Hearing*, as being without Colour or Sound; nor by any other of the Senses, because they have no Sensible qualities, or if they think they have, let them declare them. But if they cannot satisfie us herein, what remains but for them to own our Assertion, That the Notions of *Thinking* and *Being* do not depend on the Senses, but that our *Mind* forms them by its own proper virtue or efficacy; tho' we do not deny but the *Mind* may be sometime excited to the forming of them by outward things that affect our Senses.

VI. *GOD cannot be represented by any outward Appearance.*

Who can believe that the Idea of *GOD*, which is in us, doth proceed from our *Senses?* Or shall we think so, because some Ignorant persons conceive him under the form of a *Venerable Old Man*, as *Gassendus* tells us. But this is to confound and deprave *Idea's*, when we go about to imagin Spiritual things under a Bodily form: And he is in as great a Mistake, who would imagin Immaterial Substances as he is, who would hear *Colours* and see *Sounds*. It is apparently false therefore, that the Notions which we have of Spiritual things do proceed from the Senses; nay, what is more, it is certain that no Representations of Material things come to our *Mind*, save only occasionally; that is, forasmuch as the *Motions* made in our *Brains* (for nothing but *Motions* can affect our Senses) do give the *Soul* occasion of forming several Notions, which without them it would not do. Which *Notions* are also

wholly

wholly diſtinct from thoſe Motions and Repreſentations, which are in the *Brain* or *Senſes*. For they who are *Blind* and *Deaf*, tho' they receive no Species or Sounds from the *Objects*, yet are not without the Idea's of *Cogitations*, eſpecially when they reflect upon the things they are thinking of.

VII. *How the Idea of Immaterial things are ſaid to be inborn in us.*

Wherefore ſeeing we can perceive nothing by our *Senſe* or *Imagination* but what is Material, it follows that the Idea's of all other things that are not Material, are inborn with us; for by what other means could they be convey'd to our *Minds?* Yet when I aſſert that theſe *Notions* were put into the Mind in its firſt beginning, I would not be ſo underſtood, as if they did actually exiſt there, and were continually obvious to our *Thoughts*; but only that God hath vouchſafed a Faculty to our *Mind*, of exciting and producing ſuch Notions; as ſhall be more largely treated in the *Ninth Part*, concerning the *Mind of Man.*

The Fourth Rule of Truth.

That is True which we know clearly and diſtinctly.

I. Cogitation *is the Rule of Truth.*

Wherefore there can be no more certain Rule of *Truth* than our *Cogitation*, ſo that the ſame be but diſtinct and clear, and without the leaſt Doubtfulneſs; becauſe it is impoſſible for us to miſtake, as long as the *Judgments* we frame of any thing do correſpond to our *Perceptions*. It being an undoubted Axiom with us, *That our Knowing of a thing is a ſure Argument of its Eſſence.* Not as if becauſe we perceive the Eſſence of any thing, that from thence we ſhould preſently conclude that it exiſts: But becauſe it is impoſſible that any thing which is clearly known by us, ſhould not be ſuch as it is known by us; that is, the thing muſt exiſt, if its Exiſtence be perceived by us, or muſt be of this or the other Nature, if its Nature be repreſented to our Mind.

II. *From this Principle the Exiſtence of GOD is proved.*

From this Principle *Deſcartes* evidently demonſtrates the Exiſtence of GOD. *For if upon the account only* (ſaith he) *that I have ſuch an Idea in my Mind, it doth follow that whatſoever I perceive clearly and diſtinctly to belong to it, doth really do ſo; may I not from hence fetch an Argument for the* Exiſtence of God? *Yes ſurely: For the Idea of* GOD, *repreſents a Being abſolutely Perfect: Now it is every whit as repugnant to a Being abſolutely Perfect, to want any Perfection, as for Example,* Exiſtence, *as it is for a Triangle not to have three Angles equal to two right ones.*

III. *Provided it be clear and diſtinct.*

I ſaid in the Beginning, provided our *Cogitation* be clear and diſtinct; becauſe no Certainty can be expected from a thing, whoſe Knowledge involves the leaſt degree of Obſcurity or Confuſion. And therefore *Plato* in his *Timæus* tells us, That *when we diſcourſe of a firm, ſtable, and intelligible thing, our Reaſons alſo muſt be Stable, immutable, and inſuperable.* For ſeeing that clear and diſtinct *Knowledge* is ſomething which we our ſelves are not the Authors of, it muſt follow that GOD is the Author of the Connexion there is between clear and diſtinct *Knowledge*, and the aſſent which the *Will* infallibly yields to it. So that it is abſolutely impoſſible, that what I thus apprehend to be true, ſhould be falſe: As for Example, When I perceive *Two and Four to be Six*; *that in a Triangle there be three Angles equal to two Right ones*; and the like. It is impoſſible theſe ſhould be falſe; not becauſe they are ſo conceived by me, but becauſe except they were true, I could never have clearly or diſtinctly perceiv'd them.

IV. *It is impoſſible that what we clearly and diſtinctly perceive ſhould be falſe.*

For if any thing thus apprehended by me could be falſe, this would deſtroy all Human Knowledge; neither could any of us be ſure of any *Truth*, no not of the *Exiſtence* of *God*, nor of any of thoſe things which are related to us in Holy Writ: Since it might ſtill be objected to us, that thoſe very things may be falſe which we moſt clearly and diſtinctly perceive.

V. *Knowledge ariſing from the Senſes is Doubtful.*

But we cannot attain the ſame certainty of *Knowledge* in thoſe things which are only perceived by the Senſes, foraſmuch as they are liable to Miſtake: As when a Man, whoſe Eyes are deprav'd by a ſuffuſion of *Gall*, takes all things he ſees to be Yellow; and perceives the ſame as clearly, as thoſe who ſee the true Colour of every thing.

VI. *The certainty of our Perception depends on the* Understanding.

It remains therefore, that all the Certainty we have, is only of thoſe things which we apprehend with our *Underſtanding*. Neither doth it deſtroy this Rule, that ſome tell us they have ſometimes been deceived even in thoſe things which they thought to be moſt true, and which they were confident they had clearly perceived. For this happens to them, becauſe they derive the *clearneſs* of their Cogitation, not from their *Mind*, but from their *Senſes*, or from ſome preconceived Opinion: For we can never doubt of thoſe things which we clearly and diſtinctly know. As will be evident to thoſe who by frequent Meditation, and earneſt Study, have acquir'd a habit of Judging between a clear and dark Conception.

VII. *The foreſaid Rule is not to be extended to Believers.*

We are alſo to take Notice, that when we aſſert *that to be true which is evidently and diſtinctly known by us*; and therefore that we are not to give our Aſſent to things that are not ſo known by us, this is not to be underſtood of Matters of *Faith*; foraſmuch as they are not accompanied with any ſuch *Evidence*, neither have we any clear Notions of them, as we have of the Subjects of *Natural Sciences*. For there is a vaſt difference betwixt the *Myſteries of Faith* and *Natural things*, becauſe in theſe *Evidence*, but in the former *Authority* commands our Aſſent. That a Man may be a Believer, he muſt believe without Evidence; but to be a *Philoſopher*, he muſt have a clear and diſtinct Perception.

VIII. *How a man may be certain that he clearly knows a thing.*

If any Man demand, How he may be ſure of his knowing a thing clearly and diſtinctly? I anſwer; If he follow the Order preſcribed by *right Reaſon*; if he do not precipitate his *Judgment*, before he be enlighted with the *Truth* of Evident Perception. So that the Judgment of our *Underſtanding* muſt always go before, as it does when we never aſſert or deny any thing, except it be of Things we have clearly and diſtinctly perceived; that is, when our *Judgment* is exactly conform to our *Perception*. For it is not a ſufficient Argument for us to embrace any Opinion, becauſe there is Truth in it, except the ſame do appear to us; ſo as that our *Perception* may be the Rule and Line of *Truth* to us.

To the Right — Worshipfull S.r —
Thomas Mompesson — of Bathampton —
in Wilt-Shire — Knight —
This Plate is humbly — Dedicated by Rich: Blome —

A Tranſition, containing the ſubſtance of what hereafter follows, concerning the clear and diſtinct Perception of Things.

IX. *The Order or Series of things to be handled in the firſt Part of Logick.* Foraſmuch as it hath been made out, that the clear and diſtinct Perception of the *Mind*, is the one and only Rule for the attaining of *Truth*; it remains now that I ſhew, how the *Mind* may arrive to the ſame: Which that I may the more eaſily accompliſh, the following Points are heedfully to be minded.

Firſt, What *Cogitation* it ſelf, or *Perception* is, and what be the Modes of it.

Secondly, What be the *Objects* of our Perceptions, whether Univerſal or Singular.

Thirdly, How our *Mind* may arrive to the knowledge or Perception of Things, with reſpect had to the *Things* that are to be known; ſuch as are the *Common Attributes*, *Cauſes*, *Effects*, *Subjects*, *Adjuncts*, *&c.*

Fourthly, Whence the clearneſs and diſtinction of *Idea's* do depend, as likewiſe the Agreement and Diſagreement of Things.

CHAP. III.

Concerning the various Modes of Perception; viz. *Pure Intellection*, *Imagination and Senſe.*

I. *We muſt never give our Judgment of a thing unknown.* FOraſmuch as *Natural Inſtinct* teacheth us never to judge of a Thing unknown; and ſince nothing is known to us but what our *Mind* clearly perceives, we will firſt treat of the Nature of *Cogitation*, before we examine that of *Simple Notions*, to the end we may be able to diſcern what things are confuſedly, and what diſtinctly apprehended by us.

II. *What is to be underſtood by Perception.* By *COGITATION* in General, I underſtand all thoſe things which we experience in our Selves, and whereof we are Conſcious: Which Deſcription comprehends all the operations of our *Underſtanding*, *Will*, *Imagination* and *Senſes*; for to *Underſtand*, to *Will*, and to *Imagine*, is nothing elſe but to repreſent to our ſelves the thing whereof we have an Idea. And accordingly from theſe various ways of Perceiving, is deduc'd that firſt *Truth*, which we meet with in an orderly way of Philoſophizing: For becauſe I Think, that is, becauſe I Perceive, Imagine and Feel, it neceſſarily follows that I exiſt: And therefore that Propoſition, *I Think, therefore I am*, is of undoubted Truth; ſince it is impoſſible that I ſhould Think, and yet be Nothing. And ſo in like manner when I ſay, *I walk*, *I write*. Not as if *Walking* or *Writing*, which are perform'd by the Organs of the outward *Senſes*, did infer my Exiſtence, becauſe I may think I perform them in a Dream; but only becauſe the Conſciouſneſs which is in my Mind, of my *Walking* and *Writing*, could not be there without I did exiſt.

III. *Our own Exiſtence is before any other Truth.* I have ſaid, that this Propoſition, *I Think, therefore I am*, is the firſt Truth we meet with in our orderly Philoſophizing; becauſe the Exiſtence of our own *Soul*, which we gather from our *Cogitation*, is more known to us than the Exiſtence of any other Beings. For the *Thinking Mind*, which is underſtood by this word, *I*, doth know it ſelf before it knows any thing elſe; and the word, *am*, which imports the firſt Perſon, is before the word, *is*, which is only applied to the Third Perſon. For who is there who doth not firſt Think of himſelf as of a particular Being, before he doth of Man in general? It is natural to our Mind to think of a *ſingular* Being, which is propoſed to our Senſe or Underſtanding, before we think of a Being taken in *general*; and therefore this Propoſition may well be eſteem'd by us as a firſt Principle, ſince from this proof of our own Exiſtence, we confirm the Exiſtence of *God*, of *Material things*, and in a word, of all *Creatures* whatſoever.

IV. *It is impoſſible for the ſame thing to be, and not to be, is not the firſt Principle.* I am not ignorant, that this is commonly taken to be the firſt Principle, *It is impoſſible for the ſame thing to be, and not to be.* But I ſee not how this Propoſition can be of any uſe to us, in order to the attaining of Knowledge, ſince it doth not prove the Exiſtence of any thing, and doth ſeem to ſuppoſe that ſomething is, which ought to have been prov'd before. For it preſuppoſeth its Diviſion into *Ens* and *Non Ens*, or *Being* and *Not Being*; whence that Maxim is derived, *Every thing either is, or is not.* But our Principle, *I who think do exiſt*, preſuppoſeth nothing at all; and when all other things are liable to be queſtion'd and doubted of, yet it is abſolutely impoſſible, that *I who think* ſhonld not be ſomething; that is, that I ſhould not *exiſt*.

V. *Three Species or kinds of Perception.* There be Three Species of *Cogitation*; *Pure Intellection*, *Imagination* and *Senſe*: For by theſe Three Modes or Ways the Mind of Man *perceives* or *thinks*.

VI. *Pure Intellect.* The Mind is ſaid to *Underſtand purely*, when by her ſelf alone, and by turning into her ſelf, ſhe perceives a thing only by attending to the *Idea* ſhe hath of it; or when ſhe perceives a thing, whereof there is no Footſtep in the Brain. And in this manner the *Soul* apprehends things *Spiritual* and *Univerſal*, *Common Notions*, the *Idea of Perfection*, and finally, all her own *Thoughts*: Or likewiſe when it underſtands *Material things*, *Extenſion* with its Affections: For it is with the *Underſtanding* alone, that a Perfect Circle, a Thouſand Corner'd Figure, &c. can be conceived.

VII. *Imagination.* The Mind is ſaid to *Imagin*, when it applies its Knowing faculty to the Body, as intimately preſent with it; or when it applies it ſelf not to the Thing it ſelf, which is preſent to the outward Senſe, but to the Phantaſm impreſs'd by it in the Brain: As when it perceives a *Figure*, a *Circle*, a *Triangle*, the *Stars*, a *Machin*, *&c.* And theſe Perceptions are called *Imaginations*, becauſe the Mind by repreſenting theſe Things to her ſelf, doth form Images in the Brain; and foraſmuch as it cannot frame any Images of *Spiritual things*, it follows that neither can they be imagined.

VIII. *Senſe.* Laſtly, The Mind of Man, by *Senſe*, only perceives ſenſible Objects and things that are more obvious, as being preſent, and affecting the outward Organs. Thus it perceives *Steeples*, *Fields*, *Animals*, *&c.* and theſe Perceptions are called *Senſations*.

'Tis by theſe Three ways only that the *Mind* of Man perceives things: For whatſoever is repreſented to it is either *Spiritual* or *Material*; if Spiritual, it can be apprehended by the *Underſtanding* only; if Material, then it is preſent or abſent: If abſent, the Soul repreſents it to it ſelf by the *Imagination*; if preſent, it perceives it by Impreſſions made on the *Senſes*. So that there are only Three ways by which the *Soul* apprehends any

thing, *viz.* by *Pure Intellect*, *Imagination*, or *Sense*.

IX. *The Object of the* Understanding *is more common or general, than the Object of* Imagination.

Hence it is manifest, that the Object of the *Understanding* is of a larger extent, than the Object of *Imagination*: For by our *Understanding* we do not only conceive the Nature of *Spirits* and of a *Body* in general; but also the Proprieties of particular *Bodies*, which cannot be discovered by the *Senses*, nor by the *Imagination* neither, being only perceivable by the *Intellect*. Thus, tho' the *Understanding* perceives that the Diagonal Line of a Square, is to that degree incommensurable with the side of it, that tho' a Division into infinite parts should be supposed, yet we could never come to a Particle that might be the common Measure of them both: Nevertheless this Truth can never be reached by the *Imagination*, but rather seems repugnant to it: Because we can imagin nothing but some particular determinate Body, the *Species* whereof is impress on our *Brain*, as hath been said.

X. *No Corporeal Species are required to* Pure Intellection

And tho' the *Mind* doth sometimes contemplate Material and Corporeal things; yet it doth never admit any Corporeal Species, which are only received into the *Brain*, on which the Mind doth not depend in its Operations. For in order to Pure Intellection, we have no need of the *Brain*, but only for Sensation or Imagination. Whence it follows, that we can Understand many things which we cannot Imagin. I perceive by the Light of Nature *that GOD exists*, tho' I cannot represent him to my self by any Image. So likewise I have a clear perception of a *Chiliogon* or Thousand Corner'd Body; which yet I cannot imagin, that is, presentially behold its Thousand Sides; because the vast number of them confounds the Imagination. Now that I have a clear Perception of a Thousand Corner'd Body appears, because I can demonstrate many things concerning it, as that all its Angles together are equal to 1996 right Angles; which could not be, if I had only a confus'd Conception of it.

XI. Truth *or* Falshood *is not in the* Understanding.

It is to be noted, that no Error can be in the *Understanding* or *Imagination*, as long as they continue purely in the Contemplation of things: For if the *Idea* we have of those things it represents be conform with them, it is true; and if it disagree, then is it no representation of them. Moreover, since *Falshood* or *Error* consists in our attributing to a Subject what doth not belong to it, or denying of it what doth, it is plain that since the *Understanding* or *Imagination* do neither affirm nor deny, there can be no Falshood in them. Neither doth it contradict this, that the *Understanding* sometimes apprehends a False thing, as when it conceives a *Non Entity*, or Repugnant terms; as when the Mind conceives one that is no *Physician*, to be a *Physician*; in which Conception there can be no Falshood, because it truly conceives a Physician, tho' it apply that Conception to a wrong Subject.

XII. *But only in the* Will.

Wherefore all danger of Mistake is from our *Will*, when we give our Assent or Dissent to any thing we have not clearly perceived. Yet is not this to be understood, as if we did wilfully embrace Error; but because we do not restrain our Will sufficiently, but reach it forth to those things we do not perfectly understand. For it is another thing to be willing to be deceived, and to assent to those things in which *Falshood* is involved. And tho' few be so careless of themselves, as to desire to fall into *Error*, yet many are willing to give their Assent to those things in which Error is hid. For all Assent belongs to the *Will*, and is to be numbred amongst its Perceptions. For we see it is in our Power, tho' we perceive a thing, yet to suspend our Judgment, which restraint is the Determination of the *Will*; as likewise are *Desire*, *Aversion*, *Dubitation*, *&c.* For to the *Understanding* only belong *Pure Intellection*, *Imagination*, and *Sensation*.

XIII. *Sometimes the* Understanding *is the cause of* Error.

Since therefore *FALSHOOD* consists in the hasty Consent of the *Will*, it can by no means be imputed to the Intellect, because *Error* is not to be found in Perceptions, neither is it any way intelligible. Yet forasmuch as the *Understanding* commonly hath imperfect and confused Conceptions of things, it may be said to be an occasional Cause of our *Errors*. For as our Bodily Sight frequently leads us into Mistake, by representing Objects confusedly and imperfectly to us; so the *Understanding* having for the most part only a confused Perception of things, is a cause of the *Wills* falling into many Errors, by assenting to those things which are obscurely perceived by the *Understanding*.

CHAP. IV.

Of the Five Universals, or Predicables.

I. *There is a twofold Genus of* Beings *or* Entities.

WE are to suppose in the first Place, that there are *Beings* that have some reality in the Nature of things; and whose Attributes belong to them, whether the Understanding think so or not. Such are all *Substances*, and all *Attributes* or *Modes*, which denominate or vary them. Others again derive all the *Being* they have from the Intellect, on the operation whereof they so depend, as to vanish away upon its Cessation; as are all those which are called *Entia Rationis* (*Entities of Reason*) in the Schools.

II. Universals *are only Modes of Thinking.*

In the Second place we are to suppose, that nothing else is to be understood by the word *Universal*, than *that which agrees or is attributable to many things*; as the word *Substance*, which agrees to *Body* and *Spirit*. Wherefore all *Universals* are in our *Understanding*, and to speak properly, are only Modes of Thinking. For seeing all Natural things are Singular and distinct from each other, these *Universals* can have no Unity, but what our Understanding gives them. By Example, Two Lines if separately consider'd, cannot be said to agree in the Notion of a Line; because in the Conception of the one, is included the Negation of the other; wherefore to the end they may agree, we must first frame an Idea, which may serve us for the conceiving of all Lines that are like one another. Thus we put some Common Name upon all those things which are represented by an Idea, which Name is commonly called an *Universal*. And thus that famous Number of *Universals*, which hath rack'd so many Brains, may easily be salved.

III. *How* Universals *are formed.*

For Example, When we consider *Substance extended in Length, Breadth and Depth*, we frame an Idea of it, and call it the Idea of a *Body*, which afterwards is of use to us for the representing of all *Bodies* to our Mind. But seeing that many of them are distinguish'd by Species, as into *Living Bodies* and

and *Inanimate*, the Universal Name with relation to them is called *GENUS*. And since many of them differ only in Number; as *two Lines* of the same Magnitude, or two *Spherical Bodies*, we conceive an *Universal Idea*, which may represent all Lines that are measur'd by the same length, and all round Bodies contain'd within the same Surface; which *Idea*, with reference to them, as Numerically distinct, is called *SPECIES*, which is the Second *Universal*.

IV. *An* Universal *is considered as a* Whole, *or as a* Part.

Whence it follows, that one and the same *Universal*, with respect to the self-same Inferiour, may be considered either as a *Part*, or a *Whole:* For both the *Genus* in respect of the *Species*, and the *Species* in respect of the *Individuals*, is called a *WHOLE:* Thus *Animal* contains a Man and Beast. *Universals* also may be look'd upon as *Parts* of their Inferiours; so a *Man* is conceived as consisting of his *Genus* and *Difference*, that is, of an *Animal* and *Rationality*.

V. *The Original of* Difference *and* Proprium.

Neither hath the *Universal*, called *Difference*, any other Original; for when we consider that there is some difference between those things which we understand to be under the same *Genus*, or *Species*; we apprehend this variety under some common Notion, which we afterwards attribute to every Difference: As *Streightness* or *Rectitude*, whereby a Line is distinguish'd from one that is of another Figure. *Roundess*, whereby a Globe is distinguish'd from an Angular Body, &c. The *Predicable Proprium* is made, when we abstract one Notion from those that are peculiar to Things, and to which alone it agrees, and to no other: As *Partition* or *Divisibility*, and *Mobility* to a Body.

VI. *How the Universal called* Accident *is framed.*

Accident is framed by us, when after we have considered that many things may happen to, or be taken from Things, without the destruction of their Nature, we conceive the Idea of an *Entity* separable from them, which we call *Accident:* Which Name we make use of for the conceiving of all those things, which fortuitously happen to Things. And this is sufficient for the Explication of the Nature of *Universals*, especially to those who do not love to spend their time in vain Questions, or to confound the Notions of Things with fruitless Disputations.

VII. *The Partition of an* Universal *into five Species is a compleat Division.*

Now that this Division of an *Universal*, is *Adæquate*; that is, that there are neither more nor less Members of them than these Five, appears thus: The Idea which we frame in our Mind, and make use of to conceive many Things, either represents many Things distinguish'd by *Species*, and then it is *Genus*; or only Numerically distinct, and then it is *Species*; or it represents the Diversity, whereby many *Singulars* differ amongst themselves, and from other things, and then it is *Difference*; or the Property which belongs to them alone, and then it is *Proprium*; or some Contingency separable from their Essence, and this makes *Accident*, or the first and last *Predicable*.

VIII. *What* Predicables *are.*

These Five *Universals* are otherwise called *Prædicabilia*, *Predicables*, because they are *Modes of conceiving Universal Notions, which are affirmed of many things Truly, Properly, Naturally and Immediately.* They are said to be Modes of *Conceiving*, to intimate to us, that *Predicables* are Second Notions. For *Genus* is nothing in it self, but only with respect to those things with which it is compared; neither is there any *Species*, but with respect to the *Genus* to which it is subjected: neither can *Difference*, *Property* or *Accident* be conceived, but with relation to the Subjects they belong to.

CHAP. V.

Universals singly examin'd, as to their Nature, Properties, and Use.

I. *It is of use to take a review of these* Universals.

THough I have in the foregoing Chapter sufficiently made out, that there are Five *Universals* or *Predicables*, and that they are distinguish'd from each other by their Differences; yet I suppose it may be of use to give a more particular Explication of them, and set down how they are predicated of their Inferiours.

II. Genus *takes the first place amongst* Universals.

GENUS deserves the first place amongst *Universals*, both in order and dignity; for from it, as from their Head, the other Members depend and are maintain'd, and upon its ceasing perish and vanish. *Genus* therefore is *an Universal, which is predicated of many things distinct by Species, in the Question what it is.* As *Substance* is a Genus in respect of Substance extended, called a *Body*, and Substance *Thinking*, which is called a *Mind* or *Spirit*; and a *Quadrilateral* or *Square Figure*, is the Genus with respect to a *Parallelogram* and a *Trapezium.* To be predicated in the Question *What*, is when enquiry is made into the Nature of any thing, what it is. Thus when I enqnire what a *Body*, or what a *Mind* is, the Answer is properly made by their Genus, *viz. Substance*; and herein it differs from *Difference*, *Property*, and *Accident:* For tho' *Difference* be predicated by What, or Essentially, of those things whose Difference it is; yet it is not simply predicated so, but with the addition of *Quale*, which denotes the Form or Quality of a thing; and *Property* and *Accidents* are only predicated in *Quale*.

III. *What it is to be distinguish'd by* Species, *in the definition of* Genus

Wherefore in the foregoing Definition of *Genus*, to be distinguish'd by *Species*, is to differ Essentially, so as that some Essential part is found in the one and not in the other. Thus *Man* and *Beast* are said to be distinct by *Species*, because a Mind or Rational Soul is found in Man, which is not to be met with in a Beast.

IV. Genus *is twofold, one supream or the highest.*

Genus is twofold: One, the most General or Highest, which hath no *Genus* above it: As a Corporeal Being amongst extended Substances; and an Intellectual or Thinking Being, amongst those that are endow'd with Knowledge and Understanding.

V. *The other,* Subaltern.

The other *Genus* is called *Subaltern*, which intervenes betwixt the highest *Genus* and the lowest *Species*; or which with respect to the things above it is a *Species*, and with respect to the Inferiour is call'd *Genus*. Thus Living Thing, if it be referr'd to *Body*, under which it is sorted, is called a *Species*; but if to Animal, it is a *Genus*. And consequently, *Body* is a remote *Genus* of *Animal*, but Living Thing the nearest *Genus*.

VI. *What* Species *is, and how it is divided.*

The Second *Universal* is *SPECIES, which is predicated of many, only Numerically distinct in the Question, what a thing is.* By the last part of this Definition of *Species* we find it agrees with *Genus*, in that they both of them answer to the Question, what a Thing is: As when I ask, What is *Peter*? I answer aright by saying, that he is a Man.

Species

VII. *The Division of Species.* *Species* is twofold: The one called the Loweſt or moſt Special; the other, Middlemoſt or Intervening: The latter of which, tho' with reſpect to the Genus under which it ſtands, it be called *Species*; yet with reſpect to the Inferiours, of which it is predicated, it is a *Genus*: So Animal which is the *Species* of Living Thing, is the *Genus* in reſpect of *Man* or *Beaſt*.

VIII. *What the moſt Special, or Loweſt Species is.* The moſt Special, or the Loweſt Species, is that which is immediately predicated of *Individuals*: As Man of *Charles* and *James*; a Circle of all particular *Circles*: Which is therefore call'd the moſt Special or Loweſt Species, becauſe it hath no Species under it, but only *Individuals*. Wherefore alſo it is commonly defined, that which is predicated of Many, differing only Numerically in the Queſtion which asks, What a thing is?

IX. *How many ways* Difference *is to be underſtood.* The Third *Univerſal* is *DIFFERENCE*, which may be variouſly conſidered: Firſt, foraſmuch as it is the Conſtituent of *Species*; and then it may be defined to be *that whereby the Species doth exceed*, or is more worthy than the *Genus*: As Man exceeds an Animal or Senſitive Creature by *Rationality*. Secondly, As it is ſomething *Predicable*, and ſo it is commonly defined to be *an Univerſal, which is predicated of many different in Specie, in the Queſtion*, Quale quid, *or of what kind of Eſſence a thing is*. And this Definition agrees only to the intermediate *Difference*. Thirdly, Inaſmuch as it divides the Genus into differing Species; thus *Rational* and *Irrational* divide *Animal*, and conſtitute two Species, *viz. Man* and *Beaſt*. So the Equality of the Sides conſtitutes an *Equilateral Triangle*, and determines the Idea of a *Triangle*, which before was common to a certain *Species*. Fourthly, As it is an Eſſential part of the whole Compound, and ſo it makes a part of its Eſſence, and belongs to its Definition: Wherein it differs from a *Property* and *Accident*, as being an Actual part of the things to which it is attributed.

X. *The Species includes more than the* Genus. For in every *Species* there muſt neceſſarily be ſomething more than there is in the *Genus*; for otherwiſe there would be no diſtinction at all between the ſeveral Species, ſeeing they all agree in the Genus; and therefore if there be any diverſity betwixt them, the ſame is to be fetch'd from the *Difference*. For Example; The *Body* and *Mind* are two Species of Subſtance, and therefore it is neceſſary that in the Idea of *Body* there ſhould be ſomewhat more found than in the Idea of *Subſtance*; and the ſame muſt be ſaid of the Idea of the *Mind*. Now whereas the firſt thing we meet with in a Body, is *Extenſion*; and in the Mind or Soul, *Cogitation*; we may ſay, that *Extenſion* is the Difference of Bodies, and *Cogitation* the Difference of the Soul: Or in other words, That a *Body* is a Subſtance extended, and the *Soul* or *Mind* a Thinking Subſtance. Wherefore *Difference*, as it is the Third *Predicable*, may be thus defined: *That which is predicated of the Species, and of the things contained under it by the Queſtion*, Quale quid, *or of what kind of Eſſence the thing is.*

XI. *The fourfold diviſion of* Property. *The firſt Mode.* PROPRIUM is taken in a Fourfold Senſe or Acception: Firſt, *That which agrees alone to the Species, but not to all the Species*; that is, to all the Individuals reſorting under it. As, *to Cure by Art*, is attributable to Man alone, but not to all his Individuals.

XII. *The Second.* Secondly, *That which agrees to the whole Species*, but not to it alone. As it agrees to Man to walk on two Feet; for the ſame may be alſo ſaid of other *Animals* yet not of all. So *Diviſibility* is the Property of *Extenſion*, becauſe every extended Being can be divided; tho' *Duration* and *Number* be alſo diviſible.

XIII. *The Third.* Thirdly, *That which is attributable only and to the whole Species, yet not always, but only at a certain time:* As to grow grey-headed is peculiar to a Man; not in his Childhood or Youth, but in his Old Age: For if it happens otherwiſe, it is look'd upon as a Prodigy.

XIV. Proprium *in the 4th Mode.* Fourthly, *That which is attributable only, and to the whole Species, and at all times:* As it is the property only of a Circle, of every Circle, and at all times, that all the Lines drawn from the Circumference to the Center, are equal. And this laſt ſort of Property is that which conſtitutes the Fourth *Univerſal*; the other three Modes being rather referrable to Accidents, becauſe they do not agree neceſſarily, nor always, nor to the whole *Species*, but contingently, ſometimes and in part only. And thus *Proprium* in this laſt Senſe may be defined, *that which is predicated of many things by themſelves, and neceſſarily*, yet not eſſentially. I have added the word *Neceſſarily*, becauſe Property doth ſo agree with a thing, that it cannot ſo much as by Thought be ſeparated from it; foraſmuch as it is a neceſſary conſequent of its Eſſence, and is convertible with it. Thus it is the eſſential Property of a *Triangle*, that two of its Sides taken together, are bigger than the third, and that its three Angles be equal to two right ones; becauſe theſe do neceſſarily agree to a *Triangle*, inaſmuch as it is a Figure bounded by three right Lines.

XV. *What an* Accident *is, and how many ways it is taken.* In the laſt place, we call all that *Accident*, which is not *Subſtance*, neither doth neceſſarily agree to it, but doth only contingently follow the ſame; or is that *which without the deſtruction of the Subject may be preſent or abſent*. As *Roundneſs, Hardneſs, &c.* are common Accidents with reſpect to a Body, as *Sorrow* and *Fear* are Accidents with regard to the Soul or Mind. An *Accident* is twofold; *Separable*, which may eaſily be ſeparated from the Subject in which it is conceived to be, as *ſleep*, from Man; or *Inſeparable*, which cannot be ſeparated from the thing in which it is by the force of Nature, as *whiteneſs* from a Swan, *blackneſs* from a Blackamore: Tho' they may be abſtracted by Cogitation; for we can conceive a Swan without *whiteneſs*, and a Man without *blackneſs*. Wherein, as hath been ſaid, it is diſtinguiſh'd from a *Propriety*, which cannot ſo much as by Cogitation be removed from its Subject.

XVI. *The definition of* Accident *is true in a divided Senſe, not in a Conjunct.* When an *Accident* is ſaid to be preſent or abſent without the deſtruction of the Subject; this is not to be underſtood in a Conjunct Senſe, as if the ſame Accident could at the ſame time be preſent and abſent from the ſame Subject: But in a Divided Senſe, ſo as that the Accident which is now preſent may be abſent, and on the contrary. For it is a Contradiction that two oppoſit *Predicats*, ſhould at the ſame time be predicated of the ſame thing, though they may at divers times.

XVII. *The Series of* Genus's *and* Species To the end that the Order of the Higheſt *Genus*, and thoſe that are Subaltern, as alſo of the *Species*, may be the better known, it will be of uſe to ſubjoyn here a Series of *Univerſals*, by which we may be

be able to descend from the highest *Genus*, to wit, Substance, to *Individuals*; and remount back again from the *Individuals* to the highest *Genus*. For by this Scheme the Mind is much enlightned, and avoids that Confusion, which otherwise is apt to arise in the Defining, Dividing, and Enumerating of things.

A Substance,
Corporeal, Intellectual.
A Body,
Living, Void of Life.
A Living Thing,
Sensitive, Void of Sense.
An Animal, or
Sensitive Creature,
Endued with Mind, Void of Mind.
A Man,
This, Another, *Plato*.

XVII. *Which Series may be made after an Analytical way.*

The Words which follow from *Substance* to *Man*, are called *Intervening Genus's*, and those on the Right and Left are the *Differences*, which are said to be placed in an Indirect Line. From those words which are disposed in a Direct Line, we make the Series in a twofold manner; either by Analysis or Division descending, beginning from the Highest Genus, which is *Substance*, and distributing it, and all other the *Genus's* that resort under it, into their Species by their Difference, till we come to the Individuals. As if one should divide *Substance* into *Corporeal* and *Intellectual*; and then a *Body* into *Living* and *Void of Life*; and then a *Living Body*, into that which is Sensitive and devoid of *Sense*; and a *Sensitive Creature* or *Animal*, into that which hath a *Mind*, and which is destitute of it; and at last, an *Animal* endued with a Mind, *viz.* a *Man* into *Plato*, *Socrates*, *Aristotle*, *&c.*

XVIII. *Or by a Synthetical.*

The other is by way of *Synthesis* ascending, beginning from the *Individuals*, and from them mounting to the *Subaltern Genus's*, and lastly to the Highest Genus, *viz. Substance*. As when considering all particular Men, and finding them all to agree in the Nature of Man, we place *Man* as the Species above the *Individuals*. Then comparing *Man* with *Animals* or *Sensitive Creatures*, and finding in them the common Nature of *Animals*, we place *Animal* as the Genus above *Man*. Afterwards making a Comparison of an *Animal* with *Plants*, and finding them to agree in the common Attribute of Life or Living; we put *Living* above *Animal*: And then if we compare Living things with those that are destitute of Life, we shall find the common Notion in them both; and therefore place *Body* above *Living*. Lastly, If we compare *Bodily things* with *Angels* and the *Mind* of Man, we shall find the common Notion of Substance in them both; and therefore will place *Substance* as the Genus above Body, by which means *Substance* will be left the Highest Genus.

XIX. *What an Individual is, and its division.*

A *Singular* or *Individual* is opposed to an *Universal*, because it cannot be common to many Inferiour; as *this Man*, *this Sword*. It is twofold, either Indeterminate, which without difference may signifie this or the other *Individual*; as *a certain Man*, *a certain Woman*: Or *Signate* and Determinate; as *Julius Cæsar*, which is called Determinate by its Signification; or by Demonstration, as when a common Word is determined by a demonstrative Particle; as *this Colledge*, *this Court* or *Yard*: Or by Circumlocution; as the *Son of Sophroniscus* for *Socrates*, or *the Son of the Blessed Virgin* for *Christ*: And are therefore called by *Aristotle*, *Individuals*, *Singulars*, and Things differing in *Number*, because they cannot be divided as the foresaid *Universals*; and because we in a manner point at them, as if we were counting of them one by one, when we say *this*, *that*, *the other*, *&c.*

XX. *The first Use of Universals.*

Hence it appears what is the Use of *Universals*, and how far they conduce to the Knowledge of Things: For seeing that a thing considered under an *Universal Notion*, is a thing; as it is apprehended common to many Inferiours, or as it is predicable of many; we shall find that the consideration of *Universals*, is a great help to clear and distinct Perception, the obtaining of which is chiefly aimed at by all that is handled in this LOGICK. For by the help of these *Universals*, or *Prædicables*, we are enabled to discern the Attributes which constitute the Essence of a thing, from those which are Consequent to, and to know which are the *Properties* and *Accidents* of every thing: As for Example, it belongs to the Constitution of *Socrates* his Nature, that he be a *Man*, a *Sensitive Creature*, and *Rational*: Which Three in their Universality are distinguish'd; Man being the *Species*, Sensitive Creature or Animal the *Genus*, and Rational the *Difference*. Which tho' in *Socrates* they are all one and the same, yet are distinguish'd according to our Mode of Thinking. But the Faculty of *Laughing*, or *Laughter* it self, is consider'd as a consequent of *Socrates* his Essence, who is already constituted a *Man*, by his being an *Animal* and *Rational*. And the Faculty of *Laughing* is the *Property* of Man, but the Act of Laughing an *Accident*.

XXI. *The second Use of Universals.*

The Consideration of *Universals* is also of great Use to the more clear Perception of Things, whether they be Singular or Common. Of *Singulars*, whilst we enquire under what Species they are placed, what Genus's they have, ascending by degrees to the Highest. Of *Common* or *Universals*, when we examine what Differences they have, and what Species they contain, descending in this manner to the very Individuals. Thus by ascending, I know *Socrates* to be a *Man*, a Man to be an *Animal*, an Animal to be a *Substance*: And again by descending, I learn that Substance is either *Intellectual* or *Corporeal*; the Intellectual to be either *Infinite*, as *God*; or *Finite*, and that either without a Body, *viz.* an *Angel*, or joyned to a Body, as *Man's Soul*; under which Species the Mind of *Socrates*, as a Singular or Individual doth resort.

XXII. *Our Mind frames a general Idea two several way, the one by joyning or aggregating.*

The Second thing which follows from the Consideration of *Universals* is, that there are two ways of framing General Idea's, the one by *Aggregation*, the other by *Abstraction*. The Mind forms an Universal Idea by *Aggregation*, when it joyns many Singular Idea's of a like Nature together into one complex Universal Idea, which is called *Genus*. Thus making a Congeries or Collection of all Brute Beasts, as of *Lions*, *Horses*, *Bears*, *&c.* we find them all to agree in the Idea of a Brute Beast, which we therefore call the *Genus* of them.

XXIII. *The other by Abstraction.*

Again, we may form an Universal Idea by *Abstraction*, when we attribute the Attributes which constitute the Essence of a thing into several ranks or degrees, as if they were so many Parts. For tho' the Idea's of Singular things do agree in some one thing, yet they differ in more; wherefore when the *Mind* doth abstractedly and severally consider

things, in which many like Idea's are found; neglecting those wherein they differ; this abstract Consideration is called an *Universal Idea* or *Genus*. As for Example; If I take from *John*, *Peter*, *James*, all the Particularities that determine them, as that the one is a *Physician*, the other *old*, the third *young*, &c. and that I only consider them as being all *endued with Sense and Reason*: This affords me the General Idea of a *Man*, forasmuch as thereby not any particular Man is represented to me; but Man in Common, or the Nature of Man as such.

CHAP. VI.

Of Substance, and its Affections or Modes.

I. *The difference of our Perceptions.* THe difference of *Perceptions* or *Idea's* is taken either from the Things themselves which we understand, or from our different ways of Perceiving them, or lastly proceeds from the *Words* or *Signs* whereby we express our Notions. Now whatsoever is understood by us, is either conceived as a *Thing*, or *Substance*, existing by it self; or as the Attribute of a Thing, or Mode of *Substance*; or as something made up of a *Thing* and *Mode*; or a *Modified thing*; or lastly, *Propositions of Eternal Truth* residing in our Mind.

II. *What Substance is.* Substance *is a thing, which does not need any other Substance for its existence*; that is, which hath an Essence really distinct and separable from others. By this means is a *Substance* distinguish'd from an *Accident*, which is not really distinct from a *Substance*, nor can exist separate from it: Nay, an *Accident* cannot be clearly and distinctly conceived without a *Substance*, because its very Essence is to be in another; and nothing can be clearly and distinctly conceived without its Essence.

III. *Substance is known by its Attributes.* Tho' it be sufficient for the Explication of the Notion of *Substance*, to say, that it is a thing which exists independently of another; yet we cannot distinctly understand it, but by means of some Attributes that belong to it; and the more of these are found in any Substance, the clearer it is said to be known. For the *Attributes* or *Properties* of Things are, as it were, certain Forms that actuate them, and distinguish them from others: For we more easily know a Rational Soul, by conceiving it as a *Thinking* Substance, than as a thing *Existing*; because if it thinks, it must of necessity exist. So in like manner we have a clearer knowledge of a Body, by considering it as a Thing extended, than only as a thing existing, as is evident to him that considers it.

IV. *A Substance is either Created or Uncreated.* SUBSTANCE is twofold, *Created* or *Increated*. Increated is a Substance independent of all other things whatsoever, as GOD: A *Created Substance* is that, which tho' it do not stand in need of another Substance for its Existence, yet wants the Divine Concourse, without which it cannot exist; and therefore is not an absolute, but only a dependent *Being*.

V. *Created Substance is divided into Intellectual and Corporeal.* Of *Created Beings*, some are *Intellectual*, others *Corporeal*. An *Intellectual Being* is a Thinking Substance, as the *Mind* of Man: A *Corporeal*, is a Substance extended in Length, Breadth and Depth; or is the immediate Subject of Local Extension, and of all Modes that presuppose Extension, as *Magnitude*, *Motion*, *Figure*, *Position*, and all other such like, which cannot be conceived without Local Extension, as the foundation of them. And to the Mind or Soul belong all Acts or Modes of *Cogitation*, as to *Understand*, *Imagin*, *Feel*, and whatever else agrees in the universal Notion of *Cogitation*.

VI. *There be only two Genus's of Things.* Whence follows that there are only two *Genus's* or General Heads of Things, *viz.* of *Material* and *Intellectual*, or *Cogitative*: All others being reducible to these as *Modes* or *Affections*; now what these are, and how related to their Subjects, we shall next proceed to explain.

VII. *What an Attribute or Modus is.* There be many Attributes we may conceive in every thing; some of which constitute the Nature and Essence of a thing, and distinguishes it from all others; as *Extension*, which constitutes a Bodily Substance, and distinguishes it from a Cogitative Being: Others again presuppose the Nature constituted, and do only diversly affect or vary the same, as *Volition* doth the Mind, and *Figure* the Body; and these are called the *Modes* of *Substances*. Because tho' they affect or vary the Substance, yet it may be conceived without them, tho' they themselves cannot be understood but as inherent in some Subject; for herein properly the Nature of a *Modus* doth consist, that it cannot be conceived without including the Conception of the thing whose Mode it is. Thus I clearly perceive that a *Body* is an extended Substance, without Motion or Figure: But it is impossible for me to conceive Motion or Figure, except it be in an extended Being. So likewise I clearly perceive the *Mind* to be a Thinking Substance, without *Imagination* or *Sense*, because tho' these were absent it would be Cogitative notwithstanding: But *Sense* and *Imagination* cannot be conceived, but in a Cogitative Being.

VIII. *How Modes are distinguish'd from Aristotelical Accidents.* Wherefore a Modern Philosopher calls a *Mode*, the *Appendix of a Being*; because it cannot exist without the thing whose *Appendix* it is. Which we are to observe in opposition of those, who suppose that the *Modes* of things differ not at all from Real Accidents; forasmuch as these, according to them, may be conceived separate from their Subjects, and can exist so by the Divine Power: Whereas *Modes* can neither be separated from their *Subjects*, nor conceived without them; for otherwise they would be *Substances*, whose Nature it is to be Things subsisting.

IX. *What a Substance is.* *Substance* therefore is a thing that subsists by it self, and is the Subject of all the Attributes that are conceived to be in it.

X. *Whas a Mode is.* A *Mode* is that Attribute or Quality, which is conceived to be in the *Substance* it self, which determinates it to be such like. And this Mode is called by us an *Imperfect Being*, because it belongs to the Nature of it, that it cannot be by it self, and without some Substance in which it is; and whose *Being*, as the Schools express it, is nothing else but *Inbeing*; so that it is a contradiction for a *Mode* to be, and not to be or exist in a Substance. Wherefore neither can a *Modus* pass from the *Substance*, which is its Subject, and does support and uphold it, into another; for this would argue it not to have been dependent on the Substance wherein it was before, which implies a Contradiction.

XI. *The division of Modes into Internal and External.* Of *Modes*, some are Internal, others External: *Internal* are such as are conceived to be in the very Substances, as *Figure*, *Motion*, *Rest*, &c. *External* are such as depend on other Things, and are not in

in the Subſtances themſelves, as to be *Beloved, Deſired, &c.* which are Modes depending on the Action of another; and the Expreſſions we make uſe of to ſignifie the ſaid Modes, are called *Extrinſecal Denominations*; becauſe they only expreſs the Modes under which things are conceived.

XII. *What a thing Modified is.* A *Theng modified* is the Subſtance it ſelf, which is determined by a *Modus*.

XIII. *Theſe Three things explain'd by an Example.* As when I conſider a *Body*, the Idea I have of it repreſents to me a Body or Subſtance, becauſe I apprehend it as a Self-ſubſiſting thing, which needs no outward thing to its exiſtence: But when I conſider that Body *Round* or *Square*, the Idea which I have of its Roundneſs or Squareneſs repreſents nothing elſe to me, but a certain Mode of Exiſtence, which I find cannot naturally exiſt without a *Body*, to which the Roundneſs or Squareneſs belongs: And laſtly, when I joyn the Mode with the Thing, that Idea repreſents to me the Thing modified.

XIV. *Modes make no Compound of the thing whoſe Modes they are.* From what hath been ſaid, it follows, Firſt, That the *Modes* of Things are no hindrance to their Simplicity: For *Extenſion*, by Example, with the various Modes of Extenſion, as *Figure, Motion, &c.* is not a Compound, but a Simple thing. For that is ſaid to be a *Compound* which contains two, or more Attributes, whereof the one may be diſtinctly perceived without the other; and ſince the *Modes* cannot be conſidered without the *Subſtance* in which they are, it cannot be ſaid that they make a Compound of it. A *Simple Being* is that in which one only Attribute is found; whence it follows, that that Subject in which *Extenſion* alone, with its various Modes is underſtood, is a Simple Being; and that wherein we only apprehend the Cogitative Faculty, with the various Modes of *Willing, Underſtanding, Imagining*, is likewiſe a Simple Being: But that which comprehends both *Extenſion* and *Cogitation* is a Compound, *viz. Man*, who conſiſts of *Soul* and *Body*.

XV. *Subſtance is ſometimes conſider'd as a Mode.* Secondly, Hence it follows that a *Subſtance* may ſometimes be applicable to another in manner of a *Mode*. So *Cloaths*, when a Man is ſaid to be *Cloathed*, muſt only be called a *Modus*, notwithſtanding that they are Subſtances; becauſe Man is then conſidered as a Subject, to which Cloaths are added in the manner of a Mode.

XVI. *The diſtinction betwixt an Attribute, a Mode, and a Quality.* Thirdly, From what hath been ſaid we may gather, that we may conceive ſome difference between an *Attribute*, a *Mode*, and a *Quality*: As that an Attribute is that which is generally conceived to be in a Subſtance; ſo he who thinks of the Duration of the *Sun* doth contemplate an Attribute, under which the *Sun* is underſtood, foraſmuch as it continues in its being. And thus all Attributes are then diſtinctly underſtood by us, when we take care to affix no Conception of a Subſtance to them. We call that a *Mode*, which any way affects or varies a thing: So *Wax* is diverſified by Figures. And a *Quality* is that whence a Subſtance is denominated *Talis*, or ſuch like; as *Wax*, that is, *ſoft, cold, white, &c.* ſo *ſoftneſs* is the Quality of *Wax*.

XVII. *With what Names Subſtances and Modes are expreſt.* The Names whereby we expreſs Subſtances, are called *Nouns Subſtantive*, as *Mind, Body, &c.* The Names which expreſs Things modified, and which primarily and directly ſignifie Subſtances, and Modes indirectly, are alſo *Nouns Subſtantives*: As the *Earth*, the *Sun, &c.* But Words that primarily and directly, but confuſedly ſignifie Subſtances, and which indirectly, but diſtinctly expreſs Modes, are called *Nouns Adjective*; ſuch are *round, white, juſt, &c.*

XVIII. *What Propoſitions of Eternal Truth are.* The other things which fall under our Knowledge, are Propoſitions of *Eternal Truth*; which are not underſtood as Exiſting things, or the Modes of things; but as Eternal Truths abiding in our Underſtanding: As, *That which is, whilſt it is, cannot be nothing*: *I am, becauſe I think*: *What is once done, cannot be undone*; which are therefore called *Common Notions*, becauſe they are ſo ſimple and clear, that they cannot but be perceived by all Men. Neither muſt it be look'd upon as an Abſurdity, that we call any thing *Eternal* and *Immutable*, beſides GOD; becauſe we do not ſpeak here of Exiſting things, but only of Notions and Axioms which are in our Mind.

XIX. *The ſame are perceived by all, except their Prejudices hinder them.* Neither doth it hinder the Truth of theſe Propoſitions, that all of them do not appear equally evident to all Men; for the Reaſon of this is, becauſe they are not all conceived after the ſame manner, and conſequently not with the ſame Evidence. Not that I think the *Minds* of Men to be divers, and that the Knowing Faculty of one Man is larger than anothers; but becauſe probably theſe Common Notions may thwart the prejudicate Opinions of ſome Men, who therefore cannot ſo eaſily apprehend them; tho' others that are free from ſuch Prejudices, do perceive them with the greateſt Evidence.

CHAP. VII.

Of the Common Attributes of Subſtance.

I. *The Attributes by which Subſtance is known.* FOraſmuch as Things are underſtood by their *Attributes*, and are the more diſtinctly conceived by us, by how much the more Attributes we apprehend in them; I thought it needful to reckon up all the Attributes of *Subſtance*, that ſo nothing that belongs to the Nature of it, may be concealed from us.

II. *There are two Genus's of Attributes.* The Attributes of *Subſtances* are either Primary or Antecedent, or Originate and following from the Antecedent. The *Primary* are thoſe which are conſidered by us as certain Principles (not Effective, but Formal) as well of the Subſtance, as chiefly of all the reſt of the Attributes; ſeeing that when they are ſuppoſed, the others immediately follow, and are therefore called the *Principles of Being* or *Subſtance*; and they are two, *viz. Eſſence* and *Exiſtence*.

III. *Eſſence.* ESSENCE is the firſt Radical and inward Principle, Foundation, and Root of *Subſtance*, and all its Properties and Operations: For it is the Entity or Form whereby it is ſomething, and that which it is. Thus a Spiritual thing, ſuppoſe an *Angel*, by means of its Eſſence is not only a thing, but alſo ſuch a Being that is Intelligent, and not a Material Subſtance. And ſo likewiſe a *Body* hath not only from its Eſſence that it is ſomething, but alſo that it is Material, and void of Underſtanding. And therefore the *Eſſence* is by the Schools called, the *Metaphyſical Form*, becauſe it is the Chief thing whereby a Thing is diſtinguiſh'd from all others. When I ſay, the *Chief Thing*, it is not to be underſtood as if there were ſomething in Subſtance, beſides Eſſence, but only with reſpect to our Perception, which commonly proceeds by Parts, tho' the Thing it ſelf be Simple, without any Compoſition.

Having

IV. *Exiſtence.* Having inform'd our ſelves *what the Thing is* that is in queſtion, the next enquiry is, *Whether it be*; that is, whether ſuch a thing be to be found in the Nature of Things, to which the foreſaid Eſſence doth belong; and to this Queſtion *Exiſtence* belongs, by which a *Being* is ſaid to ſubſiſt, or by which the Eſſence is conſtituted in the Nature of Things: And therefore is called *Actus Entitativus*, an *Entitative Act*; as if Exiſtence were only underſtood by the operation or acting of Things. A Being in *Potentia*, or a *Poſſible Being*, is oppoſed to a Being in Act. So a *Lilly* in Summer is ſaid to be an *Exiſtent Being*; but in Winter, a *Poſſible Being*, *Ens in Potentia*; becauſe tho' it do not then exiſt, yet it is not repugnant to it, to be or exiſt in Time. Whence it appears that *Eſſence* and *Exiſtence* cannot be ſeparated from each other, ſince (to ſpeak properly) they are nothing elſe but two different Modes of Thinking: For we do otherwiſe conceive the Eſſence of a thing, when we abſtract Exiſtence or Non-exiſtence from it, than when we conceive it Exiſting. So when we apprehend *Poſſible* and *Actual Being* in one and the ſame thing, by different Conceptions, we do indeed conceive the thing as in a twofold State, but do not therefore divide it into more things. Thus the *Sun* that now appears in our Heaven, is the ſame that has continued from the beginning. Therefore the Power by which things that are not yet, are ſaid to be Poſſible, is called *Objective*; foraſmuch as ſuch Things are the Objects of ſome Cauſe, by which they may be produced in due place and time.

V. *Attributes Originate, or proceeding from others.* From theſe two firſt or primary Attributes, other *Attributes* follow, which are likewiſe common to all *Subſtance*, and are called *Originate*, or *Conſequent*; and are either *Abſolute*, which belong to the Subſtance conſidered by it ſelf; or *Reſpective*, which agree to the Thing with reference to others. The Abſolute Attributes are *Duration*, *Unity*, *Truth*, *Goodneſs*, *&c.*

VI. *Duration.* *Duration* is nothing elſe but an Attribute, under which the Exiſtence of Created Things is underſtood, with reference to their perſeverance in their Actual exiſtence. So that *Duration* agrees to all *Exiſtent Beings*, as long as they exiſt. With reſpect to *Duration*, ſome things are called Corruptible, and others Incorruptible. A *Corruptible Being*, is that which can periſh and ceaſe to be, or loſe the Exiſtence it hath: As the *Individuals* of every Species, which may be corrupted and changed into another Species. An *Incorruptible Being* is that, whoſe Exiſtence cannot be deſtroyed, and is either Simply ſuch, as *GOD*, who is *ſubject to no Change or Corruptibility*; or in certain reſpects only, which is preſerved by the *Power* of *GOD*, ſo as to ſuffer no diminution or increaſe. So *Matter* which continues one and the ſame in the World, is ſaid to be *Incorruptible*; tho' ſecond or ſingular *Matters*, as to their Forms, be ſubject to Generation and Corruption.

VII. *Unity.* Another Attribute of Subſtance is *Unity*, by which every thing is ſaid to be Undivided in it ſelf. Thus thoſe things are ſaid to be One, which are of the ſame Subaltern Genus or Species, becauſe they are conſidered by us under one and the ſame Notion, and for that we make uſe only of one Conception, to repreſent all thoſe Things to our Minds which agree together: And this Unity is called *Univerſal*. But *Singular Unity* appertains to thoſe Things, which without the Operation of our Mind are undivided, or to whoſe Nature it is repugnant to be divided into more *Entities*; whereby is verified that Common Saying of the *Philoſophers*, That *whatſoever is, is Singular*; becauſe that which is not One, cannot be eſteemed to be. Some Things again are *One* by themſelves, and others by Accident: Things *One by themſelves* are ſuch as have an Undivided Nature, whether they be Simple or Compound. For the multitude of Parts is no hindrance of *Unity*, ſo the Parts, which conſtitute a Third thing, be but cloſely joyned together. For *Man* is ſaid to be One by himſelf, notwithſtanding that he conſiſts of Parts of a different Nature, and ſeparable from each other. Whereas thoſe things are called *One by Accident*, which conſiſt of diſjoynted Parts, and between which there is only a very ſlight Union. So an *Army* is called *One Body* by Accident, becauſe it conſiſts of a great number of Men joyn'd by an Imperfect Union.

VIII. *Truth.* In Subſtance we alſo conſider *Truth*, which is commonly called *Metaphyſical*, or *Tranſcendental*; and is nothing elſe but the correſpondence of the Name with the Thing ſignified by it. For in this Senſe the Nature and Eſſence of every thing may be ſaid to be *True*. So that to *enquire into the Nature* of any Thing, is the ſame as to ſearch what a Thing is, and of what kind it is: And to *find out Truth* is nothing elſe, but to comprehend whether a Thing be, and of what Nature a Thing is. Wherefore, ſince it is not in the Power of Creatures, to change the Natures and Eſſences of Things, no more than they can *Eternal Truths*, it follows, that there is nothing oppoſed to *Tranſcendental Truth*. For tho' *Juſtice* be oppoſed to *Injuſtice*, *Truth* to *Falſhood*, and *true Gold* to *falſe Gold*; yet the Things which are oppoſed to *true Vertues* have no Nature, neither have we any poſitive Idea of them: For that which is oppoſite to *true Gold* hath no Eſſence at all; and in like manner, that which is contrary to *True Faith*, or *True Fortitude*, is

IX. *What things are ſaid to be true Metaphyſically.* To *Metaphyſical Truth* are referred not only thoſe Things which have, or may have an Exiſtence without the Intellect, as all *Natural Beings*; but alſo whatſoever is Poſitive, and conſequently hath an Eſſence or Nature, tho' it have no Exiſtence without the Intellect. For not only thoſe Things which are the Object of our Senſes, as *Heaven*, *Earth*, the *Sea*, *Sound*, *Colour*, *&c.* do enjoy a True and proper Eſſence; but *Fortitude*, *Juſtice*, *a right Line*, *a Triangle*, *Cauſe*, *Effect*, and in a word, whatſoever we apprehend as Poſitive, or in the manner of an *Entity*. For we ſay, *True Juſtice*, a *True Triangle*, *&c.* becauſe their Nature is True, and becauſe we can demonſtrate many things of them; as of *Juſtice*, that it *gives to every thing its own*: Of a *Triangle*, that its *three Angles are equal to two Right ones*.

X. *Goodneſs.* *Goodneſs* follows *Truth*, and is likewiſe reckoned amongſt the General Affections of Subſtance: For if a Thing have that Eſſence which it ought to have; that is, if it be *True*, it muſt of neceſſity be *Good* alſo. And therefore we frequently confound the Denominations of *True* and *Good*; as when we call a *True Syllogiſm*, *Good*, becauſe the thing which agrees with our Underſtanding, cannot diſagree with our Will, in caſe the Will be right, and

and that it be carried towards it after clear Perception. Thus GOD, after he had Created the *World*, and all things contain'd in it, he declar'd them all to be *very good*, becauſe they agreed with the Idea's he had of them, and therefore were ſuch as he would have them to be. Wherefore *Ariſtotle* defines *Good* to be that *which all do deſire*; foraſmuch as nothing is deſired, but what agrees with the Will. As there are many degrees of *Truth*, ſo alſo of *Goodneſs*, whilſt we account ſome more excellent than others, which we more eſpecially do, when we meaſure the *Goodneſs* of any thing from its Actions, or the ſtrength and force of its Acting. Thus we ſay, that the *Mind* excels the *Body*, and the *Fire* the reſt of the Elements.

XI. *Relation.* Thus much for the Abſolute Attributes of *Subſtance*; we proceed now to the *Relative*, which agree to a Subſtance as related to another, and not as conſidered in it ſelf. Now *Relation* is nothing elſe, but a Mode of our Underſtanding, comparing one thing with others, becauſe of ſome Properties or Acts that are found in them: So a *Father* is Related to his *Son*, becauſe he hath begot him; and the *Son* to his *Father*, as being begotten of him. If we conſider a *Father* and *Son* Materially, without their Relation, we ſhall call them *Subject*; but if we conſider them with reſpect to one another, we ſhall call the one the *Relate*, and the other the *Correlate*; becauſe as the Father is related to the Son by *Paternity* or *Fatherhood*; ſo is the Son to the Father by *Filiation* or *Sonſhip*. Upon which account it is that *Relatives* are ſaid to be or exiſt *Naturally both together*; becauſe you cannot ſuppoſe the one, without ſuppoſing the other: For ſuppoſing a *Husband*, you muſt ſuppoſe a *Wife* too; and ſuppoſing a *Maſter*, he muſt have a *Servant*.

XII. *Relation is manifold.* *Relation* is manifold; *viz.* a Relation of *Origination*, of *Negation*, of *Affirmation*, of *Compariſon*, of *Compoſition*, of *Acceſſion*, and of *Subſtitution*.

Relation of *Origination* is, between a Principle and that which proceeds from it; as between the *Day-break* and a *Day*, a *Point* and a *Line*, a *Subſtance* and its *Properties*.

Relation of *Negation*, is between diſtinct Things, or between Things going before, and thoſe that follow after. The former of theſe is called a Relation of *Diſtinction*, the latter a Relation of *Order*.

Relation of *Affirmation* is, whereby one thing is affirmed of another.

Relation of *Compoſition*, is between the Whole and the Parts, the Simple and the Compound, the Perfect and Imperfect.

Relation of *Acceſſion*, is between the Subject and the Adjunct.

Laſtly, *Relation* of *Subſtitution*, is that which intervenes betwixt the Sign, and that which is ſignified by it; the Meaſure and the thing Meaſured; the Image and the Original.

XIII. *Oppoſition.* As one *Subſtance* is related to another, ſo likewiſe it is oppoſed to another: As when we ſo conceive of Two things, as that they cannot conſiſt together. So *white* and *black Things* are ſaid to be oppoſed, and theſe are called *Contraries*, becauſe the Eſſence of one is different from the Eſſence of the other; yet not wholly and altogether, but becauſe there is ſomething in the Nature of one of them, which is not in the other. Thoſe things are called *Diſparate*, or *Diſagreeing*, when one thing is oppoſed to many after one and the ſame manner: As *white* is oppoſed to *green*, *yellow*, *blew*; becauſe *white* is not only oppoſite to *green*, but alſo to *yellow* and *blew*, and all Middle Colours. But when one *Oppoſite* altogether denies the other; as *a God*, *No God*; they are commonly called *Contradictories*. And this is the greateſt of all Oppoſitions, foraſmuch as it denies every where, and always. But if it deny the ſame only in a certain Subject, as *Sight* in a Senſitive Creature, then they are called *Privative Oppoſits*: Becauſe by Privation is underſtood the abſence of ſome *Entity* in a Subject capable of receiving it, as *Blindneſs in the Eye*, which is capable of *Sight*.

XIV. *Order.* *Order* is another Attribute of *Subſtance*, conſiſting in firſt and laſt, or former and latter. It is various, according to the diverſity of *Place*, *Time*, *Dignity*, *Knowledge*, and *Perfection*, which we conceive to be in things. *Order of Knowledge*, is taken from the Things themſelves; and by this *Cauſes* are before *Effects*; *Simple Terms* are more known than *Complex*. *Order of Dignity*, is fetch'd from the Eſſence of things; thus the *Mind* is more worthy than the *Body*: Or from *Accidents*; thus a *King* is more worthy than his *Subjects*, a *Maſter* than his *Servants*. A Thing is ſaid to be before another in *Nature*, whoſe Eſſence doth precede the other; or from whoſe Exiſtence the latter is not inferr'd, but on the contrary: So an *Animal*, or a *Senſitive Creature*, is ſaid to be by Nature before *Man*; becauſe tho' an Animal exiſt, it doth not therefore follow that a Man exiſts; yet when a Man exiſts, it follows that an Animal exiſts alſo.

CHAP. VIII.

How the Name of Subſtance *agrees to GOD and the Creatures.*

I. *How many ways Names agree to a Thing.* FOr the better clearing of this Difficulty, we are to ſuppoſe with *Logicians*, that a Name may after divers manners be communicated to a Thing. Firſt, *Univocally*, when it agrees to many Things for the ſame Reaſon; as when the name *Triangle* is given to all Figures contained within three Lines. *Equivocally*, when we call many things that are Eſſentially diſtinct by the ſame common Name, for divers Reaſons: As when in Latin we uſe the Name *Gallus*, to ſignifie a *Cock* and a *Frenchman*; or when we uſe the word *Parabola*, to ſignifie an *Allegory*, or *Similitude*, and a *Geometrical Figure*. *Analogically*, as when we give the ſame Name to many Things; but to one Principally, and to the other Secondarily: As when we ſay that an *Animal*, a *Pulſe*, and *Phyſick* are Healthful; for *Health* principally and chiefly agrees only to an *Animal*, to the *Pulſe* as it is a ſign of it, and to *Medicine*, becauſe it procures it. Having briefly obſerved theſe things,

II. *The Idea of Subſtance does not agree Univocally to GOD and the Creatures.* I ſay, Firſt, that the Name of *Subſtance* doth not agree to God and the Creatures *Univocally*. Which I prove thus: Different *Participation* deſtroys *Univocation*; but *God* and the *Creatures* participate the Name of *Subſtance* after a different manner therefore. The Minor is proved, becauſe *God* is a Subſtance Independent of any other; but all other *Creatures* are Subſtances dependent of

Him: GOD alone is He, who needs no other to his Existence; but all *Creatures* stand in need of the Divine Concourse for their Existence, neither can they without it be conceived to exist in the Nature of Things.

III. *The same expresst in other words.* Or otherwise thus: The Idea of *Substance*, is the conception of a Being subsisting of, or by it self; but there is no *Creature* so exists by it self, as to be sufficient for its own Existence, or so Powerful, as to be able to keep and preserve it self: Wherefore the Name of *Substance* cannot *Univocally* agree to *God* and the *Creature*.

IV. *A Being from himself and from another, are absolute Differences.* And if with more attention we consider the Matter, we shall find that *God* and the *Creature* do not agree in the Idea of any Genus whatsoever; and that the word *Being*, *Ens*, which is commonly by *Logicians* attributed to *God* and the *Creature*, is perfectly *Equivocal*; and that the *Equivocation* is not more plain in the word *Dog*, when attributed to a *Constellation* in Heaven, and to a *Beast* on Earth; or in the Latin word *Jus*, which signifies *Law* or *Right*, and *Broth*, than in the word *Ens*, or *Being*, when given to a Being which is of it self, and to one that is from another and altogether dependent. For to exist of ones self, or to be made by another are meer *Differences*, which do not admit any common Genus; and as *God* is distinguished by the former, so are all *Creatures* by the latter: *God* being a purely Self-existent and Independent Being, and the *Creatures* purely dependent Beings, and existing from another.

V. *God is above Substance.* Wherefore S. *Denys* calls GOD *Super-substantia*, and *Super-ens*, (*Above-substance*, and *Above-entity*) because he is raised above all Substances, and separate and distinct from all other Things whatsoever. Accordingly he that would make a true Scheme of the *Predicaments*, must set down *Ens à se*, or a *Self-existent Being* by it self, and distinct from the Series of other things; and afterwards *Ens ab alio*, or a *Being* that is from another, as the Original of *Differences*, placing at the Right hand of it *Intellectual*, and on the Left *Corporeal*, and then put the next Division of *Things*. Because the Name of *Entity*, or *Being*, only agrees with the Being, which is of it self, and can only Equivocally be assigned to *Creatures*, that have their Being from another.

VI. *An Objection answer'd.* If any one say, that the word *Substance* agrees in common both to *God* and the *Creatures*, and that all the Inequality that is found in them doth arise only from the *Differences* of it? I answer, That this is not true, forasmuch as Dependency is involved in the Essential Conception of a Creature. Now it is required to the Nature of *Univocal Words*, that they be equally communicable to all, and not to one Primarily and to the other Secondarily, or with dependance on the First.

VII. *The Idea or Notion of* Substance *is Univocally competent to Creatures.* I say in the Second place, that the word *Substance* doth *Univocally* agree to all Creatures. For all *Creatures* are conceived under this Common Notion, that all of them stand in need of the Divine Concourse for their Existence. Now that Name which is attributed to many for the same Reason, and equally participated by them, is *Univocal*; therefore the Name of *Substance* is distinctly understood to be Common to all *Creatures*, according to the property of *Univocals*.

VIII. Having thus explained these Things, I think I have with one and the same labour explained all *Metaphysicks*, concerning *Entity* and its Affections; yet that no Body may complain, that the same has been left out in this *Institution*, seeing the consideration of it doth indeed belong to *Logick*, I shall subjoyn here such a Genealogy of *Things* and *Modes*, by means of which the Student of *Philosophy* may, as it were at one View, contemplate the whole University of Things. *Why the Genealogy of Things and Modes is here annexed.*

The Fifth Rule of Truth.

It avails much to the clear and distinct Perception of Truth, *to retain in ones Mind an accurate Genealogy of* Things *and* Modes, *that with one cast of an Eye we may be able to take a view of the whole Universe of* Things, *beginning from the most General, and ending in the most Special.*

IX. *The Use of the foregoing Rule.* The Reason is, because this will be a great Help towards the thorough Knowledge of Things, as pointing us to what *Tribe* they do belong, what Affinity they have with some, and what Difference from other Things; neither will it be of less Use to us in the *defining*, *describing*, and *distributing* of Things. And to the end you may have a short Compendium at hand, of all those Things in general, which fall under the Perception of our Mind, and consequently also of those *Idea's*, which the Mind forms to it self, whilst it beholds them: Behold I here furnish you with such a *Genealogy*, as contains all and every one of the *Genera* of *Things* and *Modes*, each in its proper order and degree.

The Genealogy of Things and Modes.

Whatsoever falls under the clear and distinct Perception of our *Mind*, is somewhat.

And that Somewhat, is either { A *Thing*, *A* / or, / The *Mode* of a Thing, *B*

I. A *Thing*, (or an *Entity* or *Substance*, for they are Synonymous) is something which hath an Essence and Existence distinct from all other Things. *Essence* is the Natural and Invariable Constitution of the Thing, by which it is that which it is. *Existence* is a Consequent upon the Essence of a Thing, by which it now actually is, or is the *Essence* it self now existing in the University of Things. The Consideration whereof belongs to Ὀντολογία, by some called *First Philosophy*; and by others *Metaphysicks*, which treats of Things Universally, and therefore also is called *Catholick*, or *Universal*. *A.*

A Thing or Substance in General, is twofold { *Thinking*, *a* / or, / *Extended*, *b*

Thinking, or a Mind is either { 1. Infinite, as *GOD*, whence is *Natural Theology*. / 2. Finite, as the Mind of { an *Angel*, whence is *Angelography*. / a *Man*; whence *Psychology*. } *a.*

This part of the Genealogy of a *Thinking Substance* is handled in *Noëtica*, that is, *Pneumatica*, as others term it; the Parts whereof I have just now mentioned.

A Thing Extended, or a Body, is twofold. *b.*

I. An *Element*; that is, a Principle whence other *mix'd Bodies* have their Original, and into which they are resolved again at last. Which again is Threefold.

1. *Subtil*

1. *Subtil Matter*, which constitutes the *Stars*.
2. The *Heavenly Globular Matter*, whence the *Light* and *Heavens* are.
3. The *Grosser Particles of Matter*, whence are the *Planets* and *Comets*.

II. *Elementatum*, or *Principiatum*; that is, all those things that have their Original from the *Elements*.

And these are again Twofold:

I. *Without Life*, or *Concrete*; which branch themselves into,

1. *Simple Concretes*; as the *Heaven*, which consists of the *Globuli* of the Second Element; and the *Stars*, of the Matter of the First Element.

2. More *Compound Concretes*.

1. Those on high, as *Planets*, *Comets*, &c.
2. Those beneath, as *Fire*, *Air*, *Water*, *Earth*, and things consisting of these: As,
   1. *Meteors*, as *Vapours*, *Wind*, *Rain*, *Snow*, *Hail*, *Thunder*, &c.
   2. *Fossils*; that is, *Minerals*, *Metals*, and *Stones* — *Common*, or *Precious*.

II. *Living*, or *Animated*.

1. Without Sense, or *Vegetable*, As all kind of *Plants*, whether — *Herbs*, *Shrubs*, or *Trees*.
2. Endowed with Sense; as an *Animal*,
   1. Rational, as *Man*.
   2. Irrational, as a *Beast*.

This Part of the Genealogy, concerning *Extended Substance*, or *Body*, is unfolded in *Physiology*, or *Natural Philosophy*, which is also called *Somatica*.

B. II. The *Mode*, (that is, the *Attribute*, *Affection*, *Accident*) of a Thing, is somewhat of an *Entity* or *Being*, that is and exists by the assistance of another thing.

These are Twofold, General, *a* or Special, *b*

a. I. *General*; Such are the Modes or Attributes of all Things in General, commonly called *Transcendentals*: As,

1. *Unity*; by which every thing is always one and the same, and Undivided. *Multitude* is a Collection of *Unities*.
2. *Truth*; by which a thing is conformable to its Idea. *Falsity* contrariwise.
3. *Goodness*; whereby it is fit for Use.
4. *Perfection*; whereby it is whole and entire, and hath whatsoever it ought to have.
5. *Locality*; whereby it is every where, as *God*; or somewhere, as all other Things besides *God*.
6. *Duration*; whereby a Thing continues in its Existence either always, or for a certain time:

As *Eternity*. As *Time*: Present, Past, Future.

These Things are explained in the *First Philosophy*, or *Metaphysicks*, which treats of Things, and of their Modes and Affections Universally.

b. II. *Special*; Such are the Modes or Attributes of Things in *Specie*.

(1) For the Division of Things: As,

1. The *Modes*, that is, the Attributes of a Thing Cogitating: As, *Intellection*, and *Volition*. *Power* to act of it self, Αὐτοκρατία.

2. The Modes or Attributes of a *Thing extended*, or *Corporeal*:

As
1. *Quantity*, or *Magnitude*; which *Mathematicks*, or *Posotica* treats of.
2. *Figure*, or the different Termination of *Magnitude*, handled in that Part of *Mathematicks*, which is called *Geometry*.
3. *Situation*, or the certain Position of a Thing in Place and Space.
4. The *Quiet* or *Rest* of the Parts of any Thing.
5. *Local Motion*, or the Variation of Situation, whence proceed Active and Passive Qualities; as *Rarity* and *Density*, *Fluidity* and *Hardness*, *Heat* and *Cold*, *Moisture* and *Dryness*, and the rest; which are treated of in *Natural Philosophy*.

(2.) From the Conjunction of a thing: *Thinking* and *Extended*, result the following Modes and Affections.

1. The Appetite of *Hunger* and *Thirst*.
2. The Senses: Internal; *Phantasy* or *Imagination* and *Memory*. External; *Seeing*, *Hearing*, *Smelling*, *Tasting*, and *Feeling*.

And their Affections, as *Waking* and *Sleep*.

3. The Affections or Passions; as *Love* & *Joy*, *Hatred*, *Sorrow*, *Hope*, *Fear*, and the several kinds of them, which are also handled in *Physiology*.

X. *The Scope of a Philosopher is, to know the Natures of Things.*

Hence we may gather in the first place, that *Philosophy* considered in all its Parts, is nothing else but a Scientifical Explication of this or a like Genealogy. For a Philosopher pretends nothing else, and is content with this alone to understand the Natures of Things, to know their Forms, Differences, Affections, and that from the nearest Causes, if the *Mind* can reach them. Now this will hardly be obtained by him who is not well vers'd in the Genealogy of Things.

In the next place, That this Genealogy is abundantly sufficient to supply the place of the Common Categories and Predicaments of the *Aristoteleans*.

XI. *What the Peripateticks understand by Predicaments.*

By *Predicaments* and *Categories*, they understand such a Series and Disposition of Things, in which the Superiour is always predicated, that is, affirmed Univocally, that is, according to Name and Thing, of its Inferiours in the same *Predicamental Line*. Taking this for granted, as a thing known to all Men, there are many things which I cannot approve of in the Constitution of those *Predicaments*.

XII. *What is to be disproved of in the Categorical Series.*

First, That they divide *Ens* into Substance and Accident without any Reason: Forasmuch as an *Accident* is no *Entity*, as appears from the foregoing Definition of *Ens* (*A.* I.); but rather is something belonging to an *Ens*, according to (*B.* II.)

Secondly, In that they constitute Nine supream *Genera* of Accidents, which they thus reckon up; *Quantity*, *Quality*, *Action*, *Passion*, *Relation*, *When*, *Where*, *Situation*, and *Habit*.

Where first they mistake in this, that they make those to be the Supream *Genera*, and distinct too, which truly are not so; as *Quantity*, and *Quality*: For the greatest part of *Physical* or *Natural Qualities* arise from *Quantity*, *Figure* and *Motion*. Secondly, *Relation* doth not in the least belong to the Genealogy of Things, because it is no

no absolute thing, but only an Affection framed by Reason, *viz.* an *Opposition*, with or under some respect. Thirdly, *Action* and *Passion* in Bodies are reducible to Motion, whose Species or Modes they are. Fourthly, The Division of *Ens* into Substance and Accident, invented by *Aristotle*, deviates from the Rules of a good Division; because the Parts of it are not opposite. Fifthly and lastly, If any true *Attributes* of Things be found amongst them, the same may be more fitly deduced from our Genealogy: As for Example, *Quantity* belongs to the first Mode of an Extended Being: *Quality*, if it be Mental, to the Modes of Intellection and Volition; if it be Physical, or Corporeal, to the Fifth Mode of an Extended Being, or to others: *When* and *Where*, to Duration and Place, which are the General Attributes of Things: *Situation* is the Mode of an Extended thing, or the respect of one Body to others, considered as near to it: And *Habit* is the Common Adjunct or Accident of some Things; as of a *Human Body*, or some other.

CHAP. IX.

Of the Whole and Parts, Causes and Effects, Subject and Adjunct.

I. *Some other things necessary to be known in order to clear Perception.* HAving thus Explained the *General Attributes* of Things, as far as is sufficient for the Knowing of Things in General; if any one further desire to Know Things more distinctly and evidently in *Specie*, and particularly, he must consider the thing either as a *Whole*, consisting of *Parts*; or as an *Effect*, produced by *Causes*; or as a *Subject*, furnish'd with various *Attributes*. For this will be a great furtherance to attain a clear and distinct Knowledge, that is, Perception of any Thing.

II. *The Order of Things here to be treated of.* It follows therefore, that we explain the Notions of a *Whole* and its *Parts*, of a *Cause* and its *Effects*, of *Subject* and *Adjunct*; because from these Notions, the Idea of every thing is absolutely and to the Life expres'd in the Mind of him that Thinks.

III. *What a Whole is, and how manifold.* We call that a WHOLE, which consists of many things joyned together, or which hath *Parts*, into which it may be divided: For a thing which wants *Parts*, is improperly called a *Whole*. Wherefore the *Aristotelians* are in a Mistake when they say, that the Mind of Man is *Whole in the whole Body, and Whole in every Part*; because the *Mind* being an Intellectual Substance, is without *Parts*, and after an Indivisible manner in the Body. Wherefore also an Immaterial Substance cannot be said to be *Whole*, save only Negatively, inasmuch as it doth not admit of Parts, or Division. A *Whole* is threefold, *Essential*, *Integral*, and *Universal*. An *Essential Whole*, is that which consists of Parts, whereof the one is in the other, as are *Matter* and *Form*: Thus Man consists of *Soul* and *Body*. An *Integral Whole*, is that which hath Parts without each other; as a Man's *Body* consists of *Head*, *Hands*, *&c.* An *Universal Whole*, is any Genus with respect to its Species; as *Animal* respecting Man and Beast: Or a *Species*, referring to its Individuals; as *Man* to to *Socrates* and *Plato*.

IV. *What a Part is, and how manifold.* We call that a PART, which together with its *Copart*, or with many of them, doth constitute a *Whole*; as the *Soul* and *Body* make a Man. A *Part* is either Principal, without which a *Whole* cannot consist; as is the *Head* in a Human Body: Or *Less Principal*, which when sever'd doth only maim the whole, but not destroy it.

V. *What is meant by the word Cause.* Tho' the Word CAUSE be of it self sufficiently known to all, and therefore the Explication of it seems superfluous; yet is it commonly defined, *That from whose Being something else follows*: Or, *That which of it self, influenceth something different from it self*. Accordingly, GOD the *Father* is the Principle, but not the Cause of the *Son*; for the Son is another Person from the Father, but not another Thing, that is, not of another or different Nature.

VI. *The division of Causes.* There are Five *Genera* or kinds of *Causes*, *viz.* the *Material*, the *Formal*, the *Efficient*, the *Exemplary*, and the *Final*.

VII. *What the Material Cause is.* The *Material Cause*, is that out of which things are made or formed; as *Wax* is the Matter of which *Tapers* are made; *Pewter*, the Matter of which *Pots* are made; *Gold*, of which *Guinea's* are made. So that whatsoever is agreeing or disagreeing with the Matter, the same also agrees or disagrees with the Things that are made out of it.

VIII *What the Formal.* The *Formal* is that which Constitutes another thing and distinguisheth it from all other; as the *Soul* is the Form of Man. But whether the Forms of other things be *Physical Entities*, as they talk in the Schools, or only a disposition of *Parts*, shall be discoursed in the General Part of *Physiology*, where this Point shall be distinctly handled. Both these *Causes* are called *Internal*, because they abide in those Things whose Essence they do constitute.

IX. *The Efficient.* The *Efficient*, or *Effecting Cause*, is that which produceth another thing; and the same is manifold.

X. *A Total Cause.* *Total* or *Adequate*, which alone doth produce the Effect, excluding other Causes of the same Rank; as *God* creating *Adam*, whom he produc'd without the Concourse of any Other.

XI. *Partial Causes.* But a Father and Mother, or Male and Female, are said to be *Partial Causes*, with respect to the Child they generate; because they need each others assistance, and can do nothing solitarily.

XII. *Proper and Accidental Causes.* The *Sun* is the *Proper Cause* of *Light*; but only an *Accidental Cause* of the Death of a Man, who is kill'd by too great Heat; because the bad Constitution of his Body, was the occasion of his being hurt by the Heat of the *Sun*.

XIII. *The Near and Remote* A Father is the *Near Cause* of his Son; but a Grandfather the Remote.

XIV. *The Effective Cause.* A Mother is the *Effective*, or *Productive Cause* of her Son, because she effects a thing which before did not exist.

XV. *The Conserving Cause.* A Nurse is only the *Conserving Cause*, because she only effects the Continuation of its Existence, and lends her assistance that it may continue in that Existence, which it hath received from its Parents.

XVI *An Univocal Cause.* A Father is an *Univocal Cause*, with respect to his Children; becuse they are of the same Nature with him.

XVII. *An Equivocal Cause.* But GOD is only an *Equivocal Cause*, with respect to his Creatures; because they are of a different Nature from His, and in Dignity inferiour to him.

XVIII. *A Principal Cause.* An Artificer is called the *Principal Cause* of his Work, because he acts voluntarily; but *Instruments*, because they are managed by him, as means subservient to the performing of his Work, are only said to be *Instrumental Causes*: Because tho' there be some kind of Power to work in the Instruments, as in

in the *Hatchet* to Cleave, in the *Knife* to Cut; yet can they not produce the said Effects, except they be actuated and applied by another *Cause*. And therefore are called *Passive*, because they receive their *acting Power* from the *Principal Cause*.

XIX. *An Universal Cause.* The *Water* that springs up into divers Water-Works in the Gardens of Princes, and which moves variety of Machins, is the *Universal Cause* of their Motion, because it is indifferently forced up into them all: But the Artificial disposition and figure of the Pipes is the *Particular Cause*, which determines the *Universal*, and restrains it to some particular effect.

XX. *A Natural Cause.* Bodily Things, when they act, are said to be *Natural Causes*, because they produce an Effect from a Natural Propensity or Necessity, without any fore-knowing Knowledge; as the *Sun*, *Fire*, and the like: But *Man* is the *Intellectual Cause* of those things which he effects by his Understanding and Will.

XXI. *A Voluntary Cause.* A Man that *Walketh* is a *Free Cause*, because he acts spontaneously, and not by force: But a *Fire* burning Wood is a *Necessary Cause*; because where those things are present which are required to its action, as *dry Wood*, application of them to the *Fire*, and *Ventilation* or *Blowing*, it cannot but *burn* them, neither can it exert any other Action instead of it.

XXII. *A Proper Cause, and without which.* The *Sun*, whilst it enlightens a Chamber, is the *Proper Cause* of the *Light* that is in it: But the opening of a *Window*, or taking down of the *Shutters*, is only a Cause *sine qua non*, or without which such an Effect would not follow; which Cause is also called the *Condition*, without which a Thing cannot be.

XXIII. *A Physical and Moral Cause.* A *Fire* that burns Houses, is the *Physical Cause* of that Burning or Consuming, because the *Fire* properly and of its own Nature burns: But a Man who sets *Houses on Fire*, or that exhorts or commands others to do so, is only a *Moral Cause* of this Burning; because he hath only Morally contributed to that effect, *viz.* by Exhorting or Commanding. Thus the *Serpent*, or the *Devil*, was the *Moral Cause* of the Fall of our First Parents.

XXIV. *An Exemplary Cause.* The Form which a Man proposeth to himself in going about to make a Work, is called the *Exemplary Cause*; as the Form which an Architect conceives of a *House* he is about to build; and generally whatsoever can be a Cause of an *Objective Entity*, or of forming any other Image. So he who is the Object of the Eyes or Mind of the *Painter*, is the *Exemplary Cause* of his own Effigies or Likeness.

XXV. *What the Final Cause is.* The *Final Cause*, is the *End* for which any thing is; as when a Man applies himself to his Studies, in order to the attaining of *Learning*: And therefore the *End* is commonly defined, the *Cause* for whose sake any thing is.

XXVI. *A Primary End.* An *End* is twofold, either *Primary*, which is principally intended; as the *End* of a Knife is to *Cut*; of a *Garment*, to cover the *Body*, and to shield it from the Injuries of the *Weather*.

XXVII. *A Secundary End.* A less Principal or *Secundary End* is, which moves one only in a less degree, and is only considered as something Accessory. Thus the *Secundary End* of a Garment is to adorn the Body.

XXVIII. *The End for whose sake.* That which a Man intends to do, or to obtain, is called the *End for whose sake*: So *Learning* is the End of Studies, *Health* the End of the Physician's Art, as being that which it intends to procure.

XXIX. *The End for whom, Adequate and Partial.* He for whom any thing is desired, is called the *End for whom*: So Man is the *End for whom* of Medicine; because it designs to procure *Health* to him. To form ones *Reason* aright, or to direct the *Understanding* into the knowledge of all things whatsoever, is the *Adequate End* of *Logick*: But to direct the *Understanding* in Natural things, or in the exercise of Vertuous Actions, is the *Inadequate* or *Partial End* of *Logick*.

XXX. *The Number of Causes.* Whence we may gather, that the *Material Cause* is that out of which Things are made; the *Formal*, by which; the *Efficient*, from which; the *Exemplary*, according to which; and the *Final*, for which things are made.

XXXI. *The Causatum, or Thing Caused is fivefold.* Whence it follows, that the *Effect* or *Thing caused*, which depends on the *Cause*, and by virtue whereof it is, is Fivefold; *viz.* an *Effect*, which proceeds from the *Efficient Cause*: The *Thing designed*, or the *Means* ordained to the *End*: The *Thing materiated*, or which consists of the *Matter*, and is made of it: The *Thing formed*, or constituted by the *Form*. To these you may add the *Thing exemplated*, in respect of the *Exemplar* according to which it is made.

XXXII. *What a Subject is.* That is called a *Subject* to which something is adjoyned, or to which something accrues besides its Essence: So *Cloaths* are put on the *Body*; the *Soul* of Man is joyned to his *Body*; *Writing* is applied to *Paper*.

XXXIII. *The difference twixt a Subject of Inherence and Adherence.* A Subject of *Inherence*, is that into which something is received: So a *Spunge* is said to be the *Matter* into which the *Water* is received: The Outside of the *Wall* is that which receives the *plaister* or *whiting* in it. A Subject of *Adherence* is, which receives another thing upon it self, or to it self, as a *Hand* that puts on a *Glove*. A Subject *Containing*, is that which comprehends any thing within it self; as a *Vessel* doth *Water*, or the *Sheath* doth the *Sword*: Because by *Subject* nothing else is understood here, than that to which something is joyned besides its Essence; or to which something supervenes after its production and constitution.

XXXIV. *A Subject is sometimes taken for an Object.* A *Subject* is sometimes taken for an *Object*; as when we say, to *subject* a thing to the Eyes of any one; that is, to propose a thing to any ones Faculties, that he may act about or in it. So the Object of *Hearing* is a *Sound*, the Object of *Seeing*, *Colour*.

XXXV. *What an Adjunct is.* We call that an *Adjunct*, which we consider to be in a thing besides it Essence, as something added, accruing or hapning to it, whether the same bring along with it some proper Reality; as *Fire* in the Pores of hot *Iron*, the *Soul* in the *Body*: Or whether it be nothing else but a Mode of Substance; as *Love* or *Science* in the Mind; *Motion*, *Figure*, *Rest*, *Situation* in a Body.

XXXVI. *Adjuncts are only attributed to their Subjects in the Concrete.* An *Accidental Adjunct* is predicated of its Subject in *Concrete*, and not *Abstractedly*. That is called a *Concrete Adjunct*, which denotes the Accidental form together with the Subject; as *White*, *Learned*, *Great*, *&c.* An *Abstract Adjunct* is that which signifies only the Accidental or Modal form; as *Whiteness*, *Learning*, *Greatness*. Wherefore an *Adjunct* is predicated of its Subject in the *Concrete*; *Snow is white*, Socrates *is Learned*, *Great*: But by no means in the *Abstract*; as *Socrates is Whiteness*, *Learning*, *Greatness*.

To these things thus at large explained, we will subjoyn this Rule.

The Sixth Rule of Truth.

XXXVII. The Sixth Rule of Truth.

The Idea or Perception of every thing is by so much the more clear and perfect, by how much the more Parts, Causes and Adjuncts of the thing it doth represent.

For from the *Parts* we have a view of the *Whole*; from the *Causes*, what is contained in the *Effects*; from the *Adjuncts*, as so many Complements and Ornaments, we perceive the *Nature* of the Subject, and its *Qualifications*, especially from its proper inborn Qualities.

CHAP. X.

Concerning the Distinctions, whence the Nature and Difference of Idea's *is deduced.*

I. *What is the Consent and Dissent of Things.*

FOr a more clear understanding of what follows, we will premise something concerning the *Consent* and *Dissent* of Things. Now those things seem to me to Consent, which agree in Common *Attributes* and *Logical Notions*; and those to Dissent, which do more or less disagree in the same.

The Seventh Rule of Truth.

II. The Seventh Rule of Truth.

Those Things are to be looked upon as Agreeing, which agree in some common Idea or Reason, or whereof the one is included in the Idea of the other; and they are said to disagree or to be diverse, which are the Objects of Different Idea's, and are apprehended after a diverse manner; or the one whereof is not included in the Idea of the other.

III. *Which Things agree, and which do disagree.*

For those things only do *Agree*, which have the same Genus or Species, or Parts, or Causes, or Effects, or Subjects, or Adjuncts; or Agree upon some other account: Whereas those which *Disagree* in the same, are diverse and dissentaneous. But those things do most of all Disagree, which are separated from each other by opposite Differences.

IV. *What distinction is, and how manifold.*

Wherefore *Distinction* in Common is nothing else, than the Diversity we find, between many things. Which Diversity, to speak properly, is only to be found between *Existent Beings*: For that which is not, cannot be said to be distinguish'd. *Distinction* is threefold, *Real*, *Modal*, and *Distinction of Reason*.

V. *What a Real Distinction is.*

Real Distinction is that which is found between two or more compleat Beings or Subsistances; as between the *Soul* and *Body*, which we know to be distinguish'd from each other, because we can distinctly know the one without the other: For we can have no more evident sign of *Real Distinction* than this, that we do distinctly and clearly understand the one without the other. I said in the Definition, that Distinction is a *Diversity*, and not a *Division*; because Distinction doth not take away *Union*, but *Identity* only. For tho' the *Soul* be never so closely United to the *Body*, yet it continues no less distinct from the same, than if it were actually separated from it: For it is sufficient to make a distinction, if the Things may be separated and preserved apart from each other.

VI. *The Soul and Body are Really Distinct, as Compleat Beings.*

But you'l object against the Instance of *Soul* and *Body*, that they are only *Incompleat Subsistances*, and therefore cannot be really distinguish'd? I answer, by distinguishing the Minor. I grant that the *Soul* and *Body* are *Incompleat Subsistances*, if they be referr'd to the Compound which they constitute. But if by calling them *Incompleat Subsistances*, you mean that they cannot subsist by themselves: This I deny.

VII. *What we are to understand by these Words,* A Compleat thing.

For when we say a *Compleat thing*, we understand nothing else, than a *Substance* furnished with such *Attributes* and *Forms*, as from which we gather it to be a *Substance*: For it is plain, that we do not know a *Substance* immediately, but from its *Attributes*, which because they must be in something or other, therefore we call the Subject in which they are, *Substance*. In which respect the *Soul* and *Body* are said to be *Compleat Beings*. The same may be said of all the Parts that concur to the making up of a *Whole*. Thus an *Eye*, for Example, is an *Incompleat Substance*, if it be compar'd with the *Body*, whose Part it is: But is said to be a *Compleat Entity*, when considered by it self alone; and in like manner the *Soul* and the *Body* are *Incompleat Substances* in reference to the Whole Man; but *Compleat*, when they are considered with those *Attributes* by which we know them to be *Substances*.

VIII. *What a Modal Distinction is.*

A *Modal Distinction* is that which is found between a *Mode* and its *Subject*, whose *Mode* it is: So *Figure* is distinguished from a Bodily Substance; the Act of *Imagining* or *Willing* from an Immaterial Substance, or the Soul. For those things we know to be Modally distinguish'd, where the one of them may be conceived to exist without the other, but not on the contrary: As we can easily understand a Corporeal Substance without *Motion* and *Figure*, but can by no means conceive Motion or Figure without a *Body*.

IX. *How two Modes are distinguish'd.*

There is another *Modal Distinction* between two Modes of one and the same Substance: As between the Figure and Motion of one and the same *Body*, or between a Substance and the Mode of another *Substance*: But this latter is rather to be called a *Real Distinction*, than *Modal*; forasmuch as That *Mode* may be clearly understood without the other, and hath no dependance on the *Substance*, as not affecting or modifying it.

X. *Distinction of Reason.*

A *Distinction of Reason*, is that which is found between a Substance and some one of its Essential Attributes: Thus *Quantity* doth not differ from a Bodily Substance, but only by a Distinction of *Reason*; as *Cogitation* from the Mind. The Sign of this *Distinction* is, when we cannot have a distinct *Idea* of the Thing, if we remove from it that *Attribute*, as appears in the Examples alledged. And so likewise, two *Attributes* of the same Substance are distinguish'd only by *Reason*, if they be such as that the Notion of the one cannot be clearly conceived without the other; as *Justice* and *Mercy* in GOD. And these are said to be *Formally* distinguish'd, because their Formal Idea's or Definitions are distinct or diverse.

XI. *What the Idea's are which we have of Things.*

From what hath been said, we may gather first, What the *Idea's* are which we have of Things; *viz.* that they are *Conceptions*, or rather the Things themselves conceived and understood by the *Mind*; by which Intellection things are said to be Objectively in the *Intellect*. So that we can express nothing in *Words*, if we understand what we say, but there must be an *Idea* in us of what we express by our *Words*: Tho' the *Idea* may sometimes be more clear and distinct, and at other times more obscure and confuse; because it implies a Contradiction

diction for me to know what I say, when I express any thing, and yet to have no other conception of it, besides the bare sound of the words. By the word *Idea* therefore we are to understand, not an Image represented in our Bodily Imagination, and delineated in some part of our Brain, but all that which is in our Mind, when we assert with Truth, that we do conceive a thing, after any manner whatsoever.

XII. *The Idea's we have, are not the Product of our Senses.* In the Second place we infer hence, that the *Ideas* of our *Mind*, do not proceed from our *Senses*: For, as was said before, nothing is so clear an object of our *Mind*, as our *Cogitation*, neither is any thing more distinctly known to us, than this Proposition, *I think, therefore I am*: Now we can have no certainty of this *Proposition*, except we distinctly conceive, what *Being* is, and what *Cogitation* is; and it would be in vain for any to demand any further Explication of these Words from us, since every one understands them, and cannot be further explained without some confusion. But who will say that these *Idea's* of *Being* and *Thinking* are produced by the *Senses*, and have been convey'd to the *Mind*, by the help of *Bodily things*? Wherefore *Ideas* are not to be attributed to the *Senses*, but to the *Mind*, which hath the Power of producing them, and forming them out of it self, without any outward assistance. Tho' indeed the *Mind* be often excited to the producing of them from things that strike the *Senses*: Because this is no more, than in the case of an *Architect*, who may be inclined to Build a House from the Mony which is promised him: But it would be very foolish therefore to assert, that Mony had been the Original of the House.

XIII. *Clear Idea's.* Thirdly, We may gather that *Idea's* are of two kinds, clear and confused: Because all of them have not the same Evidence, but exceed one another in clearness and distinction. Now those *Idea's* are called clear, which are evident and manifest to our *Mind*, when it gives heed to them; in the same manner as we say that Objects are clearly beheld, when being present to us, they act strongly enough to be perceived by us, and our Eyes are well disposed to behold them.

XIV. *Distinct Idea's.* Those *Idea's* are called *Distinct*, which are so precise, and diverse from all others, that they contain nothing, which doth not manifestly appear, to him that gives heed to them, as he ought. So when a Man feels some great *Pain*, that perception of *Pain*, is very clear to him, but is not always *distinct*: For commonly Men confound it, with their obscure *Judgment* concerning its *Nature*, which they suppose to be in the grieved part, and to resemble the *Sense* of *Pain*, which alone they clearly perceive. And the reason is the same concerning other *Qualities*, viz. *Sound*, *Colour*, *Smell*, *Cold*, *Heat*, all which they conceive to be in the Objects themselves, and think there is something like these Sensations in the *Senses*, or the *Idea's* we have upon their account. These *Idea's* therefore are called *Obscure*, because they represent things or *Objects*, confusedly or obscurely. Let this therefore be

The Eighth Rule of Truth.

XV. *The Eighth Rule of Truth.* *That Idea, or perception of a thing is clear and distinct, which represents the thing it self to the Mind, according to the foregoing Rules of* Truth: *And that obscure and confused, which doth more or less depart from the same.*

For seeing that that *Idea* is more clear and distinct, which involves least doubtfulness, and which represents more parts and Adjuncts of a thing to the Mind, and distinguisheth it from all other things; it must follow that that Perception is clear and distinct, which represents a thing to the Mind according to the foregoing Rules.

XVI. *The Rule explained.*

The Ninth Rule of Truth.

XVII. The Ninth Rule. *He whose Mind is furnished with most, and most perfect Idea's, is the most knowing and understanding Man.*

XVIII. *The Explication of this Rule.* For seeing that every thing is made manifest by its *Idea*, and whatever is known of it, is contain'd in its *Idea*, it is clear that the more *Idea's* we have in our Minds, the greater must be our Knowledge: And by how much the several Perfections do evidently and distinctly comprehend more particulars, by so much the more excellent and perfect must that Knowledge be.

AN APPENDIX.

Of the Imposition, Signification, Definition and use of Names.

I. *Of the Things that are handled in this Appendix.* FOr as much as the *Names* or *Words*, we use in discourse are Marks and Signs of our Conceptions, and consequently of the things themselves, we have thought fit to add something here concerning their *Imposition*, *Signification*, *Definition* and *Use*, and this by way of *Conclusion*.

II. Epicurus *was of opinion that the names of things were from* Nature. It hath been an enquiry amongst the *Philosophers* of old, whether the Names or Words we use in Speech, were from Nature, or from Custom, and Consent: Or, which is the same, whether it be natural for all Men to speak those words, by which they utter their Conceptions; or whether they were imposed on things from the free choice of Men, and invented to be put instead of our Conceptions. *Epicurus* ascribes the original of *Names* to *Nature*, and asserts them to be effects produc'd by the force thereof. So that the first Men, when they were struck by the Image, proceeding from the Object, and found several *Passions* of *Love* or *Hatred* stirr'd up in them, broke forth into some Voices, by which they designed them, no otherwise than if they had pointed at them with the Finger, or some other Bodily Gesture. And accordingly his opinion was, as *Proclus* tell us, Chap. XVII. That *Names* are as well from *Nature*, as are the operations of *Nature* that go before them, as a Vocal Sound, or the Function of Seeing; *for that the same thing that sees and hears, must also name the things it sees and hears; So that the Name Nature, is an effect or work of Nature.*

III. *Whence the variety of Names proceeds according to* Epicurus. For the variety of Names according to *Epicurus*, which is found in divers Nations, is to be ascrib'd to their different Temperaments, who being affected with different Passions, at the perceiving of things, did express one and the same thing diversly, that is, by a different Voice or Sound. Whence it came to pass that those Nations, who had no Commerce with others, still kept their own Idiom; whereas those that had more Communication with others, did take in some of their Words, which were unknown to their Forefathers.

IV. *Names were imposed from* Mens *free choice.* But whatsoever *Epicurus* may alledge to the contrary, the Names of things do not seem to proceed from Nature, but from the consent and agreement

ment of Men. As may be proved first from *Homonymy* or *Equivocation*, by which the same word is attributed to divers things; which was occasion'd by Mens joyning the same sound to different *Idea's*, so that the same Sound agrees to many *Things*, not according to the same, but different *Idea's*. As for Example, this word *Vacuum* or an *Empty space*, according to the vulgar use signifies, a *place in which nothing is contained, of that which we suppose ought to be in it*: As when we say that a Ship is empty, because it hath no lading. But according to *Philisophers*, *Vacuum* signifies a place in which no bodily thing is contained. In the second place, that Names have their original from the voluntary imposition of Men, is apparent from *Polyonymy*, and *Synonymy* which attributes divers words to one and the same thing: As *Liber*, *Codex*, both which signifie a Book; *Ensis*, *Gladius* a Sword. Thirdly, The same may be proved from the changing of Words, by which sometimes one Word, and at other times another is given to the same thing: as now *Aristocles*, afterwards *Plato*; now *Tyrtanus*, then *Euphrastus*, and afterwards *Theophrastus*. Which would not happen so, if words owed their use to *Nature*, and not to the voluntary institution of Men.

V. *Words signifie diversly amongst divers* Nations.

Moreover we find by Experience, that *Words* have their signification from the imposition and will of Men, forasmuch as the same *Word* signifies one thing in this *Nation*, and another in another *Nation*. For what is more common than for a Name or Word, which before represented nothing to your Mind, now to signifie something from the institution of Men? For tho' words must be taken from the People, who have the Power of giving Law concerning them: Yet it is certain, that there is a kind of Speech proper only to those who follow some particular Art or Calling. And tho' as *Philo Judæus* saith, Speech be proper to Man, as *Neighing* to a *Horse*, *Barking* to a *Dog*, and *Lowing* to an *Ox*; yet is not the faculty of speaking Natural, as to the signification of speech, but only with respect to the sound of the *Word*. For the signification of every word doth not agree to it, by any force of Nature, but wholly depends on the free will of Men.

VI. *Names are the Notes or Marks of our* Conceptions.

WORDS therefore being instituted by Men, are the *Notes*, and Signs of our *Conceptions*, and therefore of the things themselves; whether they signifie our conceptions, or the things themselves. That they signifie the inward conceptions of our Mind, appears hence, that whenever we please, we can discover our Secrets, by words to others, they being the Interpreters of our Mind, which represents the image of our Thoughts. *The word that sounds without*, saith S. *Austin* 15 *de Trin.* Cap. XI. *is a sign of the word, that lies hid within.* For otherwise, except *Words* did intimate our *Conceptions*, there would be no such thing as a Lye, which consists in this, that the Mind of a Man doth disagree with the words he utters; or when we have other conceptions in our Mind, than our words import.

VII. *Names do also signifie the things themselves.*

And that *Names* do also signifie the things themselves, we can prove by experience; for because we cannot carry all things with us, we make use of words, for signs whereby to signifie absent things. For it is apparent, when any one calls for some particular Person, as for Example, *Socrates*, that the Name by which he calls him forth signifies the thing which *Socrates* is; and when he commands him to come to him, to return answer, that the Thing is meant and not the Words. Hence the Scripture tells us, that GOD set all living Creatures before *Adam*, that he might give Names to them, conform to the Things themselves. So that it appears that Mankind makes use of Words to manifest their Conceptions, and the Things themselves.

VIII. *To avoid the confusion of Perceptions, we ought to define our Words.*

But because when Words are wrongly understood by us, it occasions great *Confusion* in our *Idea's*, and also in our *Discourse*, therefore we are used to define what we mean by our *Words*, and to declare what we would have to be understood by them. For it often happens, that one Word, signifies many Things, by which means, the Mind may be easily confounded, by applying it sometime to the one, and sometime to the other *Idea*. For example, The antient *Philosophers* perceiving that there was something in Man, that was the cause of *Nutrition* and *Augmentation*, called it the *Soul*, which *Idea* they afterwards attributed to *Animals* and *Plants*, as finding the same Faculty in them. And discovering also in Man a *Principle* of *Cogitation*, they gave to it likewise the Name of *Soul*. And so from this Sameness of the *Name*, they took occasion to confound the *Principle* of *Cogitation* with that of *Nutrition*, and *Growth*, and took Things wholly different to be one and the same: Which confusion can no otherwise be avoided, than by considering the word *Soul*, only as a Sound, devoid of any meaning, and afterwards bestowing it upon that Thing alone which Thinketh, Saying, *I call that the* Soul, *which is the* Principle *of* Thinking *in us*.

IX. *What the Definition of a Name is.*

And this is that which commonly is called the *Definition* of a *Name*, and is very familiar with *Geometricians*, by whom it is rightly made to be a kind of *Principle*. For it is in the Power of Men, to denote a certain *Idea* by certain Names or Words, and to apply them to what they have a mind. This being the difference between the *Definition* of a Name, and the *Definition* of a Thing, that it is not in the power of the Will of Man, to make the *Idea* contain what they please. For they must needs fall into Error, who going about to define Things, attribute any thing to their *Idea's*, which they do not contain. As for example, If we deprive the name *Parallelogram* of its signification, and no longer consider it, as a Figure including Four sides, but consider it only as a naked Sound, or will have it to signifie a Triangle or Figure consisting of Three sides, we may do so, if we please, neither shall we thereby make ourselves lyable to Error, as long as we make use of the word *Parallelogram* only to signifie a Figure contained within Three lines. And therefore we may say; *A* Parallelogram *hath its Angles, equal to two Right ones*, and *that the greater Angle in a* Parallelogram, *is subtended by the greater side, &c.* But if retaining the signification of the Word, and its ordinary *Idea*, which represents to us a Figure, whose opposite sides are *Parallel*, we should still assert that a *Parallelogram* is a Figure consisting of Three sides, we should fall into Error; for then we should not define a Name, but the Thing; seeing it is a contradiction, that a Figure consisting of Three lines should have its sides *Parallel*.

From

X. *How the Definition of a Name, is distinguish'd from the Definition of a Thing.*

From hence it follows. First, That the *Definition* of *Names* cannot be called in question, because they depend on the will and choice of Man. For it cannot be denied, but that he who defines a *Name*, may give such a signification to the sound of the Word, as best pleaseth him, and maintain that signification, which he puts upon it. But this cannot be in the *Definition* of *Things*, which frequently are controverted, for as much as they may be false, and represent the thing otherwise, than indeed it is.

XI. *The Definitions of things may be doubtful.*

In the second place it follows, that since the *Definitions* of *Names* cannot be questioned, they are therefore to be lookt upon as *Principles*; which cannot by any means belong to the *Definitions* of *Things*, they being *Propositions*, which can be denied by those who find any obscurity in them, and therefore stand in need to be proved, as other *Propositions*; neither are they to be taken for granted, except they be self-evident, and partake of the clearness of *Axioms*.

XII. *Whence Errors do arise in the common* Philosophy.

Wherefore they who are taught in the *Aristotelean Philosophy*, do doubly mistake, First, By confounding the *Definition* of a *Thing*, with the *Definition* of a *Name*, and attributing to the former, what only belongs to the latter; for after that they have alledg'd several *Definitions*, not of *Names*, but of *Things*, which are altogether false, and neither express the *Essence* of *Things*, nor the *Idea's* which we Naturally frame from them; they will needs have us to consider these *Definitions*, as so many *Principles*, or *Perspicuous Notions*, which no Man is able to gainsay; insomuch that if any one refuse to admit them for *Principles*, they are incensed, and do not think such a Person fit to be disputed with.

XIII. *The necessity of Defining Names.*

Secondly, The common *Philosophers* are mistaken, in that they seldom or never have recourse to the *Definition* of *Names*, to rid them of all obscurity, and to addict them to certain and clear *Idea's*, but leave them in their confusion and obscurity. Hence it is that the greater part of their *Disputations* are no better than Contests about Words; which would be easily removed, if those Words that involve any obscurity were defined, and whatsoever makes their meaning doubtful and uncertain were removed. This will appear more fully by an Example: *Philosophers* suppose that nothing is more evident in Nature than that *Fire* is *Hot*; but except it be first cleared what we are to understand by *Heat*, we shall never know, how or in what regard *Fire* is said to be *Hot*. By *Heat*, therefore they do understand either a certain power, wherewith the *Fire* is endowed, to produce in us the sensation of *Heat*, and in this case they truly apprehend the thing as it is: Or else by *Heat*, they apprehend a certain Quality, like to the sensation they perceive, wherein they are mistaken, since that is obscure, neither can it any way be made out how *Fire* is *Hot*, after this manner. For tho' it be clear that the cause of that *Motion* which we experience in our *Bodies*, be in the *Fire*, yet have not we the least ground of evidence, that the *Fire* contains any thing like that which we feel, when we stand near the *Fire*.

XIV. *It is not necessary to define all Names or Words.*

But tho' the *Definition of Names* contributs much towards the clear understanding of *Things*; yet it is not necessary to explain all *Names* by *Definitions*, because that would be often superfluous, and indeed is utterly impossible. For it is certain that Men have many *Idea's* that are so distinct, that those who understand the same Language, as soon as they hear the *Names* of *Things*, they immediately form the same *Idea's*. So they who hear those Names *Entity* or *Being*, *Cogitation*, *Existence*, *Certainty*, *Equality*, and such like, do immediatly apprehend the *Things* that answer to them in their *Minds*; and therefore it is superfluous to explain them by *Logical Definitions*, as being most simple *Things*, and such as are known of themselves. I said also that it was impossible to define all *Names*, forasmuch as to the explaining of any Word, we must make use of other Words, to determin the *Idea's*, to which the Words are addicted, and those Words again stand in need of other Words to explain them, so that it would be necessary to run into infinite. For this Reason we must keep to Primitive Words, and not easily change those which Use hath made to pass current amongst Men.

XV. *In the use of words we are never to recede from the common received Sense and meaning of them.*

They are much in the wrong, who when any Word is to be defined, do not consider what Sense Men commonly attribute to it, and that as far as may be, they are never to recede from it. So he that would put the Name of *Parallelogram* upon a Triangle, would be accounted a Mad-man for his Pains, for contradicting the *Etymology* of the Word, and running Counter to common use and custom. In which regard the *Chymists* are greatly to be blamed, who without the least profit thence ensuing, have changed the Names of Things, and assigned others to them, which have no true Affinity at all with those *Idea's* to which they affix them. Thus by the Name of *Sulphur* (*Brimstone*) they do not understand that Thing, which the Vulgar know and call by that Name, but *a liquid, odorous, oleous* and *Inflammable Substance*, which is the Glue that joyns the Parts of dry Things together: Neither do they by the word *Mercury*, understand *Quicksilver*, but a certain most subtil and clear Liquor, of an *Acid* or Sourish Taste, which readily Penetrates every where, and easily vanisheth away. And by the name of *Water* they understand another far more copious Liquor, which dissolves *Salt*, which cannot be dissolved by *Sulphur* or *Mercury*. Hence we infer

The last Rule of *Truth*.

XVI. The Tenth Rule of Truth.

The Names of Things which we use in Philosophizing, *must be clear and determinate as to their Signification; not Obscure or Ambiguous.*

For seeing that all the Things which we do heedfully Interpret, are delivered by us, in *External Expressions*, the highest excellency whereof is *Perspicuity*, it is necessary that we make use of fit and usual Words for the expressing of Things, and take care to give distinct Names to distinct Things.

The Second Part of Logick.

Concerning the Right Judgment of the Mind; or Proposition.

CHAP. XI.

Of Judgment, *Absolute and Compared.*

I. *What Judgment is, and that Affirmation and Negation belong to it.*

HAving thus informed our selves what *Idea's* are, and how they are distinguish'd from each other, the Order we have set our selves in the beginning of this Treatise of LOGICK, requires that we now speak of their *Composition*, whence JUDGMENT, or the Second Operation of the *Mind*, as others call it, doth proceed. And herein consists the whole Sum of our *Knowledge*; because when our *Mind* hath once past a firm and stable *Judgment* of any thing, it thinks it self arrived to the very Top of *Science*. To *Judge* therefore, is nothing else, than to assent to those Things, of which we have clear and distinct Idea's; or to deny our assent to those things whilst the Idea's that represent them are obscure, and are perceived to be so. And therefore *Judgment* is a kind of *Composition*, by which the *Mind* joyns one *Idea* with another by *Affirmation*, or separates it from another by *Negation*: As when from the Perception of the *Sun* and *Light*, he assents that the *Sun is Lucid*; or from the Perception of the *Moon* and *Cheese*, denies *the Moon to be Cheese*.

II. *To Judgment* assent *or* dissent *is required.*

For it is not sufficient to *Judgment*, to know two *Idea's* jointly; but it is necessary, that the one be conceived to be in the other, and that assent be given to *Truth* as soon as it appears: For an *Affirmation* and *Negation* appertain to the Essence of *Judgment*; neither can there be any Judgment without *Assent* or *Dissent*. Wherefore as long as a Man sticks in doubtful Enunciations, to which the *Will* doth not yet yield its *assent*, and being Uncertain, enquires concerning the *Truth* of them, he cannot be said to *Judge*, till after a full determination of his *Mind* he affirms the thing to be, or denies it to be such as he perceives it.

III. *To the right forming of Judgment, it is first required, that the* Understanding *precede.*

To the right Forming of *Judgment*, it is required, First, That the *Understanding* do precede, and that the things be known, before that we affirm or deny any thing concerning them; since we cannot attribute ought to another thing, except we have first perceived them both. Wherefore in every *Categorical* or *Simple Proposition*, it behoves us to have a distinct Perception of the Terms, *viz.* the *Subject* and the *Attribute*, before we assent to the Conjunction of them; in every *Hypothetical*, of the *Connexion* of the *Antecedent* and *Consequent*; in a *Modal*, of the *Mode* and the *Thing said*; in a *Disjunctive*, of the *Repugnance* between the *Antecedent* and the *Consequent*; in a *Copulative*, of their *Simulty* or Existing at one and the same time. And the same Caution is to be used in refusing our *Assent* to any Proposition; seeing that Men for want of this Observance fall into great Errors, and judge preposterously of things. How many are there that judge the *Earth to be plain* or *level*; that the *Moon* has the *Figure of a Dish* or *Platter*; that the *Stars* are very *Little things*, and that the *Sun* is *much less than the Earth*; because they never had a true Perception of any of these things, but trusting to their Infant Prejudices, believe nothing to be True, but what agrees with the report of their Senses.

IV. *Secondly, we must examine all things anew.*

Wherefore it is requisite in the next place, for the avoiding of all Mistakes in *Judging*, to take a firm Resolution, not to admit any of those things for *Truth*, which formerly we believed such, before we have called them to a fresh and accurate Account, according to the foresaid *Rules* or *Precepts* of clear and distinct *Perception*; and that we suspend our *Judgment*, till we be certain of their Truth. For he who withholds his *Assent* is thereby secured from Error; and he who *assents* to what he hath well understood, is so far from being Mistaken, that he embraces and enjoys *Truth*.

V. *Thirdly, In passing our Judgment, we are to distinguish between Objects and Occasions.*

In the Third place, To avoid our mistake in *Judging*, we must distinguish between the Things and Occasions in which we are to pass our Judgment: For either we are conversant about the Search of *Truth*, or about the things that belong to *Life*, and which are considered with relation to Practice. If we consider things under the first respect, we must suspend our *Judgment*, when they are not fully known by us, that is, when any obscurity or confusion appears in the things we have under Examination. If we consider them the Second way, we need not make use of so great Precaution, especially when the necessity or opportunity of Business doth not allow us sufficient time for an exact Disquisition; for otherwise we should often let slip an Occasion, before we could resolve our Doubts about the matter. Wherefore in cases where delays are prejudicial, it is best to examine the thing only so far as Time permits, and to embrace what appears for that time cleerest and best to us. And having once past our Choice, we are no longer to consider it as Doubtful, in reference to Practice; but as a thing most evident and certain, as if we had been assured of it by a clear and manifest Demonstration.

VI. *What Compar'd, or Comparative Judgment is.*

Compared, or *Relative Judgment*, is between more things, which we refer to another Third thing; in which, if they agree, they are called *the Same*; but if they disagree, *Diverse*. For *Comparison* is not the simple Consideration of one thing, to which we Assent or Dissent; but the Comparing of one thing with another in *Quantity* or *Quality*: In *Quantity*, when we enquire not only of the Dimension, but of the Value, Virtue, or Perfection of a thing; for from hence comes the *Equality* and *Inequality*, *Greater* and *Lesser*. For things that are compared together in *Quantity*, are such as have either the same *Quantity* one as the other, or a greater or lesser.

VII. *What things are even or Equal.*

Things that agree in the same *Quantity*, are called *Even* or *Equal*, because they are compared with respect to something, which is found in the things compared in an Equal Proportion. As at the *Equinoxes*, the *Night is equal to the Day*: Hector *is equal to* Achilles *in Bodily Valour*. For-asmuch as by the Name of *Quantity*, is not precisely to be understood *Mathematical Magnitude*, but any Equality or Inequality, whether it be measurable, or not.

VIII. *What Uneven, or Unequal. What Greater.*

Things that differ in *Quantity*, are called *Uneven*, or *Unequal*; and such are either Greater or Lesser. *Things Greater*, are such as exceed others in Quantity, or which by their Quantity, exceed the Quantity of those things wherewith they are compared.

Those

G. Freeman Inv.

I. Kip Sculp.

To the R.t Worshipfull Knight, their Majesties Son and Heyre of Henry near Rippon in Yorkshire Daughter and Coheyre of Blencow in Cum=berland Knight.

S.r William Thomson Sergeant at Law, only Thomson of Hollin Hall Gent, by Elizabeth of S.r Henry Blencow, Knight.

This Plate is humbly Dedicated, by Richard Blome.

IX. *What Lesser.* Those things are *Lesser*, which in Quantity are exceeded by others: For the Lesser is made use of to set forth the Greater *Excellence*, *Dignity*, *Number*, or *Usefulness* of the other. Thus *Plato* is *said to be a more Excellent Philosopher than* Socrates: *A Dog swifter than a Wolf.* A Comparison in *Quality* is, when the *Similitude*, that is, the Proportion; or *Dissimilitude*, that is, the *Disproportion* of things is consider'd. Where by the Name of *Quality*, we are not to understand a *Physical* or *Natural*, but a *Logical Quality*; such as is *Affection*, *Nature*, *Faculty*, *Action*, *Passion*, *&c.*

X. *What things are Like.* Hence those Things are called *Like*, which agree in *Quality*; or which being compared together, are found to have some *like* Affection or Faculty. As when we compare the *Sun* and the *fix'd Stars*, with respect to *Light* which is found in them both, we say they are like one another. For things compared are not alike in all things, but differ also in many *Specialties*. But when we compare those parts or respects wherein they agree, from one Like we rightly conclude the other, because the *Effects* and *Adjuncts* of like Causes and Subjects are alike, and so on the contrary.

XI. *What Unlike.* Those things are *unlike* whose *Quality* is diverse; or those are diverse *Comparates*, which differ in Qualities, Actions, and Passions. So, *A Wise man is unlike to the Moon; A Constant man is unlike to a Reed shaken with the Wind.* Hence from things that are Unlike, Unlike things are concluded; because the *Effects* of Unlike Causes are unlike, as are the *Adjuncts* of unlike Subjects, and on the contrary. Wherefore because a *Reed* is easily driven this way and that way by the Wind; and S. *John* is not so easily shaken, therefore in this regard, S. *John* and a *Reed* are unlike. Here we are to take notice, that the Unlikeness is to be restrained within the bounds of that *Quality*, wherein the Comparison is made.

CHAP. XII.

What a Proposition is, and how manifold.

I. *What things make up a Proposition.* A *Proposition*, or *Enunciation*, according to *Aristotle*, is an *Oration* or *Speech*, which *affirms* or *denies*; or an *Oration*, that signifies either *true* or *false*. From which Definition it clearly appears, that to every Proposition two *Forms* at least are required; the One, of which something is affirmed or denied, which Term is called *Subject*; the Other, which is said or denied of another, which Term is called the *Attribute*: As when I say, *God is Existing*; *God* is the Subject, and *Existing* the Predicate.

II. *The word* Is, *joyns the Predicate with the Subject.* But because it is not sufficient to conceive these two Terms, except by our *Cogitation* they be joyned together, or disjoyned; the word *Is*, is the Sign of the *Mind*'s affirming, that is, of joyning these two Idea's of *God* and *Existing*, as agreeing together. But when I say, *God is not finite*, the word *Is*, joyned with the Negative Particle *Not*, imports an Action contrary to Affirmation, or denotes, that we look upon these two *Idea's* as repugnant; forasmuch as in the conception of *Finiteness* something is included, which is contrary to the Nature of *God*.

III. *A Proposition doth not always stand in need of an Attribute, Subject, and something to joyn them both.* Yet sometimes we express Propositions after another manner: As when we say, *Charles walketh*; *Injustice thrives amongst men*; because under these words, as well the Connecting word *Is*, as the Predicate are contained: And therefore these Propositions are the same as if one should say, *Charles is walking*; *Injustice is thriving amongst men*: Yea, it is customary with *Logicians*, as often as the word *Is*, is used without any Predicate following it, to understand the Predicate to be comprehended under it: For this Proposition, *Man is*, is resolvable into this other, *Man is existing*. It matters not therefore whether a Proposition consist of Three words, as *Charles is walking*, or of Two, as *Charles walketh*, or One word only, as *Ambulo*, *I walk*, the Latin word including all the Parts of a Proposition in it.

IV. *A Proposition is either Affirmative or Negative.* From this Explication of a *Proposition* it follows, that all *Propositions* are either Affirmative or Negative: For since the Judgment of our Mind is twofold, *viz. Assent* and *Dissent*, Propositions which are the Interpreters of it, must likewise be divided into *Affirmative* and *Negative*. Which indeed is the first and chiefest Division of them, as being taken from the *Copula* or Connecting word it self, or from that Action of the *Mind*, which either joyns the Attribute with the Subject, or separates it from it.

Wherefore concerning the Judgment of an *Affirmative* and *Negative Proposition*, let this be

The First Rule.

V. *The first Rule.* *That is an Affirmative Proposition in which the* Subject *and* Attribute *are joyned, or do agree; and Negative, in which they are disjoyned, or disagree.*

VI. *Explication of the Rule.* For a Thing is then affirmed to be what it is, when the *Predicate* or *Attribute* agrees with the Subject, or when it is one and the same thing with it: As when we say, *Man is an Animal*. But a thing is pronounced not to be, what it is not, when the Attribute differs from the Subject, and agrees not with it: As when we say, *Man is not a Beast*, because Man is declared not to be such, as indeed he is not. This Division of a *Proposition* is according to *Quality*; because when any one asks, of what kind the Proposition is, it is answered, *Affirmative* or *Negative*.

VII. *In an Affirmative Proposition the Attribute is restrained.* We are to observe, that in an *Affirmative Proposition* the *Attribute* is to be taken in all its Comprehension, but not in all its Latitude. As when I say, *Every Circle is a Figure*; whatsoever is contained in the Idea or Essence of a *Figure*, the same is affirmed of a *Circle*; but yet the word *Figure* is not taken in its whole Latitude, for it is of much larger extent than that of *Circle*; and therefore this Proposition cannot be simply converted in saying, *Every Figure is a Circle*. Wherefore in this Proposition the *Attribute* is restrained by the *Subject*, and reacheth no farther than the Subject doth.

VIII. *But not in a Negative.* But the case is different in a *Negative Proposition*; as, *No Circle is a Square*: For here the *Attribute* is taken in its whole Latitude; so as that we may say as well, that *No Square is a Circle*, and all *Squares* must be denied of a *Circle*. But the Attribute is not taken according to the whole Comprehension of its Idea, as if all the Attributes of a *Square*, were to be denied of a *Circle*: For a *Circle* and *Square* agree in the Idea or Notion of *Figure*.

There

IX. *There are Propositions Universal, Particular and Singular.*

There is another *Distinction* between *Propositions*, which ariseth from the Subjects, that go before the *Copular* according to which they are called, *Universal*, *Particular*, or *Singular*. An *Universal Proposition* is that to whose Subject a Note of *Universality* is annexed; such as *Every* or *All*, *None*: As, *Every Man has a Soul*; because Man is a common Term, which is taken in its whole *Latitude*. But when a common Term is only taken in an undeterminate part of its *Extension*, with these Notes; *Some*, *Some Body*, *&c.* then it constitutes a *Particular Proposition*, whether it Affirm, as *Some Lovers are miserable*; or deny as, *Some Courtiers are unjust*. But if the Subject of the Proposition be Particular, it makes a *Singular Proposition*, as *Charles* I. *now Reigneth in England*. And this *Distribution* of a *Proposition*, into *Universal*, *Particular* and *Singular*, is said to be made with respect to *Quantity*, because when any one asks *Quanta* (of what extent) the *Proposition* is, we fitly answer, that it is *Universal*, *Particular* or *Singular*.

The Second Rule.

Concerning the Judgment of an Universal, Particular and Singular Proposition.

X. The Second Rule.

The value of these Propositions is to be Estimated, from the Extension and Limitation of the Subject and Attribute.

XI. *Universality is two-fold*, Metaphysical *and* Moral.

That we may the more exactly distinguish *Universal Propositions* from Particular, we are to take notice of a two-fold *Universality*, the one *Metaphysical*, the other *Moral*. *Metaphysical Universality*, is when a thing is taken according to its whole Extension, without any Exception: As, *Every Body is Extended*: For this admits no Exception. *Moral Universality* is that which hath Exception; because in Moral Things, it is only minded whether things be so for the most part, as they are declared to be. As if one should say, *All Singers have this fault, that they never will be entreated to Sing, but when not entreated, they can never leave Singing:* Because it is sufficient if it commonly be so. For seeing that such *Propositions* as these, are not so general but that they admit of Exception, nothing can be rigorously infer'd from them; since it may be false of this or the other particular *Singer*, that he will never be Entreated to *Sing*, and never cease *Singing* when not Entreated.

XII. *Propositions of the Singulars comprehended under one Genus.*

There are other *Propositions* that are *Universal de Generibus Singulorum*, but not *de Singulis Generum*, that is, of all the Species contained under one *Genus*; but not of all the Particulars of the same kind: As, when it is said that *all living Creatures were saved in the* Ark *of* Noah, which is not so to be understood, as if all, of all the Species of *Animals* had been shut up in the *Ark*, in the time of the *Deluge*; but only that some of all kinds were there saved.

XIII. *Propositions Indefinite.*

Besides the *Universal*, *Particular* and *Singular Propositions*, there are those which are called *Indefinite*, which tho' they have an *Universal Subject*; Yet the same is taken neither Universally nor Particularly, but Indeterminately: As, *Man is a Living Creature*. *A Triangle has Three Angles equal to Two Right ones*. Because no Universal Note as *Every*, *None*, or Particular, as *Some*, *Some one*, is put before *Man* and *Triangle*.

XIV. *Of Propositions, some are Simple and others Compound.*

A *Proposition* in general is divided into *Simple* and *Compound*. That is a *Simple Proposition*, which consists only of one Subject and Predicate: As, *Man is a Living Creature*. *A Loadstone draws Iron*. *Compound Propositions* are such as consist of more Subjects and Predicats: As, Peter *and* John, *went up at the ninth Hour of Prayer*. Where this *Attribute went up*, is not affirmed of one Subject, but of more than one, *viz.* *Peter* and *John*. And such *Propositions* as these are Equivalent to two or more *Propositions*; for if this *Proposition* were to be explained, we must do it by these two *Propositions*, Peter *went up*, John *went up*.

XV. *Words Adjective make a Complex or Compound Term.*

Words Adjective, or *Connotative*, make a *Complex Term*, whether they be put alone, or joyn'd with *Substantives*. For the Word *Wise*, doth confusedly signifie the thing in which *Wisdom* is; but denotes *Wisdom* distinctly. And when I say, a *Wise Man*, in these two Words a kind of *Proposition* is contained: For it comes to the same thing whether I say, a *Wise Man*, or a *Man that is Wise*. Wherefore every *Adjective* or *Connotative Term*, doth include a *Proposition*, which since it accedes from without, to the *Proposition* called *Principal*, it may be rightly called an *Adjunct*, or *Incident Proposition*.

The Third Rule.

Of the Judgment of a Simple and Compound Proposition.

XVI. The Third Rule.

The Simplicity or Composition of a Proposition is taken from the Combination or Disjunction of the Terms, that is, of the Subject and Predicate, whether the same be single or manifold.

XVII. *Compound Propositions are manyfold.*

Compound Propositions are of two kinds; for some are such in which the Composition is Evident; others again in which it is more hid, which the *Logicians* therefore call *Exponibiles*: Of the first sort are *Propositions*, *Copulative*, *Disjunctive*, *Conditional*, *Causal*, *Relative*, and *Discretive*.

XVIII. *Of Compound Propositions some are Copulative.*

Copulative Propositions are such as include more Subjects and Predicates, joyned by an *Affirmative* or *Negative Conjunction*. As when I say, *the Sun and Moon Illuminate the Earth*; for here I joyn *Sun* and *Moon* together, and affirm of them both, that they *Illuminate* the *Earth*. For the parts of a *Copulative Proposition*, are entire simple *Propositions*, which have another Predicate or Subject.

XIX. *Some Disjunctive.*

Disjunctive Propositions are those in which the *Disjunctive* Note *or*, *either*, *whether*, and the like is found; As, *a Man either has, or has not a Child*. *Either the* Earth *is mov'd about the* Sun, *or the* Sun *about the* Earth. The truth of which *Propositions*, depends upon the necessary Opposition of the Parts, between which no Medium can be assigned. And therefore this *Disjunctive Proposition*, *It is either a* Man, *or an* Animal, *is false*, because the Parts are not opposite to each other. As is likewise this, *It is either Peace or War*, because there may be a *Truce* or *Cessation* of *Arms*, which is a Mean between *War* and *Peace*. So that to the absolute *Truth* of *Disjunctive Propositions*, it is necessary that they have no Mean at all; but to their being Morally true it is sufficient, if commonly they have none.

XX. *Others Conditional.*

Conditional Propositions consist of two *Propositions*, joyned by the *Conditional If*, as; *If God be merciful, he will forgive Sinners*, *If that be a Triangle*,

Triangle, it hath three Angles equal to two Right ones. The First, In which the Conditional is put, is called the *Antecedent*, and the other the *Consequent*. And it is to be noted, that the *Truth* of an *Hypothetical* or *Conditional Proposition*, doth not consist in the *Truth* of the *Antecedent* or *Consequent*, but in the Union and Knitting of them both by the Conditional *If*; for a *Conditional Proposition* may be true, tho' both its Parts be false; as *If a Tree walks it hath Feet.*

XXI. *Others Causal.* *Causal Propositions*, are such as contain two *Propositions*, joyned by the *Causal Conjunctions Because, That*; As, *A Covetous Man loves no Body, because he confides only in himself. Kings are often raised to a Throne, that they may be miserable.* For to the *Truth* of such *Propositions* as these it is requisit, that the one of them be the cause of the other, and therefore both of them must be True: For what is false hath no Cause, neither can it be the Cause of another thing.

XXII. *Others Relative.* *Relative Propositions*, are known by some Note of *Comparison*; as *Where the Treasure is, there is the Heart also. A Woman is so far to be esteemed, as she is Vertuous.*

XXIII. *Others Discretive.* Lastly, *Discretive Propositions*, are such in which we frame different *Judgments*, and determine the said Difference by such Signs as these, *But, Yet*; As, *Tho' GOD be Merciful, yet he is Just. The beloved thing may be separated from a Lover, but Love not.* The *Truth* of these depends on the *Truth* of their Parts, and of the separation which is put between them. Tho' both the Parts were true, yet because there is no opposition between them, this would be a ridiculous *Proposition*: *A Covetous Man Loves Riches, and yet cannot endure that any one should be Liberal towards the Poor.* A *Discretive* is the only *Proposition* that is excluded from the *Composition* of a Syllogism.

XXIV. *Of Propositions some are Subaltern, Contrary, Subcontrary, and Contradictory.* Amongst *Propositions* that have the same *Terms*, and disposed in the same *Order*, but modified with various *Quantity* or *Quality*, are reckon'd up the *Subaltern*, *Contrary*, *Subcontrary* and *Contradictory*. *Subaltern Propositions* are an Universal, and particular of the same *Quality*: As, *Every Circle is a Figure*; *some one Circle is a Figure. Contrary*, are two *Universal Propositions* of divers *Qualities*: As, *Every Man is Rich, No Man is Rich*; which may be both false. *Subcontrary Propositions*, are two particulars of divers *Qualities*; As, *Some one Man is a Physician*; *Some one Man is no Physician. Contradictory* are such as differ in *Quantity* as well as *Quality*; As, *Every Man is a Living Creature, Some one Man is no Living Creature*: Which cannot both of them be true, nor both false.

CHAP. XIII.

Concerning the Truth and Falshood of Propositions.

I. *Truth is found in three things* 'Tis commonly said that *Truth* and *Falshood* are found in these three Things; *viz.* In the *Mind*, in *Things*, and in *Propositions*. *Truth* is in the *Mind*, as in its Subject: So things are said to be true, in the *Divine Intellect*, because they had there from Eternity, their objective and known *Being*: Which does not properly place any *Eternity* in them, but in *God*. *Things* are said to be *True*, when they have such an Essence as they ought to have, or when they comport with their *Idea*; and those false which disagree with their *Definition* or *Essence*. So GOD answers to that *Idea*, which he himself hath of a *Being*, Infinite, Immense, Eternal, &c. But the *Sun* is no true *God*, because it differs from that form of Cogitation which we have concerning *God*.

II. *Wherein the Truth and Falshood of a Proposition doth consist.* The *Truth* of a *Proposition*, consists in this, that it pronounceth a Thing to be such as it is: As when I say, *the Earth is Round*, it is a true *Proposition*, because I Affirm that of the *Earth*, which belongs to it, *viz.* a Round Figure. So likewise when I say, *A Beast is not Rational*, it is a true *Proposition*, because I remove from a Brute what does not belong to it. Wherefore *Truth* is said to be the Property of a *Proposition*, and to which it peculiarly doth belong. For since a *Proposition* is either *Affirmative* or *Negative*, that wherein the Attribute is affirmed to be in the Subject, is True, that is, conformable to the Object, if it be really in it; and False if it be not in it. And so a *Negative Proposition*, in which the Attribute is denied to be in the Subject, is True if it be not in it; but False if it be in it.

III. *Truth is either objective or Subjective, which is also called Formal.* The *Truth* which consists in the Connexion or dissent of both extreams, is called *Objective*; but *Subjective* or *Formal Truth*, is the *Judgment* or *Act* of the *Mind*, by which the extreams of a *Proposition* are joyned together; or disjoyned as far as the Judgment agrees with the thing it self.

IV. *One and the same Proposition cannot be true and false at one and the same time.* The same *Proposition* cannot be both True and False, for then Contradictories would exist together. For suppose some *Affirmative Proposition*; if it be true, the Attribute agrees with the Subject; if *False*, it doth not agree. And therefore, if we should suppose it to be *True* and *False* at once, then must it at the same time agree and not agree. Now it is a contradiction that the same thing should agree and disagree with the same thing; or that the same Attribute should be, and not be in the same Subject. It follows also, that we cannot at the same time Assent to, and Dissent from the same thing, because both those Judgments are opposite, and that the one excludes the other: Which would happen, if the same *Affirmative Proposition*, were at the same time *True* and *False*; for we should assent to it, if the Attribute did agree with the Subject; and should deny our assent, if it did not agree; which plainly implies a Contradiction.

V. *An Objection answered.* If you object, this *Copulative Proposition*, Claudius *and* Theophilus *Gaze upon the Stars*, when only one of them beholds the *Stars*, will be both *True* and *False*; seeing it is True, that the one beholds the *Stars*, and the other not. I answer, that this *Proposition* to speak absolutely is *False*, forasmuch as *Copulative Propositions* import a Sameness of Time, and their *Truth* depends on both extremes, so that if one of them doth not agree with its Attribute, it renders the *Proposition False*. As, suppose any one should say, *A Good Life and Riches are necessary to Salvation*, this Proposition would be False, because that tho' a Good Life be necessary to Salvation, yet Riches are not. But if we take this Proposition without including any Sameness of time, then it will furnish us with two *Mental Propositions*, and so it will be True, *Claudius* Gazeth on the *Stars*, and *Theophilus* does not; and on the contrary.

VI. *Propositions necessarely true, and necessarily false.* Tho' it be necessary that all Propositions be either True or False, yet are not all equally true and certain: Or which is the same, the Attributes do not agree with the Subjects in the like degree of necessity.

neceſſity. For ſome *Attributes* are after that manner in their Subjects, that their *Subjects* cannot be without them: As *Extenſion*, with reſpect to *Bodily Subſtance*; *Cogitation*, in reference to the *Soul*: And therefore this Propoſition, *A Body is an extended Subſtance*; *A Soul is a thinking Subſtance*, are called neceſſary, becauſe their Predicats and Subjects are united by an Indiſſoluble Band. Whereas other Attributes are at ſuch a diſtance from thoſe Subjects, that its impoſſible for them to agree with them, as a *Stone* with relation to *Man*; *Unevenneſs* with reſpect to the Number *Two*; and therefore theſe Propoſitions, *Man is a Stone*; *The Number Two is Uneven*, are ſaid to be neceſſarily *falſe*; becauſe there is a manifeſt Repugnance, that the Predicate *Stone* ſhould agree with *Man*, and *Unevenneſs* with the Number *Two*. Both theſe kind of Propoſitions, by reaſon of the immutable Conſent or Diſſent of their Terms, are ſaid to be of *Eternal Truth*.

The Fourth Rule.

Concerning the Judgment, or a Propoſition neceſſarily true or falſe.

VII. The Fourth Rule. *That Propoſition, whether Affirmative or Negative, is true, wherein things to be joyned, becauſe of the immediate and indiſſoluble Band of the Terms, that is, of the Subject and Predicate, are conjoyned univerſally of themſelves, and reciprocally; or are diſjoyned, becauſe of the incompoſſibility or repugnancy of their Terms. And on the other hand, That Propoſition is falſe, wherein Things to be joyned are disjoyned, and things Diſſentaneous conjoyned.*

VIII. *The Rule explained.* For ſeeing that *Objective Truth* conſiſts in the Agreement or diſagreement of both Extreams, *viz.* of the *Subject* and *Attribute*, it muſt follow that that Propoſition in which things conſentaneous are Conjoyned, becauſe of their indiſſoluble Connexion, is neceſſarily true: As, *Man is a living Creature*; becauſe Man, without a living Creature, cannot be. And, *Man is not a Beaſt*, is neceſſarily true; becauſe it is repugnant that Man ſhould partake of the Nature of a Beaſt. In like manner theſe Propoſitions, *Man is not a living Creature*, and *Man is a Beaſt*, are neceſſarily falſe; becauſe it is a contradiction that living Creature ſhould be ſeparate from Man, or that Man ſhould be a Beaſt.

The Fifth Rule.

IX. The Fifth Rule. *That Propoſition, whether Affirmative or Negative, is contingently true, wherein the Subject and Attribute do only ſometimes agree, or not agree, becauſe of their ſeparable connexion; and that falſe, in which the thing is otherwiſe expreſt than it is, whether it be propounded Affirmatively, by conjoyning things which are to be disjoyned; or Negatively by disjoyning things to be conjoyned.*

So this Propoſition, *The Air is enlightned*, or *Man runs*, is only contingently true; becauſe the *Subject* in the firſt Propoſition, *viz. Air*, may be without its Attribute, as being but ſometimes enlightned: And the *Subject* in the ſecond Propoſition, *viz. Man*, may likewiſe be without its Attribute, ſeeing it is but ſometimes that he Runs. But if any one, whilſt the Air is enlightned, ſhould ſay the Air is not enlightned, the Propoſition will be falſe; becauſe he ſeparates Light from the Air, which then agrees to it: Or if when it is dark, he ſhould ſay, The Air is Light; becauſe he joyns things that ought to be disjoyned.

X. *What Opinion, Science and Error is.* Hence it appears, what is a probable Propoſition and *Opinion*, as alſo what *Science* and *Error* is. For ſeeing that the probability of a Propoſition conſiſts in this, that it approacheth more to Evidence than Obſcurity, that *Propoſition* is to be accounted *probable* to which the Mind aſſents, becauſe of the likelyhood there is of the Attributes agreeing with the Subject, or on the contrary, of the Attributes diſagreeing with the Subject. Whereas *Science* is, when the Truth of a thing is certainly and evidently perceived by Reaſon. For ſince the certainty of a Propoſition depends of its Evidence, that Propoſition is accounted certain to which the Mind firmly adheres, and whoſe Attribute it judges doth neceſſarily agree with the Subject. And laſtly, *Error* is, when the Mind aſſents to a falſe Propoſition for a falſe Reaſon, which it apprehends to be a true one.

XI. *Contingent Propoſitions are disjunctively neceſſarily true or falſe.* There are other Propoſitions, which tho' they be neither neceſſarily true nor falſe, yet muſt needs be either true or falſe *disjunctively*; ſuch are thoſe Propoſitions whoſe Predicats do only *contingently* agree with their Subjects, and may be abſent or ſeparate from them: As, *Rich*, *Powerful*, *Married*, *&c.* with reſpect to Man. Wherefore theſe Propoſitions, Croeſus *is rich*; Caligula *is powerful*; Thomas *is a Husband*; are ſaid to be Contingent, that is, they are true in ſuch a manner, as that they may be falſe; and yet it is neceſſary for them to be either true or falſe ſeparately: Becauſe every Propoſition, in contingent matter, is either true or falſe disjunctively, that is, cannot be deny'd to be either true or falſe. It may indeed be deny'd, that ſuch a Propoſition is neceſſarily true or neceſſarily falſe; but it cannot be deny'd, but that it muſt be either neceſſarily true, or neceſſarily falſe disjunctively.

XII. *A true Contingent Propoſition, cannot be changed into a falſe one.* A true Propoſition in Contingent Matter, cannot be changed into a falſe one. Which is thus proved; becauſe if this Propoſition, for Example, *John walketh*, be true, tho' but in one inſtant of time, yet it cannot be ſaid to be falſe in that very inſtant wherein it is true: But it is true at one inſtant; therefore for that inſtant it cannot be falſe. Moreover, this Propoſition conſiders *John walking* ſuch a time, at which time wherein he is ſuppoſed to walk, it is always true; or if it ſignifie another time, in which it may be *John doth not walk*, in that caſe the Object is changed, and therefore is not the ſame, but another Propoſition.

XIII. *Objection.* If you ſay, That during the Time wherein this Propoſition, *John walks*, is pronounc'd, *John*, who before walked, may ceaſe from motion, and reſt; and thus this Propoſition, *John walks*, which before was true, will be changed into a falſe one.

XIV. *Anſwer.* To this I anſwer, That tho' at that time wherein this Propoſition, *John walks*, is pronounced, *John* may ceaſe to walk; yet the Propoſition continues true notwithſtanding, if once it was true: Becauſe it either determines the *time* wherein he walks, or that wherein he did walk, and in this reſpect the Propoſition is true; or elſe abſolutely denotes ſome difference of time in reference to which it is verified, and therefore with reſpect to that Time wherein he hath walked, is true.

The

XV. *Propositions concerning a future Contingency, have a determinate truth or falshood.*

The Difficulty is greater concerning the truth of Propositions of a future Contingent: For it is evident enough, that of opposit Propositions of the Present time, one is true and the other false: As, *Peter speaks*, and *Peter doth not speak*: But it may be doubted, whether the same truth be found in these Propositions that respect the Future time; As, *Peter will speak to Morrow*; *Peter will not speak to Morrow*. But it seems certain, that Propositions of a future Contingent, have a determinate truth or falsity: For supposing *Peter* to exist, these two Propositions, *He shall speak*, *He shall not speak*, are contradictory: Now as two Contradictories cannot be together, so it is impossible they should be both of them true, and therefore one or other must be true only; and therefore *Peter will either speak, or not speak*; if he does, the Proposition is true; if he does not speak, it is false: So that one of them is determinately true, and the other false. Again, such as are the Propositions of the Present or Past time, with respect to *Truth*, or *Falshood*, such are the Propositions of the Future: But one of these is determinately true, and the other false; *Therefore, &c.* The Major is clear: For he that pronounceth that a thing will be, and that it will not be, doth speak as true, as he who pronounceth that a thing is, and that it is not; or that a thing was, or that it was not, because it is necessary that one of them must come to pass.

XVI. *Yet is is not necessary, that it be known which of them is true.*

Neither doth it hinder, that we know not which of the Propositions be true, and which false: Because the Truth of Propositions doth not depend upon its being known, or unknown; but upon the Being, or not Being of the thing. Besides, it is certain, that *GOD* knows which of them is true, and that he can reveal the same to whomsover he pleaseth.

CHAP. XIV.

Of Division, and Definition.

I. *Transition, or Connexion of the following Matter, with what goes before.*

HAving explained the Nature of *Propositions*, and clearly and distinctly unfolded their Affections of *Affirmation* and *Negation*, *Universality* and *Particularity*, *Truth* and *Falshood*; it only now remains, that we add something concerning *Distribution* and *Definition*, which are accounted the most Scientifical, or conducive to Science of all other *Propositions*; and are nothing else, but Tokens or Instances of a clear and distinct Perception; or, if you will, they are Primary Enunciations, Axioms of solid Judgment, and Maxims worthy of all belief.

II. *What Division is.*

DIVISION therefore is the Distribution of some Whole into Parts; As, *of a Living Creature into Man and Beast*; *of Number into Even and Uneven*. Now *Division* will not a little conduce to our acquiring a clear and distinct Knowledge of Things, if so be we know how dexterously to make use of it. For seeing that almost in every Object there are many things to be considered, which because of the Difficulties wherewith they are involved, cannot be clearly apprehended by us; it is needful to resolve them into Parts, that so having by Division removed all Confusion, the Particulars may more clearly appear such as they are.

III. *Division is either Real, or Mental.*

Division is twofold, the one *Real*, the other *Mental*: The *Real* is, whereby a Whole is really and indeed divided into Parts; as *a House into the Roof, Walls, Foundation, &c.* of which it consists. A *Mental Division* is, when we divide a Whole only by the help of our *Understanding*: As when we consider in *GOD*, his *Goodness*, *Omnipotence*, *Eternity*. For it doth not always follow, that the thing which our Mind *distributes* into Parts, is compounded and *divisible*; but that only our Conception of it is compounded, and unable to understand so many *Attributes* under one and the same Notion.

IV. *The Primary Division of Genus and Species; and of an Integral, and Essential Whole.*

Division is manifold, according to the threefold kind of a *Whole* and its *Parts*. For it is either of the *Whole Genus into its inferiour Species*, or *of the Species into its Individuals*: As the *Division* of *Substance* into *Mind* and *Body*; of *Mind*, into an *Angel*, or Man's *Soul*: The other is *of an Integral Whole into its Parts*; which is properly to be called *Partition*: As the *Division* of the Body of Man into *Head*, *Teeth*, *Hands*, and *Arms*. The third and last, is the Division *of an Essential into its Essential Parts*; as the *division* of Man into *Mind* and *Body*. And these Three are called *Primary Divisions*.

V. *The Difference between the Division of a Genus into Species, and of a Whole into its Members.*

There is this difference between the two former *Divisions*: In the Division of a *Genus* into *Species*, and of a Species into *Individuals*; the thing Divided may in the Nominative Case be predicated, of the several Parts that divide it: As when *Living Creature* is divided into *Man* and *Beast*, *Living Creature* is expreset in the Nominative of Man and Beast; as Man is a Living Creature; a Beast is a Living Creature. But in the Division of an *Integral* into its Members, the thing *divided* cannot be predicated of the Dividing Members, but in an Oblique case; as when a Body is divided into *Head*, *Breast*, *Belly*, *&c.* it cannot be pronounced of the Parts, but in an Oblique: For we cannot say, *the Head is the Body*, *the Belly is the Body*, but part of the Body. And the reason of this difference is, because the whole Essence of the *Genus* is included in the *Species*, whereas the Nature of the Whole is not in every Part.

VI. *The Secondary Division of an Accident into Subjects, or contrariwise.*

The other *Divisions* are called *Secondary*; as a Division of *an Accident into the Subjects*, in which it is found. As if we should say of the things that are moved, one is the *Earth*, another is the *Moon*, *&c.* A Second, is the *division* of a Subject into its Accidents; as when a Subject is ranged or distributed according to its Accidents. As for Example, Some men are Learned, others Ignorant; some Good, and others Wicked. The Third, of *an Accident into its Accidents*; by which an Accident is divided, not by its own Differences, but by other Accidents of a different kind: As when we say of *White things*, some are hard, others soft, &c.

VII. *Conditions of a good Division. The First.*

Moreover, there are some Conditions required to the constituting of a right *Division*. First, That all and every one of its Parts be exactly enumerated, without omitting any that belong to it; so that the Dividing Members may exhaust the Divided Whole, and neither be more extended or contracted than it: As, *Even*, and *Uneven*, do comprehend the whole extent of this Term, *Number*, seeing there is no Number which is not in it self either Even, or Uneven.

VIII. *The Second.*

The Second is, That both parts of the *Division*, be as far as may be expressed in positive Terms. For the Attributes of a thing that is *distributed*, may

may be better underſtood by *Poſitive Terms*, than by Negative. I add, *as far as may be*, becauſe it ſometimes happens, that the *Poſitive Thing* wants a *Poſitive Name*, and ſo we are forced to uſe a Negative in the dividing of it: As when we divide *Living Creature* into *Rational and Irrational*: Or *Subſtance* into *Material* and *Immaterial*.

IX. *The Third.* The Third Condition is, That the Whole be diſtributed into its neareſt *Parts*; According to this Rule, it would not be well done to divide *Subſtance* into *Rational* and *Irrational*; becauſe theſe are not immediately contained under Subſtance, but under Living Creature.

The Sixth Rule.

Of the Judgment of Diſtribution.

X. The Sixth Rule. *That Diſtribution or Diviſion is the moſt perfect of all, which doth honeſtly and equally divide a Whole into its Parts; whether it be a Genus into Species, or an Integral into its dividing Members, or a Subject with reſpect to its Accidents, or an Accident into the Subject, to which by the Right of Diviſion they belong.*

XI. *Explication of the Rule.* Thus the moſt perfect *Diſtribution* of a *Genus* is, when all its Species are Enumerated: As if one ſhould ſay of *Living Creatures*, ſome *Walk*, others *Fly*, others *Swim*, others *Creep*, and others are *Plant-Animals*. An *Integral Whole* is well divided, when all the Parts that conſtitute it are inſtanc'd: As the Parts of a Man are, *Head*, *Breaſt*, *Belly*, *Arms*, *Legs*, *&c.* That is a perfect Diſtribution of a Subject, with reſpect to its *Adjuncts*, when the *Adjuncts* are reduc'd to certain *Heads*, and theſe again ſubdivided into others: As when we ſay, In *Man* there are ſome *Adjuncts* of the *Soul*, and others of the *Body*; thoſe of the *Soul*, are *Knowledge*, *Virtue*, *&c.* thoſe of the *Body* are *Health*, *Beauty*, *Tallneſs*, *Strength*, *&c.*

XII. *What a Definition is, and of what Parts it conſiſts.* DEFINITION is that which manifeſts the Nature of Things, ſhewing why they are, and how they are diſtinguiſht from others. There are two things principally that conſtitute a *Definition*, *Genus* and *Difference*. By the firſt we underſtand the agreeableneſs which the *Thing Defined* hath with others, that are of the like nature with it. By the *Difference* we are informed, how it differs from the ſame, and what Rank it keeps amongſt *Real Beings*. As for Example, when we define Man to be a *Reaſonable Living Creature*; by a *Living Creature* which is the next *Genus* of Man, we underſtand ſomething that is common to other things like unto us, *viz.* the *Beaſts*. And by *Reaſonable*, which is the Difference, we clearly perceive our Diſtinction from them; foraſmuch as no *Beaſts* are partakers of *Reaſon*. *Definition* therefore is that, *which by exhibiting the Eſſential Parts of the Thing Defined, expreſſeth its Nature*; as in the foregoing Example.

XIII. *In Definitions we muſt make uſe of the neareſt Genus.* We are to obſerve, that every *Genus* is not ſufficient to lay open the Nature of a Thing, but the Neareſt only: Partly, becauſe it contains all the *Genera* above it, ſo that by expreſſing it we include all the reſt: For he that affirms Man to be an *Animal*, doth conſequently affirm him to be *Living*, *Corporeal* and a *Subſtance*, and whatſoever elſe can be imagined higher. Partly, becauſe there is no other *Genus* can more fitly be joyned with the Specifical Difference, than the neareſt, nor which doth more correſpond with it.

XIV. *Of Definitions ſome are Eſſential, others Accidental.* Amongſt *Definitions* ſome are *Eſſential*, which properly deſerve the Name of *Definition*; and are thoſe which are explained by their Eſſential Degrees. By Eſſential Degrees, I mean *Eſſential Attributes*, which conſtitute the Nature or *Eſſence* of a thing. And theſe are only Genus and Difference, as, *Animal* and *Reaſonable* with reſpect to Man. Other *Definitions* are *Accidental* and leſs exact, which expreſs the thing by ſome *Properties* or *External Cauſes*, as when we define Man, to *be a Creature made after the likeneſs of God*. For tho' Property be an *Eſſential Attribute*, yet not in that Senſe as if it did conſtitute the Eſſence or Nature of a Thing, but becauſe it immediately follows the Nature of a thing already conſtituted: As, *Partition* and *Mobility* with relation to a *Body*. Wherefore the firſt Definition is called a *Perfect Definition*, becauſe it conſiſts only of Cauſes that do conſtitute the Eſſence, and by them doth moſt fully and perfectly lay open the Nature of the thing: Whereas the ſecond Definition is called imperfect, or a *Deſcription*, becauſe it defines and explains the Thing by other ways, than by its Cauſes.

XV. *What things are required to a perfect Definition.* Yet we are not to think, that all things that are objected to the *Mind*, may be comprehended in a *Definition*; but it is required, that the Thing which is to be defined be *One*, that is of one Eſſence; for thoſe Things which involve a manyfold Nature, cannot be manifeſted by a *Genus* and Difference. The Second is, That it be *Univerſal*; for ſeeing that Definition is a Declaration of the Nature of a Thing, it is neceſſary that we diveſt it of all particular Circumſtances, that it may be viewed ſuch as it is. Thirdly, No *Univerſal Nature* but a *Species* can be exactly defined; and that becauſe nothing but a *Species* can conſiſt of a *Genus* and Difference; and therefore ſeeing that the Supream *Genus* does want them, it follows that the Things which are defined muſt be either *Species* of the loweſt Rank, or Intermediate: Which alſo will but be obſcurely defined, without their *immediate Genus* and neareſt Difference.

XVI *Rules of a right Definition. The Firſt.* There are *Rules* and *Precepts* of a right *Definition*. Firſt, That the *Definition* muſt be of the ſame extent with the Thing defined, and agree to all thoſe things which the Thing defined agrees with. As for Example, becauſe *Animal* agrees to a Man, therefore a *Corporeal Subſtance* endowed with *Life*, *Senſe* and *Motion*, which is the Definition of an *Animal*, muſt agree to Man alſo.

XVII. *The Second* Secondly, That nothing be wanting or redounding in the *Definition*, but that only thoſe Words be made uſe of, that are neceſſary for the explaining of its Nature: Wherefore this Definition of a Man, That he is a *Reaſonable*, *Mortal Animal*, is Superfluous, becauſe the Word Mortal is not needful to the Definition of a Man.

The Third. The Third, That the *Definition* conſiſt of that which is *more known*: For ſeeing that a *Definition* is declarative of the *Eſſence*, it muſt therefore employ clearer Terms; leſt we ſhould be guilty of endeavouring to explain an unknown thing, by that which is more unknown, and ſo inſtead of attaining a clear and diſtinct Perception, ſhould fall into Obſcurity and Confuſion. Wherefore the common Definition of time, that it is, *The Number or Meaſure of Motion*, cannot be good, ſeeing it is evident, or apparent, that Time doth as well Meaſure Reſt, as Motion, ſince we ſay, as well that a thing hath reſted ſo long, as that it hath been in Motion for that time.

The

To the Worship-full Thomas
Vincent of Fetcham in the County
of Surrey Esqr.
This Plate is humbly Dedicated by Rich: Blome.

The Seventh Rule.

Concerning the Judgment of Definition.

XIX. The Seventh Rule. *That Definition is the most perfect and consummate of all others, which defines the Thing by its Essential Attributes, or constituent causes of its Nature and Essence.*

As if one should define the *Soul* to be a *Cogitating Substance*, or a *Body* to *be a Substance consisting of three Dimensions.* Because *Substance* as the *Genus* doth constitute the *Soul* and *Body*; and *Cogitation* as the *Difference*, distinguisheth the *Soul* from the *Body*; As *Extension in Length, Breadth and Depth*, doth difference the *Body* from the *Soul*: Neither is there any thing else required to the understanding of them both.

The Third Part of Logick.

Concerning the Minds Ratiocination, Syllogism.

CHAP. XV.

Of Reasoning or Argumentation.

1. *What it is to Reason or Discourse* HAving spoken of *Idea's* which represent *Substance*, and their *Modes*, and concerning the *Judgment* and *Axioms* which arise from their *Connexion*, it now remains to explain what *Reasoning* or *Ratiocination* is, or that *Judgment*, by which from one *Axiom*, another is gathered or inferred. For to Reason is nothing else than from a thing known to derive the *Knowledge* of another: And *Reasoning* is nothing else, than the *Knowledge* of one thing deduc'd from the *Knowledge* of another: As when a Man infers *the Heaven to be extended*, because *all Bodies are extended.* And therefore this *Judgment* is called *Dianoetick* or Discursive, because the Mind by it runs from one thing to another, and from the *Antecedent* is lead to the *Consequent.*

II. *What it is that Argumentation superadds to Judgment.* Wherefore as *Judgment*, or the second Operation of the Mind, superadds to the first, which is *Perception*, Assertion, that is, *Assent* or *Adhesion* to Truth: So *Ratiocination* adds to them both, *Deduction, Illation, &c.*

III. *What things are to be minded in Discourse.* In every *Argumentation* there are two Things chiefly to be minded, the *Question* it self, that is propounded, and the *Argument* or *Reason* that proves the same, or which confirms that which is doubtful, by those things that are certain and evident, and from the *Question* produceth an undoubted Conclusion. Accordingly in every *Argumentation* there are two things, that which infers, and that which is inferr'd; that which is gathered, and that from whence it is gathered, howsoever these parts may be disposed or expresst.

IV. *Ratiocination contains two Parts.* Hence it is that every *Argumentation* consists of two Parts, *viz.* of an *Antecedent* and *Consequent*, or the Part *inferring* and that which is *inferr'd.* That goes before for the confirming of something else; this follows and is gathered from the former: As, when I say, *An Angel is Immaterial*; and *therefore is Indivisible.* For the first Part, *viz. An Angel is Immaterial*, is the *Antecedent*, and the other, *An Angel is Indivisible* is the *Consequent:* And the word *Therefore* is the Sign of the Inference, or formal Consecution.

V. *The Premisses must be more known than the Conclusion.* It is requisit to the Notion of an *Antecedent*, from which a certain *Conclusion* may be deduced, that it be *better known and more evident* to us; for otherwise it will not conduce to that which we would infer thence. For the Order of Science requires, that beginning from the *Easiest things*, we proceed by degrees to those which are more difficult to be known. Wherefore, to discourse readily, it is needful that we have ready at hand a Stock of many *Axioms*, Springing from the Complexion of the Things we have clearly and distinctly conceived, that may serve us instead of *Principles*, and by whose helps we may arrive to the knowledge of things more abstruse. For we must not promiscuously make use of any known and certain *Propositions* to infer any thing; but it is requisit that between them there be some Connexions by means whereof, this rather than any thing else may be gathered or inferr'd from it. Because there is a Consequence assigned to every *Argumentation*, yea a necessity of Consequence, which doth not only depend on the Order of *Knowledge*, but also on the Natural Connexion of the Things that are to be known.

VI. *Reasonings or Argumentations differs in Truth.* All *Argumentations* have not the same force; for seeing that the *Judgments* of which they are compounded, have not the same Connexion, they must needs according to the variety of *Propositions*, produce various kinds of *Reasoning*. For *Consequences* that are deduc'd from *Contingent Premisses*, cannot have so great *Truth* and Certainty as those, which are inferr'd from *Necessary Premisses*, and which cannot be otherwise. By Example, this Proposition, *Sempronia Loves her Childeren*, deduced from this Antecedent, *every Mother Loves her Childeren*, differs from this, Peter *is an Animal*, which is deduced from this Antecedent, *A Man is an Animal*: Because the certainty we have that a *Man* is an *Animal*, is *Metyphysical*; Seeing we cannot conceive a *Man* any otherwise. And therefore this Proposition, *A Man is an Animal*, is so *True*, that it can never be false: Whereas the certainty we have, that *Mothers* Love their *Childeren*, is only *Moral*, since it can happen that some *Women* may not Love their *Children.*

VII. *The Definition of an Argumentation in general.* An *Argumentation* in general, is a Speech wherein from *certain Propositions* expresly or tacitly premised, *An* other *Proposition* distinct from those premisses is necessarily inferred, by Reason of the due *Disposition* of them.

VIII. *What the Major Proposition is.* If there be just three *Propositions* in the *Argumentation*, The first is called the *Major*, because in it the *Major Term* is disposed with the *Mean* or *Medium.* And by some it is called only The *Proposition*, by way of *Excellence*, because it propounds the Foundation of the whole *Argumentation.*

IX. *What the Minor is.* The Second is called the *Minor*, in which the Minor Term is disposed with the *Medium.* It is by some called *Assumption*, because it is assum'd or taken in as a help, to infer the Third, or *Conclusion.*

X. *What the Conclusion is.* The Third is called *Conclusion*, in which the *Minor* and *Major Terms* are disposed. And is by some termed the *Question*, because it contains that whose Truth was enquired after, as also the *Inference* or *Consequence*, because it is inferr'd and follows from what went before, and that by the illative Conjunction *Therefore, &c.*

XI. *The two Propositions must go before in every Argumentation.* The two first *Propositions* are called *Premisses*, because they must Precede the *Conclusion*, at least in our Conception, in as much as it necessarily follows from them; because it is impossible, supposing

the Truth of the *Premisses*, that the *Conclusion* should not be true. Yet it is not necessary, that in every *Argumentation* the *Premisses* should be expressed, since frequently one alone is sufficient, to make the Understanding, tho' somewhat confusedly, to conceive both. For he who from this Antecedent, *Every Stone is a Body*, deduceth this Consequence, *A Diamond is a Body*, had a confused Knowledge thereof in the *Antecedent*, wherein it is implicitly contained. And he that from this Proposition, *A Body is a Substance*, infers, that *A Diamond is a Substance*, by knowing it to be a *Body*, knows it to be a *Substance*.

XII. *In every Argumentation are found three Idea's.*

Every *Argumentation* consists of three Idea's; the *Minor Extream*, or *Idea*, which is the Subject of the Question, or Conclusion, and is also called the *Minor Term*; because the Subject is of less extent than the Predicat: The *Major Extream*, or *Idea*, which is the Predicat, and which is also called the *Major Term*, because it is of larger extent than the Subject: And the *Mean*, or *Medium*, which is twice put in the Premisses, and is that which joyns both *Idea's* together; as in this Argumentation:

Every Intellectual Substance is Cogitative,
The Mind is an Intellectual Substance;
Therefore the Mind is Cogitative.

Here *Intellectual Substance* is the Middle Term; *Cogitative*, the Major Extream; and *Mind*, the Minor Extream.

XIII. *Why there are three Idea's required in every Argumentation.*

The Reason why these Three are required in every *Argumentation* is hinted by *Aristotle*, when he saith, That we meet with Three things in every *Science*, or *Demonstration*, *viz.* the *Subject*, of which the *Attribute* is demonstrated: The *Property* it self, or *Attribute*, which agrees with the *Subject*; and the *Reason*, or *Principle*, which makes out this Agreement of the *Affection* with the *Subject*. So that the *Subject*, of which the Demonstration is made, is the *Less Extream*; the *Attribute*, or *Affection*, which is prov'd, the *Greater Extream*; and the *Common Term*, wherewith the *Subject* and *Attribute* are joyned together, is the *Argument*, or *Middle Term*.

XIV. *The matter explained by an Example.*

For Example: This Question is propounded to be explained, whether *the Earth be Round*; and the thing required is, That from the Doubtful Question a certain Conclusion be deduced: The *Earth* ir the Subject or Minor Extream; *Roundness* is the Affection, or Property, to be demonstrated; and I am to find out a *Medium*, by which it may appear that the Attribute agrees with the Subject. Which may be this: That the *Shadow of the Earth*, as appears in a Lunar Eclipse, *is Round*, for the Shadow intimates the figure of *Opaque Bodies*: From which accordingly this *Syllogism* may be framed.

A Body whose Shadow is round, must it self be round also.
But the Earth is a Body, whose Shadow is round.
Therefore the Earth is round.

XV. *Sometimes more than three Idea's are found in an Argumentation.*

But notwithstanding that an Argumentation is made up of *three Propositions*, yet many more may be added to them, without any Redundance or Defect; as long as the Precepts of *Ratiocination* are but observed. For if the *Third Idea*, which we have taken to discern whether the Attribute agree with the Subject, or be removed from it, after having compared it with both the Extreams, do not give us a clear discerning, whether it agree with it or no; we may assume another *fourth Term*, to procure a further clearness; and if that be not yet sufficient, may proceed to a *fifth*, until we come to some Term, which may joyn the Attribute of the Conclusion with the Subject. As, supposing a Man should doubt whether *Courtiers be miserable*, he may consider that *Courtiers* are subject to many Passions, as *Ambition*, *Envy*, *&c.* and if he thinks this not to be sufficient, to prove them to be *miserable*, he may further examine what it is to be subject to *Ambition*, *Envy*, *&c.* which if he does, he shall find that it is continually to hanker after *Honour*, to be *grieved at the prosperity of others*, *&c.* and that such a Condition as this cannot but be obnoxious to many Miseries; whence he may form this Argumentation: *Courtiers are tormented with Ambition and Envy, and they that are so, are in continual Trouble, and they that are in continual Trouble, are miserable: Therefore Courtiers are miserable.*

XVI. *The Division of an Argumentation into Perfect and Imperfect.*

Argumentation in General, is divided into Perfect, and Imperfect. *Perfect Argumentation* is a *Syllogism*, which forasmuch as it consists of Three Propositions, duly disposed, is of a perfect Form, and most proper to persuade. An *Imperfect Argumentation* is, either an *Enthymeme*, an *Induction*, an *Example*, a *Dilemma*, or a *Sorites*, whose Form is less accurate, and not so accommodate to persuade as the Perfect. We shall first treat of a *Syllogism*, and afterwards proceed to the rest.

CHAP. XVI.

Of Simple Syllogisms; and those either Complex, or Incomplex.

I. *What Simple, and what Conjunct Syllogisms are.*

OF *SYLLOGISMS*, some are Simple, others are Conjunct. *Simple Syllogisms* are such, in which the Medium is only joyned to one Term of the Conclusion at once: *Conjunct* are those in which the Medium is at once joyned with both Extreams. Accordingly this *Syllogism*:

Every Planet is enlighted by the Sun:
Saturn *is a Planet*:
Therefore Saturn *is enlightned by the* Sun.

Is Simple, because the Medium, *viz. Planet* is separately joyned with the Term *Saturn*, which is the Subject of the Conclusion. But for the contrary Reason this *Syllogism*:

If a Covetous man serves Mammon, *he cannot obey the Law of God;*
But a Covetous man serves Mammon:
Therefore a Covetous man cannot obey the Law of God.

Is Conjunct, because a *Covetous man*, which is the Subject of the Conclusion, and *cannot obey the Law of God*, which is the Predicat, are both joyned with the Medium, *serves Mammon*, in the Major Proposition. Of this latter sort we shall speak in the next Chapter.

II. *There are two sorts of Simple Syllogisms.*

A *Simple Syllogism* is divided into two other kinds: For there are some, in which tho' the Conclusion be Complex, that is, composed of Complex Terms; yet one part only of its Subject or Predicat is taken, to be joyned with the Medium in one Proposition; and the rest, which is no more than one Term, is taken and joyned in the other Proposition: As in this *Syllogism*;

The

The Divine Law requires us, to honour Kings;
Charles *the Second is a King:*
Therefore the Divine Law requires us to honour Charles *the Second.*

There be others again, in which each whole Term of the Concluſion is joyned with the Medium; to wit, the Attribute in the Major, and the Subject in the Minor. The former are called *Complex*, the latter *Incomplex:* And of theſe two kinds of *Simple Syllogiſms*, we ſhall ſpeak under this Head.

III. *The Definition of a Simple Syllogiſm.* A *Simple Syllogiſm* therefore is a *Perfect Argumentation*, in which from two Propoſitions premiſed in the Antecedent, the Concluſion or Conſequent neceſſarily follows, in caſe the two foregoing Propoſitions have been granted. I have ſaid in the Definition, *That the Concluſion neceſſarily follows from the Premiſſes*; becauſe our aſſent to the *Premiſſes* neceſſitates the *Concluſion*, not only as to *Species*, as they call it, but as to *Exerciſe*. For the Knowing Faculty acts neceſſarily, that is, ſuppoſing all Requiſites neceſſary for Operation, cannot chuſe but operate: But when the *Major* and *Minor* are granted, there is nothing more wanting to infer the *Concluſion*; therefore the Underſtanding cannot but infer it.

IV. *The Underſtanding cannot but aſſent to a Propoſition that is clear and evident.* Neither is it any obſtacle to what hath been ſaid, that the *Underſtanding* is ſubject to the *Will:* For this is falſe, whenever the Object is evidently and diſtinctly propounded to it; becauſe in that caſe it is forced to aſſent by the Evidence of of the thing. For we often experience in our ſelves, that the *Underſtanding* cannot be reſtrained from giving its aſſent to a *Propoſition* which appears clear and manifeſt to it; tho' the *Will* may ſometimes indirectly hinder it, by diverting it, and buſying it about other Objects: But this it cannot do *directly*, by commanding it not to aſſent to the *Concluſion*; becauſe the *Underſtanding* doth not follow the command of the *Will* in things that are Evident, but only in thoſe that are obſcure and doubtful.

V. *The Form of a Syllogiſm.* The Form of a *Syllogiſm*, is the Regular diſpoſition of the three *Propoſitions*, ſo that the *Concluſion* may neceſſarily follow from the *Premiſſes*; which conſiſts in this, that the Middle Term be fitly ranked with the two Extreams, that is, with the *Major* and *Minor*; and alſo that the *Propoſitions* be orderly placed, as to *Quantity*, that is, Univerſality and Singularity; and *Quality*, that is Affirmation and Negation. The former of theſe, which is the Diſpoſition of the Terms, is called *Figure*; the latter, which is the Determination of the Propoſitions, is called the *Mode of a Syllogiſm*. So that the *Figure* reſpects the *remote Matter* of a *Syllogiſm*, *viz.* the Three Terms, the Middle Term, and both Extreams; whereas the *Modus* regards the *next Matter* of a *Syllogiſm*, *viz.* the Three Propoſitions, the Major, Minor, and Concluſion.

VI. *The three Figures of Syllogiſms.* There be three Figures of *Syllogiſms*: The Firſt is, when the Middle Term is the *Subject* in the *Major*, and the *Prædicat* in the *Minor*. The Second, when the Middle Term is the *Prædicat* in both Premiſſes. The Third is, when the Middle Term is the *Subject* in them both.

VII. *Of the Modes of Syllogiſms.* There are reckoned 21 Modes of *Syllogiſms*, which may be reduced to 14.

The *Modes* of the Firſt Figure, are *Barbara, Celarent, Darii, Ferio.*

Of the Second, *Ceſare, Cameſtres, Feſtino, Baroco.*

Of the Third; *Darapti, Felapton, Diſamis, Datiſi, Bocardo, Feriſon.*

The Modes of the *firſt Figure* are called *Direct* and *Perfect*, becauſe all manner of *Queſtions*, whether Affirmative or Negative, Univerſal or Particular, may be concluded by it. Whereas in the *Second*, Negatives only; and in the *Third*, Particulars only can be inferr'd. In all the foregoing Artificial Words there are Three Syllables, whereof the firſt ſignifies the *Major*, the ſecond the *Minor*, and the third the *Concluſion*; and the *Vowel* of each Syllable ſhews what *Quantity* and *Quality* the Propoſition muſt be of. For *A* ſignifies an Univerſal affirming; *E*, an Univerſal denying; *I*, a Particular affirming; and *O*, a Particular denying Propoſition, according to the common Diſtick.

Aſſerit A, *negat* E, *verum Generaliter ambo:*
Aſſerit I, *negat* O, *ſed Particulariter ambo.*

A *affirms*, E *denies, but Generally both:*
I *affirms*, O *denies, but Specially both.*

For the further clearing of the Figures of *Syllogiſms*, I ſhall add Examples of the Modes of each *Figure.*

The Firſt Figure.

VIII. *The firſt Figure.*

Bar- ba- ra. — *Every Body is extended,* / *Every Stone is a Body;* / *Therefore every Stone is extended.*

Ce- la- rent. — *No Mode is a Subſtance,* / *Every Figure is a Mode;* / *Therefore No Figure is a Subſtance.*

Da- ri- i. — *Every thing that is mov'd, is moved by another,* / *Some Body is mov'd;* / *Therefore ſome Body is mov'd by another.*

Fe- ri- o. — *No Spirit is Material,* / *Some Subſtance is a Spirit;* / *Therefore ſome Subſtance is not Material.*

IX. *On what Principles the firſt Figure is grounded.* The force of the firſt Figure is grounded on the *Dictum de Omni*, and *Dictum de Nullo.* The *Dictum de Omni* is this: Whatſoever is Univerſally affirmed of an Univerſal, is alſo affirmed of that which is contained under that Univerſal: As of a *Body*, it is univerſally affirmed that it is *Extended*; which muſt therefore alſo be affirmed of a *Stone*, which is contained under it. *Dictum de Nullo* is, when whatſoever is univerſally deny'd of an Univerſal, is alſo deny'd of that that which is comprehended under that Univerſal: As when every *Subſtance* is deny'd to be a *Mode*, and *Figure* is contain'd under the Notion of a *Mode*; therefore *Figure* is denied to be a *Subſtance.*

X. *The ſecond Figure.*

Ce- ſa- re. — *No Stone is a Plant,* / *Every Oak is a Plant;* / *Therefore no Oak is a Stone.*

Ca- me- ſtres. — *Every Body is diviſible,* / *No Point is diviſible;* / *Therefore no Point is a Body.*

Fe- ſti- no. — *No Impenitent perſon ſhall be ſaved,* / *Some man ſhall be ſaved;* / *Therefore ſome man is not an Impenitent perſon.*

Every

Ba- *Every Univerſal is communicable to more than one,*
ro- *Some Nature is not communicable to more than one;*
co. *Therefore ſome Nature is not Univerſal.*

XI. *The third Figure.*

The Third Figure.

Dar- *Every Body is diviſible,*
ap- *Every Body is a Subſtance;*
ti. *Therefore ſome Subſtance is diviſible.*

Fel- *No Angel is circumſcrib'd by place,*
ap- *Every Angel is Finite;*
ton. *Therefore ſomething that is finite, is not circumſcrib'd by Place.*

Di- *Some Number may be increaſed,*
ſa- *Every Number is an Affection of things;*
mis. *Therefore ſome Affection of things may be increaſed.*

Da- *Every one that ſerves God is a King,*
ti- *Some one that ſerves God is poor;*
ſi. *Therefore ſome one that is poor, is a King.*

Bo- *Some Folly is not to be blamed,*
car- *Every Folly is a defect of right Reaſon;*
do. *Therefore ſome defect of right Reaſon is not to be blamed.*

Fe- *No heavy Body tends downward of its own accord.*
ri- *Some heavy Body is Matter;*
ſon. *Therefore ſome Matter doth not tend downward of its own accord.*

XII. *Galens Fourth Figure.*

The Fourth Figure is ſaid to be *Galen's*, and is when the *Medium* is predicated in the *Major Propoſition*, and ſubjected in the *Minor*; which tho' it concludes neceſſarily, yet (as *Averrhoes* ſaith) with ſome Machination or difficulty, and beſides Expectation.

General Rules of Syllogiſms.

XIII. *The Rules of Syllogiſms.*

Foraſmuch as all *Concluſions* cannot be deduced from any Premiſſes: There are ſome Common Rules, which are to be obſerved in all *Syllogiſms*.

XIV. *The Firſt.*

The Firſt is this, *The Middle Term muſt be diſtributed, that is, it cannot be twice taken particularly, but muſt once at leaſt be taken generally.*

For ſhould the *Medium* be twice taken particularly, as it muſt be when the *Premiſſes* are particular, it may be taken for divers parts of the ſame *Whole*; becauſe Particulars are diſtinct, and ſo nothing will be concluded, or at leaſt nothing neceſſarily concluded. Which is ſufficient to make an *Argumentation* faulty, ſince that only is called a good *Syllogiſm*, whoſe *Concluſion*, if the *Premiſſes* be true, cannot be falſe. And therefore this *Argument*,

Some Body is Triangular,
Some Body is Spherical;
Therefore ſome Spherical Body is Triangular.

For ſince *Body* is taken here for divers parts of *Bodies*, a Spherical cannot be joyned with a Triangular; becauſe the ſame Body which is *Spherical*, cannot alſo be *Triangular*.

XV. *The Second Rule.*

The Second, *From pure Negatives nothing can be concluded.* The Reaſon is, becauſe two *Negative Propoſitions* ſeparate the *Subject* from the *Medium*, and the *Attribute* alſo: Now from the ſeparation of two things from the ſame Thing, it doth not follow, that they are the ſame Thing, or that they are not the ſame Thing. As for Example, from theſe *Propoſitions* that the *Mind*, is not the *Body*, and that the *Body* is not capable of *Perception*, it doth not follow, that the *Mind* is not capable of *Perception*.

XVI. *The Third.*

The Third, *The extreams of the Concluſion, muſt not be more Univerſally taken, than they were taken in the Premiſſes.*

Wherefore when either of the Extreams is taken Univerſally, the *Argumentation* muſt needs be falſe, if it be taken particularly in the two firſt *Propoſitions*. The Reaſon of this *Rule* is deducible from the firſt, becauſe it is irregular to Argue from a Particular, to an Univerſal. For from this, that ſome Men are given to *Drink Wine*, it cannot be concluded, that all Men are given to *Drink Wine*.

XVII. *The Fourth.*

The Fourth, *The Concluſion always follows the weaker part of the Premiſſes. That is, if either of the Premiſſes be Negative, the Concluſion muſt be ſo alſo; and if either of the Premiſſes be Particular, the Concluſion muſt be Particular alſo.*

The Reaſon of this *Rule* is, becauſe where there is a Negative *Propoſition* in *Syllogiſm*, the *Medium* is removed from one of the extreams of the Concluſion, and therefore can never joyn them together, which is required to make an *Affirmative Concluſion*; and if either of the *Propoſitions* be particular, no *Univerſal Concluſion* can be deduced from them. For if the *Univerſal Concluſion* be Affirmative, the Middle Term being Univerſal, muſt alſo in the *Aſſumption* or *Minor Propoſition* be Univerſal, and therefore muſt be its Subject, ſince the *Attribute*, in *Affirmative Propoſitions*, is never taken Univerſally; wherefore the *Medium* joyned to the *Subject*, will be particular in the *Minor*; and ſo the Univerſal will be in the *Major*; for otherwiſe it would be twice particular: And therefore it will be the *Subject*, and therefore that *Major*, muſt be likewiſe *Univerſal*. So that there can be no particular Propoſition in an *Affirmative Argumentation*, whoſe Concluſion is Univerſal.

Of Complex Syllogiſms.

XVIII. *What Complex Syllogiſms are.*

From what hath been ſaid, may eaſily be underſtood what *Complex Syllogiſms* are: For they are not ſo called, becauſe they conſiſt of *Compound Propoſitions*, but becauſe the Terms of their *Concluſions* are *Complex*, and are not taken entire in each of the *Premiſſes*, in order to their being united with the *Medium*, but only one part of their *Terms*: As in this Example.

Gold is an Inanimate Thing,
Covetous Men worſhip Gold;
Therefore Covetous Men worſhip an Inaminate Thing.

In which *Syllogiſm* the *Attribute* of the Concluſion is, *Worſhip an Inaminate Thing*, whereof only ſome part is put in the *Major*, *viz.* an *Inaminate Thing*, and *Worſhip* in the *Minor*.

XIX. *Complex Syllogiſms are to be reduced.*

Theſe *Syllogiſms* in the Converſation and Diſcourſes of Men, are more frequent than Incomplex ones, which are ſeldom or never uſed, except it be in the *Schools*? For who ever in common *Speech*, heard a Man Diſcourſe at this rate: *Every Stone is a Body, A Diamond is a Stone; therefore a Diamond is a Body.* And tho' *Complex Syllogiſms* ſeem at the firſt ſight, to deviate from the *Rules* of *Figures*, yet they appear to be true, when they are reduced to Incomplex ones. For this *Syllogiſm*, *The Scripture Commands us to Honour Kings.*

Charles

Charles *the Second is a King,*
Therefore the Scripture Commands us to Honour Charles *the Second.*

Tho' it be in the *Second Figure*, in which it is repugnant for all the *Propositions* to be *Affirmative*, yet it is for all that a true *Syllogism*, becauſe in this *Propoſition*, *The Scripture Commands us to Honour Kings*; the word *Kings*, is taken for all *Kings* in particular, and therefore *Charles* the Second is reckoned amongſt them, that are to be Honour'd. Beſides *King*, which is the *Middle Term*, is not the *Attribute* in this Enuntiation; *the Scripture Commands us to Honour Kings*, tho' it be united to the *Attribute Commands*. For that which truly is the *Attribute*, is affirmed and agrees: But *King* is neither affirmed, nor agrees, that is, it is not here annexed to *Scripture*, which is the Subject. Again, the *Attribute* is reſtrain'd by the Subject, but the term *King*, is not reſtrain'd in this Propoſition; *The Scripture Commands us to Honour Kings*, becauſe it is taken Univerſally. Wherefore we muſt ſay, that it is the Subject of another *Propoſition* involved in it, as if I ſhould ſay, *The Scripture Commands that Kings be Honoured.* So that this whole *Argument* conſiſts in theſe *Propoſitions*,

Kings are to be Honoured,
Charles *the Second is a King*;
Therefore Charles *the Second is to be Honoured.*

And therefore this Propoſition, *The Scripture Commands*, which before was look'd upon as Principal, is only incident to this *Argumentation*, and is joyned to the *Affirmation*, to which the *Scripture* is added as a Proof. Whence it is manifeſt, that this Argument is of the *firſt Figure*, and in *Barbara*, becauſe that Singulars are eſteemed Univerſals, when they are made uſe of in their whole Latitude.

CHAP. XVII.

Of conjoynd or Compound Syllogiſms.

I. *What is required to make a Compound Syllogiſm.*

Conjoynd or *Compound Syllogiſms* are thoſe in which the *Major* is ſo compounded, that it contains the whole Concluſion. And becauſe the *Major Propoſition* of ſuch *Syllogiſms* is four-fold, *viz.* Conditional, Copulative, Disjunctive and Proprotional or Analogical, therefore they conſtitute four kind of *Syllogiſms*, *Conditional*, *Copulative*, *Disjunctive*, and *Analogical.*

II. *Conditional Syllogiſms.*

Conditional Syllogiſms are thoſe in which the *Major Propoſition* is Conditional, and contains the whole Concluſion, As

If the Soul of Man be Corporeal, it may be divided into Parts,
But the Soul of Man cannot be divided into Parts,
Therefore it is not Corporeal.

The Major conſiſts of two *Propoſitions*; the firſt is the Antecedent, *If the Mind of Man be Corporeal*; the ſecond, the Conſequent, it *may be divided into Parts.*

III. *The twofold Figure of Conditionals.*

The *Figure* of *Conditionals* may be two-fold; the firſt is, when the Antecedent of the *Major*, or *Principal Propoſition*, is put in the *Minor* or leſs *Principal*, ſo as that the Conſequent of the ſame may be put into the Concluſion; as in this *Syllogiſm:*

If created things cannot ſubſiſt of themſelves, it is neceſſary that they be preſerved by God,
But created things, cannot ſubſiſt of themſelves,
Therefore it is neceſſary that they be preſerved by God.

IV. *The Maxim of the firſt ſort of Conditional Syllogiſms.*

And this ſort of Argument is founded upon this Maxim; *where the Antecedent is put the Conſequent muſt be put alſo.*

The other *Figure* is when the Conſequence of the ſaid *Major Propoſition*, is taken away, that the Antecedent may be taken away alſo; As,

If John *doth Marry this Woman, he is unwiſe,*
But John *is not unwiſe,*
Therefore John *doth not Marry this Woman.*

V. *The Maxim of the other ſort of Conditional, Syllogiſms.*

This kind of *Argumentation* is founded on this Maxim; *Where the Conſequent is taken away, the Antecedent muſt be taken away likewiſe.* Now to put the *Antecedent* or *Conſequent*, is to Affirm that which is *Affirm'd*, and to *Deny* that which is *Denied*: And to take them away, is to *Deny* that which is *Affirm'd*, or *Affirm* that which is *Denied.* Or to ſpeak more diſtinctly, to *put*, is to Affirm the *Antecedent* that hath been Affirm'd, or to Deny the *Antecedent* that hath been Denied; and on the contrary to *remove*, or take away, is to Deny the Affirm'd Conſequent, or to Affirm the Denied Conſequent. So that he alſo takes away that Affirms, that which was Denied before. As for Example, *If an Angel hath not Organs, he doth not Feel: But he hath not Organs, Therefore he doth not Feel*, Is a *Syllogiſm* deduced from the *Poſition* of the *Antecedent*, to the *Poſition* of the *Conſequent*, notwithſtanding that it proceed by way of Negation.

VI. *Conditional Arguments may be faulty two manner of way.*

Conditional Arguments become faulty, theſe two manner of ways; the one is when from a true *Major*, a falſe Concluſion is deduced: As when the *Antecedent* is inferred from the *Conſequent*: As if one ſhould ſay,

If a Stone be a Living thing, it is a Subſtance,
But a Stone is a Subſtance,
Therefore it is a Living thing.

And another way, when from the *Negation* of the *Antecedent*, is inferred, the *Negation* of the *Conſequent*; As in the ſame Example,

If a Stone be a Living thing, it is a Subſtance,
But a Stone is not a Living thing,
Therefore it is not a Subſtance.

VII. *What Copulative Syllogiſms are.*

Copulative Syllogiſms are only of one ſort, as when in a *Copulative Propoſition Negative*, one part is put, to take away, or remove the other: As,

The ſame Body cannot be at the ſame time, both Round and Plain;
But the Earth is Round,
Therefore it is not Plain.

Becauſe theſe *Syllogiſms* do not neceſſarily conclude, when one part is taken away, and the other is put in its place; as appears in this *Argument*, taken from the ſame *Propoſition.*

The ſame Body cannot be both Plain and Round,
But the Earth is not Round,
Therefore it is Plain.

VIII. *What Diſjunctive Syllogiſms are.*

Diſjunctive Syllogiſms are ſuch whoſe firſt *Propoſition* is *Diſjunctive*, that is, whoſe Parts are joyned with the *Diſjunctive*, *or*, *either.*

Death happens to Man either by default of the Soul, or of the Body;

But it doth not happen by default of the Soul,
Therefore by default of the Body.

IX. *Their Figure is twofold.* The *Figure* of *Diſjunctive Syllogiſms* is twofold; the one, when one part is taken away, that the other may be put; as in the Example before alledg'd: The other, when one part is put, that the other may be taken away: As,

They who firſt gave us an account of Antipodes,
either ſpoke the Truth, or impoſed upon us;
But they ſpoke the Truth,
Therefore they did not impoſe upon us.

A *Diſjunctive Syllogiſm* is grounded on this Principle, that *two Contradictions cannot be true at the ſame time.* Wherefore it is neceſſary, that the Parts of a *Diſjunctive Propoſition* muſt be Repugnant, ſo as that when one is put, the other is remov'd; and when one is remov'd, the other is put, as in the alledged Examples. When it happens, that there be more Parts of the Disjunction than two, one of them muſt be oppoſed to all the reſt; as if one ſhould make this *Propoſition:*

It is either Winter, *or* Summer, *or* Spring, *or* Autumn,

One part only muſt be put in the *Aſſumption* or *Minor Propoſition*; that ſo in the Concluſion, the reſt may be taken away; As thus,

It is Winter, *therefore it is neither* Summer, *nor* Spring, *nor* Autumn,

Or elſe the reſt muſt be taken away in the *Aſſumption*, that one Member may be put in the Concluſion; thus,

It is neither Summer, *nor* Spring, *nor* Autumn, *therefore it is* Winter.

X. *How Analogical Syllogiſms are formed.* To theſe we may add *Proportional* or *Analogical Syllogiſms*, in which the *Analogy* and *Proportion* is dilated, or *Adjuncts* are explained. For *Proportions* here ſpoken of is nothing elſe, than the agreement of *Relatives*. As when from four *Relatives*; as for Example, four Numbers, 2,4,3,6, we ſay that the ſame is the Relation of the half, and double, between 2 and 4, as between 3 and 6. Or when in a *Triangular Figure*, conſidering the two Angles of it, and the two oppoſit Sides; we aſſert the Relation of Equality and Inequality to be the ſame, as there is between Side and Side. The Firſt and Third, are by *Geometricians* commonly called *Antecedents*, as the Second and Fourth *Conſequents*, becauſe they follow from the former.

XI. *What Analogical Syllogiſms are.* SYLLOGISMS are called *Proportional* or *Analogical*, when the *Proportion* ſet down in the *Major Propoſition*, is protracted, or dilated: Which then happens, when the *Conſequents* in the *Minor*, being taken for *Antecedents*, are further referred to other *Conſequents*: And then conclude, that there is alike Proportion between the firſt *Antecedents*, as between the latter *Conſequents*. As when we ſay, 2 are to 4, as 3 are to 6, and 4 are to 8, as 6 to 12. Therefore 2 are to 8, as 3 to 12. Becauſe in this way of Diſcourſe, it is made clear, that 4 and 6, which are the *Conſequents* in the *Major Propoſition*, are made the *Antecedents* in the *Minor*: And becauſe the Relates are the Middle Terms, to which the Extreams (*viz.* the *Antecedents* and *Conſequents*) are joyned, therefore we infer, that the Extreams themſelves, agree alſo. And ſuch *Syllogiſms* as theſe, are ſaid to *conclude equally*; foraſmuch as in them, both the Relations as they begin in the ſame manner, ſo likewiſe they proceed and end, in the ſame manner.

XII. *The Second way of forming Proportional Syllogiſms.* *Analogical Syllogiſms* are alſo formed in this manner, when after that a like Proportion hath been ſet down in the *Major Propoſition*, an *Adjunct* is taken up in the *Minor*, by which the *Proportion* is rendred more evident, which therefore ſo agrees to one *Antecedent*, with reſpect to its *Conſequent*, that thence we conclude, that it alſo agrees with another *Antecedent*, with reſpect to its *Conſequent*. For if one ſhould call at Pleaſure two Sides of a *Triangle*, A,B, and the two oppoſit *Angles*, C,D, and then argue thus: The Side A is to the Side B, as is the Angle C to the Angle D; but the Angle C is greater than the Angle D; therefore the Side A is greater than the Side B. For by this Term *Greater*, it is clearly explained wherein the Proportion conſiſts.

XIII. *The Third way.* Thirdly, *Proportional Syllogiſms* are made by the *Commutation of Proportions*; *viz.* when a Proportion being ſet down in a like manner in the *Major Propoſition*, the *Minor* is paſt by in Silence, and the *Relates* are ſo inverted, that they are mutually concluded of each other. This way of Arguing is often uſed by *Geometricians*, and more eſpecially by *Arithmeticians*: As when they reaſon thus; There is the ſame Proportion betwixt 2 and 4, as betwixt 3 and 6, and therefore 4 are to 2, as 6 are to 3; becauſe that Maxim is implicitly underſtood, that *Like things agree with their Like reciprocally.*

CHAP. XVIII.

Of Imperfect Argumentations.

I. *What Imperfect Argumentations are.* SOme Argumentations are called *Imperfect*, not with reſpect to the Matter whereof they are compoſed; but with regard to the *Form*, which is not ſo exact in them, but leſs digeſted than that of a *Syllogiſm*. For in theſe the Antecedent conſiſts expreſly but of One Propoſition, or of Many: Such are *Enthymeme*, *Induction*, *Example*, *Sorites*, and *Dilemma*.

II. *What an Enthymeme is.* An ENTHYMEME ſeems to have taken its Name from this, that it expreſſeth only One *Propoſition*, and ſuppreſſeth the other, as being too clear and obvious, and which is eaſily underſtood by thoſe we diſcourſe with. This way of Arguing is very common among Men, who in their uſual Reaſoning commonly ſuppreſs the *Propoſition*, as ſuppoſing that they to whom they ſpeak will eaſily ſupply it: As when we ſay,

I was able to ſave thee,
And therefore alſo to ruin thee.

In which *Argumentation* there is only one of the Premiſſes expreſs'd, and the other ſuppreſt or imply'd, which when added it affords this *Perfect Syllogiſm.*

Whoſoever was able to ſave thee, was alſo able to ruin thee;
But I was able to ſave thee,
Therefore I was alſo able to ruin thee.

III. *Induction.* INDUCTION is an Argumentation, which from many *Singulars* concludes an *Univerſal*: As,

This Triangular conſiſts of three Lines, and ſo doth that likewiſe, and all the reſt; therefore every Triangle conſiſts of three Lines.

To

To this way of Reasoning it is required, that it contain an enumeration of all the *Species* and *Parts*; for if but one be wanting, it admits of an Exception, and subverts the whole *Proposition*. Wherefore nothing can certainly be proved by *Induction*, except the same be whole and compleat in all its Parts, and so General, as to admit no Exception, which is very difficult, and almost impossible. For who can recollect in his Mind all the Cases of *Law?* or what Student of Natural Philosophy, can reckon up all the several kinds of *Bodies*, all *Plants*, *Animals*, *Stars*, *&c.?* Are not almost all Men of Opinion, that *Heat* dilates, and *Cold* contracts? Yet when we search more narrowly into the matter, we find that when *Water* is frozen, it takes up more space than when it is not frozen? Wherefore in cases where the greatest part of Particulars is only known, we can infer no more but thus; that *for the most part it is so:* Tho' sometimes we meet with some Special Cases, which swerve from the Common Rule. So from many Experiments we conclude, *Snow to be white*, *a Crow black*, and *Honey sweet*; notwithstanding that in some Countries there be found *red Snow*, *white Crows*, and *bitter Hony*.

IV. *What Example is.* EXAMPLE is a kind of *Imperfect Argumentation*, whereby from one *Singular* we gather another, because of a likeness of Reason that is between them. As when from this, *That* Cæsar *subdued the People of* Rome *more by his Clemency, than by his Arms*; I gather, that a Prince ought rather to have recourse to *Clemency*, than to *Arms*, for the reducing of his Subjects. Or when considering that others, by serious Meditation have arrived to some degree of Learning; I infer, that I my self also may arrive at the same by closely following my Studies, and by an attentive Consideration of the Things I undertake to examine.

V. *Argument from Authority.* To an *Example* belongs that which is called an *Argument from Authority*; which is, when we make use of the Testimony of one or more, to infer a Conclusion; whose force depends of a concealed, but yet imply'd Proposition: As when a Man saith, *Archimedes, and other famous Mathematicians assert, that the* Sun *is many times bigger than the* Earth: *Therefore we ought to hold the* Sun *to be many times greater than the* Earth. For here this *Proposition* is understood, That *every man ought to be belived in his own Art and Profession:* Or we are to take that for Truth, which *Archimedes*, and the most Learned *Mathematicians* do assert of their own Art.

VI. *Sorites.* SORITES, is an *Argumentation* consisting of many Propositions so disposed, that the *Predicat* of the foregoing Proposition becomes the *Subject* of the following; whence the last *Predicat* is in the Conclusion attributed to the first *Subject:* As in this Example, *Covetous persons desire many things*, *They who desire many things want many things*, *They who want many things are miserable*; *therefore Covetous men are miserable.*

VII. *When a Sorites doth not conclude truly.* This Argument doth not conclude truly, but when whatsoever is said of the *Attribute*, is likewise said of the *Subject:* Wherefore this *Ratiocination*, *Salt-meat excites to drink, and by drinking Thirst is extinguish'd*; *therefore Salt-meat extinguisheth Thirst*, is faulty: Because *Salt meat* only by Accident invites Men to drink, forasmuch as it eaves a dryness in the Throat, which causeth drinking.

VIII. *What a Dilemma is.* A DILEMMA is made by the *Disjunction* of many Propositions opposite to one another, whereby the Answerer is so shut up, that there is no way left for him to avoid the dint of it, which part soever he chooseth: As suppose a Man should accuse another of a Crime he hath committed, thus; *Either you did know your self to have offended against the King, or not; if you did know it, how durst you violate the Law of Majesty? If you did not, why did you run away?*

IX. *A Dilemma may be faulty two manner of ways. The First.* A *Dilemma* may be faulty two manner of ways: One, when the *Disjunctive Proposition* wherein it is founded doth not contain all the parts of the thing divided: As if a man would prove, That one ought not to Marry, by this way of Arguing; *If you marry a Wife, she will be either Beautiful or Deformed; if Beautiful, she will make you Jealous; if Deformed, you will loath her; therefore you ought not to marry at all.* The Mistake is, because there are *Women* who neither are so Beautiful, as to cause Jealousie; nor so Deformed, as to cause Loathing.

X. *The Second.* In the Second place, a *Dilemma* is vicious, when the particular Conclusions of either part are not necessary: Thus it doth not follow that a *Beautiful Wife* must needs make her *Husband* Jealous, forasmuch as she may be so Prudent and Chaste, as not to give the least occasion to doubt of her Vertue. Neither is it necessary that a *Deformed Wife* should be displeasing to her *Husband*, because her Deformity may be made up by her Vertue and Ingenuity, which may render her very grateful to her *Husband.*

XI. *What is to be observed in a Dilemma.* He that makes use of a *Dilemma*, must take care that it be such as may not be retorted upon himself, which it is said *Protagoras* did; to whom *Euathlus*, his Disciple, having promised a certain Sum of Mony in consideration of his instructing of him, to be paid on that Day when he should first get the better in the Cause he pleaded; and taking that for his first Cause, to plead whether he was to pay that Sum of Mony he had promised him, made use of this *Dilemma: Either I shall lose this Cause, or I shall win it: If I lose the Cause, then according to our Agreement, I am to pay you nothing; if I win it, then I shall owe you nothing by the Sentence of the Judges.* Which Argument *Protagoras* thus retorted; *Either you will lose this Cause, or win it: If you lose it, you will by Sentence be obliged to pay me; if you win it, you must pay me according to the Tenour of our Agreement.*

CHAP. XIX.

Of Demonstration, a Topical Syllogism and Sophistical.

I. *How Science, Opinion, Faith, and Error are distinguish'd.* FOr the better understanding of the following Discourse of *Apodictical*, *Topical*, and *Sophistical Syllogisms*, it is necessary that we first explain the Nature of *Science*, *Opinion*, *Error*, and *Faith*; that by exhibiting their distinct Notions, the Principles from whence they are derived may be the better known.

II. *What Science is.* SCIENCE is the certain and evident knowledge we have of any thing: For whatsoever is so evident to us, that we are certain of it, that we are said to know, or have the *Science* of. Accordingly the knowledge of a Conclusion is certain and evident,

dent, when the *Premisses*, whereon as *Principles* it doth depend, are so.

III. *What Opinion is.* OPINION, is a Knowledge that is not altogether certain, but joyned with some fear or wavering of the Intellect, in its assent to it. For *Opinion*, tho' it be a true assent to the Conclusion, yet is it doubtful and uncertain; and such an assent as this is the Effect of a *Dialectical Syllogism*, as *Science* is the Effect of a Demonstrative, or Apodictical *Syllogism*.

IV. *What Error is.* ERROR is an Opinion opposite to *Truth*, that is, a False one.

V. *What Faith is.* FAITH is a Persuasion founded upon the Testimony of another, which may be either true or doubtful, according to the different Authority it rests upon. So the *Faith* we have to God is most firm and stable, because we know him to be True, and that to Lye is repugnant to his Nature. But the *Faith* we have to a Man, hath always something of Uncertainty joyned with it; since there is no man but can deceive another, if he please.

VI. *How we may distinguish the several kinds of knowledge.* If in considering any *Axiom*, the truth of it do immediately appear to us, from the Evidence that is found in it, without any further Proof or Disquisition, this kind of *Knowledge* we call INTELLIGENCE: And thus we know *first Principles*. But if by its own proper Evidence, it cannot engage the *Understanding* to assent, then we must have recourse to other Motives, by which the Intellect may be convinced of its Truth: Now these Motives can be no other, but *Reason* and *Authority*. If *Authority* engageth us to assent to the things Propounded to us, this is that we call *Faith*: But if *Reason* sways us, then either that *Reason* leaves some fear behind it, whereby we are made doubtful of the certainty of the thing, and then this assent is called *Opinion*: Or the *Reason* doth satisfie fully the Understanding, and then it is either *Seemingly* only Evident, for want of due Attention, and thence comes *Error* in case it be really false; or at least a *Rash Judgment*, if we take it to be true, before we have sufficient grounds of giving our Assent to it: Or if the *Reason* proposed to us, be not only seemingly true, but evidently so, and be clearly and distinctly perceived by our Understanding, then the Conviction produced in our Mind by this *Reason*, is called *Science*.

Forasmuch therefore as *Demonstration* begets *Science*, and that the Conclusion of a *Demonstration* is *Science*, we will first Treat of it, and afterwards in order, of those things that produce *Opinion* and *Error*.

VII. *What Demonstration is.* DEMONSTRATION is a *Syllogism* consisting of *Premisses* that are *True, Immediate, Prior, more known and causes of the Conclusion*. Those *Propositions* are said to be True and Immediate, which have their Evidence from themselves, and not from any other thing: And which are known by their Terms: As, *Every thing is, or is not*. For there is an Inborn Power or faculty in us, whereby we assent to first *Principles*. Wherefore we should never give our assent to the Conclusion, except the *Premisses* appeared evident to us; neither do we assent to the Conclusion, but because we believe the *Premisses* to be true; and therefore it is necessary that the *Premisses*, be more known than the Conclusion, according to that saying; *That for which any thing is such, is more such it self.*

VIII. *Demonstration is twofold either à Priori, or from the Cause.* *Demonstration* is twofold, the one *à Priori*, and the other *à Posteriori*. *Demonstration à Priori* (which alone, to speak properly, is *Demonstration*) is that in which the Effect is Demonstrated by its Cause: As when we prove the *Existence* of *Light*, by the *Existence* of the *Sun*. Or when *Geometricians* prove that round Wounds are longer a Healing, than such as are of a long Figure, forasmuch as in those, the Sides are further distant than in these.

IX. *Demonstration à Posteriori, or from the effect.* *Demonstration à Posteriori* is when we Demonstrate the Cause by the Effect: As when from the *Existence* of *Light*, we Demonstrate the *Existence* of the *Sun*. When we prove the *Heaven* to be Fluid and Corruptible, from the various Things that are Generated in it; as from the *Comets* that are found in it; from the *Spots* about the *Sun*, and from many *Stars*, which for some time shew themselves there. To this kind of *Demonstration* may also be reduced the *Demonstration* which is made from the remote Cause, as when one proves that a *Stone* doth not breath, because it is not an *Animal*, when it would have been more proper to have proved it by this, because it hath no Lungs. For the having of Lungs is the near cause of *Respiration*, and not the being an *Animal*; nay it will be found that to have Longs is not the property of an *Animal*, since there are many *Animals* that have no Lungs, as *Oysters, &c.*

X. *Of Ostensive Demonstration.* Antient *Authors* make mention of another kind of *Demonstration*, which they call *Ostensive*, by which a thing is Demonstrated from proper *Principles*, directly and by it self. As if a Man, when a right Line is given, and a *Semidiameter* made of two *Circles*, and two other right Lines, to one of the Intersections of the *Circles*, drawn from their Extreams, and by these three Lines a *Triangle* is made, should prove Ostensively that this *Triangle* is *Equilateral*, or hath all its Sides alike, by shewing that the two last Lines are even, or of the same Length, because they are equal to the same Line given; and that they are equal to the same Line given, because both of them separately proceed from the same Center, to the same Circumference with it.

XI. *Demonstration by Deduction to an inconvenient.* To this they have added another kind of *Demonstration*, which they call *Deductive to an inconvenient*; which tho' it be inferiour to the former, yet may be of use, where we cannot have an *Ostensive Demonstration*, as being also of insuperable necessity. And this is when we demonstrate a thing to be so, because if it should be otherwise, either an Absurdity, or an Impossibility, or a contradiction must necessarily be granted: Such as is, *That the Effect doth not depend on the Cause*; And *that the thing containing is less, than the thing contained*, and the like. As if by Deduction to an inconvenient he would prove the aboveSaid *Proposition* from hence, because no Side can be admitted to be equal to another; but at the same time it must be granted, that all Lines drawn from the Center to the Circumference are equal; or that two things which are equal to one thing, are not equal between themselves.

XII. *What a Topical Syllogism is.* A TOPICAL SYLLOGISM, which is also called *Suasory*, or *Opinable*, is that which *concludes from Probables*: Or whose *Premisses* do not hold forth, a necessary Connexion of the Subject, with the Middle Term, or of the Middle Term with the Attribute. For tho' the Conclusion it proves, partaks more of Evidence than Obscurity, yet it leaves something of doubt or *Hesitation* behind

hind it, which makes that the understanding cannot assent without some Scruple. And therefore 'tis commonly said that a *Topical Syllogism* doth persuade indeed, but doth not force one to assent as a *Demonstration* doth.

XIII. *What things are called probable.*

Those things are called *Probable*, which seem to be so to all, or to the most, or to the Wise, or at least to the most, or most considerable amongst them: As it seems *Probable to all*, that the approaching *Summer* will be *Hot*, yet it is not certain, forasmuch as it sometime happens that the *Summer* is very *Cold*. *It appears to most, that Physick is necessary for the Curing of Diseases*, whereas, notwithstanding it often happens, either through the Ignorance of the *Physitian*, or through Default of the *Patient*, the Distemperature of the Air, or the Unhealthfulness of the Place, that a *Medicin* may do more hurt than good. It appears to *Wise Men*, that *Learning* ought to be desired by all; when notwithstanding there be many found that despise it, and who prefer their *Ignorance* before *Learning*. The *most considerable Men*, are of Opinion that the *Earth* is moved, and that the *Sun* stands still in the midst, and yet there are many that oppose this Opinion, and maintain the contrary.

XIV. *How a Topical Syllogism is distinguisht from all others.*

Wherefore all those *Syllogisms*, whose *Premisses* are *Contingent*, and do not infer a necessary Connexion between the *Subject*, and the *Middle Term*; or between the *Middle Term*, and the *Predicate*, are called *Topical*, that is, *Local* or *Probable*. The former from the *Places* whence their *Proofs* are taken, the latter from the likelyhood of them.

XV. *What a Sophistical Syllogism is.*

A SOPHISTICAL or *Paralogistical Syllogism*, which with one Word is called a *Sophism*, is a *Syllogism* consisting of false *Propositions*, which yet have an appearance of *Truth*: Or is a *Syllogism*, that begets Error. As for Example, this *Syllogism*,

All Lines drawn from one Point to another are Equal;
But a Right and a Crooked Line, may be drawn from the same Point, to the same Point;
Therefore a Right and a Crooked Line are Equal.

XVI. *Of the various ways of deception in Sophitical Syllogisms; and first of the Fallacy in Words.*

All *Fallacy* or *Deception*, is either in the very Form of the *Argument*, or in the Words, or in the Things. As to the Form of *Argumentation*, we have already largly Treated, in Chapter XVI. As for the Cavilling which consists in Words, that is callen *Fallacia Dictionis*, or *Fallacy* in *Words*, which frequently consist in the Homonymy of the *Words*, when things altogether different are signified with the same *Word*. Sometimes also in the Ambiguous context of the Speech, and then it is called *Amphibology*; Examples of which kind, do also occurr amongst the best of Authors.

XVII. *The Fallacy from a conjoyned Sense to a divided, and on the contrary.*

There is another *Sophistical* way of Arguing, *from conjoynd Things, to those that are divided*; and on the other Hand, *from Things divided to those that are conjoynd*. This hath given occasion, to that Distinction of a Divided and a Compound Sense. The former is, when a *Faculty* or *Power* is joyned with an oppsite Act; as the *Faculty* of *Laughing*, with the Act of *Weeping*; for this Proposition, he that *Weeps* can *Laugh*, is true in a Divided, though not in a Compound Sense. But a Compound Sense is, when two oppsite Acts are united together; and thus, this Proposition, *He that Laughs cannot Weep*, is true in a Compound, Though not in a Divided Sense.

XVIII. *The Fallacy from the second Intention to the first.*

There is a Third way of *Cavilling*, when we Argue from Second intentions, to First; as thus; *A Circle is a Figure; But Figure is a Genus, therefore a Circle is a Genus.*

XIX. *From a Relative to an absolute Expression.*

The Fourth is *à Dicto secundum quid*, from a Relative Expression, *ad Dictum simpliciter*, to an absolute Expression; As if a Man should Argue, that because *Blackamoors* are *White*, with repect to their *Teeth*, therefore they are absolutely *White*; or because *Wine* is for the most part Hurtful to Sick Persons, should conclude *Wine* to be absolutely Hurtful.

XX. *Ignorance of the matter in Question.*

The Fifth is that which is called *Ignoratio Elenchi*, or Ignorance of the matter in *Question*, which is, when another thing is proved, than that which is denied by the Adversary.

XXI. *Petition of the Principle.*

The Sixth is *Petition* of the *Principle*, when the Point indispute is taken for granted. As if one should go about to prove that the *Earth* doth rest, because the *Sun* is moved: that being the *Principal* thing in Question, whether the *Sun* be moved.

XXII. *From a No cause to a Cause.*

The Seventh is taken *à Non Causa ad Causam*, from *a No Cause to the Cause*, as when that is brought in for a Cause, which is no Cause at all: As when we refer the changes of times to the *Moon.*

XXIII. *From a manifold Question.*

The Eighth way of Cavilling, proceeds from a *manifold Question*, which is, when many *Questions* are so Propounded, that they look like one only. As if one should ask, whether the *Sun* and *Earth* are moved.

XXIV. *The manner how to avoid Sophisms.*

There is no safer way to avoid these Captious *Sophisms*, than to define the Words themselves, in case of a *Fallacy* from *Equivocation*, or *Homonymy*. Neither are we only diligently to consider, what the thing in *Question* is, but also, what is the *Attribute* of the *Question*, and what Relation and Order it hath to the *Subject* it self. For it is of great importance, whether the *Attribute* be *Universally* by it self, and primarily *Attributed* to every *Subject*, or that it agree to some one only, or by *Accident*. In like manner, whether the *Attribute* be spoken of the *Subject* simply, that is, absolutely, or with respect to something: All which particulars may be easily known, from what hath been already said.

The Places from whence the Middle Term is Fetch'd.

XXV. *What the Places are from which the Middle Term is fetch'd.*

We come now to the General Heads, or as the *Rhetoricians* call them, *Places* of *Arguments*, to which the Proofs which we use in any matter, may be reduced. For as some *Syllogisms* are *Demonstrative*, others *Opinable* or *Opinionative* and *Suasory*, and others again *Paralogistical* or *Erroneous*, so there must be divers Places, whence the *Middle Term* or *Argument* may be Fetch'd.

XXVI. *The Middle Term in a Demonstrative Syllogism, may be the Genus.*

For in a *Demonstrative Syllogism*, the *Middle Term* agrees with the Subject, and the Attribute with the *Middle Term*, as a *Genus*, or a Propriety, or a Definition, or a Cause acting necessarily, and the like. As if a Man should have a Mind to Demonstrate that a *Mote* in the *Sun*, is indefinitely divisible, he may take the *Genus* for his *Middle Term*, and argue thus: A *Mote* is a *Body*, but a *Body* is indefinitely divisible, therefore a *Mote* is indefi-

finitely divisible. The Minor is to be suppos'd from *Natural Philosophy*.

XXVII. *Or a Propriety.* So to demonstrate a Mans being *Rational*, we may take his Property, which is the Faculty of Speaking, and Reason thus: The *Power of Speaking*, that is, the Faculty of expressing ones Mind by Words, Signs, or Gestures, *belongs to Man*; *But whatsoever enjoys this Faculty doth partake of Reason*; *therefore* Man *doth partake of Reason*.

XXVIII. *Or a Definition.* So likewise a *Definition* may serve for a Middle Term, to prove that *Oysters* are *Animals*, thus: *Oysters are Bodily things, endued with life and motion: But whatsoever hath life and motion is an Animal*; *therefore Oysters are Animals*.

XXIX. *Or a Cause.* And so also a *Cause* acting necessarily, may be the Middle Term; for thus a *Lunar Eclipse* may be proved from its Efficient Cause, *viz.* the *Sun* and *Moon* being placed in opposite *Nodes*, or in the Intersections of their *Orbs*, after this manner: It is necessary for the *Moon* to be Eclipsed, as often as the Globe of the *Earth* interposeth between the *Moon* and the *Sun*, from which the *Moon* borrows her *Light*; but then the Globe of the *Earth* interposeth between the *Moon* and the *Sun*, when the *Sun* and *Moon* are in opposite *Nodes*; (because at that time they are Diametrically opposite, and the *Earth* plac'd in their Diameter) therefore there must necessarily be an Eclipse of the *Moon*, when the *Sun* and *Moon* are constituted in their *Nodes*, or the opposite intersection of their *Orbs*.

XXX. *The Middle Term in a probable Syllogism, may be fetch'd first from the Genus.* We make use also of like places in a *Probable* or *Suasory Syllogism*; yet so as that tho' the *Middle Term* agree to the Subject, (yet the *Attribute* does not to the Middle Term, as a *Genus*, *Propriety*, *&c.* as before:) As if a Man to prove *Rhetorick* to be profitable for Mankind, should argue thus; *Rhetorick is an Art, but every Art is profitable to Mankind*; *therefore Rhetorick is profitable to Mankind*. In which *Syllogism*, the Middle Term *Art*, is indeed the Genus of the Subject *Rhetorick*; but the Attribute *is profitable*, is not its Genus, but only a contingent Adjunct, or common Quality; and therefore neither doth the Mind assent to it without something of Doubtfulness, whether or no *Rhetorick* may not be reckon'd amongst those Arts, which tho' they be accounted Subtil, yet are esteemed by some as unprofitable, or at least indifferent.

XXXI. *From a Propriety.* In like manner one may prove, from a *Propriety* of *Logick*, that *Logick* is a thing desirable, thus: *It is the Property of Logick, to direct the Mind in the knowledge of things*; *but what directs the Mind in the Knowledge of things, is something desirable*; *therefore Logick is a thing desirable*. This Argument also leaves some hesitation in the Mind, because the directing of the Mind in the Knowledge of Things, doth not necessarily conclude the thing to be desirable; because there are many who rather desire to continue in their Ignorance, than to be instructed in *Logick*.

XXXII. *From the Cause.* We may also argue from the *Cause* thus: *This Picture is drawn by* Apelles; *but the Pictures drawn by* Apelles *are very exact: Therefore this is an exact Picture*. Which enforceth only a Probable, but not a certain Conclusion; because the best *Painters* do not always Paint alike, nor so exactly, but that sometimes Faults may be spied in their *Works*.

XXXIII. *Ambiguity is the only place for a Sophistical Syllogism.* A *Paralogistical*, or *Sophistical Syllogism*, has but one only place, *viz. Ambiguity*; which being once detected, its Imposture lies open; and that which seem'd to be a good *Syllogism* appears to be none at all. Because the Reason of *Syllogism* requires, that it have only one Middle Term, one Subject, and one Attribute; whereas in a *Sophistical Syllogism* there are two *Subjects*, and as many *Attributes* without a Middle Term: As when a man Argues, *some Mountain is* Taurus, Taurus *is a Lowing Animal: Therefore some Mountain is a Lowing Animal*. For the Ambiguity here lies in the word *Taurus*, which agreeing to two different things, is in the Major taken for a *Mountain*, and in the Minor for a *Four-footed Animal*. Whence it appears, that the word *Taurus* is no Middle Term, forasmuch as it doth not agree with the *Subject* and *Predicate*.

XXXIV. *Ambiguity is the cause of Deception in all things.* For *Ambiguity* is that which occasions deception in all things; for he that concludes, that a Man *asleep* is *awake*, because it hath been before granted, that it *is possible for a man that sleeps to be awake*, doth not do it for any other Reason, but because this *Proposition* may be understood either disjoyntedly, with respect to different times; or conjunctly, with regard to the same time. And he who concludes that the *Buyer hath eaten raw flesh*, because it may be, he confess'd that he had *eaten* what he had bought, doth so because of the Ambiguity of the words, *What he had bought*; which may either be taken only for the substance of the Flesh; or also for an Accident of it, *viz. Rawness*. And the like may be said of all *Sophistical Places*, *Amphibology*, *Composition*, *Division*, *Account*, *&c.* forasmuch as they all agree in this, that they have some *Ambiguity* either in a *Word*, or in a *Phrase*; or that one Sense is taken in the *Proposition*, and another in the *Assumption*. So that it is no wonder, that when both are admitted for True, an Absurdity follows from them.

The Fourth Part of Logick.

Concerning Method, or the Orderly Disposition of our Thoughts.

CHAP. XX.

Of the General Method of Knowing.

I. *Method is necessary to the Right forming of our Thoughts.* FOrasmuch as LOGICK was found out for the attaining of *Sciences*, and that our *Thoughts* can hardly be rightly formed without its assistance, METHOD seems to be necessary to assist and accomplish our Mind in the *Knowledge* of Things. For tho' possibly there may be some of such quick and piercing Wits, as without difficulty to dive into the Natures of Things, and to solve the most abstruse Questions; yet will he never be able to attain certain *Knowledge*, except he be first acquainted how he must direct his *Mind*, and what *Order* he must observe. Wherefore *Method* is necessary, as well to assist him in the searching out of *Truth*, as in the avoiding of *Error*, *Confusion*, and *Obscurity*. Which *Method* is nothing else, but *an Orderly disposition of things to be treated of, suitable and accommodate to the Capacity of Learners*. For it must

must be of that Nature, as not to put any force upon the *Wit* of Man, but rather pleasantly allure it, and guide and direct it by the Evidence and Easiness of its *Rules* and *Precepts*.

II. *Three things are requisite to the manner of Knowing.* This Mode or manner of *Knowing* consists in Three things: *First*, That the thing propounded may be clearly and distinctly Perceived. *Secondly*, That we judge rightly concerning the Matters we have thus clearly and distinctly perceived. *Thirdly*, That we commit to Memory the *Truths* we have discover'd, that is, the things we have rightly Perceived and Judged. By observing these Three *Precepts*, we shall relieve all the Weaknesses of our Mind, and prevent those *Errors* into which it is apt to fall. For seeing that the main Obstacles of *Science* are, either an *over-hastiness* of the Mind; the same will be removed by clear and distinct Perception; or else *Error* and *Doubt*, which will be cured by Sound Judgment; or lastly, *Forgetfulness*, which will be prevented by the Remembrance of the Things perceived and judg'd by us. It remains only to enquire, by what means this *distinct Knowledge* may be attained; and how our Mind may be brought to that pass, as never to assent to any thing which it has not before clearly perceived, and so to impress the Things she has judged of in her Memory, that she may never forget them.

III. *First, the distinct Perception of the thing.* As to the First, it is requisite, that setting aside all *Precipitancy*, we give heed to the Matter propounded, and (as it were) scan the same with our inward Eyes. In order to which, it will be proper for us to behold or contemplate one thing only at once, that our Understanding may not be distracted by the multitude of *Objects*, and lest by minding many things, our attention to Particulars may be the less. For the multiplicity of *Objects* presented to our Understanding, breeds Confusion; and as they who behold a Field, distinguish'd with variety of *Colours*, do not distinctly perceive the variety of Colours that is in it, but behold it under the appearance of one Colour only: So they who consider several *Objects* at once, cannot bestow a due attention upon every particular; and it cannot otherwise be, but that they must be promiscuously confounded in their Mind.

IV. *Wherefore we must rather set our selves to examine Simple things, than those that are Compound.* In order to attain this due *Attention*, it will be of good use to undertake the examining of a *Simple thing*, or of some *Attribute* or *Mode*: For these kind of Perceptions, whereby Simple and Incomplex things are represented to us, are more clear and distinct. As for Example, The *Soul of Man* is more distinctly perceived by us than *Man*; because the *Soul* of Man imports one Nature only, *viz.* a *Thinking Being*; whereas a *Man* comprehends two Natures, *viz.* a *Soul* and *Body*, which belong to two different *Genera*, and therefore cannot be both at once proposed to the *Intellect* without some confusion.

V. *Things Simple are to be examin'd before those that are Compound.* Accordingly *Simple things* are to be known before *Compound*, near before remote, and few before many. Thus we attain a fuller knowledge of the things that are born, if we begin the consideration of them from their first beginning. By which means the Famous *Harvey* perspicuously discovers the *generation* and *growth* of a *Chicken*, by shewing what Parts are daily formed in an *Egg*, which an *Hen hatcheth*. In like manner we arrive to a more accurate knowledge of a *Plant*, when we take a view of its *beginning*, *progress*, and *perfection*, considering it in its distinct Stages of its *budding*, *growth*, *blooming*, and *bringing forth fruit*; and the same may be said of all things that grow and increase.

VI. *Things Positive are more distinctly conceiv'd than Negative.* But forasmuch as *Substances* are chiefly known by their *Attributes*, and that many of them are found in every *Substance*, we are rather to consider those that are *Positive*, than the *Negative*. Thus the Nature of the *Soul* is more easily known by me, when I consider it as an *understanding*, *willing*, and *judging Subject*, than when I conceive it as *Immaterial*, *Incorporeal*, *Invisible*, *&c.* because Negative Attributes do not so much declare *what a thing is*, as *what it is not*. Wherefore it will also much conduce to the attaining of *Knowledge*, if we always begin our Enquiries with those things that are more Universal, and from them to proceed to Singulars: Because the *knowledge* of *Universals* doth more accomplish our Minds, than that of *Singulars*; the reason whereof is, because *Universals* are in a manner *Eternal*, as having no Original, and not being comprehended within any difference of Time or Space of *Place*, which has given occasion to that noted Axiom of Philosophers, that *Science consists in Universals, and not in Singulars*.

VII. *We must call to Mind, what hath been said in the First Part of this Discourse.* We shall the better understand all these Particulars that refer to clear and distinct Perception, by firmly retaining in our Memory, what hath been already handled in the First Part of *Logick*; because this Fourth Part is founded upon those *Rules* which are there delivered, concerning the Genealogy of things, their *Causes* and *Effects*, *Subjects* and *Adjuncts*, *Agreement* and *Disagreement of things*, *&c.*

VIII. *The Second Precept, about the manner of Knowing, is concerning Judgment.* The Second Precept about the Mode of *Knowing* is this, That our *Judgment* do always follow our *Conceptions*; that is, that we never assent to any thing which we have not before clearly and distinctly perceived: For the Order of *Reason* requires, that *Knowledge* always go before *Judgment*, and that Simple Terms make way for those that are Complex, but yet so, as that the *Judgment* we pass of any thing, may exactly answer to the *Knowledge* we have of it; as I have before hinted in the *Fourth Rule* for the *attaining of Truth*. For since the Second Operation of the *Mind*, or *Judgment*, doth involve two things, the *Subject*, and the *Predicate* or *Attribute*, it is necessary that the Nature of both be fully known to us, before we can judge whether the one do agree with the other, or dissents from it. Thus we must first have distinctly understood what the *Sun*, and what *Heat* is, before we can affirm the *Sun to be hot*, or (which is the same) that *Heat agrees to the Sun*. As to which point they do greatly mistake, who too much cleaving to the Prejudices wherewith they have been tainted from their *Childhood*, do judge according to them; because they pervert the Order of *Reason*, and do not follow their Perceptions as they ought to do, but anticipate them, and believe them to be true, before they have perceived them to be such.

IX. *What is to be done by him who is in doubt about the Matter propounded to him.* If a Man chance to doubt of the *Truth* of the thing he is enquiring into, he may easily avoid falling into any Error, by suspending his *Judgment*, and not affirming or denying any thing concerning it, until he have exactly examin'd all the Difficulties of it, and by the Rules of *Perception* have

have removed all doubts concerning it. For we muſt not think it enough, that this or the other thing appears diſtinctly and clearly to others, except it appears likewiſe to us. For ſeeing every one deſires Knowledge for himſelf, it is but reaſonable, that he make uſe of his own Underſtanding, and not of anothers; and that he paſs Judgment ſo far only, as his own Knowledge guides him. Wherefore, before we can with any ſafety give our aſſent to any thing, we muſt be certain that the thing be ſo indeed, as it is conceived by us, and not only ſo, but that it cannot be otherwiſe.

X. *There is a different certainty of Truth in things.*

Yet are not we to conceive that all things that are true, are of the ſame certainty; for ſome things are only *Contingently* true, that is, ſuch as are taken to be true by us, tho' indeed they may be falſe; as when I take a Man to be *Godly*, becauſe he is frequent at *Church*, and at *Sermons*, and is liberal to the *Poor*; all which Signs are ſufficient *Morally*, to perſuade me that he is *Godly*; tho' notwithſtanding all this, it may happen that he is not ſo. Other things again, are altogether *Certain* and *True*, as are all *Propoſitions* of Eternal Truth, which are true in that degree, that they cannot admit any ſuſpicion of *Falſhood*: Such as are theſe Propoſitions, *Twice four make Eight. Three is a number.* And therefore ſuch neceſſary Propoſitions as theſe are called *Axioms*; becauſe their Predicates agree with all their Subjects, and at all times, and according to the different degree of neceſſity, they partake and admit of ſeveral Names.

XI. *What Phyſical Certainty is.*

Some *Attributes* are ſaid to be joynd with their Subjects, by a *Phyſical* certainty, when according to the order of Nature, it is impoſſible but they muſt be joyned to them; as when we ſay, that *a Man hath two Feet*; becauſe, that tho' a Man may be conceived without Feet, yet Naturally Man is never without them. Other things are called true, by *Metaphyſical* certainty, when an *Attribute* is ſo indiſſolubly attributed to its Subject, that it cannot be conceived to be otherways: As when we ſay, *Three is a number.* And the ſame may be ſaid of ſingular *Axioms*, foraſmuch as the ſame *Definitions*, *Differences* and *Attributes* occur in them as in Univerſals. As to Judgment, the Reader may have recourſe to what hath been ſaid in the ſecond part of *Logick*, where is treated of *Judgment*, and the nature of *Propoſitions*.

XII. *The Third Precept is Memory.*

And foraſmuch as it is of little uſe to know the nature of things, except we remember them; we are alſo to be informed, how the things we underſtand, may be ſo *impreſt* on our *Memories*, that we may not eaſily forget them again. This we may eaſily procure, by following the Order of *our Method*; that is, by taking care, that we commit nothing to Memory, which we have not before throughly examined, and paſſed a right *Judgment* of. For daily experience ſhews us, that the more clearly any thing is perceived by us, the ſtronger it is impreſt on our *Memories*, and that we more eaſily remember the things, that are in order propounded to us, than thoſe which are offered to us confuſedly. For the *Memory* doth of it ſelf, and ſpontaneouſly embrace things that are clearly underſtood, and, as a Foot-boy, follows right Judgment.

XIII. *Helps of the Memory.*

But yet we may promote and aſſiſt our *Memory*. Firſt, By keeping our Mind ſtill and quiet, without ſuffering our Underſtanding to be variouſly diſtracted by multiplicity of Objects: Eſpecially if to theſe we add the deſire of Learning ſome new thing or other, or that we be excited by admiration to inſiſt the longer on the matter we deſire to know. For ſuch things as theſe we are wont more to imprint in our *Memory*. It is alſo greatly ſtrengthened by moderate Study and frequent Exercitation. For as the *Fingers* by playing upon a *Lute*, do accuſtom themſelves to ſuch and ſuch Motions, ſo by Exerciſe we attain to ability and readineſs. To which we may add, that by Study, the Species in the *Brain* become diſtinctly ranged and joyned, and by uſe alone, almoſt all obſtructions are removed. *Thirdly*, It will be a great help to our *Memory*, if the things we commit to it be not only evident, but alſo connexed, and orderly diſpoſed, and adorned with the *Circumſtances* of *Cauſes*, *Effects*, *Time*, *Place* and other ſuch like. This is the firſt office of *Memory*.

XIV. *The Office of Memory.*

It is the office of *Memory*, to retain the things we have committed to it; which we ſhall obtain by frequently repeating, and a diligent conſideration of them: As likewiſe by endeavouring to reduce Compound Things to thoſe that are *Simple*, and ſpecial things to *General*. For by this means, they will more clearly be repreſented to our *Minds*, and more firmly fixed in our *Memory*: As is apparent in thoſe *Sciences*, which from ſimple terms proceed to *Propoſitions* and *Axioms*; which without any trouble, are inſinuated into our *Minds*, and continue with us till our *Lives* end.

CHAP. XXI.

Concerning ſpecial Method; and firſt of that which is called Analytical.

I. *Another Method neceſſary to the orderly diſpoſing of our Thoughts.*

THe word *Method*, is taken more ſtrictly here than in the *foregoing Chapter*; becauſe it being there, only our deſign to inform *Beginners*, what *Order* they were to obſerve in the knowledge of *Things*; it was ſufficient to ſet down a *Method*, which might be helpful to them for this end, and point out to them the way, whereby to arrive at the diſtinct knowledge of *Things*. But here we are to handle, not only how we ought to form our Conceptions, but alſo how we ought to order and diſpoſe them, either for the diſcovering of the *Truth* we are ignorant of, or for the proving of the *Truth* we know to others.

II. *Method is twofold, Analytical and Synthetical.*

And accordingly there is a twofold *Method*, the one called *Analytical*, or the *Method of Reſolution*, which ſhews the true way, by which the thing was Methodically and Primarily invented. The other *Synthetical*, or *the Method of Compoſition*, which clearly demonſtrates what hath been concluded; but by an oppoſit way, and fetch'd *à Poſteriori*. For a whole *Science* cannot be ſet down according to *Analytical Method*, but only ſome particular *Queſtions*, about certain *Terms* or *Things*.

III. *What is to be obſerved about Terms.*

About *Terms* we may enquire, what is to be underſtood by the *Word* in Queſtion; for ſeeing that ſome *Words*, belong to Notions, that are common to all Men; and other proper or peculiar to ſome that profeſs ſome certain *Diſciplines*: We are to mind, what Men are wont to underſtand by the *Word*; or what the *Maſters* of thoſe *Diſciplines* are uſed to ſignifie by them; or what he means by them, who makes uſe of them in *Writing* or in his *Speech*. For it cannot be doubted, but that the

moſt

most part of our disputes arise from the Ambiguity of *Words*; whilst one takes them in one Sense, another in another; which disputes might easily be decided, if the Parties in contest were agreed about the signification of the Word in question.

IV. *What is to be observed about things.* About the thing it self, we are to consider *what it is*, that is, what its Essence and Properties are. *Whether it be*, that is, whether it exist in the Nature of *Things*; and if it do, whether its existence be possible or necessary. *Whence it hath its Original*, whether *from it self*, or from some other *thing*; and if it proceed from another, whether by *Creation* or *Generation*. Of what Nature it is, *Material* or *Intellectual*, and with what Faculties it is endowed, &c. *Of what quantity*, or bigness it is, and what space it takes up amongst other *Bodies*, if it be *Material*; and what if it be *Intellectual*, what its *Powers* are. *What effects it produceth*, that is, whether it be a Principal Cause, or an Instrumental only; whether it work voluntarily or necessarily; whether it be Univocal, or Equivocal, &c. *How it is distinguished from other things*, or what distinction there is between it, and other things, and whether it differ from them really, or Notionally only.

V. *What a Question is.* *Analytical Method* being the Art which guides Reason in the Research of *Truth*, we must before all things, endeavour to know the Nature of the *Question*, which we are to examin, and to consider afterwards, how many sorts of *Questions* there may be made. *Questions* are *Propositions*, which include something that is already known, and something that is unknown. For otherwise, they would be rather known *Truths*, than *Truths* to be known; and if they did not also contain something that is known, they could not properly be called *Questions*, because we cannot proceed to that which is unknown, but by means of something that is known.

VI. *There is a four-fold way of searching out the Truth of things: First when by the Effects we find out the Cause.* All *Questions* concerning things may be reduced to four *Species*. First, When from the *Effects* we find out the *Cause*. As for Example it is Notorious, that the *Sun* shining upon a *Prism*, represents therein variety of *Colours*; the Question is, what is the true cause of so many divers *Effects*. It is a known thing, that *Air* and *Water* are subject to *Rarefaction*, and that at one time they take up more space than at another: the *Question is*, what is the reason of this change, and what there is in Nature, that can encrease the quantity of *Bodies*.

VII. *The second is when from the Causes we enquire into the Nature of the Effects.* The second *sort of Questions is*, when *Effects* are endeavoured to be discovered by their *Causes*. It is a known thing, that *Wind* and *Water* have great force in them, to move *Bodies*; but our *Fore-Fathers*, for want of due attention, not considering duly what *Effects* might be produced from those *Causes*, did not make that good use of them, as we now do, by the useful inventions of *Watermils* and *Windmils*, and many other conveniences, by which abundance of human labour is spared, which is an advantage of true *Natural Philosophy*. The first sort of *Questions*, in which the *Cause* is searched out by the *Effects*, are the total Object of *Natural Philosophy*; and the second sort, in which the *Effects* are enquired into by the *Cause*, are the whole *Practise* of it.

VIII. *Thirdly, when from the Parts we enquire into the Nature of the Whole.* The third *sort of Questions is*, when from the Parts we enquire into the Nature of the whole; as when after having set down several Numbers, by adding them together, we enquire, what Number results from them all. Or when having got two Numbers, we enquire, what they produce by mutual *Multiplication*.

IX. *Fourthly, when from one Part we search into the Nature of another.* The Fourth is, when having a whole, and some part of it, we search out the other part of it: As, when having a determinate number, and that part which is to be taken from it, we enquire, what number will afterwards remain to us. By the Word *Part* in this place, we are not strictly to understand, only the *Part* of a thing, but whatsoever doth belong to any *Substance*, such as are *Modes*, *Properties*, *Accidents*, and in a Word, all the *Attributes* that are found in any thing.

X. *What is required to enable us to answer these Questions.* That we may be able to answer these *Questions*, in the *First place*, it is requisite, that we clearly and distinctly conceive the point, that is precisely enquired after. Secondly, that we do not precipitate our Answer, till we have discovered whatsoever belongs to the *Question*, by certain *Signs* and *Tokens*, and not imitate those, who hearing their Friends Name, presently conceive it to signifie that particular *Person*, and give their answer, before they know what he, who asked the *Question*, means by it. Thirdly, Forasmuch as in every *Question*, there is something conccaled, we must be careful to denote that which is hid, by some certain *Conditions*, which may determine us to the seeking of one thing, rather than another, and which may induce us to judge, that that which we have found is the very same thing, that was enquired after. Fourthly, After we have examined the *Conditions*, let us set our selves seriously to consider, whatsoever in the matter propounded is either hid from us, or clear and evident to us; forasmuch as by means of this, we may arrive to that which is unknown to us. And in this our Attention to that which we know of a *thing*, in the resolving of a *Question*, *Analytical Method* chiefly consists: The whole Art and industry whereof consists in this, by this Examination to find out several *Truths*, which may lead us to the knowledge of that thing, which we are endeavouring to discover.

XI. *What Analytical Method is.* *Analytical Method* therefore is nothing else, but *a Particular application of the Mind, to that which is known, of that which is most particular in the Question to be resolved; whence it successively deduceth other Truths, which lead it at last, to the thing it desires to know.* I say, that *Analytical Method is a particular Application of the Mind, to that which is known*; to observe that which *Analytical Method*, hath in common with *Synthetical*, which also begins with that which is known. And add, *of that which is most particular in the Question it would resolve*. To intimate the difference that is between the *Analytical* and *Synthetical Method*; and that this latter takes that which is known, of that which is most general in the *Questions*; whereas the other takes it of that which is most particular in them.

XII. *How by way of Analysis we may prove the Mind of Man to be Immortal.* As suppose the *Question* to be *whether the Mind of Man be immortal*; and to find out this, we consider the Nature of the *Mind*, and presently discover, that Thinking is the property of the *Mind* of Man, which tho' it might be supposed to doubt of every thing besides, yet cannot doubt of its own Thinking, since its doubting is a kind of Thinking. Afterwards it proceeds to examin what it is to Think, and when it perceives that nothing is

included in its *Idea*, of what is involved in the *Idea* of an *Extended Subſtance*, or a *Body*: Yea, that it may be denied of *Cogitation*, that it belongs to the *Body*, foraſmuch as it is ſomething extended in *Length*, *Breadth*, and *Depth*, hath *Parts*, is of ſuch and ſuch a *Figure*, is *Diviſible*, *&c.* without deſtroying the Idea we have of *Cogitation*: We conclude, that *Cogitation* cannot be the Mode of an *Extended Subſtance*; becauſe the Nature of a *Mode* is ſuch that it cannot be conceived, when the thing whoſe *Mode* it is, is denied of it. Whence it may alſo be inferr'd, that ſeeing *Cogitation* is not a *Mode* of the *Body*, it muſt needs be the *Attribute* of another thing; and that therefore a *Thinking Subſtance*, and an *Extended Subſtance*, are two diſtinct Subſtances. From which finally we conclude, that the deſtruction of the one, doth not infer the deſtruction of the other. Add alſo, that *Extended Subſtance* cannot properly be ſaid to be deſtroyed, ſince whatſoever we may call its deſtruction, is nothing elſe but a change or diſſolution of ſome *parts* of the *Matter*, which ſtill remains the ſame in Nature as it was. As when all the *Wheels* of a *Watch* are broken, we may eaſily judge that no p rt of the *Watch* is deſtroyed, tho' the *Watch* it ſelf be commonly ſaid to be ſpoil'd or deſtroyed. From which *Example* it appears, that the *Soul*, which is not *diviſible*, neither conſiſts of any *parts*, cannot periſh, and conſequently that it is *Immortal*.

XIII. *Analytical Method proceeds from a heedful Conſideration of a thing.*

Whenſoever therefore the *Nature* or *Cauſe* of any thing is propoſed to our Examination, we muſt in the firſt place accurately examine all the Conditions of the *Queſtion* propounded, without minding ſuch as are *Extraneous*, and do not belong to the *Queſtion*. *Secondly*, We are to ſeparate thoſe things which are certain and manifeſt from thoſe that include any thing of *Confuſion* or *Doubt*: For we are to ſearch and trace out the thing we enquire for, from clear and evident *Idea's*. *Thirdly*, Every Difficulty we meet with is to be divided into Parts, which *Parts* are to be conſidered by themſelves. For *Partition* is like a *Torch* to a Learner, directing him which way he is to go, without uncertainly wandring up and down. *Fourthly*, We are orderly to diſpoſe of our *Perceptions*, and the *Judgments* we frame thence; ſo that beginning from the moſt eaſie, we may proceed by degrees to thoſe that are more difficult. Wherefore our chief buſineſs muſt be, diligently to conſider, and well to weigh thoſe Particulars chiefly, which are clear and perſpicuous in the *Queſtion*, and not proceed to thoſe that are unknown, except we find that by thoſe which are already known to us, we are likely to Maſter them. *Fifthly*, That the *Thing* in queſtion, be furniſh'd with ſome *Note* or other that may determine it, and make us judge it to be the ſame, whenever we meet with it.

XIV. *An Example of the aforeſaid Analytical Method.*

As by *Example*, it is apparent that *Water*, and all *Liquid things*, have their Parts in *Motion*: For we ſee that *Water* diſſolves *Salt* and *Sugar*. which would not be, if the inſenſible parts of the *Water* by their continual *motion*, did not run againſt the *Salt* and *Sugar*. And if we enquire into the Cauſe of this *Motion*, we ſhall find that *Water* and other *Liquid Bodies*, are not moved of themſelves, becauſe they are *Bodies*, ſince all *Bodies* are not moved. and thoſe which reſt are *Bodies* as well as thoſe which are moved. Wherefore we are to ſeek for a *Foreign Cauſe*, which produceth *Motion* in *Liquid Bodies*, and makes them to diſſolve the Particles of *Salt*. And finding that the *Air*, by penetrating the *Pores* of the *Water*, cannot be the Cauſe of this *Motion*; for whence ſhould the *Air* have the force to agitate all the parts of the *Water*? it remains that we aſſign ſome other Matter more ſubtil than *Air*, and more fluid, which may put the *Air*, *Water*, and other *Liquid Bodies* into *Motion*, which in the General Part of our *Natural Philoſophy* we ſhall declare to be the *Firſt Element*. For the more ſubtil any *Body* is, or divided into leſs Parts, ſo much the more eaſily it is agitated, and being once put into *Motion*, doth the more eaſily retain it. Wherefore the moſt *ſubtil Æther*, or *Celeſtial Matter*, muſt be ſuppoſed to be the *firſt Principle* of *Motion*, which *Matter abounds* in the *Fire*, *Sun*, *Fix'd Stars*, *Spirit of Wine*, and other Liquors.

XV. *In all Method we are to proceed from that which is more known, to that which is leſs known.*

Wherefore in the *Analytical*, as well as *Synthetical Method*, we are always to proceed from that which is more known, to that which is leſs known. This *Rule* is common to all *Method*, neither is any to be accounted true that deviates from this *Principle*. Yet there is this difference between the *Method of Reſolution*, and that of *Compoſition*; that in the former, the *Known Truths* uſed in the Examination of the thing, which is propounded to be known, are taken from *Particulars*, and from them we do (as by ſpecial Steps) aſcend to *Generals*; not as is done in the latter, where beginning with *Generals*, we come down to *Particulars*. So that theſe two *Methods* differ, as the *Aſcent* or *Deſcent* of the ſame *Hill*; or the *Way* whereby we go up from the *Valley* to the Top of the *Hill*, and again come down from thence to the *Valley*.

CHAP. XXII.

Of the Method of Compoſition.

I. *What uſe we are to make of the Synthetical Method.*

THis *Method* is called the *Method of* COMPOSING, becauſe it makes uſe of General and Common things, to come to things Particular and Compound: As for Example, If I have a mind to teach another by the way of *Synthetical Method*, that *the Soul of Man is Immortal*, I begin with theſe general *Maxims*; That Every *Being* is either a *Subſtance*, or a *Mode*; that there are two *Subſtances*, *viz.* a *Thinking Subſtance*, and an *Extended Subſtance*; that no *Subſtance* can properly be ſaid to periſh; that what we call Deſtruction in a *Bodily Subſtance*, is only a Diſſolution of its *Parts*: Whence I conclude, that that which hath no *Parts*, as the *Soul*, cannot be deſtroyed, and that by conſequence it is *Immortal*.

II. *Why Synthetical Method proceeds from things General, to leſs General.*

I have ſaid, that the *Method of Compounding* proceeds from more *Univerſal things*, to ſuch as are leſs *Univerſal*; and it does ſo, becauſe by this way of proceeding, all Repetitions, which commonly occaſion Confuſion and Tediouſneſs, may be avoided. For ſhould we treat of *Species*, before we have ſpoken of the *Genus*; foraſmuch as we cannot know the *Species*, without knowing the *Genus* firſt, we ſhould be fain to explain the Nature of the *Genus*, as often as we had occaſion to treat of any *Species*. But becauſe this way of Demonſtration is peculiar to *Geometricians*, and is look'd upon by them as very neceſſary to perſuade Truth, we will borrow from them whatſoever we have

have to say concerning it, to the end that we may follow the same way in searching out the *Knowledge* of other things, which they use in the demonstration of Matters *Geometrical.*

III. *What things Mathematicians make use of in their Demonstrations.*

Mathematicians are wont to deduce those things that are of the greatest moment and weight from known and easie *Principles*, by a Chain of Simple *Truths*; which they refer to three kinds; the first whereof includes *Definitions*: As, a *Right Line* is that which is the shortest betwixt two *Points*. A *Point* is that which hath no *Parts*. The second contains *Postulata*, or things demanded or taken for granted, which are so evident as to need no confirmation, and want nothing but the *Hearers assent*, *viz.* that from any *Center*, and at any distance, a *Circle* may be described. The Third comprehends *Axioms*, or common *Notions* of the Mind, which are not only manifest and evident in the *Science* we are treating of, but also in all others: As that all *Right Angles* are equal amongst themselves; that which is Equal, is bigger than all its Parts taken together.

IV. *Three things are required to the Extorting an Assent.*

Hence three things are chiefly observed by *Geometricians*, for the forcing of *Assent*. *First*, That *no Ambiguity be left in the Terms*, which is easily avoided by the *Definitions* of the *Terms*, which (as was said before) are nothing else but open Explications of the *Terms* and *Words* by which the things under debate are signified. The *Second* is, That every *Ratiocination be founded on clear and distinct Principles*, being so evident, that whosoever rightly understands the Words, must needs give his Assent to them. Which is the Reason why *Mathematicians* do always presuppose their *Axioms*, which they require to be granted them, as being so evident, that they stand in need of no Explication. The *Third* is, That *every Conclusion they propound be proved demonstratively*, making use only of those *Definitions* they have already alledged, or such *Principles* as have been granted them: Or lastly, *Propositions*, which by force of *Argument* they have deduced from them. So that all which *Mathematicians* observe concerning this matter, may be reduced to these *Heads*, which we shall comprehend in the following *Rules*.

Rules of Definitions.

V. First Rule of Definitions.

The First, *That every Obscure or Equivocal Term be defined.*

VI. Second Rule.

The Second, *That no Terms do enter the Definition, which are not altogether clear, or have not been before explained.*

Which two *Rules* are of that necessity, that they cannot sufficiently be imprinted in our Minds; forasmuch as by this means many *Disputations* are taken out of the way, which oft consists only in the *Ambiguity* of Words; as when the same *Term* is by divers Persons taken in a different Sense; which is a thing that happens very frequently in *Schools*. Wherefore, for the Removal of so many *Disputations*, which often do arise amongst the divers Sects of *Philosophers*, it will be sufficient if the Disputing Parties take care to explain distinctly, and in few words, what they conceive by the *Term* about which they Dispute, and what they would have others to understand by it. As for the *Qualifications* of the *Definitions* of things, of these we have treated in the Fourteenth *Chapter*.

The Rule of Axioms.

VII. A Rule for Axioms.

This is a Rule of *Axioms*, *That no Propositions be set up for Axioms, but such as are most manifest and evident.*

For no body questions, but that there are some Common Notions of the *Mind* that are so clear and perspicuous, as to stand in need of no *Demonstration*, to make them appear more distinctly. For did they involve the least Doubtfulness, they could not be the Foundation of a certain *Conclusion*. And therefore they are called *Axioms*, or common *Enunciations*, because they are so clear and manifest, as to stand in need of no Demonstration.

VIII. *The Evidence of Axioms doth not arise from the Senses.*

But we are not to suppose, as some do, that the *Certainty* and *Evidence* of *Propositions* doth in any degree proceed from the *Senses*; for that is absolutely false. For the *Truth-discerning-Faculty* is not placed in the *Senses*, which are often deceived by a *Similitude* of Things, and are not able to dive into the Difference that lies hid in them. Who is it that doth not experience how narrow and weak our *Senses* are, and how frequently they deceive us, when we go about to search out any thing by their means?

For altho' this *Axiom*, That *the Whole is greater than any one of its Parts*, be in some sort discernible by the *Senses*, yet not with such a *Certainty* as is necessary to *Science*; because whatsoever our *Senses* discover to us concerning it, is only founded on the observations of our *Infancy*, which cannot afford us an undoubted, but only a probable *Certainty*. For by *Induction* a thing cannot be certainly known, except we be certain of the fulness of the *Induction*; there being nothing more common, than for us to discern at last the falsity of those things, which from general *Inductions* we were persuaded to be most True. The whole Truth of this Proposition, *the Whole is bigger than its Parts*, doth depend on the clear and distinct *Notions* we have of the Whole and Parts, by which we judge that the *Whole* is greater than any one of its *Parts*, and that the *Part* is less than the *Whole*. For when we are discoursing of any thing that is firm and stable, we must not have recourse to the *Senses*, as *Plato* saith; but to constant, immutable, and impregnable *Reasons*. Thus we clearly know, that a *Triangle* is a *Figure*, that the Number *Two* is an even Number; because the Notion of a *Figure* is contained in the Definition of a *Triangle*; and in that of the Number *Two*, the Notion of an *Even Number*.

IX. *The Certainty of Propositions depends on the clear Knowledge we have of them.*

Wherefore all the Certainty of our Knowledge in *Natural things*, depends on this Principle, *Whatsoever is included in the clear and distinct Idea of any thing, the same may with truth be affirmed of it.* Thus because *Substance* is included in the Conception of a *Body*, we may affirm a *Body* to be a *Substance*. *Because it is involved in the Idea of a Circle, to have equal Diameters*, we may assert of every Circle, *That all their Diameters are Equal. Because it is included in the Idea of a Triangle, that all its Angles are Equal to two Right ones, we may affirm the same of all Triangles.* What must be the *Qualifications* of *Axioms*, appears from what we have said of the framing of *Propositions* that are necessarily true, in the Thirteenth *Chapter*.

Most

Moſt General Axioms.

X. *To have many* Axioms *in a readineſs, is a great help to ready Arguing or Ratiocination.*

But foraſmuch as it is of great uſe, to have good ſtore of *Axioms* at hand, whereby to prove and diſcover what is obſcure and abſtruſe; it will be neceſſary to ſet down here ſome general and neceſſary *Propoſitions*, from which as ſo many *Fountains*, more ſpecial ones as *Rivulets* may be derived.

I. *Whatſoever is comprehended in the clear and diſtinct Conception of any thing, the ſame may with Truth be affirmed of it.*

For ſince in the clear and diſtinct *Conception* of a *Body Extenſion* is contained, and *Cogitation* in the *Idea* of the *Soul*, I can truly affirm of a *Body* that it is extended; and of the *Soul*, that it is a *Thinking Subſtance*. Wherefore we are to lay down this, as the Foundation of all *Sciences*; that we muſt never give our full aſſent to any *Propoſition*, which doth not appear evidently true to us, ſo as that we cannot but aſſent to it, without doing violence to our *Minds*.

II. *In every Idea or Conception is involved either Poſſible or neceſſary Exiſtence.*

Since nothing can be apprehended by us, except under the notion of being *Exiſtent*; that is, neceſſary *Exiſtence* is comprehended in the notion of a *Being* abſolutely perfect, that is, of *God*; and poſſible *Exiſtence* in that of a *Creature*, or of a limited and finite *Being*.

III. *Nothing has no Affections or Properties.*

So it cannot be ſaid, that nothing is Diviſible, that it hath *Parts*, that it can be moved, &c. Wherefore, whereſoever any Property is found, there we may aſſert that there is a *True* and *Real Being*.

IV. *Nothing cannot be the Cauſe of any Thing.*

Foraſmuch as the Cauſe of a *Thing* is ſuppoſed to be, before it can produce any *thing*, and that Nothing cannot exiſt, it doth follow, that neither can it be *Principle* or *cauſe* of any *thing*. For if *Nothing* could ever be Something, it would follow, in oppoſition to the foregoing *Maxim*, that it muſt have ſome Property, which is a Contradiction.

From this *Axiom*, ſome others are deduced by way of *Corollaries*; ſuch as are,

V. *Nothing, nor any Perfection of a thing, actually Exiſtent, can have Nothing, or a thing not Exiſting, for the cauſe of its Exiſtence.*

Another *Corollary*:

VI. *Whatſoever Reality, or Perfection there is in any thing, the ſame is formally, or eminently in the firſt, and adequate cauſe of that thing.*

Whence it follows, that the *Objective Reality* of our *Idea's*, requires a Cauſe in which the ſame *Reality*, is contained, not only *Objectively*, but Formally, or Eminently. For this *Axiom* doth not only belong to the *Efficient Cauſe*, but alſo to the *Exemplary*. For if an *Image* be made more excellent than its *Exemplar* or *Original*, ſo that more Perfections are found in it, than in the thing it ſelf, after the likeneſs of which it is made, it cannot be ſaid to imitate its Exemplar, and conſequently cannot properly be called its *Image*.

VII. *A Thing or Subſtance, cannot naturally be Annihilated.*

That is, it cannot ſo ceaſe to be, as that nothing at all ſhould remain of it. For we eaſily conceive, that when any thing ceaſeth to appear, it doth chage its *Nature*, or is converted into another thing; As for Example, we can well enough conceive, how *Wood* comes to ceaſe to be *Wood*, how it comes to be *Fire*, and how the ſeveral *Particles* of *Fire* are ſubdivided into others, that at laſt they cannot be perceived by any *Senſe*: But we can by no means conceive, how they ſhould be reduced naturally to nothing, and from *Being* paſs, to not *Being*.

VIII. *That which is clear and evident is not to be denied, becauſe that which is obſcure, cannot be comprehended.*

For we cannot doubt, but that there is Liberty and Indifferency in us, becauſe we are conſcious of it, and comprehend nothing more evidently or perfectly, tho' we cannot comprehend, how *God* doth leave the free actions of Men indetermined.

IX. *It is the nature of a Finite Mind, to be unable to comprehend that which is infinite.*

Becauſe it is the nature of an *Infinite being*, to be Incomprehenſible; for if it could be comprehended, it would not be Infinite. What wonder is it therefore, that we cannot conceive matter to be Diviſible into Infinite? Or that we cannot underſtand the *Myſtery* of the *Trinity*, or the *Incarnation* of the *Divine Word*? Becauſe our *Mind* is *Finite*, and bears no propotion to the *Myſteries*. Would but ſome Men weigh this *Axiom*, as they ought, they would not with ſo much obſtinacy, rely upon their weak Reaſon, or truſting to their own Wits, invent a new kind of *Divinity*.

X. *If you take Equals from Equals, what remains will be Equal.*

XI. *If you add Equals to Equals, the whole will be Equal.*

XII. *It is in vain to endeavour that by more, which can commodiouſly be performed by leſs.*

Special Logical Axioms.

Logical Axioms are of great uſe.

To theſe we may ſubjoyn ſome *Logical Axioms*, which are of great uſe, in the guiding of our *Diſcourſe*, and are taken from the *Genus, Species, Difference, Diviſion, Cauſes, &c.*

From the Genus.

I. *Whatſoever is affirmed or denied of the* Genus, *the ſame is affirmed or denied of the* Species.

The reaſon is, becauſe the *Genus* contains the *Species*, and becauſe the whole *Eſſence* of the *Genus* is found in them: Thus, becauſe it is affirmed of an *Animal*, that it is *Senſitive*, the ſame is alſo affirmed of *Man* and *Beaſt*. And becauſe the ſame *Animal* is denied to be a *Stone*, ſo likewiſe, the ſame is denied of a *Man* and a *Beaſt*. Wherefore, the *Genus* is of no uſe to prove the *Species*, but only to remove it. For that which is not an *Animal*, neither can it be a *Man*; but that which is a *Man*, muſt therefore be an *Animal*.

II. *The ſuppoſing of the* Genus, *doth not ſuppoſe ſuch a* Species.

As for Example, ſuppoſing any thing to be an *Animal*, it cannot from thence be concluded, that it is a *Man*; becauſe it may be a *Beaſt*, which is likewiſe an *Animal*.

III. *The* Genus *being deſtroyed, the* Species *muſt be deſtroyed with it.*

For ſeeing that the *Genus* is an eſſential part of the *Species*, it muſt follow that the *Genus* being deſtroyed, that muſt needs be deſtroyed with it, which conſiſts of *it*. Thus if we take away an *Animal*,

Animal, we together take away the *Species*, that are contained under it. And by taking away a *Foursquare Figure*, we at the same time take away a *Parallelogram* and a *Trapezium*, which are the *Species* of a *Foursquare*.

From the Species.

I. *The supposing of the* Species, *supposeth the* Genus; *but the taking away of one* Species, *doth not necessarily remove the* Genus.

Because the *Idea* of the *Genus*, is comprehended in the *Essential Conception* of the *Species*, without which the nature of the *Species* cannot be explained. So supposing a *Binary* or the number two, we suppose a *number* also; and asserting a *Parallelogram*, we likewise assert a *Square*. And if all *Beasts* were taken out the *World*, yet would not *Animal* be therefore taken away, seeing it would be preserved in *Man*. Hence it is, that the *Species* is of great force to prove the *Genus*, but of none at all to deny it. For that which is a *Binary*, must be a *number*, but it does not follow, that that which is no *Binary*, is therefore no *number*.

II. *All the* Species *being destroyed, the* Genus *is destroyed likewise.*

For in this case all the power of the *Genus* is exhausted, neither doth there any thing remain, of which it can be affirmed. So supposing the *Sight*, *Hearing*, *Tasting*, *Smelling* and *Feeling* to be destroyed; the outward *Sense* must be destroyed likewise: And taking away *Prudence*, *Justice*, *Temperance* and *Fortitude*, takes away *Vertue* also.

From the Form or Difference.

I. *The Form is that by which a thing is, what it is.*

Because the *Form* or *Difference*, is the chief *Essential Attribute* that is found in the *Species*, and whose property it is to constitute the same, and distinguish it from other *Species*. Thus *Extension* constitutes a *Body*, and *Cogitation* the *Mind* or *Soul* of *Man*.

II. *Where the total Difference or Form can be affirmed or denied, of the same the* Species *also may be affirmed or denied.*

This *Axiom* as a *Corollary* is deduced from the former; for seeing the thing is constituted by the difference, where the same is found, it is necessary that there the *Species* be also. Thus, because *Cogitation* may be affirmed of the *Mind* of *Man*, therefore we may affirm it to be a *Thinking Being*.

III. *The Form and* Species *are reciprocated.*

The *Reason* is, because *Difference* constitutes the *Species*, and doth distinguish it from other *Species*, and therefore must have the same latitude as the *Species* it self, and therefore must reciprocally be affirmed of one another: As, *Every thing that Thinks is a* Mind, *and every thing that is a* Mind *Thinks.*

From the Property.

I. *The Property is consequent on the Form.*

For the *Property* is something flowing from the nature of the *Species*, and so bound to it, that it agrees to the whole *Species*: So *Divisibility* follows *Extension*, and is so necessarily joyned to it, that no Body can be extended, but that it must be Divisible also.

II. *The supposing of the Form, supposeth the Property, and the taking away of it, takes away the Property also.*

As when *Extension* is supposed, *Impenetrability* and *Divisibility* are supposed likewise; and if that be taken away, the *Properties* are taken away also.

From the Definition.

I. *Whatsoever agrees with the Definition, agrees also with the thing Defined.*

For seeing that a *Definition* declares the nature of a thing, by its *Essential Attributes*, *viz.* by its *Genus* and *Difference*, it must include the Whole, contained in the thing defined; and therefore whatsoever is *Attributed* to the *Definition*, the same must necessarily be also *Attributed* to the *thing defined*. Thus, because it agrees to the *Art of Discoursing well*, to direct the *Mind*; therefore also it must agree to *Logick*, to direct the *Mind*.

II. *If the Definition belong to a thing, the thing defined must also belong to it.*

Thus, because it belongs to the *Mind* of *Man*, to be a *Thinking Substance*, it belongs also to the same to be a *Spirit*. And because to a *Stone*, belongs Extension in Length, Breadth and Depth, therefore it also belongs to it, to be a *Body*.

III. *If a Definition agree with a Definition, the thing Defined also, must agree with the thing Defined.*

As, That which consists of a *Body* and *Mind*, is endowed with *Sense*; therefore *Man* is an *Animal*. *Substance* is something which hath an *Essence* and *Existence* distinguisht from all other *things*; and on the contrary.

From Division.

I. *If no part of the Division agrees to a thing, neither doth the thing divided agree with it.*

Thus, because the notion neither of a *Spirit* nor *Body*, doth agree to *Substantial Forms* (save only the *Soul* of *Man*.) Therefore, *Substantial Forms* cannot be *Substances*.

II. *Every Division must be entire, that is, it Enumerates all and every Part belonging to a thing.*

For should any part belonging to a thing, be omitted in the *Division*, there could not be an Adequate Enumeration of the *Parts*, neither consequently would the thing, by means of such a *Division*, be distinctly perceived. Thus the *Division* of a *Man* into *Sound* and *Sick*, is not Adequate, because there is a kind of Middle State, as, is that of a *Man*, that is recovering from *Sickness*. But the *Division* of *Hand* into *Right* and *Left*; of a Line into *Right* and *Crooked*; of a *Number* into *Even* and *Odd*, is Adequate because it Enumerates all and every *Part*.

III. *The Parts of a Division must be opposit.*

This Axiom follows from the foregoing. Thus things are better divided into *Material* and *Immaterial*, than into *Visible* and *Invisible*; because some *Invisible things*, as a very clear *Air*, and our *Breath*, are not by nature distinct from *Visibles*.

From the Cause.

I. *The Cause is always before the Effects*

For seeing the *Cause* is that from which a thing hath its Original, or that of which that *Being* doth in some sort depend, therefore it must needs exist before it. So a *Carpenter* is before the *Building*; A *Father* before the *Son*, *&c.* A *Cause* is in a twofold Sense said to be before its Effect, *viz.* by a Priority of *Nature* and *Time*. A *Cause* is before

its *Effect* by a Priority of *Nature*; becauſe the *Effect* exiſts by the Power of the *Cauſe*, and not the *Cauſe* by the power and virtue of the *Effect*; yet not always by priority of *Time*, becauſe ſome *Effects* exiſt at the ſame time with their *Cauſes*, as all thoſe *Effects* which proceed by Emanation; as the *Proprieties* do from their *Subjects*, which therefore exiſt the ſame moment with them.

II. *Nothing can be a Cauſe of it ſelf.*

For ſeeing there is a Dependance in the *Effect*, whereby it proceeds from ſomething that was before it; it cannot be conceived, how any thing ſhould be prior to it ſelf.

III. *Suppoſing the Cauſe in Act, we ſuppoſe the Effect in Act alſo.*

The Reaſon is, becauſe when the *Cauſe* is conſtituted in *Act*, it always does ſomething, and that which it does is called its *Effect*. As ſuppoſing *God* a Producer, we muſt neceſſarily ſuppoſe ſomething produced; and therefore the Cauſe and its Effect, as well as other Relates, are ſaid to be *ſimul Natura*, that is, to be both at once; for no ſooner is one *Relative* named, but at the ſame time we underſtand the other. So he is a *Father*, who hath a *Son*; and he a *Son*, who hath a *Father*.

IV. *A Cauſe cannot give that which it hath not.*

For a *Cauſe* gives ſomething to another thing, but it cannot give that which it ſelf wants.

V. *Whoſoever Acts by another, is eſteemed to act of himſelf.*

As he who deſires, exhorts, and adviſeth others to commit ſome Wickedneſs, is ſaid to be the *Moral Cauſe*; becauſe by Deſiring or Commanding, &c. He makes the Effect to be imputed to him.

From the Effect.

I. *The Effect is poſterior to its Cauſe.*

This *Axiom* follows from the foregoing: For if the *Cauſe* be before the *Effect*, it follows that the *Effect* muſt preſuppoſe it.

II. *No Effect exceeds the virtue of its Cauſe.*

For ſeeing the *Effect* borrows its Being from the *Cauſe*, it is impoſſible it ſhould take any thing that goes beyond or exceeds the Power of its *Cauſe*. For *Fire* would never be able to warm the *Hand*, if *to warm* did exceed the virtue of *Fire*.

III. *That becauſe of which every thing is ſuch, is it ſelf more ſuch.*

That is, if the Nature of the *Effect* be good or bad; the ſame doth more clearly appear in the *Cauſe*. This is true when both are capable of the ſame *Quality*: Thus becauſe the *Kettle* is hot becauſe of the *Fire*, the *Fire* muſt needs be more hot. But we cannot argue, a *Man* is ſatiated with the *Meat* he eats, therefore the *Meat* is more ſatiated.

From the Subjects, and Adjuncts.

I. *Where the Subject is, there are the Adjuncts alſo.*

For ſeeing that the *Adjunct* is the Mode of the *Subject*, it does always accompany the ſame: As where the *Fire* is, there is *heat*; where a *Dead Carkaſs* is, there is a *ſtink*.

II. *Such as the Subject is, ſuch are the Adjuncts.*

For ſuch as the *Orator* is, ſuch is his power in Perſuading; as the *Sick* is, ſuch are his *ſymptoms*.

III. *Where the Adjuncts are, there is the Subject.*

Becauſe *Adjuncts* are added to the *Subject*, and are conſidered as things that belong to it. As where *Motion*, *Magnitude*, *&c.* is found, there muſt alſo be a *Body*.

From the Whole.

I. *What agrees to a Similar Whole, agrees alſo to the Parts of it.*

For ſeeing that a *Similar Whole* is made up of a Conjunction of *Similar Parts*, it muſt needs be of the ſame Nature with them. Thus, becauſe *Lead* is heavier than *Braſs*; therefore every part of *Lead*, proportion being obſerved, muſt be heavier than *Braſs*.

II. *Where any Whole is, there are all its Principal Parts.*

For the Principal Parts are Eſſential to the Whole. I ſay, the *Principal Parts*, as the *Head*, and the like; becauſe there are ſome Parts which belong to the *Entireneſs*, but not to the *Eſſence* of the thing.

III. *The Entire Whole being ſuppoſed, all its Parts are ſuppoſed alſo.*

The Reaſon is, becauſe this *Whole* is nothing elſe than the *Parts* taken all together: As where the *Entire Body* of *Man* is, there muſt be its *Skin*, *Bones*, *Sinews*, *Veins*, *Fleſh*, and all things that belong to the Entireneſs of it.

From the Parts.

I. *Every Part, with reſpect to its Whole, is Imperfect, and Incompleat.*

So the *Soul* and *Body*, with reſpect to a *Man*, are Imperfect and Incompleat; becauſe they both belong to make a Perfect *Man*. So the *Hands*, *Feet*, *Head*, which are the *Integral Parts* of Mans Body, are more Imperfect than the Whole Body.

II. *Where all the Parts are, and joyned together, there is the Whole.*

This *Axiom* is evident from what hath been already ſaid.

From Like and Unlike.

I. *Like do agree with Like.*

A *Prince* muſt govern a *Commonwealth* after the ſame manner, as a *Father* of a *Family* takes care of his *Family*.

II. *To Unlike things, Oppoſits do agree.*

As we love an *Honeſt man*, ſo we hate a *Wicked perſon*. A *Shepherd* feeds his *Sheep*, an *Hireling* neglects them.

From Relates.

I. *Relates are by Nature together, or at one and the ſame time.*

For ſeeing that every *Relation* is mutual, and one *Relative* reſpects the other; it cannot be, but that if you put the *Relate*, you muſt put the *Correlate* likewiſe: And therefore the *Cauſe* and the *Effect*, that which is before, and that which is after, and all other things that do mutually reſpect each other, are always at once and together in the *Mind*. From whence follows alſo this *Axiom*.

II. *One Relative being put, the other is put alſo; and being taken away, the other is ſo likewiſe.*

From

From Contraries.

I. *That which is ſuſceptive of one Contrary, is alſo ſuſceptive of the other.*

As *Water* can be made *hot*, therefore it may alſo be made *cold*. A *Dog* cannot act juſtly, and therefore neither unjuſtly.

II. *Of Contraries, it is neceſſary that the one be in the Subject ſuſceptive of it; the other not.*

Thus if a *Number* be not Even, it muſt be Uneven. Yet this *Axiom* doth not hold in all *Contraries*; for it is not neceſſary that a *Wall* ſhould be *white*, becauſe it is not *black*.

From Privative Oppoſits.

I. *If the one be Abſent, the other muſt be abſent alſo.*

This muſt be underſtood in a Capable Subject. As if a Man *ſees*, he is not *blind*. It is *Light*, therefore not *Dark*.

II. *For the Moſt part, there is no going back from a Privation to a Habit.*

As from *Death* to *Life*, from *Blindneſs* to *Sight*.

III. *What in one Subject is Privation, is often a Negation with regard to another.*

This appears in our *Errors*, which with reference to *God*, who doth not beſtow upon us the whole knowledge of *Truth*, are only called *Negations*; but with reference to us are *Defects* and *Privations*. Thus Ignorance of the *Laws* is blame-worthy in him, who profeſſeth skill in *Law*; but not to him who is of another Profeſſion.

From Contradictories.

I. *One Contradictory being put, the other is removed; and on the contrary.*

As ſuppoſing that *Peter walks*, it cannot be that he ſhould not *walk*.

From Parity, or Equality.

I. *Even things with Even things agree, or diſagree.*

As *Faith* to the *Patriarchs* was neceſſary to Salvation; therefore to us alſo.

From the Greater.

I. *If that which is more Likely is not; much leſs that which is leſs Likely.*

As if a *Woman* could not be tempted to *Sin* by an hundred *Guinea's*, much leſs by thirty.

From the Leſſer.

I. *If that which is leſs Likely is, much more that which is more likely.*

As, a Man hath kill'd the *King*, therefore he will make no difficulty of killing one of his Fellow-*Citizens*.

From Divine Authority.

I. *The Teſtimony of a Being Sovereignly Intelligent, Wiſe, and True, is of greater efficacy to perſuade, than any other the moſt ſtrong and evident Reaſons that may be.*

Thus ſince *God* tells us, that they are *bleſſed who are perſecuted for Righteouſneſs ſake*, we are to hold it for an undoubted *Truth*; becauſe we have a greater Certainty, that he who is Sovereignly Intelligent, and Infinitely Good, cannot be deceived, than we can be certain that we our ſelves are not deceived, even in thoſe things that appear moſt clear and evident to us. For we are to give credit to the *Divine Teſtimony*, not becauſe of the *Affirmation* or *Negation*, but for the Authority of the *Witneſs*, as being *Omnipotent*, *Omniſcient*, and of the moſt *Sovereign Veracity* and *Truth*.

From Human Authority.

I. *We ought not to oppoſe that which is owned by all Men, or moſt Men, or wiſe Men, or by the moſt Famous and moſt Approved of them.*

As for Example, it is a *Truth* received by the common conſent of all Men; that *we ought to venture our Lives for the welfare and ſafety of our Native Country*: And that it is the Duty of every Man, *to live honeſtly, to hurt no body, and to give to every Man his Right*. For this unanimous Agreement of all Men ſhews, that their *Judgment* in theſe Caſes proceeds from common inborn *Notions*, and not from any Compact to impoſe upon others, or deceive themſelves.

But yet we muſt not have the ſame Opinion of thoſe Men, who being over-credulous, deceive others, by reporting *Prodigies* which they had from others; as that there are *Sciopodes*, Men that have but one Foot, and that ſo great, that lying on their Backs they can ſhade their whole *Body* with it; or that there are Men that have ſo great Ears, that they reach down to their *Feet*, and ſo broad that they can lye upon them; and others again that have no *Heads*, and have their *Eyes* about their *Shoulders*: Becauſe we are not to believe every one, but only thoſe whoſe ſufficient knowledge of the Matters they relate, and Veracity, are fully known to us.

Two Rules of Demonſtrations.

I. *All Propoſitions that involve any thing of Obſcurity, are to be proved without alledging any thing in proof of them, beſides Definitions* which have gone before, or *Axioms* that have already been granted, or *Propoſitions* before demonſtrated, or the *Conſtruction of the thing in diſcourſe*, when any Operation is to be done.

II. *We are never to make an ill uſe of the Equivocation of Terms.* This may be occaſioned by not adding their *Definitions*, to reſtrain or explain them. For to every true *Demonſtration* two things eſpecially are required. *Firſt*, That in the *Matter* it ſelf nothing be contained, but what is certain and indubitable: The *Other*, That there be no fault in the Form of *Argumentation*: Which Faults we ſhall avoid by the Rules now given, that is, by not making an ill uſe of *Equivocal Terms*, and by uſing no other *Propoſitions* in our *Demonſtrations*, but what are either *Definitions* of *Terms* before explained, or *Axioms* that have been before granted, and which ought not to have been ſuppoſed, without being ſure of their Evidence; or *Propoſitions*, that have been before demonſtrated; or the *Conſtruction of the Thing* of which we treat, when any operation is to be performed. For by obſerving of theſe things all Defects or Miſtakes will be eaſily avoided both in Matter and Form.

As to the Conſtitution of *Demonſtrations*, we have handled it in the Nineteenth *Chapter* of the Third *Part*.

CHAP. XXIII.

Of Genetical Method.

I. *Themes are two-fold, Simple or Conjunct,*

HAving largly enough, as I suppose, spoken of *Method in general*, and of *Analytical* and *Synthetical* in particular, it may now be fitting to subjoyn something concerning *Genetical Method*, because it is of use, and belongs to the true Practice, or Exercise of *Logick*. *Genetical Method*, teacheth us to frame a *Discourse* upon any *Theme*, and takes it Name from *Genesis*, because it is as it were a new *Generation* of a *Thing*, and that whereby we Elaborate a *Theme*, that hath not as yet been Explained, or Demonstrated. And for as much as the *Theme*, or Matter proposed to be known, is either *One* and *Simple*, or *Conjunct* and *Complex*; as when for Example, I consider *God*, or the Power of *God*, in Creating the *World*, I consider something that is *Simple* or *Incomplex:* But when I set before me this Sentence, *God Created the World* (or any other Proposition, whereby any thing is affirmed or denied of another) I think of something that is *Conjunct* or *Complex*.

II. *How we are to handle a Simple Theme.*

The handling of a *Simple Theme*, consists in the seeking of *Arguments*, that may declare a *Simple Theme*, and the disposing of them in a due order. *Arguments* shew us the manner of inventing the *Definitions* of *Single Terms*, such as are the *Cause* and *Effect*, *Genus* and *Species*, the *whole* and its *Parts*, *Subject* and *Adjunct*, *Opposits*, *Divers*, *&c.* As for Example, if any one seeks for the *Efficient Cause* of *Man*, he must have recourse to the *Definition* of the *Efficient Cause*, which is, *that from which a thing by true Causality doth proceed:* Which *Definition* of the *Efficient Cause*, if it be referred to *Man*, presently, either *God* will be brought to his *Mind*, by whom he was Created presently after the *Beginning* of the *World*; Or his *Parents*, by whom all other *Men* since have been produced. And after the same manner he may find out the Matter of which he is made, the Form by which he is distinguisht from all other things; and the End for which he was *Created* by *God*.

III. *How the Effects are shewed.*

So likewise the *Effects* of *Man* are manifested by examining the *Works* that proceed from *Man*, as the *Efficient Cause*, *&c.* and in like manner handle the rest, as far as the *Theme* propounded will bear: For it is evident, that all *Themes* will not admit the same *Arguments*; seeing *God*, for Example, hath neither any *Efficient Cause*, nor *Form*, nor *Matter*, and therefore the same cannot be considered of in him. The same may be said of the *Angels*, and the *Mind* of *Man*, which have neither *Matter*, nor *Form*, nor consist of any *Parts*.

IV. *In a Simple Theme we are to examin the Word.*

In the handling of a *Simple Theme*, this order is commonly observed, as far as the nature of *Argument* will permit: *First*, To examin the *Word* of the *Theme*, whether it be derived, and if so, to give its *Etymology: Secondly*, Whether it be Ambiguous, and then its various *Significations* are to be Enumerated and expounded. *Thirdly*, Whether it be *Abstract* or *Concrete*.

V. *The* Genus.

In the Second Place, we must enquire into the *Genus*, from the *Predicamental Table* set down in the *First part*, Chap. V. which represents all the *Genera* and *Species*, which conduceth much to the knowledge of the *Theme*, forasmuch as the manner of handling *Themes* varieth according to the Diversity of the *Genera*.

VI. *The* Causes.

Thirdly, We must enquire into the *Causes*, which we have set down and Enumerated, *First part*, Chap. IX.

VII. Effects.

Fourthly, The *Effects* are to be considered; not every one, but such as are Memorable, and *worth* the Mentioning.

VIII. Adjuncts.

Fifthly, The *Adjuncts* are to be handled according as the *Theme* is, whether *Universal* or *Proper*; as also the *Antecedents* and *Consequents*.

IX. Definition.

In the Sixth Place, *Definition*, which, as soon as we have have found out the *Genus* and *Difference*, doth present it self unto us.

X. Division.

Next comes DIVSION, whereby the *Subject* is divided into its *Integral Parts*, if the *Theme* be an *Integral Whole*; or into *Species*, if it be a *Genus*.

XI. Comparates.

In the Eighth Place, COMPARATES, or *Things* that agree in *Quantity* or *Quality*.

XII. Opposits.

Lastly, OPPOSITS, are subjoyned to all these, and are of considerable *use*, according to that common Saying, *Contraries set together, Illustrate each other*.

XIII. *How a Conjunct Theme is to be demonstrated.*

A *Complex Theme*, or *Proposition* is *Genetically* Demonstrated from the *Subject* and *Predicat*, which as two *Integral Parts* do constitute the same. Because by them we judge, whether a *Proposition* be *True* or *False*, *Universal* or *Particular*, *Necessary* or *Contingent*, *Affirmative* or *Negative*. As suppose this *Conjunct Theme* be to be proved, *Man is Created after the Image of God*, we are to consider both the Parts, *viz.* the *Subject Man*, and the *Predicat*, the *Image* of *God*, after which *Man* is said to be *Created:* Next the *Quantity* and *Quality* of the *Proposition* are to be Examined: And Lastly, The *Reasons* or *Arguments* of the *Affirmation* are to be investigated from the nature of the *Subject* and *Predicat*.

XIV. *How the Subject is to be considered.*

The *Subject Man* furnisheth us with *Reasons* or *Arguments*. First, From the *Efficient Cause*, because the *Holy Trinity* entred as it were into Consultation about the *Creating* of *Man*, which was not done in the other *VVorks* of the *Creation*, which is an *Argument* of a peculiar *Prerogative* of *Man*, before other *Creatures*, which consists in that he is an *Image of God*. Secondly, From his *Matter*, because he is made with a *Face*, directed towards *Heaven*, *&c.* Thirdly, From his *Form*, because he only of all sublunary *Creatures*, had a *Mind* breathed into him. Fourthly, From Singular *Effects*, which are the Evidences of a peculiar *Virtue* bestowed upon him. Fifthly, From his *Adjuncts*, because he excells all other *Creatures*, by the Power he has of *Understanding*, and determining himself. Sixthly, From his *Definition*, because he is a *Substance* consisting of *Mind* and *Matter*. Seventhly, From the *Place* of *Comparats*, because he comes near to the nature of the *Angels*; and Ninethly, From that of *Oppositis*, because he is not a *Beast*, devoid of *Reason*.

XV. *How the Predicat is to be considered.*

The *Predicat*, *made after the Image of God*, doth also afford us *Arguments* taken from the *Nature* of the *Divine Image*; *viz.* from its *Formal Reason*, or from its *Effects*, *Adjuncts*, *Parts*, *Definitions*, *Comparats*, *Contraries*, *&c.* which *Theology* handles at large.

The Second Part
OF THE
INSTITUTION
OF
PHILOSOPHY.
Viz. Natural Theology,
OR, A
TREATISE
CONCERNING
GOD.

An Introductory Discourse
Of the Definition of Natural Theology, and its Certainty.

I. *Why* Natural Theology *is set before the other parts of* Philosophy.

SOME, it may be, will find it strange that I have given NATURAL THEOLOGY the precedence before other Parts of *Philosophy*, and that I betake my self to the demonstration of the *Existence* of GOD, and of his *Perfections*, before I have handled the Nature of *Corporeal Things*. But their Wonder will cease, if they consider how necessary *Natural Theology* is to other *Disciplines*, and of how great concern the knowledge of the *Divine Existence* is, for attaining a firm and evident *Knowledge* of all other Things. For seeing that GOD is the *Author* of the *World*, and all things that are in it, and the *Original* of all *Truth*, the Knowledge of him is to be premised, of whom all Certainty and Truth of *Science* doth so closely depend, as that without it no *Evidence* or true *Knowledge* at all can be had. For since *Science* cannot be had but from *First Causes*, how will the same be attainable by us, if we do not know them? Seeing it is the Nature of *First Principles* to be *Clear* and *Evident*; and that the *Knowledge* of other things do so depend upon them, that tho' *Principles* may be known, tho' the *things* be unknown; yet the *things* themselves can never be known, except the *Principles* be known: Seeing therefore that GOD, the *Author of All Created Beings*, is (according to S. *Austin*) *the Light of all things knowable*, and *the Good of all things to be done*; we must *Know* him, before other Causalities can either have a Being, or be exactly known by us.

II. *All Geometrical Demonstrations derive their Evidence from the Existence of GOD.*

Notwithstanding that *Geometrical Demonstrations* be of that Evidence as to force our Assent, and being once clearly perceived, do no longer leave any place for doubting, as long as we attend to them; yet will they cease to appear such, if we be ignorant of the *Existence of God*. For how can we know, but that we are made with such Natures as to be deceived in those things that appear most evident to us? For we cannot be convinc'd to the contrary, except we first know *God* to Exist, and that He is the Fountain of all *Truth*, and hath not given us such *Understandings*, as to be deceived in the *Judgment* we make of things that we do most clearly and distinctly comprehend.

III. *We cannot be certain that any Conclusions are true, but only so long as we do give heed to the Premisses.*

True it is, that our *Mind* is conscious to several *Idea's* in it self, in the Contemplation whereof it never finds it self deceived, as long as it neither affirms nor denies ought concerning them. It is certain also, that it finds in it self Common Notions, whence it frames several *Demonstrations*, which it persuades it self to be very true, as long as it gives heed to the Premisses from whence it deduceth its *Demonstrations*. But because it cannot continually give its attention to them, and often forgets them, it may afterwards easily come to doubt

of their certainty, if it have not a clear and diſtinct Conception of *God*, that is, except it be aſſured that *God* is *True*, and that it is repugnant to his Nature to be a Deceiver. For as *Carteſius* ſaith in his Fifth Meditation, *Tho' I am of that Nature, that as long as I clearly and diſtinctly perceive any thing, I cannot but believe it true; yet becauſe I am alſo of that Nature, as not to be able always to fix the intention of my* Mind, *upon one and the ſame thing, in order to my clear perceiving of the ſame, and that I oft call to* Mind *a* Judgment *I have made before, when I no longer attend to the Reaſons, upon which I judged it to be ſuch, other Reaſons may be alledged, which might remove me from my* Opinion, *if I were Ignorant of the* Exiſtence *of* God; *and conſequently ſhould never have any true or certain Science concerning things, but only Fleeting and Mutable Opinions.*

IV. *This confirmed by an Example.* Thus he who conſiders the *Nature* of a *Triangle*, is indeed forced to conclude, that *its Three Angles are equal to Two right ones*, neither can he think otherwiſe as long as he attends to its *Demonſtration*: But yet as ſoon as he turns the bent of his *Mind* from it, tho' he remembers that he hath clearly perceived it, yet he may eaſily queſtion the truth of it, if the *Exiſtence* of *God* be unknown to him.

V. *An Objection taken from Atheiſts.* If it be ſaid that *Atheiſts*, who deny the *Exiſtence* of *God*, do notwithſtanding clearly underſtand general *Axioms*, ſuch as theſe, *Equal Quantities added to Equal, make the whole Equal*: *Thoſe things which agree in a Third, do agree amongſt themſelves*; and ſuch like: From which they eaſily Demonſtrate, that the Three *Angles of a right Angle, are Equal to Two right ones.* And that it is a thing apparent to all that are skilled in the *Principles* of *Geometry*, that the *Square* of the *Baſis* of a *Triangle*, is equal to the *Square* of the *Sides*: So that it is poſſible to have true knowledge, without ſuppoſing the knowledge of *God*.

VI. *Anſwered.* I Anſwer, That it cannot be denied, but that *Atheiſts* have a clear knowledge of *Geometrical Demonſtrations*, and that they are ſo evident, as to force their aſſent: But yet this knowledge of theirs cannot be ſaid to be true *Science*, founded upon certain *Principles*: Becauſe no knowledge deſerves the name of *Science*, that can in the leaſt be called in doubt, and whoſe certainty doth not depend on an evident *Principle*. Now foraſmuch as theſe Men are ſuppoſed to be *Atheiſts*, neither can they be certain that they are not miſtaken in thoſe very things, which they think themſelves to have moſt clearly apprehended. And tho' it may be this doubtfulneſs do not trouble them at preſent, yet it may hereafter, upon their examining of the matter, or upon its being ſtarted by others; neither can they ever be ſecured from this Heſitation, without owning *God* to be the *Author* of their *Being*.

VII. *Natural Theology influenceth all human Diſciplines.* NATURAL THEOLOGY Tranſcends all the *Parts* of *Philoſophy*; and as the *Sun*, that Enlightens all the *World*, is diffuſed through all *Arts*, and *Sciences*: For who is there, that conſidering the *Works* of *God* as he ought, doth not admire his *Power*, *Goodneſs* and *Wiſdom*, and is not raiſed thence to the *Knowledge* of *Him*? Do not the *Earth*, the *Water*, *Vegetables*, *Animals* and *Stars*, all lead us to the Underſtanding of Him? For all things have relation to *God*, as to their *Firſt Principle*, and proclain him to be the one *Supream cauſe* of their *Being*. For how is it poſſible for him, who attentively conſiders the *Connexion* of *Bodies*, the *Motion* of the *Stars*, the *Viciſſitude* of *Seaſons*, the *Succeſſion* of *Generations*, the orderly *Diſpoſition* of the *Parts* of the *World*, not to diſcern the Wiſe Author and Orderer of all theſe?

VIII. *The reſt of Bodies proves an Intellectual Principle.* *Bodies* have no power to move themſelves; how can therefore their ſo orderly Motion be perform'd, but by ſome *Intellectual Being*, by which as their *Effective Principle*, they are diſpoſed, and directed to their appointed end? Wherefore *Lactantius* was of Opinion, that no Man could be ſo Ignorant or Savage, but that, lifting up his *Eyes* to *Heaven*, tho' he may not know by whoſe *Providence* all theſe things are govern'd, yet muſt needs underſtand from the *Motion*, *Diſpoſition*, *Conſtancy*, *Uſefulneſs*, and *Contemperation* of things, that they are under a wiſe conduct; and that it is impoſſible, that what is ſo wonderfully framed and ordered, muſt be managed, by the higheſt Counſel and Wiſdom.

IX. *What Natural Theology is.* From what hath been ſaid it appears what *Natural Theology* is, *viz.* the *Knowledge* or *Science* of *God*. For *Theology* is divided into Natural and Supernatural; *Supernatural* is called that which is fetched from *Holy Scripture*, and which, by the aſſiſtance of *Supernatural Light*, attains Divine *Truths*: *Natural*, is that, which declares and demonſtrates the *Exiſtence* and *Attributes* of *God*, from the *Book* of *Nature*, and from *Principles*, derived from the *Light* of *Nature*.

X. *How uſeful the ſame is to Atheiſts and ungodly Men.* Wherefore, this *Natural Theology* is very profitable for Unbelievers, and Wicked Perſons, that are Theoretically ſo, who cannot be brought to any *Religion*, except it be firſt demonſtrated to them, that *God Exiſts*. As alſo for thoſe who are *Practical Atheiſts*, that is, who live, as if there were no *God*, no *Providence*, no *Reward* after this Life, nor any *Puniſhment*; for how will theſe be able to defend this their Opinion, after that they are once convinced, that there is a *God*, and that his *Attributes*, are not only ſhadowed out in all things throughout the whole *World*, but beſides are moſt clearly repreſented in their own *Souls*?

XI. *The Certainty of Natural Theology.* The Certainty of *Natural Theology* doth plainly appear, in that it is required to the laying of the Foundations of *Human Diſciplines*, and in that without the knowledge of *God*, no ſolid Knowledge can be had of any thing whatſoever. He cannot be called a *Philoſopher*, who is deſtitute of the knowledge of *God*, and who doth not worſhip him as he ought. Hence *Des Cartes* 1. *Princ. Artic.* 29. proves the certainty of the Natural Light given to him by *God*, by this Argument, becauſe *God* is True, and that he is the *Original* and *Principle* of our *Intellect*.

CHAP. I.

What God is, and how he may be reached by us.

I. *We are to enquire what God is, before we enquire whether he is.* FOraſmuch, as according to the *Rules* of *Logick*, we are never to enquire, *whether a thing be*, before we conceive *what it is*: I ſuppoſe it needful to examin, what the *Nature* of *God* is, and what is included in the *Eſſential* Conception of him, before that I proceed to the Diſcuſſing of the Point, how his *Exiſtence* comes to be known to us.

The

II. *All Men agree in the knowledge of God.*

The first of these will not be difficult, if we only follow the *Judgments* of *Men*, that ever had any Opinion of *God:* For I believe, that Men do less disagree in this, than in any other Opinion whatsoever. There is no Man that ever heard any thing of *God*, but doth acknowledge him to be a *Substance Infinite*, *Independent*, of the *Highest Understanding* and *Power*, and the *Creator* of all *things* that are. Or if he doth not distinctly conceive thus much, yet at least must own, that all Perfections that can possibly be conceived by Man, do belong to him in the highest and most perfect manner that can be.

III. *Tho' God be infinite, yet doth he not therefore exclude all Finite Beings.*

It may be some will here Object, that if *God* be an *Infinite Being*, or such a one as comprehends all manner of *Perfections* whatsoever, he must necessarily exclude every *Finite Being*, and so nothing would exist besides him. But the Falsity of this *Reasoning* is apparent; for we cannot conclude, that, because a Man hath a more excellent Wit than others, that therefore others have no Wit at all. Or supposing his Wit to encrease to *Infinity*, would this diminish the less Portion of Wit possest by others? Thus, tho' *God* be consummate in all manner of Perfections, yet doth not he therefore exclude all other *Beings*; except we should conceive *God* to be *Corporeal* and *Material*; for indeed if he were *Corporeally Infinite*, he must exclude all other *Bodies*. But if we should conceive *God* to be *Corporeal*, we cannot suppose him *Infinite*, that is, comprehending all manner of *Perfections*, because then he would be Divisible, and lose his highest Simplicity and Unity.

IV. *Gods Perfections are only Infinite.*

But some will urge further, that it is of the Nature of a most perfect *Being*, to include all manner of *Perfections*, and therefore it is necessary for him, formally to comprehend whatsoever *Perfection* is in the *Creatures*. To which I Answer, That the *Antecedent* is false, for seeing that the *Perfections* of the *Creature* are *Finite* and imperfect, they cannot be in *God*, because otherwise *God* could not be the most *Perfect Being*, as containing imperfections in himself. Wherefore we ought rather to say, since *God* is the *Highest Being*, he includes only *Infinite Perfection*, and excludes all other.

V. *How God is said to be Infinite.*

God is said to be *Infinite*, because he is without all *Bounds*, not only as to his *Essence*, but also as to his *Duration*, as being a necessary *Being*, and Subject to no Change or Mutability.

VI. *God is Independent.*

He is said to be *Independent*, because he derives his *Being*, from none besides himself. Which yet is not so to be understood, as if *God* did depend of himself, as of an *Efficient Cause*, since it might be still further enquired, whether that Cause had its *Being from it self* or *from another*. But that he is possest of so great and immense a *Power*, that he doth not stand in need of the help of any *Being*, for his *Existence* and Conservation; and that therefore in some *Sense*, *God* may be said to be the *Cause* of himself.

VII. *In what Sense God is said to be Positively of himself.*

You will say, that *Divines* will not allow this way of *Speaking*, as abhorring to admit the notion of *Causality* in *God*; and therefore when they would explain How *God* is from himself, they say, that that ought only to be understood Negatively, that is, *God* is not of another, but by no means positively of himself, as of a *Cause*.

I Answer, That it is true, that *God* is of himself Negatively, or which is the same thing, that he is not beholden to any *Cause* for his *Existence*; but withal do assert, that this Negation is not sufficient to explain the Nature of *God*, without admitting something that is positive, by which he continues to be or exist; and this we say is nothing else but his Inexhaustible and Incomprehensible *Power*; for it is certain that the *Power*, *Efficacy* and *Vertue* which we conceive in *God*, is the most Positive, Perfect and Real that can be: And therefore, forasmuch as *God* exists by reason of his *Nature*, or the *Perfections* that are in him, who can question but that he is positively of himself? For if the first Man had been from *Eternity*, so as nothing had been before him, yet forasmuch as the *Parts* of *Time* in which he *Exists*, may be separated from each other; and because from his *Being* to Day, it doth not follow that he shall be to Morrow, except there be some cause to renew him, and as it were, to produce him anew every *Moment*; we make no difficulty to assert that the *Cause* which thus preserves is something *Positive*. Thus notwithstanding *God* hath been from *Eternity*, yet because he himself preserves himself, we may conclude he is of himself, not only *Negatively*, but *Positively*, inasmuch as his *Immensity* is the Cause of the Perseverance of his *Being*.

VIII. *This Argument further urged.*

But you will say, if *God* be positively of himself, he will be his own *Cause*, or the *Cause* of himself, since he does the same with reference to himself, what the Efficient *Cause* doth with respect to its *Effect*. Now to say, that *God* is the *Cause* of himself, sounds harshly in the *Ears* of some *Divines*, and is looked upon as an Error.

IX. *Answered.*

I Answer, that *God* may be said, in some manner to be the *Cause* of himself, inasmuch as he is positively preserved by himself, as long as by the word *Cause* we do not understand the *Efficient*, but only the *Formal Cause*; so that the meaning of that Expression will be no more than this, that the *Immensity* of the *Divine Essence*, is the Reason why he doth not stand in need of any *Cause* for his *Existence* or Conservation; or that the *Divine Perfection* is so great, that he his the Reason of his own *Existence*, not diverse, but inseparable from himself. Which is not so to be understood, as if *God* by a Positive Influx did conserve himself, as all *Created Beings* are conserved by him; but only that this supreme Power, and the Immensity of his *Essence* is such, that he stands in need of no Conservator. But now who will pretend, that this Immensity of the Divine Power is not a most *positive thing*? When therefore it is demanded why *God Exists*, we must not answer, by an *Efficient Cause*; because that is properly called an *Efficient Cause*, where the Cause is distinguisht from the Effect, and where the Effect is supposed different from the *Cause*; but we are to Answer, by the *Essence* of the Thing or the *Formal Cause*, which bears some *Analogy* with the Efficient.

X. *God is conceived by all as supremely Intelligent.*

GOD is also acknowledged to be a *Being* of Sovereign *Wisdom* and *Understanding*, because nothing is hid from him, and because al past, present and future things are Naked, and open before him.

XI. *As most Powerful.*

Moreover *God* is acknowledged to be *most Powerful*, because he Rules over all, and can produce whatsoever doth not imply a Contradiction.

He

XII. *In what sense God is said to be the Creator of all things.*

He is also owned to be *the Creator of all things*, because all *things* depend on Him, not only to their *Being*, but also with regard to their *Conservation*. For since *Infinite Power* is included in the *Idea* we have of *God*, it is a Contradiction, that any thing should *Exist*, which is not produced by him.

XIII. God *may be known by us, tho' not comprehended.*

Under these *Attributes* it is, that *God* may be known by us: For we have a clear and distinct knowledge of *God* as he is. *A Being Infinite, Omnipotent, Eternal, Omniscient, and the effective Principle of all things.* And he may be thus defined by us: *A Being thinking in Perfection* (or most perfectly thinking) *Simple, Unchangeable, Eternal, Consummate, Necessary, Immense, Incomprehensible, Omnipotent, and of which all things depend, not only with regard to their Nature and Existence, but also to their Order and Possibility.* Neither is it any Contradiction to what hath been said of our *knowing* him, that he is declared to be *Incomprehensible*: For it is one thing to *know* a thing, and another to *comprehend* it: I own that we who are *Finite* cannot comprehend the *Infinite Essence* of *God*, since it is of the Nature of *Infinity* to be *Incomprehensible*: But it is no Contradiction to say, we may know that which is *Infinite*, that is, clearly and distinctly apprehend a thing to be such, that no bounds or limits can be found in it, or set to it.

XIV. *A Objection fetch'd from the Divine Incomprehensibility.*

You will oppose, That if the Weakness of *Man* cannot aspire to the comprehension of that which is *Infinite*, he will never be able to conceive the Notion of that which is so, but only of that which is *Finite*: For who will say that he sees a *Man*, when he sees only one *Hair* of his *Head*? Now there is less proportion between a *Finite* thing and an *Infinite*, than there is between one *Hair* of a Man's Head, and his whole *Body*.

XV. *We may have an Idea of God, without comprehending of him.*

I Answer, That it is not at all needful, in order to our having the Notion of an *Infinite thing*, that we should comprehend all its *Perfections*, this being sufficient if we find no bounds or limits in it; because then we understand the whole *Infinite*, tho' not *Totally*, as the *Schools* term it, and as to every one of its *Parts*. Who dare say that I have not the *Idea* of a *Triangle*, when a *Figure* comprehended within *three Lines* is represented to my *Mind*; tho' it may be I am ignorant, that its *three Angles* be equal to *two* right ones? And so in like manner I may have an Apprehension or Notion of *God*, without comprehending all his *Attributes*. For if it were otherwise, I should understand nothing at all, when mention is made of the *Worship of God*, his *Works*, *Mercy*, or *Justice*. For it is not of the *Essence* of an *Image*, that it be in all things the same with the *thing* it represents, but only that it be in some degree like it.

XVI. *The word* Cogitation *is Equivocal.*

But yet we are to observe, that the word a *Thinking-Being*, or *Substance*, is Equivocal when attributed to *God* and the *Creatures*; because the *Cogitation*, which constitutes the *Nature* of *God*, is Independent and Perfect, and that which constitutes the *Nature* of a *Created Spirit* is Imperfect, and dependent of *God*: Wherefore to mark this difference, I say, that the *Cogitation*, which constitutes the *Nature* of *God*, subsists by it self; whereas that which constitutes the *Nature* of a *Created Spirit*, subsists indeed in it self, but not by it self.

CHAP. II.

By the Inborn Idea that is in us, we know that GOD exists.

I. *What we are to understand by the word* Idea.

BY the word *IDEA*, we understand that *form* of our *Cogitation*, by the immediate apprehension whereof we are conscious of the said *Cogitation*: So that we can express nothing, without having formed an *Idea* before of it in our *Minds*. Or to express it shorter, An *Idea* is nothing else but the *thing* it self perceived or thought of, as it is *Objectively* in the *Understanding*. Wherefore every *Idea* includes two things, the one *Formal* or *Proper*, inasmuch as it is an Operation of the *Mind*; the other *Objective*, as it is the Image of a *Thing thought*, or is instead of it.

II. *What distinction there is betwixt Idea's.*

In the *Second* place we are to tak notice, That tho' there is no inequality in the *Idea's* of our *Mind*, as they are *Modes of Thinking*; yet are they very different with respect to the *things* which they represent. For it cannot be question'd but the *Idea*, which represents *Substance* to me, contains more Objective Reality, than that which represents a *Mode*, or any thing else adventitious to a perfect or compleat *Substance*. And so that *Idea* which represents to me an *Infinite Being*, *All-powerful*, *All-wise*, *Eternal*, *&c.* doth undoubtedly contain more Objective Reality, than that which expresseth *Substances* that are *Created*, *Dependent*, *Mortal*, *&c.* For seeing that these *Idea's* are something, they must have a Cause of their *Existence*, and consequently have so much the more Reality, as the things they represent have of *Entity*.

III. *Whatsoever is in the Effect, is formally, or eminently in its Cause.*

Thirdly, we are to observe, That there is nothing found in any *Effect*, which is not *Formally* or *Eminently* contain'd in its *Cause*. A thing is said to be *Formally* in its *Cause*, when it is such there as we perceive; but *Eminently*, when the *Cause* can supply its stead. Thus *Fire*, when it produceth *heat* in a *Body*, is said to contain it *formally*, because it hath the very same thing in it self, which it hath produc'd in the *Body*; but the *Sun* and the *Earth*, when they produce *Fruits*, do not comprehend the thing caused by them *Formally*, but *Eminently* only. This *Notion* is the First of all others, and is as evident, as that *Nothing can be made out of Nothing*: For should we admit that something is contained in the *Effect*, which is not contained in the *Cause*, we must own that *Something* may proceed from *Nothing*. Neither can we give any other Reason, why *Nothing* cannot be the *Cause* of any thing, but because in it there cannot be found what is in the *Effect*.

IV. *From the Idea we have of God, we conclude that* God *is.*

Wherefore we conclude from the *Idea* we have of *God*, that he *exists*; which is, *First*, thus demonstrated: Every thing represented by an *Idea* must have a *Cause*, in which it is either *Formally* or *Eminently* contained; but we have an *Idea* of *God*, as he is a *Most perfect Substance*, excluding all Limitations: Therefore this *Idea* must have GOD for its *Cause*. The *Minor* is thus proved: There is nothing found in all *Created Beings* that can afford us this *Idea*: For tho' I can form the *Idea* of a *Substance*, because I my self am a *Substance*; yet will this *Idea* never represent an *Infinite Substance*, because I my self am Finite and of bounded *Perfections*; wherefore it is necessary that if I have an *Idea* of an *Infinite Substance*, it must proceed from *God alone*, who is *Infinite*.

If

V. *An Objection answer'd.* If you argue, that this *Idea* may be formed from the several Perfections scattered up and down in the several Parts of the *Universe*; after the same manner as from the Notion of an *Angel*, and my own *Mind*, I can frame an *Idea* of a *Divine Understanding*. I answer, How can I from the several Endowments of diverse Things, frame a *Being* that is absolutely Perfect? Shall I do it by enlarging and extending those *Images*? But whence have I the Faculty of enlarging all the Perfections of *Created Things*, and conceiving something that far exceeds them all? We ought rather to conclude, that this is, because the *Idea* of a most *Perfect Being* is impress'd upon my *Mind*. Moreover, the supream Perfection of *God* consists in this, That all his *Perfections* are not separate, as in the *Creatures*, but in conjunction with the most absolute *Simplicity* and *Unity*.

VI. *No Idea of an Infinite Being is contained in the Idea of a Finite Being.* And tho' the *Idea* of an *Infinite Substance*, which most perfectly includes all the *Perfections* our *Mind* can conceive, may also contain the *Idea* of a *Finite Substance*, (as a *Multitude* contains an *Unity*, and a greater Number a lesser;) yet is not the *Idea* of an *Infinite Being*, contain'd in that of a *Finite Being*. And therefore *Des Cartes* in his *Third Meditation* says thus: *I manifestly understand, that there is more Reality in an* Infinite Substance, *than in a* Finite; *and therefore that the Perception of an* Infinite Being, *is in some sort precedent in me, to that of a* Finite Being, *that is, the Idea of* GOD, *to that of my Self. For how could I understand that I Doubt, that I Desire, that is, that I want something, and am not altogether Perfect, if there were not in me the Idea of a more Perfect Being, by comparing my Self with whom I discern my own Defects?*

VII. *That which is Perfect cannot proceed from that which is Imperfect.* *Secondly*, That which is perfect cannot proceed from that which is imperfect, as from its *Total* and *Efficient Cause*: But we, as all other *Creatures*, are Imperfect; and the Perfections which are in *God*, are neither *Formally* nor *Eminently* contained in us: So that the *Idea* of *GOD*, which contains all his Perfections, cannot be thought to proceed from us, and consequently *God* must be the *Cause* of it; and because He cannot be the Cause of it, except He do *exist*, we may undoubtedly conclude that He doth so.

VIII. *The Idea of God is inborn in us,* If any one ask, whence we have this *Idea*, since it doth not proceed from our *Senses*, nor from any *Created Being*? My Answer is, That it is born with us, as the *Idea* of our Selves also is: For *God* impress'd it upon every *Man* in his *Creation*, and hath so order'd it, that every one should understand and know *God* by the same Faculty whereby He knows himself. For it is impossible that any one should understand himself to be imperfect, depending on another, and of uncertain Duration; but that at the same time he must also understand Him, with whom compared, he is imperfect, and on whom he depends; so that reflecting upon himself, he concludes that *God* is, and by the *Idea* which he hath of him, is convinc'd of his *Existence*. I say, by reflecting on himself; for by the impression made upon us by *God*, we are not to understand that this *Idea* is always actually represented to us; for were it so, we should always think of *God*: But by this *Impression* is meant nothing else, but that *God* hath vouchsafed such a Faculty to *Man*, whereby he can excite this *Idea* in himself, without the help of any other *Idea's* whatsoever.

IX. *The Idea of God cannot be said to be invented by us.* It cannot be said, That this *Idea* is framed or invented by us, as many *Notions* are, which have no other *Existence*, but what they have in our *Understanding*; because nothing can be added or taken away from this *Idea*, for *the Essences of things are indivisible*: So that if any Thing could be added to any *Idea*, representing the Nature of a *Thing*, it would be no more the same, but another *Idea*. And tho' new *Perfections* may still be perceived in *God*, which were not known before; yet doth not this change the *Idea* of *God*, but only makes it the more clear and distinct; no more than the *Idea* of *Man* is increased, when some new *Properties* are discover'd in him, which before were unknown, because they ought to have been included in the *Idea* which we had of him before.

X. *An Objection to prove, that the Idea of God is framed by us.* But you will farther urge, That *Man* who has this *Idea* is a free Agent, and that consequently he can frame the same at pleasure. And *Des Cartes* seems to hint as much in the *Beginning of his Fifth Meditation*, where after he hath said, That innumerable *Idea's* of Things are found in his *Mind*, adds, *Which tho' they be in some sort thought by me at pleasure*. Now if we can think of Objects according to our pleasure, why may we not say, that the *Idea* of *God* is framed by us, whilst we are thinking of it?

XI. *Many things occur to our Thoughts, which tho' they do not Exist, yet have their Nature.* I Answer, That *Idea's* do indeed depend on us, as far as they have a *formal* and *proper Being* in our *Mind*; but not as they are considered in their *objective Being*; because in that respect they have a necessary *Cause*. I own it to be in our power, to *think*, or not to *think* of any particular Object, and that we are thus free by a liberty of Contradiction, or by a liberty as to the *Exercise of the Act*, as the *Schools* express it; but that it is not in our power, to *think* differently of the same thing that is true, that is, we have no liberty of Contrariety, and as to the *Specification of the Act*. For it doth not depend on our *Will* to *think* the Number *Nine* to consist of three *Ternaries*, and not to consist, or to be an Even or Uneven *Number*, *&c.* Neither can we conceive a *Substance* absolutely perfect, as *Existing* or not *Existing*; *Wise*, or *Ignorant*, *Merciful* or *Cruel*; but must necessarily conceive him necessarily *Existing*, *All-wise*, and *All good*. Wherefore when *Des Cartes* saith, That many *Idea's* are found in him, which it may be have no *Existence*, besides his *Cogitation*, he presently subjoyns; *yet are they not feigned or invented by me, but have their true and unchangeable Natures.*

XII. *The Idea we have of God, is not derived from our Parents.* Neither doth it contradict our Assertion, what some say, That we have deriv'd all the Knowledge we have from our *Parents*, who having receiv'd the same from the first *Men*, afterwards communicated the same to us, and that consequently the *Idea* we have of GOD is not inborn, seeing that this Objection seems rather to confirm the *Idea* of GOD to be inborn in us: For let us ask them, from whom those first *Men* had this *Idea*; if from themselves; why may not we have it as well? If from GOD revealing the same to them, then they must own GOD to Exist.

CHAP. III.

That it belongs to the Nature of God to Exist.

I. *Whether Existence doth appertain to God.*

I Have evidently enough, as I suppose, Demonstrated in the foregoing Chapter, that because I find in my self the *Idea* of a *Being* absolutely *Perfect*, therefore that *Being* must *Exist*. Now I proceed to shew whether the *Existence* of *God*, can be proved from the consideration of his *Nature*, and whether a *Possible* only, or a *Necessary* Existence do belong to him.

II. *The Existence of any thing may be enquired into after a two-fold manner.*

Two *Questions* may be formed of a *thing* that *Exists* in *Nature*, the one with respect to our *Knowledge*, the other with repect to the *Thing* considered in it self. By the First, the Reason is sought, why any *thing*, suppose *God* or the *Soul*, is affirmmed by us to *Exist*: By the Second we enquire, how it comes to pass, that the said *thing* is not only Possible, but really *Existent*. By either of these ways we may enquire after the *Existence* of *God*, for we have Reasons that not only assure us that *God Exists*, but also that this his *Existence* is necessary.

III. *The Idea of an Infinite Being prove its Existence.*

Neither will it be hard to Demonstrate this, if we attend to the *Idea* we have of *God*, *viz.* that he is *Infinite*, all *Powerful* and all *Perfect*: For we argue thus: Whatsoever we clearly and distinctly perceive to belong to the *Essence* of any *Thing*, the same we know to be true as we perceive it; but we clearly and distinctly understand, that it belongs to the *Essence* of *God* that he *Exists*; therefore it is true that *God Exists*. The *Minor* is thus proved; It is a contradiction for a most perfect *Being*, to want any *Perfection*; but *Existence* is a *Perfection*; therefore *God* cannot be conceived, but *Existent*. For since where a *Multitude* is, there must needs also be a *Unity*; therefore since *God* possesseth all Perfections conceivable, he must of necessity also have *Existence*.

IV. *The Existence of God is necessary.*

Neither doth it oppose the *Truth* of what hath been said, that in all other *Created Beings*, the *Essence* is distinguisht from their *Existence*; and that it doth not follow, that a *thing* doth *exist* because we have a Notion of it. For the Reason thereof is, because in the *Idea* of all other *Things* only *Possible*, and not actual *Existence* is contained, whereas the *Nature* of *God* includes actual, necessary and *Eternal Existence*: So that it is as impossible for us to conceive a *Hill* without a *Valley*, as to conceive an absolutely perfect *Being*, to whom any Perfection is wanting, or who is not *Existent*: For as *Cogitation* supposeth the *Existence* of a *thing Thinking*, for if it had no *Being*, it could not *Think*: So absolute Perfection presupposeth necessary *Existence*, since nothing can be conceived absolutely perfect, except it *Exist*.

V. *Existence is a Perfection without which the nature of God cannot be conceived.*

Wherefore in this point, we differ from *Gassendus*, who denies *Existence* to be a *Perfection*, or the Propriety of any *thing*, but that which adds neither *Perfection* nor *Imperfection* to a *thing*. Because when we attend to the Notion of *God*, we perceive, that *Existence* is a *Divine Property*, and no less belongs to *God* than *Omnipotence* or *Immensity*, *&c.* or that an equality of *Angles* belongs to two Right ones. Because it belongs to the *Nature* of *God* to be; neither can he be conceived without *Existence*. For would not something be wanting in *God*, in case he did not *Exist*? Or how otherwise could he be said to be a *Being* absolutely perfect? Since *Existence is nothing else but the Reality of any thing, whereby it is placed out of Nothing*, which therefore no *Being* absolutely perfect, can be supposed to be without. For as *Cogitation* presupposeth the *Existence* of the thing that *Thinks*; so likewise, absolute Perfection requires *Existence*; because an absolutely perfect *Substance* cannot be conceived, but as actually *Existent*, and unchangable from *Eternity*.

V.

VI. *Objection.*

You will say: Tho' we cannot conceive a *Mountain* without a *Valley*, yet it doth not follow thence, that there is any *Mountain* in *Nature*, since a *Mountain* doth not include *Existence*: And therefore neither doth it follow that *God Exists*, because I conceive him as *Existent*. For there is no necessity laid upon things to *Exist*, from my Thought or Apprehension.

VII. *Answered.*

I Answer, That this Argument doth not proceed aright; for tho' a *Valley* enters the Conception of an *Hill*, and neither can be apprehended without the other, yet is it not inferred thence, that either a *Mountain* or *Valley* doth *Exist*; but that whether they *Exist* or do not *Exist*, they cannot be separated from each other. But seeing I cannot conceive *God* without *Existence*, I must conclude, that *Existence* is inseparable from him, and that therefore *God* cannot be conceived, but as *Existing*.

VIII. *An instance urged against this Answer.*

But you will further urge, that the *Sun Existing* doth essentially involve two things, *viz.* the *Sun* and the form of *Existence*, so that *Existence* belongs to this complex Notion of the *Sun Existing*. But *Gods* knowing this complex Notion from *Eternity*, doth not impose a necessity of *Existing* upon the *Sun*, without presupposing its actual *Existence* in the *World*. So likewise tho' *Existence* be contained in a *Being* absolutely perfect, yet cannot we conclude thence that it actually *Exists*, except we suppose it to include *Existence*, as well as the other Perfections.

IX. *The instance Answered.*

I Answer, That in the *Idea* of an *Existing Sun* there is only a Possible, but not a necessary *Existence* contained; because we do not understand that *actual Existence* must of necessity be joyned with the Properties of the *Sun*; for tho' it be conceived as *Existing*, yet doth it not follow thence that it doth *Exist*; forasmuch as this complex Notion, the *Existing Sun*, may be framed by the *Understanding*; and that these two Notions may be separated, not only by *Abstraction*, but also by a clear and distinct Operation, so as that the *Sun* may be conceived without *Existence*. Whereas, in the *Idea* of *God* actual and necessary *Existence* is involved, which hath an inseperable Connexion with the rest of his *Attributes*. So that it is impossible to conceive an *Infinite Being* to have all Perfections, except it do actually *Exist*. For necessary *Existence* is the *Property* of *God*, which agrees to him alone, and makes a part of his *Essence*.

X. *The Idea of every thing doth not argue actual Existence.*

Wherefore, when we enquire, whether the *Existence* of a thing absolutely perfect can be inferr'd from its *Idea*, the *Question* is not, whether out of every Conception or *Idea* of a *thing*, we can Demonstrate its *Existence*; but only whether from the *Idea* we have in our *Mind* of a *Being* absolutely perfect, we may rightly conclude its *Existence*. For it is a Fallacy, when we bestow an *Attribute*, that agrees only to one Subject, upon all. Wherefore I do rightly and demonstratively conclude, that if necessary *Existence* be contained in the *Idea*

of

of *God*, that is, if by a clear and distinct Perception, I cannot divide actual *Existence* from his Nature, *God* must necessarily *Exist*; by the same necessity that the Nature of Man doth consist of *Soul* and *Body*, and that a *Valley* includes the Conception of an *Hill*.

XI. *The Essence of God is not a Figment of our Understanding.*

Some with whom I have Discoursed about this Point, deny the *Essence* of *God* to subsist any where but in our *Mind*, and that it is nothing else but a figment or thing feigned by the *Understanding*. But this is easily overthrown by shewing, that necessary *Existence* is not included in any Fiction of our *Understanding*. Besides, the *Essence* of *God* is either Possible, or Impossible; if they grant the first, it must necessarily *Exist*; for what other *thing* can impart *Existence* to a thing that is *Possible*? If they say it is *Impossible*, it will lye upon them to prove the Contradiction it implies.

XII. *The Existence of God may be proved from the Conservation of us.*

The *Existence* of *God* may also be proved from our continued *Preservation*. For seeing that a *Creature* hath no power to preserve it self, we must have recourse to some *Cause* that preserves it. *Time* we know is divided into many Parts, which are independent of one another; since a Thing under *Duration*, may every particular Moment cease to be; neither doth it follow, because it was yesterday, that it must be to day; wherefore there must be some *Cause* to preserve it, and as it were to produce it anew every Moment, which its self cannot do, no more than it could at first give its self a *Being*. For *Conservation* is not distinguishable from *Creation*, but only by Reason; neither is there any less power required to Conserve a thing, than to produce it: Neither can *Parents* do this, since they only procure some Dispositions in the Matter, to prepare it for the *Reception* of the *Soul*, and we may Live after they are Dead: Wherefore there must of necessity be some first *Cause*, which may not only create and produce us, but also keep and preserve us.

XIII. *How it is to be understood that things cannot preserve themselves.*

If you oppose to what I have here alledged, the *Law* of *Nature* set down by *Des Cartes*: *That every thing, as far as in it lies, endeavours to continue in the same State, neither is ever changed, except it be forced to it by a foreign Agent*; and that according to this *Law*, every thing which *Exists*, must continue always to *Exist*, neither stands in need of any new force, whereby to be sustained in its *Essence*. I Answer, That whatsoever is besides *God*, is a *Being* depending on another; and whatsoever once essentially depends on another, must of necessity, for always so depend on it, because what is *Essential* admits of no change; and so great a *Virtue* is required in an *Independing Being*, that all things depend on it, as in the First Moment, so also in the Second, Third, &c. Wherefore when it is said, that every thing, as much as in it lies, continues in the same State; this must be understood with regard to the *Perfection* or *Nature* which hath been given to it, to which *God* who is constant and unchangeable, is supposed to afford his continual concourse.

XIV. *An account of what is to be handled in the following Chapter.*

Tho from the *Idea* we have of *God*, and from the Contemplation of him, and our own Conservation, his actual *Existence* is evidently deducible; nevertheless we will also endeavour to make out the same from all Sensible *Objects*. This was not undertaken by *Des Cartes*, forasmuch as he being chiefly intent on the *Idea* of *God*, had not yet discovered Material things, and therefore could not properly alledge any Argument from their Production.

CHAP. IV.

The Contemplation of the World proves the Existence of God.

I. *The first Argument for the Existence of a God from the Fabrick of the World.*

ALmost all the *Philosophers* that ever duly considered the *Miracles* of *Nature*, constantly acknowledged an *Eternal Godhead*, by whose out-breathing all things are Quickned, and receive *Life* and *Heat*. For who is there so stupid, who from the Stupendous Structure of the *World*, the continual Rotations of the *Heavens*, and the never discomposed order of *Nature*, doth not necessarily infer, that there is a *Supreme Creator*, who doth govern the *World*, as *Boethius* saith, by *Perpetual Reason*, at whose command *Time* is, and who being Stable, and Immoveable himself, imparts *Motion* to all *things*? What else doth the vast extent of this *World*, the variety of *things* therein contained, the Beauty of its *Parts*, the constancy of its *Motions* Preach to us, than that there is a great *Moderator*, who is the *Author* of this Transcendent *Structure*, and the Original disposer of this Harmonious Order?

We all are link'd to God, *a silent Breast,*
His Temple is. ———
What is the Place *of* God *but* Heaven *and* Earth
The Air *and* Seas, *to which he's given Birth?*
What but a Vertuous raised holy Mind?
Where if we can't, we'l scarce him elsewhere find.
All that thy Gazing Eye *doth see, and all*
That doth thee move, is that which God *we call.*

Lucan. lib. 9.

II. *Order supposeth an understanding Artificer.*

I will own that some mean *Philosophers*, may rest in the Contemplation of *Second Causes*, and entertain their *Minds* with the consideration of *Natural Objects*, without looking further. But it is impossible, that he who attentively considers their *Subordination*, and diligently weighs their Connexion, should not be forced to own a *Creator* of *Heaven* and *Earth*, and acknowledge his perpetual Providence, *except* (as *Aristotle* saith) *he be so unhappy, as to be fallen into the deepest Gulf of Blindness and Misery*. But that we may illustrate this a little by an Example, Let us suppose that *Protagoras*, or some other *Atheist*, had got a view of *Archimedes* his *Glassy Sphear*, in which the *Heavens*, I say, perform their several *Motions*, where the *Sun* and *Moon* do by degrees withdraw themselves towards the *East*, and being hurried along by the *Primum Mobile*, are whirld about, within the space of Twenty four hours; Do you think that *Protagoras* would have believed this *Machine*, to have been jumbled together by Chance, by a Fortuitous Concourse of the *Parts*, and not much rather that it was the *effect* of *Art*, and of the *Brain* of a most Subtil and Accomplisht *Mathematician*? For seeing it doth chiefly belong to an *Intellectual Agent*, fitly to adapt divers *things*, and to dispose them according to his designed end, he will be forced to confess that such an accurate and in-

genious

genious piece of Work, muſt have proceeded from *Reaſon*, and not from a Chance-medly of *Atoms*.

III. *Never were any Miracles wrought for the Conviction of Atheiſts.*

But if it be lawful to compare Great things with Little, and Weak things with ſuch as are Perfect, what is *Archimedes* his *Sphear* in compariſon to this *Univerſe*? How much more Perfect is the *Original*, than the *Copy*? And ſhall we believe that *Archimedes*, in his Imitation of the *Motion* of the *Wandring Stars*, made uſe of *Reaſon*, and at the ſame time ſuppoſe, that this infinite number of *Stars*, this wonderful adorning of the *Heavens*, this excellent Order of an unutterable variety of *Works* were the product of caſually jumbled and juſtled *Atoms*? This can never be ſuppoſed by any one in his right Wits: And he that hath either outward *Eyes* to ſee with, or an *Underſtanding* to diſcern, can never ſubmit to what is ſo contradictory to *Senſe* and *Reaſon*. For this cauſe I ſuppoſe it is, that GOD who diſpoſeth all things in *Number*, *Weight*, and *Meaſure*, and who takes ſo great Care for *Mankind*, yet hath never been known to work any *Miracles* in favour of *Atheiſts*; becauſe the Workmanſhip of *Nature* is not only a convincing Argument of his *Power*, but doth alſo ſtrongly invite and perſuade us to the higheſt Admiration of all his *Divine Perfections*. And to ſpeak the truth, I could much more eaſily believe all the Fables of *Æſop* for true *Hiſtories*, and that *Mice* had conferences together, and that a *Weeſel* entertain'd a witty Diſcourſe with the *Fox*, than that the *Riſing* and *Setting* of the *Stars*, the *Viciſſitudes* of *Day* and *Night*, the *variety* of *Seaſons* in the Fourfold divided *Year*, the two *Æquinoctials*, and as many *Solſtices*, could ever have been ſo ordered, without the *Divine*, that is, the moſt *Perfect Reaſon*; or preſerv'd in the ſame, by an invariable and uninterrupted Succeſſion. For do not all theſe, and all the other *Wonders*, with a conſtant and never ceaſing Voice ſeem to proclaim, that they are the Off-ſpring of an *Inviſible Sovereign Power*, and by no means their own *Artificers*? *He hath made us, and not we our ſelves.*

IV. *The various Species of Animals prove the Being of a GOD.*

But that I may not inſiſt too long in laying open the Beauty of the *Univerſe*, I will paſs by the vaſt Globe of the *Earth*, poiſed in the midſt of the *Air*, the *Mountains* lifting up their Heads towards *Heaven*, the *Rivers* that water and fructifie the *Earth*, the prodigious variety of *Vegetables*, which grow of themſelves, and the vaſt number of *Mines* and *Quarries*, from which *Gold*, *Silver*, and the reſt of the *Metals*, with ſeveral ſorts of *Earths* and *Stones* are dug. Let us only conſider, the almoſt infinite differing kinds of *Living Creatures*, whoſe oppoſit outward ſhape, and the great and many Conveniences and Neceſſaries they afford to *Mankind*, declare them to be the effect of the One only *Firſt Principle* or *Author* of all things. For who can imagin that the difference of *Male* and *Female*, the deſire of Mutual Embraces, and of perpetuating themſelves by their *Poſterity*, and Organs fitted for that purpoſe, were deſign'd and contriv'd by any thing leſs than a *Wiſe Omnipotence*? Who is there, that upon a diligent view of the ſeveral ſorts of *Birds*, their aſtoniſhing Artifice in making their *Neſts*, their *Hatching* and care of *Feeding* their *Young*, their dexterouſneſs in teaching them to *Fly*, doth not preſently diſcover the *Supream Cauſe* of them, who with wonderful Wiſdom and Artifice hath contriv'd and order'd all things, and hath imparted ſeveral *virtues* and *forces* to different *Animals*, according to their various uſe and capacity? How exquiſitely is their whole frame ſuited to the uſe for which they are deſign'd, and how accurately are their *Organs* adapted to their ſeveral Actions? Thus *Bulls* are furniſh'd with *Horns*; *Lions* with their *Paws*; *Elephants* with their *Teeth* and *Snout*; and the *Rhinoceros* with his cloſe *Armour*, as well in order to the attaining of their deſigned End, as to defend themſelves, and offend their Enemies.

V. *The various Faculties in Beaſts, plainly prove a Sovereign or Supream Power, ordering and deſigning all things.*

Shall any one be ſo weak as to think, that broad and flat *Feet* were given to *Water Fowl* without any deſign, and by meer hap-hazard, when the uſe of them in *Swimming* is ſo apparent? Can any one ſuppoſe that *Herns*, ſhould by chance, have long *Legs* and *Necks*, and *Beaks* ſharp-pointed like *Daggers*, wherewith they pierce the *Fiſhes*, and draw them out of the *Water* for their prey? Whench hath the *Pike* his prominent *Saw*-like *Teeth* on each ſide his *Jaws*, and the *Roof* of his *Mouth* thick ſet with *Hooks*, that the ſlippery Prey might not eſcape his greedy Jaws? Is it by chance that the *Woodpecker* is furniſh'd with *Claws*, wherewith it runs up the ſide of *Trees* like a *Cat*, and a forked *Tongue*, wherewith it robs the *Tarantula* of her Prey? Conſider the Arts and Induſtry of the *Bees*, *Piſmires*, and other *Beaſts*, about their *Food*, begetting of their *Kind*, breeding of their *Young*, and fighting with their *Enemies*, and it will appear ſelf-evident, that none of theſe can be ſuppoſed the *fruit* of an Accidental and Confuſed motion of *Atoms*, foraſmuch as nothing more excellent, more appoſit or uſeful, can be conceived by the *Mind* of *Man*.

VI. *The beholding of Man, leads us to the knowledge of GOD.*

But to make no longer ſtop here, let us take a view of *Man*, *Nature's Maſterpiece*, and behold all the Excellencies diſpers'd up and down in all other *Living Creatures*, united in this *Microcoſm*, or *Little World*. Can any one behold his comly *Form*, the erect poſture of his *Body*, his *Face* looking upwards, and (as it were) directed towards *Heaven*, and the Beautiful ſymmetry and proportion of his whole *Body* and *Parts*, and ſuppoſe him to have had no *Author* of his *Being*? But to leave the Wonders of his Outſide, if we proceed to take a view of his *Inward Parts*, their ſtructure and ſituation, the *Nerves* and *Sinews* deriving their Original from the *Brain*, the *Arteries* from the *Heart*, the *Æthereal ever moving Spirit* that fills them, and imparts *motion* to all the ſeveral *Joynts* and *Members* of the *Body*, and vigour and ſtrength to perform all manner of *Actions*, we ſhall find ſtill ſtronger Arguments to perſuade us, that there muſt be a *Firſt Cauſe*, who is the Principle of all *Human Perfection*.

VII. *The deſcription of the Eye, as to its External parts.*

But foraſmuch as Vulgar Wits are more apt to be taken with *Examples* than *Diſcourſe*, let us take to task ſome one Part of the *Body* of *Man*; for Example, the *Eye*, and ſcan the Miracles it contains. And here at firſt ſight we meet with ſo many Wonders in its moſt curious Make and Contrivance, that it is impoſſible for a *Man*, not wholly bereft of *Reaſon* and *Underſtanding*, to doubt of the Sovereign Perfection of the *Artificer*. In running over its outward Parts, we meet with the

Bony

Bony Orbit, or round *Ossea Orbita*, together with the *Eyelids*, the *Hair* of the *Eyelids*, and the *Eyebrows*, as also the *Glandules* or *Kernels*, with the *Excretory Vessels* and *Passages*, all which serve either to defend that tender Part, or assist and facilitate its *motion*. The *Eyelids* are as *Curtains* to the *Eyes*, and are assisted with the ministry of several *Nerves*, which by insertion into the *Muscles*, become useful for the opening or shutting of them. The *Eyebrows* and *Hair* on the *Eyelids*, are like Ramparts, to secure the *Eye* from things that are hurtful to it, and to prevent their sudden and unexpected eruption. The *Excretory Passages* serve to carry off the superabounding Humor, that the *Eye* may not be clog'd by the affluence of *ferous Matter*, or the *Eyesight* dimmed by the acrimony thereof.

V.

VI.

VIII. *The Inward Parts of the* Eye *consider'd.*

If we proceed to the Inner Parts, which Nature hath hid from, but Anatomy lays open to us; we shall first find the *Muscles*, wherewith this miraculous little *Globe* continues hung up and equally pois'd within the *Orbit*, and performs its various *motions*. In the Midst of it is the *Pupilla*, or *Sight*, of a round *Figure*, that the visible *Species* or *Rays* proceeding from *Objects*, might be the better received by it, from what part soever of the *Hemisphere* they come. After these appear the *Coats*, or *Membrans* of the *Eye*, and next the *Humors*, which like a *Dioptrick-Glass* do refract and concenter the *Rays* that represent the Images of *Bodies*. For the *Watry Humor* distending the *Membran*, and making it gibbous, doth ampliate the *Convexity* of the *Eye*: And the *Crystalline Humor* placed within the opening of the *Grape-like Coat*, *Tunica Uvea*, like a piece of *Glass* set opposite to a Hole, in which the Rays coming from all parts are collected and refracted. And behind the *Crystalline Humor* is placed the *Glassy Humor*, by means whereof the *Tunica Retina*, or *Network Membrane* is at a fit distance separated from the *Crystalline Humor*, so that when the *Rays* with due refraction have past the same, they attain their proper place and center.

IX. *The structure of the Ear examin'd.*

Tho' the *EAR* be not of equal use and concern to the convenience and necessities of Life, as the *Eye*, and is only design'd for the perceiving of *Sounds*; yet is it for the Excellence of its structure very little inferiour to that of the *Eye*, especially if we consider its Inner parts, and the mutual connexion of them. For from the *Lappet of the Ear*, which is narrowed by degrees, we see that the Hollow of the *Ear* goes slanting inwards, to the end that the *Sounds*, by passing its crooked Windings and Turnings, might be encreased. For the thin *Membrane*, placed near the Hole of this inward Cavity, being struck by the impuls'd *Air*, doth affect the *Fibres* and *Auditory Nerve* with the same motion. There are also three small *Bones* fitly disposed and tied together with a *Ligament*: The first of these is call'd the *Hammer*, because of the resemblance it bears with that Instrument; the second is call'd the *Anvil*, which is somewhat roundish; and the third, the *Stapes* or *Stirrop*; they are moveable, and seem to be of good use to defend the *Drum* of the *Ear*, and prevent its being too much slackened, or too stiff bent. From the fore-mention'd Hollow of the *Ear*, the Passage (commonly called by *Anatomists* the *Oval Hole*, or *Window*) opens into the *Labyrinth*, and so leads to the last *Inner Cavity*, called *Cochlea*; because in its Spiral Windings it resembles a *Snails Shell*, which if well view'd, appears to be the work of admirable Artifice; for being form'd with such Turnings, it renders the *Sounds* more distinct, and causes that there be no confusion of them. Besides, there are many other Parts not here to be insisted on, whose wonderful Contrivance does much conduce to *Hearing*.

X. *The structure of the Eye and Ear, cannot be the effect of a Fortuitous Concourse of Atoms.*

Now who can be conceived so stupid and void of all *Judgment*, as to think that the *Organs* of these two *Senses* were made by a fortuitous jumbling together of small *Bodies*; and not rather acknowledge the most *High God*, who by his inimitable *Wisdom* has so curiously framed, and orderly disposed all these several *Parts*, that nothing can be imagin'd more adapt, and better suited to the uses for which they were designed.

XI. *Living Creatures could never be by Chance.*

I could never approve of *Democritus* his Opinion, which attributes the Original of the *World* to a company of *justling Atoms*, as if their Roaming vagaries were an adequate Cause to produce all the *Bodies* in the *Universe*. For how can we suppose, that in that infinite Space, wherein he asserts his *Atoms* to be toss'd, they should come together and unite, to the framing of all the *Parts* of *Living Creatures*? Can we imagine, that by the hudling concourse of like *Bodies* so many *Nerves* and *Muscles*, so many *Ligaments* and *Tendons*, so many *Filaments* and *Fibres*, could be formed? Can we think that the *Legs*, *Shins*, *Feet*, *Toes*, *Joynts*, with all the other Organs of the *Body*, were the effect of blind and impotent *Chance*? Can we conceive that the *Heart*, that Noble *Muscle*, and the *Breast* in which it is contain'd, together with its *Ribs*, *Muscles*, the *Lungs*, and the *Midriff*, were made without a Cause and at Hap-hazard? Or that such a vast number of *Veins*, *Arteries*, *Grissels*, and *Membrans* had no other rise, but meer *Chance* and the Heavines of *Bodies*? Who can force himself to imagine, that an infinite number of *Blind Men* plac'd in an open Field, by a confused running in amongst one another, should at last produce an *Army* orderly drawn up in *Battle*, according to the most exact Rules of *Military Art* and *Discipline*? Or why may not we as well with *CICERO*, suppose that a vast number of *Alphabetical Characters*, being casually thrown upon the *Earth*, should all rank themselves into *Lines* and *Words*, making the *Annals* of *ENNIUS* the Poet? Now as no Man can so much over-bear his *Reason* as to think this possible, how much less will he be able to believe, that the curious Structure and Order of the *Parts* of *Animals*, is the effect of *Chance*, that is, of no Cause at all?

XII. Atoms *cannot produce any thing of themselves.*

And to deduce this matter from the Beginning of the *World*; If it be so that *Atoms* have a Power to produce and generate things, why do they not now produce or renew the same Things they framed so long ago; why are there no *Mountains* raised anew? How is it that they do not constitute another *Sun*? How it comes to pass that all *Living Creatures* keep to their kinds, and that no new ones do arise from their Sensless Jumbling together? Neither will it be of any advantage for the *Atheist* to alledge here, that *Flies*, *Mice*, and other *Insects* are daily generated without the Union of both *Sexes*; because the Question here is not concerning the Production of Things, but

concerning the inborn Power of Nature, or *Seeds*, out of which *Living Creatures* are Born, and are endowed with a Virtue fit for the *Generating* of them. And seeing they have not this of themselves, since it is a contradiction for a thing to be productive of it self, it must follow that they are the effect of the *All-wise God*, by whose power they act whatsoever they do.

CHAP. V.

Concerning Fate and Will, or the Divine Decree.

I. *The Ancients took great Pains to reconcile the Divine Preordination with the Liberty of Mans Will.*

THE *Ancients* were so solicitous of Preserving *Human Liberty*, that when they found they could not reconcile them with some of the *Divine Attributes*, they chose rather to acknowledge their own Ignorance, than to deny it. For when they found that all our Actions must be pre-ordained by *God*, forasmuch as he is the All-knowing Governour of the World; and on the other hand experienced in themselves a Freedom of Will, they admitted both to be True, *viz.* that *God* doth preordain all our Actions, and that we nevertheless enjoy Liberty of Will. But when they afterwards proceeded to enquire further, how it could be, that Mans Liberty standing, *God* could have fore-ordained all things from *Eternity*, they ingenuously profest their Ignorance, and that it was no wonder, that an *Infinite Being* could not be Comprehended by a *Created Understanding*. This acknowledgment of *Human* Frailty was certainly praise-worthy in them: But forasmuch as all are not satisfied with this Answer, many being solicitous to know how the Liberty of Man may be reconciled with *Gods Decree*, I suppose it will not be useless to make out, that *Gods Foreknowledge* of and *Foreordination* of *Human actions*, doth not take away the Liberty of them.

II. *What Fate or the Divine Decree is.*

And here if we consider the *Nature* of *Fate*, or the Divine Decree, we shall find it to be nothing else, but what *God* hath determined concerning every one of us: Or it is the *Eternal Decree* of his *Providence*, by which he *Sees*, *Knows* and *Governs* all things. And as *BOETHIUS* expresses it; *Fate is an Order or Disposition, Inherentin changeable things, by which Providence links them to their due Ranks and Orders.*

III. *Fate lays no necessity upon Human Actions.*

Now that this Order or Disposal doth impose no necessity upon *Human Actions*, is apparent, because we find that it is in our Power, to give our *Assent* to, or to *Dissent* from many things, and after haveing ballanced both parts, to choose one, and reject the other. We see likewise that Men frequently change their *Minds* at the Persuasions of their *Friends*, and do refuse what first they had embraced. And indeed were it otherwise, all *Prudence* and *Reason* in Mens ordering of their affairs would be taken away; for if they had no Freedom to chuse that part, to which they are inclined by Rational motives; they would not act by the direction of Wisdom, but by Chance and Fortune.

IV. *It is an Argument of our weakness, that we cannot reconcile Gods omnipotence, with the liberty of our will.*

And what can be more absurd than to go about to deny our *Liberty*, which we experience in our selves, and whereof we are so fully Conscious, that nothing can be more illustrious by the *Light of Nature* than it is, because we can scarcely reconcile it, with the *Divine Omnipotence* and *Providence*? We ought ever to remember that we are *Finite*, and that *God* is *Infinite*; and that our Liberty must not presently be denied, because we cannot conceive it inconsistence with the *Will* of *God*, which is without us, and which our Minds are not able to comprehend; forasmuch as this only proceeds from the weakness of our *Wit* and *Understanding*

V. *The Decree of God doth suit it self and comport with things.*

'Tis true indeed that *Fate* is immoveable, but yet so as that it inheres in things that are moveable; because it doth not take away the Nature or inbred Motions of things, but moves them sweetly and without any manner of constraint; according to the Requirings of the different Nature of *things*, so as to act *necessarily*, with things necessary, and *freely* with free and voluntary *Agents*.

VI. *Gods Foreknowledge lays no necessity or force upon Mans will.*

Neither is this Assertion overthrown by that common Objection: *If God foresees that I shall Sin, seeing that his Foresight cannot be deceived, it follows that I must necessarily Sin.* For *God* doth not foresee my Sinning *necessarily*, but *freely* and voluntarily; and his Knowledge imposeth no necessity upon my Actions, no more than my knowing that *Peter* will walk to morrow, doth lay a necessity upon him of doing so: Or than the knowledge I have of the *Suns* Existence in the *Heavens*, doth cause the *Sun* to be there.

VII. *The knowledge of God being external to the thing known, cannot hinder its Liberty.*

For what can be more Childish than to think, that the *Foreknowledge* of *God*, which is altogether External to the *thing known*, should put a force upon the Will of Man? But you will say, *God* cannot be deceived. And what then? Consequently, you'l say, it was either true from *Eternity*, that you were to recover of this *Sickness*, or else false: Therefore it is in vain to make use of a *Physician*, since neither the necessity of *Fate*, nor *Eternal Truth* can ever be changed. This is worthily stil'd by *CICERO* to be a lazy *Question*, because by the same *Argument* you may overthrow all *Human Actions*. But that *Gods Foreknowledge*, doth not import any necessity is evident from this; that a *Contingent thing* is of its own nature Indefinite, and of a doubtful event, tho' with respect to the *Divine Foreknowledge*, it be Definite and determined. *AMMONIUS* illustrates this by the Example of a *Globe*, resting on the Plain of the *Horizon*, the indifferency whereof as to Rest or Motion, doth well express the indifferency of our Will; but if this Plain be never so little inclined, then it must move of necessity: So likewise when the Will is inclined to any thing, this makes a kind of necessity, upon Supposition only, that the *Will* turned it self thisway; or that *God* did foresee this inclination from *Eternity*.

VIII. *The certainty of Gods Foreknowledge is no Argument for a force upon our will.*

You will say, *Gods Prescience* is most *certain*; therefore its Object cannot but come to pass; and that which cannot but come to pass, is therefore necessary: Therefore, *Gods Foreknowledge* imposeth a necessity on the *Will*. I Answer, by distinguishing the Consequent; I grant that the thing which is the *Object* of the *Divine Foreknowledge*, cannot but happen *upon Supposition*, that it is to happen so, from a necessity of *Consequence*; but I deny that it cannot but come to pass *absolutely*, and by a necessity of *Antecedence*.

IX. *There is a two-fold necessity.*

There is a two-fold necessity, the one *Antecedent*, and that is that which is the *Cause* of the *Action*, which necessity the *Will* cannot resist: The other is *Consequent*, which is not the *Cause* of the *Action*, but doth presuppose it, and is consequent to it. And it is this latter only which is brought upon *Human affairs*, by the *Divine Prescience*:

Foras-

To the Wor= shipfull Cap=
taine Richard Cheyney of Ham=
erton in the Parish of Hack=
ney in Middle= sex Esqr.

This Plate is humbly Dedicated by Richard Blome.

Forasmuch as a futurity is not the Consequent of *Gods Fore-knowledge*, but his *Prescience* is the Consequent of that which is future; and in this Sense only it is, that the Object of *Gods Prescience* is called Infallible and Eternal.

CHAP. VI.

How God is said to be the Cause of Propositions of Eternal Truth.

I. *How the Essences of things are distinguisht from their Existency.*

FOr the better understanding of this *Question*, we are briefly to presuppose, that the *Essences* of *things* are modally distinguisht from their *Existency*: For we understand the *Essence* of a *thing* after one manner, when we abstract it from *Existence* or non *Existence*; and after another when we conceive it as *Existing*. For a thing is understood to be *Existent*, when it is *without our Understanding*: But a *thing* that doth not *Exist*, is *objectively* in our Understanding, and is not *without our Thought*. Of this kind are *Eternal Truths*, *viz.* That *a Triangle hath three Angles equal to two right ones*: *Six and Four make Ten*; and such like, which are considered as *Ideas* in our *Mind*. And forasmuch as these *Idea's* cannot be said to be nothing, but something, the *Questions* is, what is the cause of them, that is, whether they depend on the *Understanding* of *Man* forming them, or whether they owe their production to some other *Principle*.

II. *God is the cause of Propositions of Eternal Truth.*

I Answer, that all *Eternal Truths* are from *God*, as from their efficient and total *Cause*; for he is the *Cause* of all *Creatures*, not only as to their *Existence*, but also with regard to their *Essence*. Forasmuch as he being *Infinite Goodness*, could not be impulsed by any other Reason of *Goodness*, to do that which is best: But on the contrary because he determined himself to produce the *things* that are, therefore they deserve the Title of being *Good*. As for Example, he did not therefore will the three *Angles* of a *Triangle* to be equal to Two right ones, because he saw, that they could not be otherwise; but on the contrary, because according to his *Free-will* he had determined the three *Angles* to be necessarily equal to Two right ones, therefore they could not be otherwise. For in *God* to *Will*, to *Understand* and *Create* are one and the same thing: Wherefore because he knows a thing, therefore it is true.

III. *The non-Existence of God being supposed nothing is less true.*

Neither can we say, that these *Truths* would be no less true, whether *God* be supposed to *Exist* or not: For this is most false; because all *Truths* depend upon the *Existence* of *God*, who is the first *Eternal cause* of them, from whence they all flow as from their Fountain. Neither is this difficult to be conceived, if we consider *God* as an *Infinite*, *Eternal*, *Incomprehensible Being*, the *Author* of all *Good*, and on whom all things depend. And therefore they are in a great Error, who think that any thing can be independently of his *Will*.

IV. *That twice four make eight is from God.*

Neither doth it oppose what we have said, that the *Mind* of Man cannot conceive *the three Angles of a Triangle not to be equal to two right ones*; or that *twice four should not make Eight*: For to prove this, it is sufficient to shew, that there can be no *Being* which does not depend on *God*, and was not freely constituded by him: For this being laid down, it evidently follows, that it was not always necessary, that the three *Angles* of a *Triangle* should be equal to two *right ones*, or that twice four should make eight, but that it was so constituted by *God*.

V. *God being of himself there is nothing independent of him.*

For seeing *God* is positively of himself, he is endowed with such an *Essence* and *Nature*, that from the consideration thereof we can assign a *Reason* for *Eternal Truth*, without need of having recourse to any other *Object*, for the clearing of their Evidence and certainty. This *Attribute* would agree to some other besides *God*, if we should suppose some *Natures*, *Truths* and *Essences* to be such as to be independent of *God*. Because if any one should demand why they were such, and whence they had their *Truth*, it might be answered, that they were Eternally so *of themselves*, and that for that Reason, they became the Objects of the *Divine Knowledge*, as being of themselves Antecedent to it. Which is so derogatory to the *Divine Omnipotence*, that it is a wonder to me how any can assert such a thing, who consider well the *Divine Independency* upon any things whatsoever. Forasmuch as it would follow from hence, that the Complement of the *Divine Cogitation* would not depend on the sole understanding of himself, but also of some other thing, which was not of the *Nature* of *God*, and which is conceived as independent on his *Will*.

VI. *In what Sense the Essences of things are said to be immutable and Eternal.*

If you *Object* that the *Essences* of things are *Eternal* and *Immutable*; I answer, That they are so indeed, if it be understood concerning the *Immutability* and *Eternity*, which *God* hath prefixt to them, whilst by his Free-will he has determined some things to be unchangeable. Or else it may be said according to the Sense of the Vulgar, that the *Natures* of *things* are *Eternal*, because there was no Time before them; or rather because the *Eternal God*, doth conceive them without Succession, neither will suffer them for ever to cease or be changed.

VII. *God is the Cause of Truths, as a King is of his Laws.*

GOD therefore is the *Efficient Cause* of all things; not only of such as *Exist*, but also of *Possibles*, and of all *Truths* that we call *Eternal*: In like manner as a *King* is the Maker of all the *Laws* in his *Kingdom*. For all these *Truths* are inborn in us from him; as a *King* also would have them so in his *Subjects*, if he had Power enough to write his *Laws* in their Hearts.

VIII. *Objection.*

If any one say, That this would make *God* inferiour to a *King*, who can at his Pleasure annul the *Laws* he has made; which if *God* should do, those *Truths* would lose their *Essence*, and consequently would be no longer *True* or *Immutable*.

IX. *Answer.*

I Answer, That the Case of *God* and a *King* are very different. A *King* can change his Laws, because his *Will* is changeable, but *God's Will* is unchangeable; for it is his *Perfection*, that he acts in a most constant and invariable manner. Neither doth it hinder this that his *Will* is free; for as his *Will* is free, so likewise is his *Power* Incomprehensible. Wherefore tho' I cannot comprehend how it should not be true, that *One* and *Five* are *Six*; yet I understand clearly enough, that it is impossible there should be any thing in the whole *Universe* of Things, which does not depend on him. And therefore it is contrary to *Reason* to think that any thing cannot be otherwise, because we cannot understand how it can be. It is indeed true in the general, that *GOD* can do all those things, which are clearly and distinctly known by

us; yet doth it not follow from thence, that he cannot do those things that we cannot conceive: For our *Imagination*, or *Understanding*, cannot be the Rule of his *Power*. Therefore we must conclude, That the *Essences* of Things, and *Mathematical Truths* are from *God*, because he so conceived them, so ordered, and so commanded them: According to that of S. *Austin*; *Because thou seest them*, (or rather, because it listeth thee) *therefore they are.*

CHAP. VII.

Concerning the Divine Attributes; and, First, Of the Unity of GOD.

I. *What the Attributes of GOD are.*

ALtho' GOD be One meer *Cogitation*, and all his *Perfections* or *Attributes* indivisibly United; yet the Acts of *Cogitation* that we have of him, stirr'd up from several Occasions, which frequently involve many *Objects*, are Many. For when I consider, that my *Mind* doth not exist of it self, neither can do all, nor understand all things, &c. I turn my self to the *Divine Cogitation*, which comprehends all *Perfections*. And these *Reflexions*, whether as referr'd to *God*, or to the various Conceptions of *Objects*, are called *Attributes*. Whence it comes to pass, that one of my *Cogitations* I have of *God*, as *Existing*, is different from another *Cogitation* I have of him, as *All-powerful*, or *Eternal*: Because the occasions of these my Thoughts are different; and one *Object* which I refer or apply to *God*, is different from another which I can likewise apply to him. Wherefore seeing I do not find my *Mind* to be one only, but perceive also the *Idea's* of other *Minds* of the same Nature with mine, I cast my Eye on the *Divine Cogitation*, and thence take an occasion of considering its *Unity*.

II. *The Divine Attributes are indivisibly united.*

If therefore we consider the *Essence* of *God* in it self, it appears to us to be one *Simple, Uniform Cogitation*, exempt from all *Order*, *Distinction*, *Priority*, or *Posteriority*. Forasmuch as all the *Perfections* that are, or we can think of in *God*, are not only actually present in his *Nature*, and inseparably united with it; but are so intimately joyned, that the one is the other; yea, that one of them is all the rest, and All are most properly One in their *Essence*: So as that his *Eternity* is his *Omnipotence*, his *Life*, his *Spirituality*. In a word, All his *Attributes* are his *Life*, and his *Life* is all his *Attributes*.

III. *The Unity of GOD was known to the Ancients.*

It was the constant Opinion of the *Ancients*, That GOD is One only, the Sovereign of the *Universe*, whom all things obey. Both *Poets* and *Philosophers* own'd this, who frequently call him, *The Maker of all things*, *The Ruler of the World*, and *The Mind diffus'd through all things*. Wherefore also they gave him no peculiar *Name*, as supposing that no *Title* could be given to him, who was singular, and had nothing common with other *things*; for that *Names* were only necessary where Plurality is to be distinguish'd, and persons discriminated by certain Marks.

IV. *The Divine Unity is to be explained.*

But because the word *Unity* is taken in divers *Senses*, we are to enquire first, in what respect *God* is said to be one, before we can come to know, that there can be no more than one.

V. *A thing is said to be One, three several ways.*

A Thing is said to be one, *First*, when its *Parts* are united; yet so as that it may be divided into them; as a *Body* is said to be One, because of the *Union* of its *Parts*, tho' they be separable. Secondly, A Thing is said to be One, because it hath one *single Essence*, which cannot be divided into *Parts*; tho' the *Attributes* and *Modes* wherewith it is diversified, may be separated from it, such as *Knowledge* and *Vertue*, without which the *Soul* of *Man* may be. Thirdly, a *Thing* is said to be *One*, which is so undivided, that it can in no respect be divided, nor hath any *Attributes*, or *Modes*, that are separable from it, but all things appertaining are most simply one.

VI. *How God is said to be One.*

In this last meaning *God* is said to be *One*, because all that is in him is *One*, neither hath he any *Attributes* that are not *Essential* to him, and Inseparable from him. And therefore according to our *Philosophy*, the *Divine Attributes* are only Modes of *Thinking*. For when we distinguish his *Will* and *Understanding*, that distinction is only made by our *Minds*, as we conceive him to be conversant about *Goodness* or *Truth*. But *Real Modes* are found in the Things themselves, which they affect and distinguish from others; as *Figure* and *Motion* in *Bodies*; *Willing* and *Understanding* in the *Mind*. And are therefore call'd the *Modes* of *Things*, because they agree to mutable Things, such as all *Created Beings* are; but not to a *Being* that is constant and ever abiding, such as *God* alone is. Wherefore whatsoever is in *God* is only distinguishable by reason.

VII. *God is one in such a manner, that there can be no more besides him.*

Having shewed what manner of *Unity* agrees to GOD, it may further be queried, Whether *God* be one in such a manner, as to suffer or admit none besides him. To which I answer, That *God* is One in such a manner that he cannot be multiplied: For seeing by the Name, GOD, we understand a most *Perfect Being*, it is necessary that it comprehend all that is most *Real*; so that supposing him to *exist*, all conceivable *Perfection* must be placed in him, so as by his *Idea* and *Essence* formally to exclude every most *perfect Being* besides himself. For indeed how can any be equal to him? Or how can all conceivable *Perfections* be in two several *Subsistences*; seeing that whatsoever admits of *Division* is subject to *dissolution*, which is the most remote from the *Nature* of *God*, who is *Incorruptible* and *Eternal*.

VIII. *Multiplicity of Gods implies a Contradiction.*

If it be said, That this *Division* is no hindrance to their *Immortality*, as long as the one doth not arrogate any thing that belongs to the other, but each of them follow their own work. It will still come to the same thing; for this distribution of their *Work* or *Business*, is an evident Instance of great *Imperfection*; because this supposeth them to stand in need of one anothers assistance, being unable all alone to govern the *World*; which is contradictory to the *Divine Essence*, which is known to be *Omnipotent*, *Infinite*, and *All-wise*.

IX. *If there were more Gods than one, they could not be equal.*

Moreover it is most certain, that supposing a *Plurality* of *Gods*, they cannot be every way equal, but that some *Perfections* would be found in the one, which are not in the other, which is altogether incompetible to the *Supream Being*. For let us suppose two *Gods*, whom for the greater clearness of Discourse, we will call *Saturn* and *Jupiter*. Now these two Gods, forasmuch as they severally include all *Perfections*, they must of necessity be *All-knowing*, so as not only to know themselves, but others also; and because in the *Idea* of either

of

of them, neceſſary *Exiſtence* is included, it will follow, that the Cauſe of the Neceſſity and Truth of the *Idea* of *Saturn*, which is in *Jupiter*, will be *Saturn* himſelf; and the Cauſe of the Truth and Neceſſity of the *Idea* of *Jupiter*, which is in *Saturn*, will be *Jupiter*; and therefore ſome Perfection will be found in *Saturn*, which is not in *Jupiter*; and in *Jupiter*, which is not in *Saturn*. The reaſon whereof is this, becauſe the Perfection of the underſtanding of either of them, will depend on the other; and ſo muſt be both of them Imperfect, which is repugnant to the Nature of a moſt *perfect Being*.

X. *Neither could they be Omnipotent, or All-knowing,* It belongs alſo to the *Idea* of a moſt *perfect Being*, that he be *All-powerful* and *All-knowing*; but it is a Contradiction, that more *Beings* than one ſhould be endowed with theſe *Perfections*: For either they would be able to hide their *Thoughts* from each other, or not be able; if the firſt, how could they both be *Omniſcious*? If the latter, how could they be *Omnipotent*?

IX. *If God exiſt, he muſt be One.* Laſtly, Neceſſary *Exiſtence* is included in the *Idea* of *God*, becauſe he is *Independent* of, and before all other *Beings*. Now whatſoever doth neceſſarily *exiſt*, muſt of neceſſity be Singular, ſince *Singular Being* is nothing, but actually to *exiſt*, which is ſo peculiar to *God*, that he cannot but *exiſt*: Wherefore ſeeing *Singularity* and *Unity* are one and the ſame thing, it is evident that the *Divine Nature* excludes all *Multiplicity*, that is, cannot be divided into more *Gods*; and conſequently, as *God* is *Undivided* in himſelf, ſo neither can he be *partible* into others.

XII. *The Heathens did not own many Gods.* But may ſome ſay, How comes it to paſs then that the *Heathens* worſhip'd many Gods, if it be ſo that more Gods than one implies a Contradiction? I anſwer, That the *Heathens* never had any *Idea* of many *Beings* abſolutely perfect, as is evident from their *Writings*; becauſe they made one to Rule in *Heaven*, another in *Hell*, a third over the *Winds*, a fourth over the *Fire*, and diſtributed the Government of the *Univerſe* amongſt many Gods: But they did not ſuppoſe any of them to contain all manner of *Perfections*, and to have the Power and Dominion over all *Creatures*; but took them to be much of the ſame Nature as we conceive the *Angels*. And *Marſilius Ficinus* tells us as much, *Argument. in Cratylum: Neither let it trouble you*, ſaith he, *that* Plato *doth frequently make mention of many Gods: For he proves in his* Parmenides *and* Timæus, *that there is but One God; and that the reſt are only his Angelical and Heavenly Miniſters; and by calling them Gods, doth not ſo much imply their being Gods, as their being Divine*. For indeed the *Philoſophers* do ſo much abhor a Plurality of *Gods*, that it would be more eaſie to perſuade *Euclid*, that many *Centers* may be found in a *Circle*, than to make *Philoſophers* believe that there are more than one *God* in the *World*.

CHAP. VIII.

That GOD is Eternal, or without Beginning and End.

I. *The Error of ſome, who ſay, that God was the Beginning,* THo' almoſt all *Philoſophers* agree in this, that there is a *GOD*, and that he governs the *World*; yet don't all of them conceive his *Exiſtence* after one and the ſame manner. Some of them are of Opinion, that *GOD* had ſome kind of *Efficient Cauſe of himſelf.* and tho' the ſame were before all Ages; yet that he was born or produced as all other Things. But foraſmuch as it was unbecoming the *Divine Majeſty* to proceed from any other, and that he who is the *Author* of all Good, ſhould derive his *Being* from another, they aſſerted him to be his own *Efficient Cauſe*, and that he ſo proceeded from himſelf.

II. *This Opinion deſtroys the Nature of God.* But this Opinion does not ſo much oppoſe *Reaſon*, as it deſtroys the very *Nature* of *God*: For how could *God* produce himſelf, ſince this ſuppoſeth that before his *Production* he was not, becauſe he was then to be produced, and yet was at the ſame time, foraſmuch as he did then influence his own *Production*, which are abſolute Contradictions. And whatever may be ſaid in this caſe, we muſt allow ſome *Principle* of the *Divine Production*, which is abſolutely repugnant to the Nature of *God*. For we no ſooner conſider the *Nature* of GOD, but we find him to be *the Moſt perfect Being*, which excludes all *Imperfections*, that is, any bounds or limitation of his *Perfections*, and includes all *Perfections*, and conſequently alſo *Exiſtence*, by which he is diſtinguiſh'd from all other things.

III. Neceſſary Exiſtence *is contain'd in the Nature of God.* For tho' whatſoever we conceive be apprehended by us as *Exiſting*; yet we find that *Exiſtence* doth not belong to *God* and the *Creatures* in the ſame manner. For in the Conception of *Creatures*, whoſe Perfections are *finite*, only *Contingent* and *Poſſible Exiſtence* is contained; whereas in the Notion of God, *Neceſſary Exiſtence* is included, as being an *Eternal Perfection*; inſomuch that it is as obvious to our knowledge that *GOD exiſts*, as it is to a *Mathematician*, that a *Triangle* hath three *Angles* equal to two right ones. For as it is the Nature of a *Triangle* to have three *Angles* equal to two right ones; ſo likewiſe it is the Nature of *God*, to be neceſſarily *Exiſtent*, and therefore as he exiſts now, it muſt be acknowledg'd that he hath exiſted from all *Eternity*.

IV. *They who diſtinguiſh God's Eſſence from his Exiſtence, takes away his Eternity.* They who do not mind this, are very liable to Error, and to aſcribe to *God* ſimple *Duration* inſtead of *Eternity*: For by diſtinguiſhing *Exiſtence* from *Eſſence* in *God*, as in other *Created Beings*, they imagine *Succeſſion of Time* to have place in him, and by this means divide that which is *Infinite*, into Parts, and aſſign differences of *Duration* to it. Hence it is that ſome demand, Whether *God* hath not *exiſted* longer now, than when he firſt Created the *VVorld*; or whether he did not *exiſt* longer before the *Creation* of the *VVorld*, than the Time that has run from the *Beginning* of the *VVorld* till now. Which *Queſtions* are occaſion'd by their ſeparating the *Eſſence* of God from his *Exiſtence*, and ſuppoſing that the *Eternity* of God may be underſtood, without the contemplation of his *Eſſence*; or becauſe they have not diſtinguiſh'd *Duration* from *Eternity*, but have concluded them to be confounded together. For *Duration* is an *Attribute* of the Exiſtence of *things*, not of their *Eſſence*. Who will not ſay that the Propoſitions, *Twice three make ſix*; *Nothing is made out of Nothing*; which are only ſaid to be true according to their *Eſſence*, that they have continued longer now than at any other time? Wherefore *Duration* is only an Affection of *Exiſtence*; whereas *Eternity* cannot be conceived without the *Divine Eſſence*; and foraſmuch as the *Exiſtence* of God is contain'd in the Conception of his *Eſſence*, we are alſo to attribute *Eternity* to him, and not *Duration*.

V. *The Nature of God includes no Conception of Futurity.* Therefore we say, that all Creatures *Enjoy* Existence, forasmuch as it doth not belong to their *Essences*, but is in a manner foreign to them. But this cannot be affirm'd of *God*, because his *Existence* is not distinct from his *Essence*, and is GOD himself. Besides, all *Creatures*, whilst they *enjoy* the present *Time* and *Existence*, may be said to have it *to come*, forasmuch as their *Existence* is without them, and only successively bestowed upon them: Whereas we cannot say of the *Divine Existence*, that it will be, or is to come, because he has now the same *Existence* he will have for ever; *Actual Existence* in him being like all his other *Attributes*, which denote no difference of *Time* in Him.

VI. *Whether the Mind of Man hath a permanent Existence, as God hath.* It may be Objected, That some *Philosophers* and *Divines* hold, that the *Duration* of the *Mind* of Man is Permament, and as they express it, *All at once*, and ye none of them attribute *Eternity* to it: So that accordingly, tho' the *Existence* of God have no Parts whereof some are before the other; yet for all that *Duration* may be attributed to him.

VII. *An Answer to this Doubt.* I answer, That *Permanent Duration* can only improperly be attributed to the *Mind* of Man, because we find a manifest *Succession* in our Thoughts, whereof nothing is to be found in the *Divine Perception*. But to explain my Mind more fully, I think that *Permanency* is very improperly attributed to *Creatures*, forasmuch as the most Perfect of them, cannot all at once admit all the *Attributes* and *Modes* it is capable of. For as it implies a Contradiction for a *Body* at one and the same time to admit several Figures, as to be *Square* and *Round*, to *Move* and *Rest*, so neither can a *Created Spirit* affirm and deny the same thing, or comprehend all those things with one *Thought*, which it is capable of knowing. But GOD possesseth all *Perfections*, and all *Attributes*, at one and the same time, neither is any of them before or after the other. And therefore *Permanence* appertains only to GOD, and *Duration* to all other *Beings*. Besides, since all *Creatures* are Created by *God* with equal dependency, and have their *Preservation* no longer than he pleaseth to continue it; it follows, that their Duration is not *permanent*, but *successive*, and can indeed be nothing else but a continual *Reproduction*, by which they persevere in their *Beings*.

CHAP. IX.

That GOD is Infinite, and how we are to understand, that he is Circumscrib'd in no Place.

I. *All things are not contain'd in some place.* AMongst those Prejudices, which we have taken in from our *Childhood*, and which some to this day hold for Truth, there is none more dangerous in *Philosophy* than that which *ARISTOTLE* teacheth in the *Fourth Book* of his *Natural Philosophy*, the *First Chapter*, viz. *That all things are somewhere*, that is, contained in some certain Space; because he supposed *whatsoever is not, to be no where*; which he takes to be so notorious and evident, that he is not afraid to rank it amongst *Common Notions*, and to esteem it an indubitable *Truth*. Wherefore also in his *First Book of Heaven*, the *Third Chapter*, he assigns the Highest place to the *Gods*, as most becoming their Dignity, and whence with greater ease they may take a View of all Things. And in the same Book, *Chap.* 2. he disputes against the most ancient *Philosophers*, and denies *God* to be diffus'd through all Things, as supposing it most unworthy the *Divine Majesty* to be present with the Earthly World.

II. *Immaterial things cannot be said to be in a Place.* But that this is an Erroneous Opinion, appears from the *Immensity* of GOD, and the *Existence* of *Spiritual Things*: For it is evident that *God* and *Immaterial Substances* are, or have a *Being*, and yet they are not comprehended in any determinate Place. For to be in a *Place* is the Property of *Extended Beings*, and cannot be attributed to an *Immaterial Substance* void of all *Extension*. If at any time *Places* be attributed to the *Soul*, this is not with respect to its own Essence, which consists only in *Cogitation*, but with respect to the *Body*, to which it is joyned; because it cannot be, but that the *Body* being limited to a certain Space, the *Soul*, which is intimately present with it, may be said to be included in one place, rather than in another. But if the *Soul* be considered by it self alone, forasmuch as it is a *Thinking Substance* and void of all Extension, it cannot fill any Space, nor have any situation amongst *Bodies*; for otherwise it would be Divisible and Mensurable, which is repugnant to the Nature of an *Intellectual Being*.

III. *God is comprehended in no Place.* And as for GOD, he is much less comprehended in any Place: For tho' he be said to be *every where*, yet may he also be said to be *no where*; forasmuch as his *Immensity* is unbounded and diffus'd through all Places. But because all do acknowledge, that the most *Perfect Being* hath no Bounds, either of his *Duration* or his *Presence*, the only difficulty will be in the Explication of the *Divine Immensity*, *viz.* in what sense *God* is said to be *Infinite*, and so diffused through all, as to be *every where*.

IV. *Some falsly suppose God to be every where by his Presence.* Some, whom I call *Vulgar Philosophers*, derive the Immensity of *God*, from his *Presence* in every place, supposing *God* to be every where, because there is no place in which he is not present, or which is not filled by him. But these seem to Attribute *Extension* to *God*, by conceiving to partake of *Quantity*, as Occupying all *places*: And therefore would think his Greatness to be *Finite*, if there could be any place, in which he were not present, and coextended with it.

V. *God, before the Creation of the World, was not in any Space.* Whereas we know that *God* was, before there was any *Space*; for what *Place* did *God* fill before the *Creation* of the *World*? If *God* therefore did Exist before there was any *Space*, it is evident that being in a Space is not *Essential* or Proper to him.

VI. *God is said to be* every where, *because all Created things perpetually depend upon him.* Wherefore to leave this gross way of *Philosophizing*, we say, that *God* is precisely *Infinite*, forasmuch as all *Created things*, are every moment as it were anew *Created*, and cannot Exist without his continual Influx: For the perpetual dependence of the *Creatures*, doth clearly Evidence *Gods Omnipresence*; because those things which are in Nature, are not preserved by any Force or Virtue of their own, but only by the *Essence* of *God*, and by his Favour continue in their *Beings*. Neither is a less potent Cause required to the *Preserving* of things, than was to the *Creation* of them. For from this that a thing now *Exists*, it doth not follow, that

it

it ſhall *Exiſt* the next moment, ſince there is no neceſſary Connexion of the Parts of time, but one of them is alway diſtinct from the other; ſo that *God* muſt influence his *Creatures* in the ſame manner for their Conſervation: In which Conſervation, and preſence in every thing, the *Immenſity* of *God* doth conſiſt. Thus *God* is ſaid to be preſent to our *Minds*, becauſe he is with every one of our *Thoughts*, and concurs to every determination of our *Wills*. And he is ſaid to be preſent to our *Bodies*, becauſe he doth diſpoſe, move and make them reſt. Laſtly, he is preſent to all *other things*, becauſe he doth as it were continually produce them anew, cheriſhing and preſerving them by a way that ſurpaſſeth our Underſtanding.

VII. *God is not preſent every where by his Power, but by his Eſſence.*

Neither can I aſſent to thoſe who ſay, that *God* is preſent every where, not by his *Eſſence*, but by his Power only, by which they ſeem to divide his Power, from his *Eſſence* and other *Attributes*; whereas indeed all things that are in *God*, are one with his *Eſſence*; nor are his *Attributes* any thing elſe, but divers *Modes* of *Thinking*. For they muſt be fain to confeſs that this *Power* is ſomething that is *Created*, or ſomething that is only accidentary to the *Divine Eſſence*, without which he may be underſtood or conceived. Now it is the moſt abſurd thing to make it a *Creature*, ſince whatſoever is *Created* doth ſtand in need of the *Divine Power* for its *Exiſtence*; and ſince this *Divine Power* it ſelf is ſuppoſed to be a *Creature*, it will ſtand in need of ſome other Power to preſerve it, and by this means we ſhall make a Progreſs to *Infinity*. Or if they will rather make this *Power* to be accidental to *God*, and diſtinguiſht from his *Eſſence*, then they muſt be forced to admit, that *God* is not a moſt *Simple Subſtance*; becauſe, according to their ſaying, he would be compounded of his *Eſſence* and that *Power*. Wherefore we conclude, that *God* is preſent to all things by his *Eſſence*, and that he is in every *Place*, foraſmuch as he continually procreates and conſerves the things which he hath *Created*.

VIII. *The Immenſity of God is only an External Denomination.*

Hence we may perceive the falſe way of *Reaſoning* uſed by the *Peripateticks*, who to make out the *Doctrin* of *Gods Immenſity*, have invented immaginary *Spaces*; as if the Immenſity or Omnipreſence of *God* were any thing elſe, but an Extrinſecal Denomination, taken from his *Works*; foraſmuch as he *Works* in all *Created things*, and by Reaſon of that Operation is ſaid to be preſent with them. For *Immenſity* in *God*, ſeems to have ſome Affinity with *Creation*; and as *Creation* is Attributed to *God*, from the *Action* of *Creation*, ſince before the *Creation* he could not be called a *Creator*: So likewiſe *Immenſity* is Attributed to *God*, with reſpect to his *Creatures*, ſince he could not be preſent with them, before they were Created.

CHAP. X.

That God is the moſt Simple Being.

I. *What Compoſition is, as it is oppoſed to Simplicity.*

AS things are more clearly and diſtinctly perceived by comparing them by their contraries; ſo I ſuppoſe it will be of great uſe for the Explaining of the *Simplicity* of *God*, to unfold what *Compoſition* is, and to what diſtinction of parts it anſwers. Now *Compoſition* is the *Coalition* or *Union* of many things, which preſuppoſeth a diſtinction of *Parts*, ſince nothing can be united to it ſelf, but to another. And it is various according to the diverſity of the *Parts*, of which things are compounded.

II. *There is a three-fold Compoſition Real, Modal and that of Reaſon.*

For one *Compoſition* is *Real*, which conſiſts of *Parts* really diſtinct; as a Man is compounded of *Soul* and *Body*, becauſe we can clearly and diſtinctly perceive the *Mind* without the *Body*, and the *Body* without the *Mind*. Another is *Modal*, which conſiſts of a *Subject* and *Antecedent* or *Mode*; as a *Prudent Man* is compounded of a *Man* and *Prudence*; and is known by this Mark, that tho' a *Subſtance* may be clearly perceived without the *Mode*, by which it is diverſified; yet on the contrary, the *Mode* cannot be clearly underſtood without the *Subject*, whoſe *Mode* it is. The third ſort of *Compoſition* is called, a *Compoſition* of *Reaſon*, which conſiſts of the *Genus* and *Difference*, as when Man is ſaid to be compounded of an *Animal*, and *Rationality*. Which conſiſts in this that we cannot perceive a thing clearly, if its *Attribute* be excluded from it: As *Extended Matter* or a *Body*, is ſaid to differ only by Reaſon from *Extenſion*, becauſe we cannot conceive a *Bodily Subſtance*, if Extenſion in Length, Breath and Depth be ſeparated from it. And therefore, ſuch kind of *Attributes* as theſe are not called the *Modes* of *Things*, but only *Modes* of *Thinking*, foraſmuch as by the help of *Reaſon* only, they are diſtinguiſht from thoſe things, with reſpect to which they are ſo called.

III. *God does not conſiſt of Parts*

Theſe things preſuppoſed, it will not be difficult to ſhew that *God* is no *Compound*, that is, that he hath no Parts that are Really or Modally diſtinct from each other. For there is no more certain *Argument* of a real Diſtinction, than that the *Idea* of one thing is perceived, not to be the ſame with the *Idea* of another thing; or to ſpeak in *School Terms*, that the one can Exiſt without the other: But it is manifeſt, that no ſuch diſtinction is to be found in *God*, foraſmuch as all his *Attributes* are Eſſential, and not Separable from him, but by the Operation of our *Mind*.

IV. *Nothing in God is before other, and therefore no Compoſition*

Moreover the things that go to the making up of any Compound, muſt at leaſt by *Nature* be before the thing Compounded, or that is made up of them: Thus every *Cauſe* is ſaid to be before its *Effect*; *Subſtance* before *Accidents*; and *Subjects* before *Adjuncts*: And therefore thoſe *Subſtances*, by the Union of which *God* is ſuppoſed to Exiſt, muſt of neceſſity have been before him, ſince we underſtand them to be, before they conſtitute the *Divine Eſſence*. Thus *Matter* and *Form*, which are conſidered in *Natural Philoſophy*, as the two *Principles* of a *Natural Compound*, are apprehended to be, before they do conſtitute their *Compound*. And in like manner, if really diſtinct *Subſtances* were found in *God*, they would be intelligible to us, before that they were *Attributed* to him; yea tho' they ſhould never be *Attributed* to them.

V. *God is not Compounded either of Corporal or Spiritual Parts.*

And foraſmuch, as we aeknowledge only two general heads of things, *viz.* *Material* and *Spiritual*, we muſt of neceſſity ſuppoſe, that the things of which *God* ſhould be compoſed, muſt be Corporal or Intellectual. If the firſt, it will follow, that ſeeing a *Body* is the immediate Subject of *Local Motion*, *God* is Diviſible and Limited, yea, Subject to *Paſſion* and *Alteration*, all which include Imperfection, and conſequently are repugnant to the *Divine Nature*. If they be ſuppoſed to be *Spiritual*, ſince there is a real diſtinction be-

tween

tween them, and one of them according to the *Rules* of *Logick*, can Exist separate from the other, consequently there will be as many *Gods* as there are *Substances*, that are supposed to constitute *God*. For seeing they can Exist by themselves, and need no assistance from any other to their Conservation, they will also have power to confer upon themselves all the *Perfections*, which belong to *God* alone. Than which nothing more absurd can possibly be imagined by the *Mind* of *Man*.

VI. *There are no Modes in God, out of which he may be said to be compounded*

We say therefore, that there are no *Substantial Parts* in *God*, into which he can be divided, or from the Union and Coalition whereof he doth consist. Neither is there any *Composition* in *God*, out of a *Subject* and *Accidents* or *Modes*; because *Modes* arise only from the various *Change* of the *Substance*, which therefore cannot be supposed in *God*, because in him there is no Change or Variation. Wherefore it follows, that whatsoever is in *God*, is only distinguishable by our *Thoughts*, because every *Attribute* of *God* may be called his *Essence*, and have the name of supreme *Perfection*: And therefore are neither more nor less than the one *God*, in the Unity of Nature. So that we must conclude *God* to be the *most simple Being*, utterly devoid of all *Parts*, or *Divisibility*.

CHAP. XI.

God is true, and as he cannot be deceived, so neither can he deceive.

I. *If God was not true, we could not be assured of any thing.*

THo' *Human Cogitation* be commonly held to be the *Rule* of *Truth*, and whatsoever, we clearly and distinctly perceive, is supposed to be true; yet all this certainty would come to nothing, if *God* were not true, and most remote from the least suspicion of deceiving us: For how should we believe *Revelation*, if it were possible for *God* to deceive us? For he having bestowed upon us our Intellectual Faculties, it might be questioned, whether it was not his pleasure to make us such, as that in the use of them, we should be deceived, and against our will fall into Error.

II. Truth *is a necessary Ingredient of a Being absolutely Perfect.*

But this Doubt will be easily removed, and the *Divine Veracity* cannot but be manifest, by considering that all Perfections that can be conceived by us, do belong to *God*. For, forasmuch as he is the *Highest Being*, he must also of necessity, be the most Soveregin *Good* and *Truth*: Now it is as much a Contradiction, that any Falsity should proceed from the *Highest Truth*, as that any *Evil* should come from the *Highest Good:* Which yet would be, if in the use of our Faculty of knowing, that is, in assenting to things that are clearly and distinctly perceived by us, we should fall into Error. And indeed seeing that whatsoever is real in us does proceed from him, and that the Faculty we have for the knowing of *Truth*, and distinguishing it from *Falsehood*, is Real, we could not but take him for a Deceiver, in case our Faculty could not reach the *Object*, but should always take *Falsehood* for *Truth*. Than which nothing can be imagined more injurious to the most *Perfect Being* and the *Fountain* of all *Good*.

III. *That the Most Perfect Being*

Besides by the *Name* God, we understand the most *perfect* Substance; and Imposture or *Deceit* is a manifest *Imperfection*, because it has a *non-Entity* for its End, that is, something that is not true; for all Deceit includes Falsity, which being oppos'd to Truth, it must be carried to that which is no Truth, that is, a *non-Entity:* So that from hence it will follow that God cannot without a contradiction be said to deceive us. *should deceive us, implies a Contradiction.*

IV. Deceit *is an Argument of* Fear *or* Malice.

Lastly, Tho' perhaps amongst *Men*, it may be accounted a piece of Cunning to deceive others, yet *Falseness* or a *will* to deceive others, proceeds from *Fear* or *Malice*: And forasmuch as *Fear* supposeth Weakness, and *Malice* the want of Goodness, neither of these can be admitted in God; and consequently neither can a Will to deceive be ascribed to him; yea, he must be supposed to be the *Highest Truth*, and not thought a Deceiver upon any account whatsoever.

V. *An Objection from the Concourse of* God.

You will object that he who concurs to those *Actions* of the *Will*, or those *Judgments* by which a *Man* is deceived, he is to be looked upon as the Cause of that *Man's* Error: But God so concurs to those *Judgments* of *Men*, by which they are deceived; therefore God is the cause of *Men's Errors*.

VI. God *doth not concur to the Formality of* Error.

This Objection is easily answer'd by distinguishing between the *Material* and *Formal*, or between an *Act* and its *Privation*. For all *Acts* are true and Good, forasmuch as they depend on *God*; and as it is a greater Perfection in *Man*, that he can exert them, than if he could not. But *Privation*, wherein alone the Formal Reason of *Falsity* doth consist, doth not stand in need of any *Divine Concourse*, because it is No thing, and with Relation to *God*, is not to be call'd a *Privation*, but only a *Negation*.

VII. *Whether* God *may be said to deceive the* Devils *and* Damned Souls *in* Hell.

I know that some *Divines* seem of a different Opinion, who think that *God* can deceive *Men*, by inspiring them with *Idea's* that deceive them; and that he does this of his free Will, as being the Supream Lord of all, and therefore may deal with his *Creatures*, as he listeth. So as that they are clearly persuaded that they feel something, which indeed they do not, according as it happens to the *Devils* and *Damned Souls*, who think they are tormented with *Fire* in *Hell*, when indeed there is no *Fire* there at all; or if there be any, it is Material, and so cannot affect *Pure Minds*.

VIII. *The foregoing Doubt answer'd.*

I Answer, That GOD does not deceive, or by false Apparitions delude the *Devils* or *Damned Souls*; because the *Fire* wherewith they are tormented, is not only an *Idea* of *Fire* impress'd on them by *God*, but the true substance of *Fire* wherewith they are tormented, and sensibly affected. For why may we not suppose, that *God* can joyn the *Soul* of *Man* with some *Body*, and so unite his *Thoughts* to the Motions of that *Body*, that according to the greater or lesser force of the one, a greater or lesser sense of *Pain* may be excited in the other? For as we see that the *Soul* of *Man* is kept link'd to the *Body*, so it may as well, by the *Divine Power*, be detained and suffer by *Corporeal Fire* (as we suppose that in *Hell* to be) seeing that this is consonant with the *Scripture*, and establisheth the *Truth* of GOD.

IX. *In what sense God is said to* Blind the Minds of Men.

If any one urge further, That GOD doth sometimes harden the *Hearts* of *Sinners*, and so blind their *Minds*, that they contemn his *Commands*, and run headlong into the greatest *Sins*, as appears by PHARAOH, whose *Mind* the LORD did so incline to *Evil*, that it was not in his

his Power to obey his *Precepts*. Besides, we read in *Scripture*, That GOD put the *Prophets* upon foretelling Things that did not come to pass; as appears from the History of *Jonah* the *Prophet*, who declar'd from *God* to the *Ninevites*, that their *City* should be *destroyed within forty days*, which never came to pass.

II. X. *Answer.* I Answer, That tho' *Pharaoh*, by the Perverseness of his Will did refuse to obey *God*, and to dismiss the *Children* of *Israel*, notwithstanding the frequent Warnings he had had from above; yet is not this so to be understood, as if *God* by any positive Influx had hardened his *Heart*, and forced him to despise his Commands; but only that he withheld *Efficacious Grace* from him, and left him to his own wicked Will. And as for *Jonah*, who foretold the ruin of the City *Nineveh*, that is not to be called a Lye, but rather a Threatning or Denunciation, the Execution whereof depended on their Obstinacy or Conversion, as appear'd by the Event: For the *Ninevites Repenting* in *Sackcloth* and *Ashes*, and earnestly deprecating the *Divine Displeasure*, did escape the *Prophet*'s Commination.

XI. God *may sometimes deceive us for our Good.* Tho' it be a most undoubted *Truth*, that it is repugnant to the *Divine Perfections* to deceive any one; yet this does not hinder, but he may make use sometimes of a Prudent Deception towards us for our profit, in like manner as *Physicians* and *Parents* sometimes deceive their *Patients* and *Children* for their good and advantage. Neither can *God* properly be said to deceive us, when things appear to us otherwise than they are; because *God* is not the cause of that Deception, but we our selves, who judge of *Bodily things* according to their *External appearance* before that we have sufficiently examin'd them; forasmuch as in these and the like Appearances we should suspend our *Judgment*, before we do determine any thing concerning their *Truth*.

XII. *We cannot be said to be deceiv'd, when we imagine the* Sun *to move, and the* Earth *to stand still.* Thus GOD cannot be said to deceive us, when by the *Earths* whirling about its *Axis*, the *Sun* seems to us to rise and set; but we rather deceive our selves, when we attribute *Motion* to the *Sun*, and *Rest* to the *Earth*, before we have fully discuss'd the Point: When indeed we ought to suspend our *Judgment* until having weighed the Reasons on both sides, we did clearly and distinctly perceive, to which of these *Bodies* the motion we perceive were to be ascribed. Neither are the *Common People* look'd upon to be absolutely in an Error, when they suppose the *Sun* to move every day about the *Earth*, tho' it be not true, because herein they follow what seems probable, which is sufficient to free them from the imputation of being deceived.

XIII. *From God's Veracity we may conclude, that whatsoever is clearly perceived by us, is true.* Hence it follows, that whatsoever is clearly and distinctly known by us, is true: For since the Light of *Nature*, or our Faculty of *Knowing*, hath been given us by *God*, it can reach no *Object* which is not true, so far as it is reached by it; that is, forasmuch as it is clearly and distinctly perceived. For *God* might with reason be look'd upon as a Deceiver, in case he had given us a Faculty that embraced *Error* instead of *Truth*: Wherefore forasmuch as *Mathematical Truths* are most clear and evident, so as to thrust themselves upon our *Understandings*, we ought not in the least to suspect them, but receive them as undoubted *Truths*.

CHAP. XII.

That GOD *is most highly Intelligent, or Omniscient.*

I. Omniscience *is included in the Conception of a most Perfect Being.* IT will not be any hard matter to make out, that GOD is *Omniscient* or *All-knowing*, and that at one view he comprehends all things, if we remember him to be the *Most perfect Being*, in whom no defect or limitation can be conceived, which would not be if his *Knowledge* were finite, and that any thing could escape his *Understanding*. Therefore the *Ancients* called GOD, the *Mind*, or *Soul of the World*; not only for that he was diffused throughout the Universe, and did animate all Things; but also because he knows them all, and pierceth their most Secret parts. For *Ignorance* is a mark of Weakness of *Soul*, and that *Being* cannot but be Imperfect, whose *Understanding* is bounded by any Bound or Limit, beyond which it cannot reach.

II. *This Point further made out by Reason.* But because *Discourse* and *Reason* serve to illustrate the *Truth* of Things, I shall make use of this Argument: Either GOD understands *all things*, or *some things* only, or *nothing at all*. If he only understand *some things*, then his *Understanding* is supposed imperfect, which no body will say of *God*, that is persuaded of his absolute *Perfection*. But if he knows *nothing*, then certainly he cannot be supposed to be *God*. Wherefore it follows, that as *God* contains all *Perfections*, so he is endowed with *knowledge* in the highest and most transcendent degree.

III. *How the* Divine Knowledge *is distinguish'd from the* Knowledge *of Men.* I say, in the most transcendent degree, because *Human Cogitation* is very different from the *Divine*. For the *Idea's* of *Men* are bounded by the *Objects* that are without them, and according to the diversity of things which it contemplates, are said to be either *clear* or *obscure*. For it does not depend of us, that our *Idea's* do represent this or the other thing to us, they being only *Modes* of *Cogitation*, and as such are all of them equal, all their difference proceeding from the *Objects* they represent; so that some hold forth to us an *Extended Substance*, others a *Mind*; some *Simple things*, others *Compound*; all which variety the *Idea's* borrow from the Things themselves. For it cannot be question'd, but that those *Idea's* which represent some *particular Substance* to us, contain more *objective Reality*, than those which only exhibit *Modes* to us, which are only the determinations or limitations of *Substance*. But the *Divine Knowledge* doth not thus depend on the *Creatures*, neither are his *Conceptions* bounded by any things without him; but all *Created Beings* derive their *Essence* from his *Understanding*, and according as they are determin'd by the same, do obtain divers degrees of *Entity*. For the *Divine Intellect*, whereby *God* knows the *Creatures*, is the same thing with his *Will* and *Power* that does determine them, and are only distinguish'd by us, according to our various ways of considering them.

IV. *There is no Object of* God's *Knowledge, that is without himself.* Wherefore we are not to suppose any Object of the *Divine Science* to be without himself, who is alone the Object of his own *Knowledge*; or to speak more properly, He is himself his own *Knowledge*. For should we suppose, that *Created Beings* were before the *Divine Intellect*, and that as Objects they did terminate his *Idea's*, they must be supposed to have a *Nature* and *Essence* independent

on *God*, as being at least by *Nature* before him. Which to assert would be as foolish, as to say that a *Pourtraiture* drawn by a Skilful *Limner*, is the *Object* of that Art: For a *Limner* stands in need of *Pencils* and *Colours*, to perform his *Work*; whereas GOD did not stand in need of any thing for the *Creation* of the *World*, but all *Created things* did proceed from his *Understanding* and *Free Will*; not only as to their *Existence*, but as to their *Essence* also.

V. *Indifferency in God is the Highest Perfection.*

Whence it appears, that *Indifferency* which is an Imperfection in Man, and is held to be the lowest degree of his *Liberty*, is the *Highest Perfection* in *God*, as being a sign of his *Sovereign Empire* and *Power*, who is unbounded by any *Laws* or *Rules*, and the sole *Author* of all *Order*, *Truth*, *Justice* and *Goodness*. For it implies a Contradiction, to suppose that the *Divine Will* was not indifferent to all things, that have been or shall be made. Because no *Goodness* or *Truth* can be imagined, the *Idea* whereof was in the *Divine Intellect*, before that his Will had determined to make it so.

VI. *How God knows Sins, and those things which are called* Entia Rationis. *Entities of Reason.*

Some Question whether the *Divine Knowledge* doth extend it self to all things, and whether *God* besides Positive things, that is, real *Substances*, doth also know things Privative and Fictitious, such as are *Sins*, *entities of Reason*, &c.

VII. *Answer.*

For Answer I say, that *God* knoweth all things whereof he is the *Efficient Cause*, because as was said in the Chapter of *Gods* Immensity, all things are continually procreated by him, as not being able to continue one Moment without his Concourse: But *Sins* being no real things, and depending on the *Will* of *Man*, are not known by him without the *Minds* of *Men*. And as for *Entities* of *Reason*, forasmuch as they are nothing else but *Modes of Thinking*, which are used for the easier Explication of the *things* we know, or the better retaining of them; these are no otherwise understood by *God*, than as he is the Procreator and Conservator of our *Minds*. For if we enquired what is meant by an *Entity of Reason*, we shall find it to be a *meer Nothing*, without the Understanding. But if we have regard to the *Modes* themselves of *Thinking*, they may be said to be *real Entities*. Thus, when I enquire what is *Genus*, I demand nothing else but the Nature of that *Mode* of *Thinking*, which is truly considered as a *Being*, and differs from a *Species*, which is another *Mode* of *Cogitation*.

VIII. *God understands Entities of Reason only forasmuch as they are conceived by us.*

Now *God* doth not contain any of these *Entities* of *Reason* or *Notions*, as if he stood in need of these *Modes* of *Cogitation*, to retain the things that he understands; but only inasmuch as the *Mind* of *Man*, whose *Modes* they are, is perceived by us to be preserved and maintained in its *Being* by *God*. We conclude therefore that *God* is *All knowing*, and that he contemplates all things by one only most Simple *Idea*; for to speak properly, *God* for no other Reason is called *Omniscient*, but because he has his own *Idea*, which being nothing else but his *Essence*, is therefore inseparable from him, and consequently extends it self to all positive or real Objects.

CHAP. XIII.

That God is Good, and doth Good.

I. *In what Sense God is said to be Good.*

SEeing that no *Creature exists* by its own *Power*, and that all thing derive their *Essence* from *God*, we must conclude that *God* is *Good* and *Beneficent*. For as by his comprehending all things he is *All-knowing*, and by his Power to do all things, *Omnipotent*: So because he hath *Created* all things, he is said to be *Good*, and because he preserves the same, *Beneficent*.

II. *Good and Evil are Respective Terms.*

This will more clearly appear, if we consider what *Good* and *Evil* is, and wherein precisely the *Nature* of both doth consist. A thing considered by it self apart, cannot be said to be *Good* or *Evil*, but is denominated such with respect to an other thing, to which it is profitable or hurtful. And accordingly, the same thing may at the same time, be said to be both *Good* and *Evil*. So the *Punishment* inflicted on a Criminal is *Good*, forasmuch as it conduceth to the Safety of the *Commonwealth*, and to deter others from committing the like *Crimes*: And yet it is *Evil* to the *Criminal*, because by the same he suffers Death, which deprives him of *Life*, being the dearest thing he enjoys. So likewise the *Sea* is of great use for the carrying of *Ships*, and in that regard is a *Good* to the *Merchants*; but *Evil* when raging by a Storm it Swallows and *Shipwracks* their *Vessels*. Yea, there be many Good things, which are not such to all: Thus, to be in *Heaven* and to enjoy the company of the *Blessed*, is a Good, yea the greatest Happiness to Man, but yet to *Brutes* and *Plants* it is neither *Good* nor *Evil*, as having no Relation to them.

III. *God is said to be Good, as being beneficial to all.*

GOD therefore is said to be supremely *Good*, because he does *Good* to all, and is the Conservator of all things, for all things are preserved by his *Omnipotence*. Moreover, forasmuch as there is no Connexion between the parts of *Durations*; and it doth not follow, that because the *Creatures* exist to day, they will continue to morrow: We may say that *Gods* Conservation of his *Creatures*, is a continual production of them. Neither doth it oppose this *Truth*, that the Will of Man is free, and is oft determined by things without it: Because even those very Actions are determined by *God*, and are not exerted but by his Good-will, as will be said more at large in the following Chapter. For it implies a contradiction, that any thing should determine the *Will*, and that the *Will* it self should not be determined by *God*, to whom all created things are Subject.

IV. *The Love of God to Mankind is from Eternity.*

Gods Beneficence doth not only appear in the *Creation* of the *World*, and the preserving of all *Creatures*; but he hath also from *Eternity* testified his *Love* unto us, by electing us from before the Foundation of *World*, and by loving us with an *everlasting Love*. For as *Heat* cannot but warm, and *Light* illuminate, so the highest *Love* cannot but in he highest degree love it self, and all things proceeding from him. And this *Eternal Love* of *God* is manifested by a two-fold effect, *viz.* the *Mortal Life* we *Live* here, and the *Immortal Life* we hope for, hereafter. With reference to the present *Life*, he hath adorned the *Heaven* with *Stars*, that they might assist inferior things with their *Light*, and promote the innumerable Generations of *Natural things*; he hath distinguisht the *Elements* in their proper Place, endowed them with *Qualities*, and made them by their inborn *Virtues*, to concur to the Mixtion and Production of all things; he hath appointed the *Fire* for Action, the *Air* for Respiration, the *Water* and *Earth* for Fruitfulness, and the Production of so many *kinds* of *things* for necessity and delight, but the chiefest Pledge of *Gods*

Love

Love towards us; is, that he hath predeſtinated us to the Adoption of *Children* in *Chriſt Jeſus*, ſo as that we have *Redemption* by his *Blood*, and the *Forgiveneſs* of *Sins*, according to the *Riches* of his *Grace*. *For* Grace *hath preceded* Merit; *neither doth* Grace *come from* Merit, *but* Merit *from* Grace. *He gave for Nothing, or out of meer* Grace, *who found Nothing why he ſhould Save, and Much why he ſhould Damn: He prevented us by the Bleſſings of his* Sweetneſs; *for that* Grace *taſtes ſweeter, which helps even thoſe that have ill-deſerved, and entertains Thoughts of* Peace *towards us, whilſt we do the VVorks of* Death. S. *Auſtin*, Serm. 15. de verb. *Apoſt.*

VI. *God is ſaid to be* Good *and* Infinite, *reſpectively onely.*

But you will ſay, What ſhall not GOD be good then, except he do Good to *Mankind*, and preſerve the *Univerſe*? What can be imagin'd more abſur'd, than not to acknowledge *GOD Good*, as well as *Immenſe*, *VViſe*, and *Powerful*?

Notwithſtanding this Objection, we muſt aſſert, That the *Attribute* of *Goodneſs* did not belong to *God* before the *Creation* of the *VVorld*; becauſe a Thing conſidered in it ſelf, and without reſpect to others, cannot be ſaid to be either *Good* or *Evil*: Neither needs this ſeem ſtrange or abſurd to any one, foraſmuch as the *Goodneſs* we ſpeak of here, denotes a Reſpect between *God* and his *Creatures*, as his *Immenſity* does, which conſiſts, as we have ſeen, in that Operation whereby he continues them in *Being*. So that as ſuppoſing they were not, tho' he would be preſent to Himſelf; yet *Ubiquity*, or *Omnipreſence* could not be attributable to him; ſo before the *Creation* of the *VVorld*, tho' GOD be *Good* by his own *Eſſence*, yet becauſe there was nothing on which he could exerciſe his *Beneficence*, he was only *Potentially Good*, *Merciful*, a *Judge*, a *Creator*, *&c.*

VII. *How it coms to paſs that God being Good, permits* Sin.

But ſome will ſay, If GOD be *Good*, why doth he permit the Corruption of *Nature*, and the *Sins* of *Men* to offend his *Divine Majeſty*?

VIII. *The Firſt Anſwer.*

To which I Anſwer, Firſt, That it is not repugnant to the *Divine Goodneſs* that there are *Sins*, and that *Men* ſwerve from their *Duty*; yea, it ſeems more to comport with his *Omnipotent Goodneſs* to bring *Good* out of *Evil*, than not to ſuffer *Evil*. But yet it is not our buſineſs to enquire overcurioufly, why *God* permits *Sin*, leſt we ſhould ſeem to endeavour with the ſcanty Line of our *Reaſon*, to fathom the depth of the *Divine Wiſdom*.

IX. *The Second Anſwer.*

In the Second place I Anſwer, That it is not contrary to the *Divine Goodneſs*, that he hath not made his *Creatures* ſo perfect, as to place them out of the reach of *Error*, or danger of *Falling*; and that he hath pitch'd upon ſuch an Order, in which *Sins* take place; foraſmuch as *Man Sins* without any force put upon him; neither can the Guilt of it be imputed to *God*: For *God* did not from Eternity decree *Sin*, neither did he decree, that *Sin* ſhould be poſſible; for ſeeing *Sin* is no poſitive thing, but a deficiency of *Reality*, it cannot be of *God*, but he only hath eſtabliſhed that Order, in which he ſees the poſſibility of *Sin* before his *Decree* and *Will* concerning it. And therefore upon this *Hypotheſis* only it follows, that having eſtabliſh'd ſuch an *Order*, and making poſitive Things poſſible, he can be ſaid the *Author* of *Sin*; foraſmuch as by the ſaid Order, *Sin* is made Poſſible, which in this ſenſe is not repugnant to the *Goodneſs* and *Holineſs* of GOD.

CHAP. XIV.

Of the Omnipotence of GOD.

I. *It is an inborn Notion with all Men, that God is* Omnipotent.

NO *Man* that ever own'd a *GOD*, deny'd him to be *Omnipotent*: This is a Notion all *Men* brought into the *VVorld* with them, who therefore when they are in any affliction or danger, lift up their *Hands* to *Heaven*, and ſend up their *Prayers* to him for the thing they wiſh for, and thereby tacitly acknowledge his *Omnipotence*. Yet there are ſome *Philoſophers* who ſeem to deſtroy this *Notion*, who aſſert the *Eſſences* of Things to be *Eternal*, as if without the *Power* of *God* they had ſome *Nature* of their own, to which *God* at a certain time did vouchſafe *Exiſtence*, and made them to be *Actual Beings*. And therefore they ſay, that *Poſſible things* only, that is, ſuch as are ſo in their own Nature, can be produc'd by *God*, and that his *Power* doth not extend it ſelf any further.

II. *What a* Poſſible, Neceſſary *and* Contingent Being *is.*

But becauſe this *Doctrin* ſeems to derogate from *God's Omnipotence*, we will endeavour to ſhew the Falſity of it, by declaring what the true Nature of a *Poſſible*, *Neceſſary*, and *Contingent Being* is, and whence they take theſe Affections. A *Neceſſary Being* is ſaid to be ſuch with a twofold reſpect, either with reſpect to its *Eſſence*, or to the *Effective Principle* whence it proceeds. After the firſt manner, we know that *God* only doth neceſſarily *Exiſt*; and therefore he is ſaid *to Exiſt ſo, as that he cannot but exiſt*; becauſe *Exiſtence* is involved in his Conception, ſo that his *Eſſence* cannot be underſtood without it. But after the Second manner, that is, with reſpect to the *Effective Principle*, *Corporeal things* are ſaid to be Neceſſary, foraſmuch as they can be produced by *God*; but not with reſpect to their own *Eſſence*, becauſe we can clearly and diſtinctly underſtand the ſame without *Exiſtence*, and therefore they can never exiſt by virtue of their *Eſſence*. That is call'd a *Poſſible Being*, whoſe *Efficient Cauſe* is known to us; but yet we do not know, whether he be determined to produce it or no; and therefore is commonly deſcribed, *That which hath not been, but might have been*; and in this ſenſe all things beſides *God* are ſaid to be *Poſſible*. But if we conſider only their *Nature*, and not their *Productive Cauſe*, we ſhall call all things *Contingent*; becauſe with reſpect to their *Natures*, no neceſſity of *Exiſting* is found in them, as in *God*: Neither is there in them any *Repugnancy* or *Impoſſibility*, but that they may be; and therefore in caſe they do exiſt, *they exiſt ſo, as that they may not exiſt*.

III. *All things preſent, and things to come, depend on* God.

We will now ſhew, That all things that are now, or are to come, have their Dependence on *God*; and that there is nothing in Nature, that doth not proceed from his *Decree*. For ſeeing no *Creature* exiſts *by the neceſſity of its Eſſence*, it follows, that they muſt all borrow their *Being* from the *Divine Decree*. For it is evident by the *Light of Reaſon*, that it is impoſſible a thing ſhould *exiſt*, which hath no *Internal* or *External Cauſe* of its Exiſtence: Now no *Creatures* can exiſt by the Power of their own *Nature*, and therefore we muſt have recourſe to one only *External Cauſe*, *viz.* the *Divine Decree*, for their Exiſtence; in which *Divine Decree*, if their *Exiſtence* be not found, they are to be look'd upon as Impoſſible, foraſmuch as they cannot be produc'd by any *Cauſe*. From whence

whence it evidently follows, not only that the *Existence* of all *Creatures* doth depend of *God*, but also their *Nature* and *Essence*: for seeing there is no perfection which is not in *God*, there can be no *Essence* in the *Creatures*, which should be the cause of *Gods knowledge*. Wherefore we must conclude that all *Creatures* before *Gods* Decree were nothing, and consequently that of themselves they have no necessity to *exist*.

IV. *God is the Efficient Cause not only of substances, but also of their Modes.*

When I say that all things have their Being from the *Divine Good Pleasure*, this to be understood not only of *Material Substance*, but also of *Thinking* or *Spiritual*; because not only the *properties* and *Modes* of *Bodies* derive their reality from the *Will of God*; but also the *Modes* of *Minds*. For it is a meer prejudice of our Youth to imagine that the *Modes* of *Cogitation*, *Knowledge*, *Judgment*, *Affections*, and other inward *Acts* of our *Mind* do less depend on the Divine Power, than the *Modes* of *Material* and *Bodily things*. Because whatsoever is not God, is of it self altogether nothing; neither can it exist but by his *will*; for since nothing can be the cause of its own *Existence*, save *God* alone, it follows that whatsoever exists, must derive all its reality from *God as its first Principle*.

V. *In what sense the Natures of things may be said to be immutable.*

If it be objected that the *Essences* of things are commonly said to be Immutable and Eternal. I answer, that the *Essences* of things are only said to be immutable, forasmuch as they are expresst by *Definition*, and are consider'd Universally, as is commonly done in *Sciences*, whose certainty requires firm and stable Definitions. So the Definition of a *Mind* that it is a *Thinking substance*, is always the same, neither is lyable to any change, tho perhaps there may be a further degree of perfection in the *Mind* of one *Man*, than of another. And whereas they are said to be *Eternal*, or that their *Essence* was known from Eternity in the *Divine Intellect*, this does not argue any Eternity in them, but in God; since to be known in the *Mind* of *God*, with respect to the *Creatures*, is only an *Extrinsecal Denomination*, or an *Entity of Reason*, which superadds no reality to things.

VI. *No things are Contingent with respect to God.*

As for Possible and Contingent Things, there are none such with respect to *God*; Because there are none that of themselves can *Exist*, and not *Exist*, or that have real Contingency. For surely there is no less Power to the *creating* of a *thing*, than to the Conserving of it; and since no *created thing* acts any thing by its own *Power*, so neither can it give it self *Existence* by the same. It remains therefore that all things must have their Dependence on *God*, and that the things that are, be produced by vertue only of the *Divine Decree*. And forasmuch as there is no Change or Inconstancy in God, we must conclude that the things which he *creates*, have from *Eternity* been decreed to be *created* by him; so that all *Creatures* from Eternity had a kind of necessity of *Existence*; And therefore that no Things are *Possible*, *Necessary*, or *Contingent* of their own *Nature*, but by the *Divine Decree*, which is the only Cause of all things.

VII. *Nothing can be supposed antecedent to Gods Decree.*

Neither doth it contradict what we have said, that *God* might have decreed otherwise concerning his *Creatures*, and that upon that score they may be said to be *contingent*; For since in *Eternity* there is no Before or After, first or last, it is a Vanity to search after those Moments in which *God* existed before those *Decrees*, and in which it is supposed that he might have determin'd otherwise. Wherefore since *God* without any necessity resolved to make *Creatures*, they are all of them said to exist Contingently, because they include no Necessity of *Existing*; tho with respect to the *will* of *God* they *exist Necessarily*: Forasmuch as no greater necessity can be conceived in Things than that whereby an Effect follows from an Efficacious *Principle* and a Determinate *Efficient Cause*.

VIII. *How the Will of Man is said to depend on God.*

There is one difficulty more remains to be discust, and that is since all *Creatures* are predetermined by *God*, and that there is a kind of necessity of *Existence* in them from Eternity, how the Will of *Man* can be said to depend of *God*, seeing that it is *free*, and indetermin'd. But notwithstanding this, we must say that the Will also is conserved by the *Divine Concourse*, so that it is not in the *Power* of *Man* to *Will* or *Act* any thing, which is not preordained by *God*. But how these two things may be reconciled, that *God* hath *decreed* all the *Acts* of our Will from Eternity, and yet our Will remains undertermin'd, is I confess more than I do clearly perceive. I do acknowledg my *Mind* to be but of a *finite* capacity; and the *Power* of *God*, whereby he hath not only foreknown all present and future things from *Eternity*, but hath also decreed and determin'd them, to be *infinite* and unbounded: Yet cannot this consideration make us doubtful of the *Freedom* of our Will, since in all our *actions* we experience our selves to be free, and that it is in our Power to give or withhold our Assent; which is so manifest that we have good reason to rank it amongst first and common *Notions*.

IX. *It is a difficult thing to reconcile the Divine Decree with the Liberty of Mans Will.*

Hence is it that the Famous *Philosopher* in the Ninth *Epistle* of his I. *Volume*, saith. *As to Free will, if we only consider our selves, I must confess we cannot but think it to be Independent: But when we cast an Eye on the Infinite Power of God, we cannot but believe that all things must depend on him, and therefore that our free will is not exempt from his Command. For it implies a contradiction that God should have created Men of such a nature, that the Actions of their will should not depend on his will: Because that is the same as if one should say that his Power is both Finite and Infinite: Finite since there is something that doth not depend on it; and Infinite, in that he was able to create this thing Independent. But as the knowledg of the Divine Existence, must not take away the certainty of our free will: So neither must the knowledg of our free will, make us to doubt of the Divine Existence. For the Independency we experience and find in our selves, and which makes our actions blame or praise worthy, is not opposite to a dependence of another kind, whereby all things are subject to God.*

X. *God is no less a cause of the Creature when it is made than when it is a making.*

Gods Omnipotence does not only appear in the Production of *things*, but also in their conservation: for *God* is not only the *Principle* of *created Beings* when they are making, but also when they are made. Hence it is that he preserves them by a continual Influence; and should he cease from his Concourse, whatsoever he hath produc'd would fall to nothing; Because before they were *created* and he afforded them his Concourse, they were nothing. Neither doth it contradict this, that all things that are produced by *God are substances*, to whom

whom it does agree to subsist; for they are not call'd *Substances* as if they could subsist without the *Divine Concourse*, but because they are such things, as do not need the assistance of any *creature* towards their being. In which Preservation of the *creatures*, the infinite *Divine Power* is evidently exemplified, in that he hath produc'd all things so, as that they cannot subsist one moment without him, like as the Image of the *Sun* reflected in the *Water*, or in a *Looking-glass*, doth depend on the *Sun*, not only as to its being, but as to its Preservation or continuance.

CHAP. XV.

That God is the Creator of all things.

I. *Some Attributes agree to God from Eternity, others in Time.*

THO all the *Divine Attributes* be Eternal, and undistinguisht from his *Essence*, yet do not all of them in a like manner agree to him. For some of them constitute his *Nature*, and can only by the operation of our *Minds* be separated from it, such as are his *Eternity*, *Omniscience*, &c. Others again presuppose *creatures*, and are only attributable to him since the beginning of the *World*, as to be a *Judge*, a *Creator*, &c. Which from *Eternity* did only Potentially belong to him. But because the *Power* to *create* the *World* was in *God* from *Eternity*, and that it appertains to his Nature to be *Omnipotent*, it is as easy to prove *God* to be the *Creator* of all things, as it is to evince him to be *Immutable*.

II. *Whatsoever hath a Being, hath it either from it self, or from another.*

For whatsoever is besides God, either hath the Principle of its *Existence* from it self, or from another: For natural light evinceth that things can not be made of nothing. If any thing was of it self, it would want nothing; Yea, it would give it self all those Perfections it hath any *Idea* of; but nothing hath the Power of bestowing those perfections on it self, for otherwise it would actually be possest of them; for the *Will* is infallibly carried to the Good it knows; and consequently it hath not the *Power* of giving it self a *Being*. If it hath its *Being* from another, we may then demand whence that other hath his *Being*, whether from it self or from another, till we come to the last *Cause*, who is the *Author* of all things that *Exist*.

III. *Forasmuch as the Parts of Time have no necessary connexion, it follows that Creatures are not preserved by themselves.*

Besides, the Parts of *time* have no necessary defendence on each other; neither doth is follow that because a *thing* is now, it will be the next Moment: Therefore to the end it may continue to *exist*, there must be some *Power*, which may each Moment reproduce it: But no such *Power* is in the *Creature*, and therefore there must be some *Being*, whose *Nature* includes *Existence*, and which is the *Cause* why the thing that hath existed hitherto, doth continue so to do. For tho' a thing have begun to *Exist*, yet doth not its Essence any more involve necessary *Existence*, than it did before its *Existence*; and therefore it stands in need of the same Virtue to continue to *exist*, as it had to begin to *exist*.

IV. *The Essences of things are clearly known by abstracting them from Existence.*

Moreover we clearly understand, that the *Soul* of *Man* is *a Thinking Substance*; that a *Body* consists of three Dimensions, and that *Man* is a compound of *Mind* and *Body*, without any *Existence*: Wherefore we ought not to ascribe to *Man* any *Power* whereby he can *exist*, and therefore he must be *created* by *God*, before he can *exist*. For every Effect we know is contained in its Cause, either *formally* or *eminently*, and seeing neither the *Soul* nor the *Body*, nor *Man* that consists of both, can be the *Causes* of themselves, they cannot be contain'd in themselves as in their *Cause*; and therefore we must look out for a higher *Cause* that may eminently contain whatsoever is formally found in the *Creatures*; and that is that which we call *God*.

V. *Abstractions do more clearly explain the nature of a thing.*

And forasmuch as the *Form*, according to *ARISTOTLE* gives *Being to a thing*, and *Concretes* are more perspicuously understood by their *Abstracts*; for a Confirmation of what we have said, it will be worth our enquiry what *Creation* is, and whether the name of *Creator* could be attributable to *God* from Eternity.

VI. *What Creation is.*

As to the first, the received Definition of Creation is, that it is *the Production of a thing out of Nothing*; Which may be admitted without Hesitation, if by *Nothing* we understand a Negation of all Reality, and not any thing Imaginary, which some do suppose to be that out of which all things are produc'd. For some do conceive this *Nothing* to be, as it were, a *matter* shut up in an Imaginary space, from whence all things do proceed. Wherefore, lest I should seem to favour their Error, I will take away all Ambiguity and define it thus, *viz. That it is an operation, whereby things are produc'd by an efficient Cause, no other Cause concurring with it.* So that a thing is said to be *created*, which besides *God* needs no other Cause towards its *Existence*. Where it appears that neither *Modes* nor *Accidents* are *created*, since they depend on the *Substance*, in which they are, and without which they cannot be conceived: As we have shewed in our *Logick*, in the *Chapter* of *substance*.

VII. *What we are to understand by the Name Creature.*

A *thing Created* is that whose nature or *Essence* can clearly be understood without *Existence*. As *the Soul of Man*, of which we have a clear and distinct Notion, for as much as it is *a Thinking Substance*, abstracted from its *Existence*. And solikewise we have a distinct conception of a *Corporeal Substance*, as including *three Dimensions*, without considering its *Existence*: And therefore these must be *Created* by *God* before they can *exist*, and when they do so, must be preserved by his continual Influx.

VIII. *Before the Creation of the World there was no Time.*

It remains now to enquire whether *God*, could be call'd a *Creator* from Eternity, or whether the things created by him could have their *Original* before all Time. Before we can resolve this clearly, we are to take notice that before the Creation of the World, no *Time* can be understood by us, seeing that *Time* is nothing else but the measure of *Duration*; or to speak more clearly, is nothing else but a meer Mode of *Thinking*. For as the *Modes* of *Material things* serve for the easier explication of their *Natures*, so we make use of *Time* to express *Duration*, so that it is necessary that before *Time* could be, there must have been, not only *Creatures*, but *Men* also, that might compare the *Duration* of things *Existing*, with the *Duration* of other things, that had a determinate *Motion*. Now *Duration*, seeing it is not distinct from the *Existence* of things, save only by Reason, begins as soon as they began to *exist*, and ceaseth when they cease to be; because it supposeth them to be *Created*. Wherefore they who imagine *Duration* or *Time* before the first Production of *things*, are as deeply prejudic'd as those are who fancy an Exten-

ſion of *Space*, without any Bodily Extenſion. To enquire therefore, whether a *Created thing* could be from Eternity, is as much as to demand whether there can be a *Duration* without any *Beginning*, and which cannot be expreſſed by any Number whatſoever.

IX. *God cannot produce Eternal Duration.* That ſuch a *Duration* as this cannot be created by *God*, appears from hence, that no *Duration* can be mentioned, but that *God* is ſtill able to produce a greater. For ſuch is the *Nature* of *Duration*, that aſſign what *Duration* you pleaſe, a greater or leſſer can ſtill be conceived, ſeeing that it is, as it were compoſed of Parts, and always may be conceived as Diviſible into them: For as there are no parts in a *Body*, altogether Indiviſible; ſo neither are there any *Moments* in *Duration*, but may ſtill be divided into leſſer parts to Infinity.

X. *No Duration can be underſtood to be in God.* Neither can we ſay, that becauſe *God* hath been from *Eternity*, and is ſtill, therefore we ought to attribute to him the greateſt *Duration* that can poſſibly be conceived; for it is evident from what hath been already ſaid, that no *Duration* conſiſting of Parts can be aſcribed to *God*, but *Eternity* only, which is not an affection of *Exiſtence*, but of *Eſſence*: And therefore that we cannot conceive any *Duration* in *God*, except we have a mind to deſtroy the *Idea* we have of him; foraſmuch as it is eſſential to the notion of *Duration* that none can be conceived ſo great, but ſtill greater may, which in no wiſe can be attributed to *God*, who is Infinite, and admits no Diviſion of Parts.

XI. *Whether God could have Created the World from Eternity.* You will ſay that *God* is as Powerful, whilſt he acts freely, as if he did act neceſſarily, ſince liberty or neceſſity of acting, doth not alter the property of Power. But if *God* acts by neceſſity of *Nature*, he muſt have *Created* the *World* from *Eternity*, foraſmuch as his *Power* is *Infinite*, and conſequently it is no contradiction, that a *Creature* ſhould be *Eternal*, that is, be produced without a *Beginning* of *Duration*.

XII. *Anſwer.* I Anſwer, that this *Argument* is deduced from a falſe *Hypotheſis*, *viz.* that if *God* ſhould act neceſſarily, he might for all that be of *Infinite Power*, which is very falſe; becauſe it is the Property of a moſt *perfect Being* to act freely, which is ſo eſſential to it, that it can never be ſeparated from its *Idea*: ſince there is but one only *Being*, that by us is conceived to be ſuch.

XIII. *God can produce ſtill greater and greater Duration.* Beſides, it is the *Nature* of *Duration* that how great ſoever any is ſuppoſed, it may be ſtill ſuppoſed greater; and therefore *God* who is of *Infinite Power* and a free *Agent*, may always produce a greater or leſſer *Duration* than the ſuppoſed *Duration* is. But if *God* did act according to the neceſſity of *Nature*, no ſuch *Duration* would be poſſible, becauſe *God* acting neceſſarily, would only produce that which did follow from neceſſary Action; and conſequently being unable to produce a greater, his Power would be Bounded, which is deſtructive of the *Idea* of *God*.

CHAP. XVI.

Concerning Gods Government of the World, and Providence.

I. *Supposing God to be All-knowing and All-powerful, he must also be Provident.* FRom what hath been already ſaid of the *Divine Attributes*, we may eaſily conclude that *God* is *Provident*, and the *Ruler* and *Governour* of all the *World*, and all things that are in it. For ſeeing that he hath *Created* all *things*, and by his alone Power, brought them into a State of *actual Exiſtence*, it ſeems to be Repugnant to his Goodneſs and Omnipotence, that he ſhould neglect the care of them, and leave them to the Government and diſpoſal of others. For ſince he is *All-knowing*, *All-powerful*, and ſupremely *Good*, he cannot but keep his *Eye* upon his *Creatures*, and govern and diſpoſe of them for their good. For Will and Power, with reſpect to things without them, are not diſtinguiſht from the *Divine Underſtanding*; and ſince *God* hath decreed that at ſome certain time, *Creatures* ſhould exiſt, he alſo determined them to exiſt ſo, as that their *Eſſence* and *Exiſtence* might depend on his *Will* and *Power*, without being able to attain any Ends without his ſpecial Providence.

II. *What Providence is.* By *Providence*, Divines underſtand that *Eternal diſpoſal*, by which *God* doth Efficaciouſly direct all his *Creatures* to certain ends foreſeen by him, ſo as that in time they come to attain them. For *Providence* doth not only denote the operation of the *Intellect*, by which a thing is foreſeen before it be brought to paſs; but alſo that of the *Will*, or the Decree and Counſel, whereby, before the *work* is done, it is diſpoſed to the end appointed for it. And that ſuch a *Providence* as this appertains to *God*, may be proved by ſeveral Reaſons.

III. *God would not be the moſt perfect Being in caſe he didnot take care of his Creatures.* For Firſt, it belongs to the Nature of *God* to be moſt perfect; but how can he be ſaid to be ſo, without being preſent to his *Creatures*, and taking care for them? For it is without doubt a greater perfection to provide for the Univerſe, and to govern and diſpoſe all things for the beſt, than to leave them to themſelves, or to be diſpoſed of by others. For by ſo much the more perfect, any one is, by how much the more he excells others in *Command*, *Wiſdom*, *Goodneſs* and *Liberality*: But if the care of the *World* ſhould be ſuppoſed taken away from *God*, we ſhall make him an Idle and Unactive *Being*, as *EPICURUS* doth; and by this means ſhall be able to conceive a more *perfect Being*, who together with the higheſt Felicity has the Sovereign command over, and diſpoſeth of all things, and whoſe Tranquillity is not diſturbed or interrupted by the Multiplicity of the Affairs he manageth. Wherefore, ſince nothing can be admitted to be more perfect than *God*, we muſt conclude, that he takes the care of, and diſpoſeth all things. *For it is not becoming*, as *DAMASCENUS* ſaith, *that there ſhould be one Builder or Architect of this World, and another that takes Care of it, foraſmuch as this would Argue a diſability in them both; in the one of Making or Effecting, and in the other of taking Care for and Diſpoſing of it.*

IV. *Gods Providence is proved from his Eternity.* *Secondly*, Foraſmuch as *God* is *Eternal*, having no Bounds of his *Exiſtence*, it is neceſſary that his *Underſtanding* ſhould be *Eternal* alſo, becauſe it belongs to his *Eſſence* to be conceived by us as Supremely Intelligent: Now his *Underſtanding* is not diſtinguiſht from his *Will* or *Decree*, but only by *Reaſon*, or our meer *Conception*; therefore when we ſay that *God* underſtood, or knew all things from *Eternity*, we at the ſame time aſſert, that he alſo from *Eternity* provided for all things, and deſigned them to their appointed ends; ſeeing that his *Will* is Supremely *Efficacious*, and never fails of the ends he intends.

The

V. *The same is made out from his other Attributes.*

The same may be confirmed from the rest of his *Attributes*: For if *God* be Sovereignly *Intelligent*, he must also be *most Wise*; and will not he be accounted more Wise by governing the *World*, and administring all things, thereby not only *Speculatively*, but *Pratically* understanding them? If *God* be *most Powerful*, he must be able to do all things, so as that nothing may be in a condition to resist his *Will*, or escape his *Power*. But how can this be, except he govern the things he hath produced, and concur to their *Actions*? If he be *most Good*, sure it is necessary that all *Creatures* experience his *Goodness*: But how can that be, if he takes no Care of them, nor Provides for them? Therefore we must own the *Divine Providence*; forasmuch as without it, his chiefest *Attributes* are destroyed, and nothing is left whereby we may demonstrate his Sovereign *Power*, *Wisdom* and *Goodness*.

VI. *God's Providence, and Government of the World, may be proved from the things themselves.*

Another *Argument* may be taken from the *Creatures* themselves. For whosoever considers the frame of this *World*, and the order of its *Parts*; whosoever takes a view of the *Earth*, the variety of its *Seasons*, the different Shapes of *Living Creatures*, the manifold *Virtues* of *Plants*; whosoever scans the *Fabrick* of the *Microcosm*, MAN, the multiplicity of his *Members*, with their admirable Connexion and Harmony: Whosoever takes a Prospect of the *Heavenly Bodies*, their Lustre, Beauty, constant Motion and Proportion, will be forced by his *Conscience* to acknowledge, that these *Wonders* could not be the product of *Chance* and *Fortune*, but the Effect of the *Great GOD*. And therefore CICERO, in his Book *de Natura Deorum*, speaks thus: *Shall we call him a Man, who beholding the certain Motion of the Heavens, the wonderful Order of the Stars, and all so fitly link'd and suited together; shall suppose that all this is manag'd without any reason, and by Chance; when indeed we can never have any Conceptions of the greatness of that Wisdom and Counsel which disposeth all these things?* When we see any thing moved by *Springs* and *Engins*, as a *Sphear* or *Watch*, have we any the least doubt of their being the Effects of *Reason*? and when we see the *Heavens* moving with admirable Swiftness, and constantly to persist in their *Motions*, finishing their *Anniversary Revolutions*, for the Health and Conservation of all Things; shall we question whether these Things are order'd and directed by a most Excellent and Divine *Reason*?

VII. *How any thing can be said to be by* Chance, *if all things be rul'd by* Providence.

Tho' no body that owns a *God*, can doubt of his *Providence*; yet this Difficulty remains to some, How any thing can be said to be by *Chance* in the World, if *God* governs all Things, and directs them to their certain Ends? And besides, How comes it to pass, that *God* taking Care of all things, his *Thunder* often spares the *Wicked*, and strikes the *Innocent*? Or, if every Motion, and all other things that keep their certain Periods, be called *Divine*, must we not also suppose *Tertian* and *Quartan Agues* to be such, whose Motion and Returns are so certain and constant?

VIII. *With respect to God, nothing happens by* Chance.

There is no question, but that many things happen by *Chance* in the World, with regard to *Second Causes*; but nothing at all with respect to the *First Cause*, who disposeth and fore-ordains all things from *Eternity*. For *Chance* and *Fortune* are only in respect of him, who is ignorant of the Intention of the *Director*: And forasmuch as the *Divine Intention* is hid from *Man*, till the thing be done; therefore the same, with respect to *Man*, is said to happen by *Chance*, but not with respect to the *First Cause*. How many things seem to happen in a *Commonwealth*, which with reference to us are *fortuitous*; but not so with respect to the *Prince* who governs it, who order'd things so on purpose, and made use of such *Ministers* and *Means*, so as that things could not happen otherwise? And whereas it is further objected, That sometimes *Thunderbolts* pass by the *Wicked*, and light upon the *Innocent*.

IX. *How things come to be so turbulently carried in this World.*

We are to consider, that all these things happen by *God*'s particular Direction, for very good ends, which tho' they be unknown to us, yet are not we therefore to deny them: For it is too great a piece of Rashness, to have so great an esteem for our own Wit, as that whenever we cannot find out the *True Cause* of any thing, we should presently suppose the World to be without a *Ruler*, and that the Concerns of *Men* are committed to the management of *Blind Chance*.

X. *Why wicked Men prosper in this World.*

But you will say, If there be a *Cause* that presides over *Inferiour things*, why do we perceive such Confusion in the *World*? Why are the *Good* neglected and oppress'd by *Poverty*, *Slavery*, and *Diseases*; whilst in the mean time the *Wicked* flourish, and abound with *Honour* and *Riches*?

XI. *Answer.*

This is the Complaint of most *Men*, who being ignorant of the *True Good*, are taken with the outside of Things: For if we attend to the Nature of *Good*, we shall find that *Vertue* alone deserves that Name, which whosoever wants, is worthily esteem'd *Miserable*. Hence it is that *Wicked Men*, being devoid of *Vertue*, do not make use of those outward *good things* with that Moderation of *Mind* as they ought, but in the midst of their *Riches* suffer *Want*, and in the midst of their *Pleasures*, *Pain* and *Torment*; so that they are not True good things to them, but in appearance only. But if on the other hand, *Evil things* happen to those that are *Good*, forasmuch as they are conducive to the exercise of their *Vertue*, they are rather to be accounted *Good things*, because by them their *Minds* are estranged from *Worldly Lusts*, and raised to the love and desire of *Heavenly things*. This therefore is the greatest Instance of *Providence*, when we see *Good things* bestowed upon Ill Men, that they may grow the worse; and *Evil things* upon Good Men, that thereby they may grow better.

XII. *Why God Created Men and Angels, whom he foresaw would be corrupted by* Sin.

But you will say, That *God* created *Angels* and *Men*, whom he foresaw would fall and continue in Evil or Wickedness. St. AUSTIN Answers, That *GOD* would not have created any *Angel* or *Man*, whom he foreknew would fall into *Sin*, if he had not known, at the same time, to what good Ends he could make use of them, and so compose the Harmony of this *Universe*, as a pleasant Song of *Discords* mix'd with *Concords*: For as these make the Sweetness of *Musick*, so the Beauty of this *World* is made up of these Contraries. And therefore in the *Third Book* of *Free-Will* he plainly teaches, That GOD ought not to have abstained from Creating of the *Creature*, whom he foresaw that by his own Fault (not by any of his *Creator*) should lose that *Beauty* in which he was *created*: For as a lost and wandring *Horse* is better than a *Stone*, which cannot wander, because it wants *sense* and *motion*; so

so that *Creature* is more Excellent, which *sins* by its Free-will, than that *Creature* which doth not *sin*; because it hath no *Free-will*. And as I would commend *Wine* as good in its kind, tho' I blame the Man that is made *drunk* by it, and yet would prefer this *drunken* and *blamed Man* before the *praised Wine* that had made him *drunk*: So likewise a *Bodily Creature* is to be commended in its degree and kind, whereas they are *Blame-worthy*, who by the immoderate use thereof, are turned aside from the Perception of *Truth*.

The Third Part
OF THE
INSTITUTION
OF
PHILOSOPHY.
VIZ.
DÆMONOLOGY;
OR,
Of Intelligences and Created SPIRITS, GENIUS's and DÆMONS, Commonly called
ANGELS.

A Prefatory Discourse.

Of the Division of Created Things; the Definition of Pneumaticks, or the Doctrin of Spirits, and its Certainty.

I. *The aim of the Author in this Treatise.*

NOtwithstanding that to Treat of ANGELS does seem chiefly to belongs to *Divines*, and the consideration of their *Nature* and *Faculties* may be thought to exceed the Bounds of *Metaphysicks*; yet I think it may not be useless to try what *Natural Light* can do in this case, and how far by the Guidance thereof, we may discover their *Essence*, *Existence*, and *Operations*.

II. *Division, a great Help to the Knowledge of Things.*

They who endeavour to search into the *Nature* of *Things*, take care to divide them, as fitly as may be, into those Parts which may be helpful to the obtaining a more distinct Conception of them. For *Division* takes away the doubtfulness of *Terms*, and makes that which before was confusedly perceived under one Name or Word, to be more clearly understood by more Words, expressing the Parts of it.

III. *The Division of Substance into Thinking and Extended.*

It is notorious to all *Philosophers*, that *Created Things* are divided into *Spiritual* and *Corporeal*, or into *Thinking* and *Extended*. By the Name BODY, all *Material* or *Extended Substances* are understood, of what Nature soever they be, whether they be more Gross or Subtil; whose *Essence* consists of three *Dimensions*, or in *Extension* in Length, Breadth, and Depth. And we call that an *Incorporeal Substance*, or *Immaterial*, which is without *Extension*, and all those *Modes* and *Accidents* which accompany a *Bodily Substance*. Whence it appears, how very improperly the Name of SPIRIT is attributed to the *Air*, *Wind*, *Fire*, *Vapor*, *&c.* because tho' these Things be more Thin and Subtil than others, yet don't they for all that cease to be *material*, *impenetrable*, and *indefinitely divisible*.

We

IV. *Quantity cannot be attributed to Angels*

We may also perceive with how little Reason some do *attribute* Quantity to *Angels* and *Human Souls*, and conceive one part of them to be without another, as if they were *Material*. Whereas if a *Man* consider a *Corporeal* and *Intellectual Substance*, he will find them to be distinguisht by Properties and *Attributes*, and to have no *affinity* at all with each other. For what Similitude can there be supposed between a *thing extended*, and a *Being* devoid of all *Extension*? Or what agreement is there, between a *Substance* that *understands*, *wills*, and *imagins*, and that which is divisible into *parts*, and is diversified by *Figures*, and which is commensurate to a certain space and *Place*?

V. *Substance is wrongly divided by some into immaterial and Bodily.*

Others divide *created substance* into *Immaterial* and *Corporeal*; but this Division doth not seem to be exact, or made according to the Rules of a *right Division*: because *Immaterial* and *Incorporeal* being *Negative Terms*, can represent no positive *Idea* to our *Mind*, such as is desir'd by all, where it may be had. For *Negative Words* represent no Properties or *Attributes* to our perception, and rather tell us what the thing is not, than what it is. True it is, that this *Division* is set down by many *Philosophers* of great note: but forasmuch as a Privative or Contradictory opposition (which those words do import) cannot have place in a lawful Division, this is not to be admitted. Moreover this *Division* seems to be grounded on this Childish mistake, that the *Substance* of *Material things* is more real, than that of *Spiritual*; and that therefore the former, as more perfect, are expresst by *Positive* words, but the latter, as more Imperfect, by *Negative*.

VI. *Is better divided into Thinking and Extended.*

Wherefore *Created Substance* is more fitly divided into *Thinking* and *extended*, or into *Intellectual* and *Corporeal*; because then the Dividing parts, are apprehended by Positive conceptions, and expresst by Positive *Terms*. For without doubt, we shall have a more clear notion of an *Angel* by conceiving him *Intelligent*, *Willing and Powerful*, than by apprehending him *Immaterial*, *Incorporeal and Invisible*: Forasmuch as these *Negative Attributes*, as I said, rather declare what an *Angel* is not, than what he is. Besides, he that perceives the Positive Properties of a *thing*, does by consequence understand the Negative; but not on the contrary: For he that knows an *Angel* to be *Intelligent*, doth at the same time know him to be *Incorporeal* and *Invisible*; but tho' he understand him to be *Incorporeal* and *Invisible*, he does not therefore understand him to be *Intelligent*; for the *Air* is *Invisible*, and yet is neither *Intelligent* nor *Incorporeal*. Wherefore *created Beings* are very properly divided into *Intellectual* and *Corporeal* or *Material*, for no *substance* can be conceiv'd by us, which is not either *Thinking* or *Extended*, or in other words, which is not *Active* or *Passive*. Hence St. *AUSTIN* saith, *Amongst things, some thing is acted, and not Acting, as a Body; another is Acting, and not Acted, as is God; and a third Acting and Acted, as are all Spiritual Substances.*

VII. *The Distribution of Science Universally consider'd.*

As all *created substance* is divided into *Material and Intellectual*, so the knowledge of that *Substance* is distinguish't into *SOMATICA*, or the *Science* of *Bodies*, and *PNEUMATICA*, or the *Science* of *Spirits*: Which may again be subdivided into other *Species*, according to the various notions under which a *Body* or *Spirit* may be considered. For as a *Body* is conceived by us, either as *Natural*, or as *Artificial*, or as having *Quantity*, and being *Figur'd*, or as subject to *Sickness* and recoverable; so accordingly divers *Species* of *Sciences* are constituted. *Natural Philosophy* considers a *Body* as *Natural*, and explains its *Essence* and *Properties*. *Mechanical Science* Minds the outward frame and structure of the *Body*, and the figures it obtains by workmanship and Art. *Mathematicks* take to task the various *Modes* of a *Body*, as the *figures* which bound it; the *situation* of one part with reference to others; the *Motion* or change of *situation*; and *Rest* or continuance in one place: Lastly, *Physick* or *Medicine* considers the *Body* as subject to *Diseases* and *recovery*, and endeavours to maintain the health, or to restore it when lost.

VIII. *The Division of Pneumatica, or the Science of Spirits.*

In like manner as *Intellectual Substances* are divided into *God*, *Angels*, and *the Souls of Men*; so *Pneumatica* is divided according to the Diversity of the *objects* it contemplates into *Natural Theology*, *Geniography* or the *Science* of *Angels*, and *Psychology*, or the Doctrin of the *Soul*. *Natural Theology* considers the *Essence* of *God* and his *Attributes*; *Geniography* the nature of *Angels* and *Intelligences*; and *Psychology* examines the constitution of the *Mind* of *Man*, its Faculties and Passions. So that *Pneumatica* is nothing else but the *science of Spirits*, which admits of divers names, as it Considers *God*, the *Angels*, or the *Soul of Man*.

IX. *The certainty of the Science of Spirits.*

The certainty of this *science* is very clear from its Definition, because it treats of *Incorporeal things*, and such as are not *subject* to change: For if *Natural Philosophy* which treats of a *Natural Body*, and *Mathematicks* which handles the *Modes* that follow it, deserve the name of *Science*, because they are founded on *Axioms of Eternal Truth*, much more doth the *Doctrin* of *Spirits* deserve the name of True *Science*, forasmuch as it is not only grounded on General Propositions, but likewise borrows its certainty from the Object it considers, and deduceth clearer Conclusions thence, than *Natural Philosophy* doth from a *Body* or *extended Substance*. For tho' the vulgar sort of *Mankind* is apt to be mistaken, and doubtful about *Immaterial Substances*, whether they do really *exist*, and think that the name of *Thing* ought only to be *attributed* to *Bodies*; yet the Lovers of *Wisdom* do own *Thinking substances*, to be much truer, and much more real than any *Bodily* or *Material Beings*.

CHAP. I.

Of the Nature of Angels.

I. *What we are to understand by the Name of Spirit.*

THE *Division* of *created Substance* into *Thinking* and *Extended* being suppos'd, it will not be difficult to conceive what a *Spirit* is, and how it is to be distinguisht from other *things*. For the *Word Spirit* is here to be taken in its most proper sense, for such a *substance* as is endued with the Faculty of *perceiving* and *willing*. Because as the formal Reason of a *Body* consists in Extension, which is always attended with Divisibility and Impenetrability; so the *essence* of a Spirit consists in this that it is a *Thinking Substance*, the concomitants whereof are Indivisibility, Perception and Volition. And as a *Body* cannot be conceived without

V.

Extenſion, ſo neither can a *ſpiritual Subſtance* without *Cogitation*: And therefore it is neceſſary that *Cogitation* do conſtitute a *Spirit* in its *ſpiritual* Nature, as Extenſion conſtitutes a *Body* in its ſenſible and diviſible Nature. Foraſmuch as according to *ARISTOTLE*, that is ſuppos'd to belong to the *Eſſence* of any thing, *without which* it cannot be underſtood.

II. *Some think there is no Subſtance but what is Material.* And whereas ſome ſuppoſe they cannot conceive an *Angel* without *Extenſion*, and ſo confound the Notion of *ſubſtance* with that of *Extenſion*; this proceeds only from a falſe prejudice they have entertained, *viz.* that there is nothing *Intelligible*, but what is likewiſe Imaginable, which certainly is a very great miſtake; for *Angels* and all other *Spiritual Subſtances*, cannot be reached by our *Imagination*, but only by our *Intellect*. For all Men generally take an *Extended Being*, to be ſomewhat Imaginable, in which there are various parts of a determinate *Magnitude* and *Figure*, and whereof the one is not the other; which Notion in no wiſe can agree with *Spirits*.

III. *Spirit is a general name to Angels and Dæmons.* By the Name *Spirit*, therefore we are here to underſtand a *Finite Thinking Subſtance*, altogether independent on, and free from Matter: Under, which *Angels*, *Dæmons* and *Intelligences* are comprehended; neither is there any Diſtinction between them, ſave only that the *Angels* are Good, and the *Devils* Evil; that theſe aim at the *Deſtruction* of *Mankind*, the other aſſiſt their *Salvation*; theſe abide in *Sin*, the others continue in *Grace*; theſe are bound in *Hell*, the other enjoy the Viſion of *God* in *Heaven*: All other things, as *Eſſence*, *Exiſtence*, *Knowledge*, *Power*, *the taking up of Bodies*, *Talking together*, *&c.* being common to them both.

IV. *The Angels are Immaterial Subſtances.* From the Definition of a *Spirit* or *Immaterial Subſtance*, we may with great Evidence conclude, that *Angels* are *Pure Spirits*, or as *DIONYSIUS* in his fourth Book concerning *Divine Names*, ſaith, *Free from Matter*, *and Incorporeal*. Becauſe a *Thinking* and an *Extended Subſtance*, are altogether diſtinct from each other, ſo that the one of them can be clearly perceived without the other. For we moſt clearly perceive a *Spirit* or *Thinking Subſtance* without a *Body*; and on the contrary, a *Body* without a *Spirit*. Now things that are thus diſtinguiſht, cannot agree to one and the ſame *Subject*: Becauſe theſe *Attributes* are altogether different; and there can be no greater oppoſition between *Attributes* of *Subſtance*, than *Diverſity*. And therefore to ſay, that *Extenſion* and *Cogitation* agree to one and the ſame *Subject*, is in effect to affirm, that one and the ſame *Subject* can have two *Natures* or *Eſſences*, which cannot be ſaid of a Simple thing without a Contradiction. Becauſe *Cogitation* and *Extenſion* are not only two *Eſſential Attributes*, but alſo conſtitute the nature of the thing to which they are attributed, and are more inconſiſtent, than *Blackneſs* and *Whiteneſs*, *Heat* and *Cold*, in the ſame Subject. For *Heat* and *Cold* may ſucceed one another in the ſame *Subject*, and the ſame thing which is *Cold* now, may afterward become *Hot*: But it is altogether Contradictory that *Cogitation* and *Extenſion* ſhould be in the ſame ſimple Subject, and conſtitute two Natures at once, or Succeſſively.

V. *Foraſmuch as Angels* Moreover, if *Angels* were *Material*, they might be divided; for *Diviſibility* is a Concomitant of Extenſion; but *Angels* are not Diviſible, therefore they are not *Corporeal* or *Extended*. The *Minor* is thus proved: The *Eſſence* of an *Angel* conſiſts in *Cogitation*, which admits of no Diviſion; or no body can conceive the half of a *Thinking Being*; wherefore *Angels* are exempt from *matter*, and from any Corporeity, how ſubtil ſoever the ſame may be conceived. *are Indiviſible, they are likewiſe Incorporeal.*

VI. *The effects of Angels proves their Incorporeity.* The *Immateriality* of *Angels* may be made out from ſome *Effects* that exceed all *Human Power*, and the utmoſt activity of *Bodily* force: Such as are the *Antient Idol Oracles*; the *Speech* of *PEOPLE POSSEST*, which are often in thoſe *Languages*, which the poſſeſſed party does not underſtand; *the Penetration of Bodies*, and ſuch like, which are an inconteſtable proof of *Intelligent Natures*, and which exert their Activity without the help of any Body. Beſides we Read in *Scripture* that a vaſt multitude of *Devils* entred one *Body*, *Mark* 5. yea, a whole *Legion*, which according to the moſt common Account contains 6666, which is abſolutely impoſſible, if the *Devils* have *Bodies* and take up a determinate place.

VII. *Whether Angels be capable of Generation.* They who aſſert *Angels* to be *Compound Beings*, and to have *Bodies*, tho' much purer, and of a more ſubtil *matter* than ours, endeavour to confirm their Opinion from *Gen.* 6. where it is ſaid, that the *Sons of God came in unto the Daughters of Men, and they bare Children to them, and the ſame were Mighty Men or Giants.* Which could not be, except we ſuppoſe the *Angels* to have Bodies; *Spirits*, as purely ſuch, being incapable of Generation.

VIII. *What we are to underſtand by the Sons of God in Scripture.* But this place is wrongly interpreted; for by the *Sons* of *God* in that place we are not to underſtand *Angels*, but the Poſterity of *Seth*, who imitating the Pious conduct of *Enos*, did worſhip *God*, and call upon his Name; but their Poſterity degenerating from the Piety of their *Fore-fathers*, and plunging themſelves into *Carnal Concupiſcence*, joyned themſelves with the *Daughters* of *Men*, that is, with *Cain's* Poſterity; from which Conjunction *Giants* were born, that is, monſtrous and deformed *Bodies*, as a Puniſhment of their Luſt. For it is contrary to Reaſon to ſuppoſe, that *Angels* can Generate. Wherefore, the *Fathers* of theſe *Giants* were not *Angels*, but *Men*, as the *Scripture* ſufficiently declares, *Gen.* 6. 3. *My Spirit ſhall not always ſtrive with Man, for that he is Fleſh.*

IX. *Objection that the Angels will be equal to God in the Simplicity of their Natures.* But will ſome ſay, if the *Angels* be altogether exempt from Compoſition, and any Matter whatſoever, they will be as Simple as *God* himſelf as being the one as well as the other *Pure Spirits*, having only an *Eſſence*, and ſome *Modes*, which do not hinder Simplicity.

X. *The Simplicity that is in God is very different from the Simplicity which is in Angels* To which I Anſwer, that tho' neither in *God*, nor the *Angels* there be any *Compoſition* of *Matter* and a *Subſtantial Form*, yet are not the *Angels* exempt from all other *Compoſition*, as conſiſting of Potentiality and Act, of *Eſſence* and *Exiſtence*: Which *Compoſition* is not to be found in *God*, foraſmuch as the *Divine Modes* are only diſtinguiſht by Reaſon (that is, our way of Underſtanding) from the *Eſſence* of *God*. Wherefore the *Schoolmen* call *Angels* and *Souls Impure*, and *Imperfect Acts*, but *God* the moſt *Pure* and *perfect Act*. Hence it is that *DES CARTES* in the 23 *Article* of the *firſt Book of his Principles*, Teacheth, that *our Mind* (*and the ſame is to be underſtood of Angels*) doth

doth understand, and will, by Operations that are in a manner distinct; whereas, God *by one and the same most Simple Operation, doth Understand, Will and Act,*

XI. Angels *do not understand all things actually.*

Besides, *Angels* have not actually all the *Cogitations* they can have, seeing that many things can be Revealed to them by *God*, and we understand them to have many *Thoughts* potentially only; so that at the same moment of time, they are conceived as Thinking in part Actually, and in part Potentially. Which is sufficient to denominate them Compounded, and excludes them from the Simplicity which is in *God*.

CHAP. II.

Whether the Existence of Angels be demonstrable by the Light of Nature, and how the same may be Evinced.

I. *The Antient Philosophers believed* Angels.

IT was the constant Opinion of the *Antient Philosophers*, that there were *Dæmons* and *Genii* or *Intellectual Substances*, which did preside over the things of this *World*, and were the managers of *Heavenly things* also, as so many *Divine Ministers*. For they thought it not beseeming the *Majesty* of *God*, to Administer the *World* by himself, but that he made use of *Ministers* and *Servants*, in the discharging of so many different *Offices*. For should *God* be thought inferiour to the *King* of *Persia*, who residing at *Susa* or *Hispahan*, Govern'd his large extended *Empire*, and by the Hands and Heads of others, was every where present with his *Subjects*, provided for them, and defended them? Seeing therefore that *God* hath his *Ministers*, they must needs be *Spirits*, that is, most active and ready to expedite his Commands: But how can they be such, if they be clog'd with the weight and cumber of a *Body*? Whence they conclude, that there are *Angels*, which are call'd *Genii*, forasmuch as they assist *Men*; and *Dæmons* as they are the *Administrators* of this lower *World*; this is confirmed by a Verse quoted by *CLEMENS ALEXANDRINUS*, and ascribed to *ORPHEUS*.

Standing about thy Throne the Angels are,
Who of Mankind do take the Active Care.

II. God *can govern the World by himself.*

By this way of Arguing it appears, that the *Antient Philosophers* did believe *Angels*, tho' it does not prove that they really Exist; forasmuch as all those things, which they commit to the care and management of *Genii* and *Dæmons*, may be done by *God* alone. Neither indeed is it unbecoming the *Divine Majesty*, by his own Power to provide for his *Creatures*, without the assistance of any *Ministers*, to share in the Burthen of the *Government*: For *God* being *Omniscient* and *Omnipotent*, always chuseth that which is best, and therefore does not stand in need of any *Angelical Assistance*, in the Execution of his designs. And if there be any *Intelligences* in the *World*, that perform his Commands, that is because *God* thinks it best, and most conducing to that State of the *World*, which in his Wisdom he hath allotted it, that so the *Universe* should be a kind of *Commonwealth*, wherein He as *Lord paramount*, should Govern and Administer all things, especially the concerns of his Rational *Creatures* by the Mediation of *Angels*, as subordinate *Magestrates* under him.

III. *The Existence of*

Neither indeed is it so easie a matter, to prove the *Existence* of *Angels* by the *Light* of *Nature* only; because tho' we have a clear and distinct perception of *Spiritual things*, as they are *Thinking Beings*, and distinguished from things extended; yet forasmuch as their Existence is only Possible and Contingent, all that we can infer from thence is only thus much, That *Angels* may Exist, but not that they do really so. For if the *Existence* of *Angels* could be demonstrated, it must be by an Argument *à Priori*, when we demonstrate any thing by its neerest *Efficient Cause*; but so we cannot prove, that *God* the Maker of all things hath Actually *Created Angels*, since *Creation* depends one the meer Good Pleasure of *God*, which cannot be known to any without a *Special Revelation*. *Angels cannot be demonstrated à Priori.*

IV. *The Existence of Angels proved from their effects.*

Wherefore we can have no certainty of the *Existence* of *Angels*, save only from their *Effects*, or other *signs* that argue their presence. Thus we may prove, that there are *Angels*, from *Persons* Possessed, who tho' they be altogether Ignorant and Illiterate, do notwithstanding Speak strange *Languages*, and Discourse of several things beyond their Capacity; declare what is done by *Persons* far absent, and are carried through the *Air*, notwithstanding the weight of their *Bodies*. Who can deny, but that all these things must be performed by *Spirits*, since they Transcend the Activity of *Bodies*, and the Power of Nature?

V. *Soothsayers and Oracles prove the Existence of Dæmons.*

The *Existence* of *Angels* is confirm'd by the Answers of *Idols*, and the Predictions of *Soothsayers*, and those unwonted Motions, the Cause whereof cannot be assigned, unless we should say, that they are produced by such Invisible Agents. For we must not say, as some do, that these *Effects* may be produced by the *First Cause*; because *God* never Thwarts himself, nor does any thing Derogatory to his *Glory*, as are the *Idol Oracles*, and things done by *Persons* that are Possessed.

VI. *From the inactivity of Matter, we may infer, there must be Spirits to move it.*

It is a received *Axiom* amongst the *Antient Philosophers*, That a *Body cannot move it self*, or that *whatsoever is moved, is moved by another*: Wherefore there must be allowed some Active *Principle*, that may move Matter. For evident Motions must have a *Cause*, which cannot be *Coporeal*; for so the Question would return, By what *Principle* that was moved, and so to Infinity, till we come to some *Immaterial Cause*. Hence it is, that *ARISTOTLE* and other *Philosophers* hold, That *Intelligences* move the *Heavenly Bodies*: And consequently, that the *Superior Bodies* communicate no other Motion to Inferiors, but what they have first received from the *Angels*.

VII. *Reason convinceth us of the Existence of Spiritual Substances.*

Neither do we want very probable Conjectures of the *Existence* of *Angels*, if we consider the Harmony and Order of the *World*, and how its extream Parts are linked together, by Intervening Middle Parts. For since we see some things in the *World*, that are Compounded of a *Thinking* and *Extended Substance*, as Man, who consists of *Soul* and *Body*; it seems very Rational, that as there are things that are altogether *Bodily*, or that include nothing but *Extension*; so on the other hand there should be *Spiritual Substances*, whose *Idea* involves nothing but *Cogitation*.

VIII. *Apparitions of Angels.*

This may be confirmed from divers Apparitions of *Angels* mentioned in *Holy Scripture*, which happened in divers *Places* and *Times*: Thus, they appeared to *Jacob* as he was on his *Journy*, *Gen.* 32. To *Zachary* in the *Temple*, *Luke* 1. To *Guideon* in his *Fathers Ground*, *Judg.* 6. To our *Saviour* in the *Garden*,

Garden, Luke 22. To the *Childeren* in the *Fiery Furnace, Dan.* 3. In the *Prison* to *Peter, Acts* 12. At our *Lords Sepulcher, Mat.* 28. In the *Wilderness* to *Hagar, Gen.* 21.

CHAP. III.

Of the Faculties of Angels, and first of their Understanding, and its Object.

I. *A thinking Nature hath two Faculties.* *Intellectual Nature* hath two *Faculties*, *Understanding* and *Will*, which are as it were its Properties, and inseparable from it. The first of these perceives Objects by contemplating the *Notions*, it finds in it self; the other determines an *Intelligent Being*, to the embracing or avoided of a thing, or to suspend its *Judgment*, where the thing is not sufficiently understood. And forasmuch as these *Faculties* are distinguisht at least by *Reason*, and are variously conversant about their *Objects*, we will also separately handle them, speaking first of the *Understanding*, and afterwards of the *Will*. Because it will conduce much to the discovery of the nature of *Angels* to know how far their *Knowledg* and *VVills* do extend.

II. *The Various objects of Angelical knowledg.* As to the Object of *Angelical Understanding*, the *Schoolmen* dispute, First, whether *Angels* and *Devils* do understand the *mysteries* of *grace* by their *natural ability*. Secondly, whether they know the *Thoughts* of *men*, and can penetrate the *secrets* of their *Hearts*. Thirdly, whether they know *Future things*. The First Question I leave for *Divines* to determine, contenting my self to speak a few words to the two latter, which do not exceed the Bounds of *Philosophy*,

III. *The Common opinion of Schoolmen concerning the knowledg of Angels.* As to the second Question, viz. *whether Angels know Mens thoughts?* the common Opinion is that *Angels* and *Devils* cannot naturally know the Thoughts of Men without their consent. The Cause of this hiddenness of Mens Thoughts, some ascribe to the *Free VVill* of Man; others to the Abyss of *Mans Heart*; others to the *VVill* of *God*, who denies his Concourse to the knowing of them; others to the nature of Mens *thoughts*, which cannot objectively occur to others without the *VVill* of him that thinks them.

IV. *The common opinion refused.* But indeed all these *Reasons* are very weak, and do not at all prove that the Thoughts of Men are inscrutable by *Angels*; because the Perceptions and Determinations of *Mans Mind*, are in themselves no less *Natural*, than the very nature of *Angels*: And therefore as an *Angel* beholds his own *thoughts*, there seems no Reason, why they should not as well perceive those of other *Angels* and *Men*, seeing they agree in *Substance*. Besides, it cannot be doubted but the *Angels* understand their own *thoughts*, and those of others too, with their consent: But the Identity or Sameness of subject, or anothers consent, doth not encrease the Faculty, or communicate any perfection to it, or render the *understanding* Faculty more proportionate to its *Object*; wherefore if Angels by the consent of another can penetrate his *thoughts*, they may as well without it. Neither is it any objection against this, that humane *Actions* are free, and depend on their Wills, because all the foremention'd difficulties recur also upon this: And this only seems deducible from it, that *Angels* know such *Acts* as these to be free, and like to those they themselves produce. But who will say that *Elicit Acts* have such a dependence on the *will* that they cannot be known by another, without the consent of him that Elicits them, seeing there is no difference between *Acts* that are free, and such as are not free; and that the same *Act* may successively change its nature, and of Free become *Necessary*? Wherefore I think we may conclude, that as *Angels* can know Acts that are not free, so likewise may they those that are free.

V. *That Angels do penetrate the secrets of Mans Heart.* Wherefore let this stand fast, that *Angels* can perceive the *Thoughts* of *Men*: For seeing that *Angels* are *Intellectual Substances*, and that the *Perception* of the *Understanding* and *Determination* of the *will*, are the operations of *Intellectual Faculties*, there must needs be a Proportion between them. Besides, there are but few determinations of our *will*, which are not discovered by some *signs*, as by the motion of *Spirits* about the *Heart*, or by some outward tokens, which may give an occasion to *Angels* and *Devils* to discover the *Thoughts* and *Affections* of the *Heart*. But if all those *signs* were taken away, yet there is such an Agreement or Correspondence betwixt the Operations of the *Mind*, that they cannot but naturally perceive the Conceptions of our *Understandings*, and Decrees of our Wills. I my self some few years since heard a *Devil* speaking out of a possessed *Woman* at *Brussels*, who revealed the inward thoughts of many that came to her, tho' they were not discoverable by any sign. And when one of the standers by asked the *Spirit*, What it was he thought of at that instant? He told him that he resolv'd to take a Journey the next day, which he could not deny, but it was so. Neither needs this seem strange to us, seeing that we our selves would know as much if we were not shut up in these *Bodies*; and therefore are our *thoughts* hidden from others, because the Eyes of Men cannot pierce into our *Breasts*, which by reason of their materiality, are impenetrable. And it is probable that when some of the *Holy Fathers* deny'd the knowledge of *Mens thoughts* to *Angels*, it was for no other reason, but because they held them to be material.

VI. *An objection from Scripture.* If you say that this Opinion seems contrary to Scripture, I. Kings 8. 29. *ver. For thou only knowest the Hearts of all the Children of Men.* And *Jerem* 17. *ver.* 9. *The Heart is deceitful above all things, and desperately wicked, who can know it? I the Lord search the Heart and try the Reins.* In which places by the Heart are meant the secret *thoughts*, and whatsoever immediately depends on the *Mind*.

VII. *Answer.* This *Objection* is easily answer'd by saying, that the *Scripture* in these places doth distinguish *God* from *Men*, with respect to the *knowledg* of *thoughts*, but not from *Angels* and *Devils*. And whereas *Holy VVrit* seems to *attribute* this *Priviledg* to *God* only, not to *Angels*; this is, because it considers the *Angels* as *Gods Ministers*, and therefore ascribes to *God* whatsoever is done, or perceiv'd by them.

VIII. *By the knowledge of Future things, we are not to understand that which is gathered by conjectures.* As to the Third Question, *whether Angels know things to come?* We are to suppose that this is not to be understood of a knowledg of *Futurities* that may be gather'd by conjecture from probable *Causes*; as a *Master* of a *Ship* foresees a *Tempest*, or a *Physician* the probable Event or Issue of a *Disease*; or a *General* the Event of a *Battle*; but of the

Knowledg

Knowledg of *things* that are meerly Fortuitous and Contingent, which have no cauſes, or which are the effects of *Mans free will*; as that *John* will be kill'd by a Tile falling from a *Houſe*; or that *Peter* is to take a Journey to morrow.

IX. *Angels naturally cannot foreknow Future things.* I ſay therefore that neither *Angels* nor *Devils* do foreknow future Contingencies, which either have no certain *Cauſes*, or depend on Free will. The *Reaſon* is becauſe an *Effect* muſt be known either in it ſelf, or in its cauſe; but theſe Futurities cannot be known either way, and therefore cannot be known by *Angels*. That they cannot be known in *themſelves* is evident, becauſe they are not determin'd, neither have any neceſſity of exiſting; nor in their *Cauſe*, for that is free, either to produce or not to produce an effect. This may be further confirm'd thus; *Angels* are ignorant what themſelves ſhall act, before they have reſolv'd it with themſelves, and therefore much leſs do they know what others will do. And therefore ſome *Schoolmen* are of Opinion, that the *Devils* did not foreknow their *Fall*, nor the Miſeries conſequent upon their Sin.

X. *Yet they may probably Conjecture of things.* Yet it cannot be deny'd but that *Angels* and *Devils* may know many things by conjecture; ſince they can have a great inſight into the *Temper* and Propenſity of *men*, by knowing their Manners, and diſcerning the reſolutions and *thoughts* of their *mind* by *external* ſigns and tokens.

CHAP. IV.

Of the Will of Angels.

I *What the* Will *is, and whether it be found in Angels.* THE *Will* is here taken for that *Power* or Faculty whereby an *Intellectual Nature* produceth all its actions and thoughts that are of choice and determination, from himſelf without any force or compulſion. For it is the nature of a *Thinking* Being, that conſider'd in it ſelf, it can do ſomething, and determine it ſelf to *Act* or not to *Act*. Now this determination proceeds either from the *things* themſelves, without the Intellectual nature, or from the *Intellectual nature* it ſelf. The *Actions* which have no other *Principle*, beſides the Thing that Thinks, are called *Volitions*; and the *Intellectual nature* as it is to be conſider'd to be an *Elective Faculty*, and a ſufficient *Principle* to produce ſuch *Actions*, is called *Will*. Now, that ſuch a *will* is to be found in *Angels* cannot be queſtion'd, forasmuch as they are *Thinking Subſtances*, or *Beings* that of their own nature have a Power of *Willing* and *Nilling*.

II. *Two Doubts about the* Will *of Angels.* Concerning the *will* of *Angels* it may be enquired, Firſt, *whether this Active Power in them be free, and without force, from any thing that is External*: Secondly, *whether the Angels have ſuch a power over their Thoughts, that they can ceaſe from all Perception and Judgment.*

III. *The Will of Angels is free.* As to the Firſt it ſeems certain, that the *Will* of *Angels* is *free*, and cannot be forc'd by any Agent to do any thing, or leave it undone; becauſe the Nature of the *Will* conſiſts in its being free, ſo that it implies a contradiction for it to be forced by any External Agent, ſince no Agent can deſtroy the Nature of another, which would then be, if the *Will* ſhould *will* any thing with reluctancy. Beſides, the original of this Freedom comes from hence, that it is the very *Angel* himſelf, that determines himſelf, and wills this thing or the other; ſo that it depends on his own meer Will, that he *freely* Wills or Nills. Moreover, *The Will*, and *Free Will*, if well look'd into, are one and the ſame thing, and differ only in this, that the *Will* is underſtood to be the Chuſing or Elective Power, by which a *Cogitative Being* doth determine it ſelf, and perform all his *Motions* and *Actions* that proceed from the ſaid *Will*: And by *Free Will*, we underſtand the ſame Faculty, foraſmuch as it hath the Power of *Chuſing*. Now ſince both theſe are found in the *Angels*, they muſt by conſequence alſo have *Free Will*.

IV. *An Objection againſt the Liberty of Angels.* If you Object, That the *Angels* do infallibly follow and embrace the *Good* they know; and that therefore *Divines* ſay, That they *Love GOD* ſo, as not to be able to turn their *Love* from him: Becauſe by *Grace* they are ſo united to *God*, that they cannot be ſeparated from him, and are ſo ſatiated with the *Divine Glory*, that they cannot be drawn from the Enjoyment of ſo great a *Good*.

V. *The Objection Anſwer'd.* I Anſwer, That notwithſtanding all this, the *Angels* ſtill continue Free, and Love *God* freely; beeauſe the *Eſſence* of *Liberty* doth not conſiſt in *Indifferency*, but in the free determination of the *Will*, by which an *Angel*, or the *Mind* of *Man*, is ſo carried towards that which is propounded to it by the *Underſtanding*, either in Affirming or Denying, Embracing or Avoiding, as not to be determin'd thereto by any outward force. For the Indifferency of the *Will* only then takes place, when there are no Reaſons to ſway the *Mind* one way more than the other; which State is the loweſt Degree of *Liberty*, and argues no Perfection in it, but only a Defect in its *Knowledge*. For who can deny, That *Man* doth nothing more voluntarily, than thoſe things in which he finds not the leaſt cauſe of Doubting? Wherefore *Des Cartes* concludes in his *4th Meditation*, That *Divine Grace*, or *Natural Inclination*, do never diminiſh Man's *Liberty*, but rather increaſe and ſtrengthen it; and that a Man ought to be accounted ſo much the more *Free*, by how much the more he is byaſſed one way; either becauſe of his clear diſcerning of the *Goodneſs* and *Truth* that is in it, or becauſe *God* ſo diſpoſeth his *Thoughts*. Wherefore, when the *Angels* do inſeparably adhere to *God*, and are link'd to him by *ſtable Eternity*, as *Divines* expreſs it, they do not by this means loſe their *Liberty*, but by *Grace* are inclined to one part; and tho' indeed their *Indifferency* be diminiſhed, yet their *Liberty* is rather increaſed, ſince *to act Freely, and to act Voluntarily, are one and the ſame thing.*

VI. Liberty *may be conſider'd two ways.* The Matter will be more evident, if we conſider the *Liberty* of *Voluntary Actions*, either before, or in the ſame moment they are exerted: If the *Actions* of the *Will* be conſidered before they be exerted, there is no queſtion, but that the *Angels* have power to determine themſelves to one or the other Contrary, that is, to proſecute or avoid one and the ſame thing. Yea, according to ſome *Divines*, the *Angels*, whether *Good* or *Evil*, daily change their *Wills*. The latter, when they ſurceaſe their *Temptations*, finding that they are of advantage, rather than any hurt or hindrance to *good Men*. The former, when they forſake the *Wicked*, whom they find they cannot reclaim from their *Impiety*. But if we conſider *Liberty* in *Voluntary Actions* the ſame Moment they are exerted,

ſo it contains no *Indifferency*, in what ſenſe ſoever it be taken; whether for that State wherein the *Will* is not prompted to embrace one thing rather than the other, by any knowledge of the *Truth*, or *Goodneſs* of them; or whether it be taken for that Poſitive Faculty of *Intellectual Nature*, whereby it can chuſe, which it pleaſeth of two Contraries. Becauſe that which is a doing, cannot but be a doing at the ſame time it is a doing. And the *Liberty* which *Angels* have is ſuch, as according to the increaſe of their Faculty of *Acting*, as was ſaid before, is increaſed and ſtrengthned.

VII. *The Angelical Will is not determin'd to one Action.*

As to the Second Doubt, *VVhether the VVill of Angels be determin'd to elicit any Action; or whether it can at its pleaſure omit the ſame, and be void of all Thoughts?* I Anſwer, That the *VVill* of *Angels* is not ty'd to any certain *Action*, as being Indifferent of its own Nature, and not bound to any certain Knowledge, ſince they neither *love* themſelves, nor *God* neceſſarily, as their Natural End. Yet they cannot at their pleaſure rid themſelves of all manner of *Thoughts*, as ſome think they may, becauſe it is the Nature of a *Spiritual Subſtance* to *Think* always; and therefore it implies a Contradiction, for an *Intellectual Creature* to be without all *Thoughts*, ſeeing we underſtand nothing elſe by the Name of *Spirit*, but a *Thinking Being*.

VIII. *An Angel Thinks, whilſt he commands himſelf to ceaſe from Thinking.*

If any one urge, That an *Angel* may abſtain from all *Thoughts*, by commanding his Underſtanding to leave *Thinking*. I Anſwer, That this very Command or Will not to *Think*, cannot be exerted by an *Angel* without his being conſcious to it, and conſequently without his *Thinking*. For to *Nill* is as much a Thought as to *VVill*; wherefore *Angels* cannot ceaſe from all *Thoughts*.

CHAP. V.

Concerning the Power of Angels, as to the moving and producing of Bodies.

I. *There is a Faculty in Angels, to move Bodies.*

BEſides the Operations of the *Will*, mention'd in the foregoing *Chapter*, there is another whereby a *Spirit* doth move a *Body*, and acts upon another *Spirit* like it ſelf. For this Faculty is ſo intimate to a *Spirit*, that it cannot be conceived without it. We may indeed underſtand a *Spiritual Subſtance*, without the Power of Moving a *Body*, or of acting on another *Spirit*, in the ſame manner as we may underſtand a *Spirit* without the Faculty of *Perceiving* or *Willing*, which are two *Modes* of *Thinking*: But we cannot underſtand a Faculty of Moving it ſelf, or from its own ſtrength, without a *Thinking Subſtance*. And therefore we rightly conclude, That the Faculty of *Moving a Body*, and *Acting upon a Spirit*, do belong to *Intellectual Nature*, and is one Mode of *Thinking*.

II. *The Point confirmed by Examples fetch'd from Scripture.*

That this *Power* is in *Angels*, ſeems unqueſtionable; foraſmuch as *Holy Scripture* doth witneſs, that ſeveral *Bodies* have been tranſlated from one place to another by the Help of *Devils* or *Angels*. Thus we find the *Prophet* was Tranſported from one place to another by an *Angel*; the *Body* of *Chriſt* by the *Devil*, to the *Pinnacle* of the *Temple*; the *Stone* remov'd from our *Saviour*'s *Sepulcher*; and other like Examples, which prove *Angels* to have the Power of *Moving Bodies*.

III. *How Angels move Bodies.*

There remains only one Difficulty to be explained; How *Angels*, that are *Immaterial*, can move *Bodies*, ſeeing they impreſs no *Quality* upon them, neither do communicate ought to the Thing moved, as *Bodies* do.

IV. *Anſwer.*

I Anſwer, That *Angels* move *Bodies* by their *Wills*, neither is there any thing elſe required to it. For tho' *God* (as ſhall be explained in our *General Phyſiology*) be the *Univerſal Principle* of all *Motion* whatſoever; yet this doth not exclude *Particular Cauſes*, that have a Power of *Moving Bodies*, according to that degree which *God* hath been pleaſed to impart with their *Wills*. And tho' it be difficult to comprehend how a *Spirit* doth act on a *Body*, and move it; yet are we not therefore to make a Doubt of it, only becauſe we are ignorant how it is done.

V. *We meet with the ſame Difficulty in our ſelves about Motion, which we find in Angels.*

Indeed, if we duly weigh the Thing, we experience the ſame thing in our Selves: We find that our *Soul* moves our *Animal Spirits*, and directs them into the *Nerves* and *Muſcles*, meerly by the Inclination of the Will it hath to excite this or the other Motion in the *Body*: And we experience alſo, That the Motion of our *Spirits*, *Muſcles*, and *Nerves*, is conſequent upon this Propenſion of the *Will*; and yet all this while our *Soul* doth not underſtand, how and after what manner our *Soul*, being an *Immaterial thing*, moves a *Body*; and therefore neither is it any wonder, if we do not know the manner how *Angels* moves *Bodies*: In like manner neither do we underſtand, how from a certain Motion of the *Spirits* and *Blood*, the Affections of *Hunger* and *Thirſt* are ſtirred up in us, tho' we plainly feel them of our ſelves. Wherefore we are certain that *Angels*, being *Spirits*, move Bodies by their *VVill*, tho' the manner how, be hid from us, as being one of thoſe things our Underſtandings cannot reach.

VI. *Angels may Generate Bodies.*

Neither do *Angels* ſeem to be deſtitute of the Power to produce and generate ſome *Bodies*. For ſince *Generation* is performed by *Motion*, and that nothing elſe is required to *Generation*, but a fit and ſuitable adaption of *Parts*, according to the Conſtitution of every thing; there is no ſufficient Reaſon, why we ſhould deny *Angels* ſuch a Production. For in the *Generation* of a *Plant* or *Animal*, no new *Subſtance* is procreated, but only the *Particles*, whether Senſible or Inſenſible, acquire a new Connexion, and are otherwiſe diſpoſed with relation to their *Magnitude*, *Motion*, *Reſt*, *Figure*, and *Scituation*; after the ſame manner as a *Houſe* or *VVatch*, which are framed without the production of any New Subſtance, by the fit joyning of *Parts* before exiſting. And ſeeing *Angels* have the Power of moving, agitating, and reducing *Bodies* into order, neither can we deny them the Power of *Generating* them. Beſides, *Angels* having great knowledge of *Natural Things*, by the ſtudy of their Virtues and Diſpoſitions ſo many Thouſand years, they cannot be ignorant at what *times*, in what *places*, with what Meaſure the *Qualities* of things are to be temper'd, and what will be the product of the Mixture of ſuch and ſuch *Particles*. Beſides, we ſee *Men*, who are much inferiour to the *Angels*, produce divers things, which before were not extant, and which would never have been ſo without their Induſtry. Wherefore we muſt conclude, that *Angels* will be much more able to do ſo,

VII. *Magicians, by the help of Devils, produce Animals.*

This is prov'd, becauſe *Magicians*, by the aſſiſtance of *Devils*, have produced ſome *Animals*, as *Frogs*, *Serpents*, *Dragons*, *&c.* So the *Scriptures* tell us that the *Magicians* of *Egypt* turn'd their *Rods* into *Serpents*, Exod. *Chap.* 7. Now that theſe were true *Serpents* appears hence, becauſe the *Scripture* tells us, That the *Serpent* into which *Aaron*'s *Rod* was turned, devoured the *Serpents* of the *Magicians*: For otherwiſe we muſt acknowledge, that *Moſes* his *Miracles* were meer *Impoſtures*, and falſe *Appearances*.

VIII. *The Reaſon why Man cannot produce ſome Animals, proceeds from the unſuitableneſs of the Matter.*

If you ſay, That we cannot rightly argue from the *Natural Perfection* of *Angels*, that they have *Power* of *producing Animals*; ſince we ſee that *Men*, who by many degrees excel *Mice*, *Gnats*, *&c.* yet cannot produce or generate them.

I Anſwer, That this Impotence in *Man*, does not proceed from his *Inability*, but from the defect of *Matter*, proper for the procreating of ſuch *Animals*. For every *Body* cannot be framed of every *Matter*, but of ſuch only as *Nature* hath appointed for that purpoſe. For as a *Stone-Cutter* can do nothing without *Sand* and *Stone*, tho' he hath the Power of *Squaring* and *Poliſhing* them; ſo ſeeing that *Man* is deſtitute of fit Matter for the *Generating* of *Animals*, it is no wonder that he cannot produce them. Neither doth it oppoſe this, that divers *Plants*, *Fruits*, and *Flowers*, do ariſe from the *Seeds* that Man caſts into the *Earth*: For if a *Man* had the *Seeds* of *Living Creatures*, and committed them to places ſuitable to their *Nature*, he would produce proportionate *Animals* from thoſe *Seeds*. We may conclude therefore, that *Angels* underſtanding the Virtues of *Herbs*, *Juices*, *Metals*, *Animals*, and *Men*, may take whatſoever is required to the Compoſition of *Bodies*, or *Animals*, and diſpoſing the ſame in a fit place, produce or procreate them.

IX. *Angels cannot Create.*

But tho' *Angels* may produce *Material Subſtances*, yet can they not *create* them, nor *Spiritual things*. For it implies a Contradiction, that a *Creature* ſhould produce any thing out of nothing; *Creation* being an Operation to which nothing concurs, ſave only the *Efficient Cauſe*; but if an *Angel* could create another, this Definition would not hold good; becauſe the produced *Angel* would either totally depend on the Producing *Angel*, or would own *God* alſo for his *Firſt Cauſe*. If the firſt; we muſt be forc'd to admit ſomething Independent in the World, beſides *God*, and ſo *God* would not be the *Firſt Cauſe*. If the ſecond; ſince this Productive *Power* in the *Angel* would be ſubordinate to *God*, the Effect would not be attributable to him, but to the *Primary Cauſe*.

X. *How we are to underſtand that the Efficient Cauſe can produce its own like.*

You will ſay, That a Perfect Efficient can produce its own like; as *Fire* can produce *Fire*, a *Lion* generate a *Lion*; and that therefore an *Angel* being more perfect than any Material Thing, can produce another *Angel*; not indeed by *Generation*, becauſe an *Angel* is a *Simple Being*, not conſiſting of Parts, but by *Creation*.

XI. *Anſwer.*

I Anſwer, That this Maxim of *ARISTOTLE* has no place in *Thinking things*, but only in *Material*, which are ſubject to Corruption, whoſe Property it is to preſerve their *Species*, by the multiplication of *Individuals*: Whereas *Angels*, being exempt from *Corruption* and Materiality, have no need to preſerve their *Species* by *Propagation*.

CHAP. VI.

Of the Number, Diſtinction, and Subordination of Angels.

I. *The Number of Angels is very Great.*

'Tis certain from *Holy Writ*, that there are vaſt multitudes of *Angels*, which tho' they be ſometimes expreſs'd by a certain number, *Dan.* 7.10. *Thouſands of Thouſands miniſtred unto him, and ten Thouſand hundred Thouſands aſſiſted him.* Revel. 5.11. *And the Number of them was, Thouſands of Thouſands*; yet they cannot be reduc'd to any determinate Number. For ſince *Great* or *Little* are only Comparative Terms, and no Number can be called the greateſt, but in compariſon with a leſſer; the Multitudes of the *Angels* muſt be *compared* with ſome other Multitude, that by the Exceſs of either we may find out which is the greater.

II. *According to ſome, the number of Angels far exceeds the number of Men.*

Hence ſome are of Opinion, That the number of *Angels* is very great, if compar'd with the number of *Men*, that are, have been, or ſhall be; ſince it is not probable that *God* hath left ſuch vaſt and magnificent Spaces without *Inhabitants*, except only the *Empyreal Heaven*: And becauſe it ſeems probable to them, that the more *Perfect Beings* ſhould exceed the leſs Perfect and Ignoble, in bulk or quantity, if they be *Extended*; and in Number, if *Spiritual*.

III. *But without any cogent Reaſon.*

This *Argument* would indeed conclude ſomething, in caſe the *Angels* were *Extended Beings*, and took up place; but being *Intellectual* and devoid of Matter, they cannot fill any Space. Nor is the Reaſon that ſupports this *Argument* of any ſtrength: For if it were generally true, that things more Perfect muſt exceed the leſs Perfect in Number, I know no reaſon, but that upon the ſame account it might be concluded, that there muſt be more *Gods* than one; more *Suns* than *Planets*; more *Pearls* and *Precious Stones*, than *Common Stones*; the firſt of which is contrary to *Faith*, the ſecond to *Reaſon*, and the third to *Experience*.

IV. *The Opinion of the Talmudiſts, concerning the Number of Angels.*

The *TALMUDISTS* reduce the *Angels* to certain *Numbers*, diſtributing them into ſeveral *Companies* or *Bodies*, and aſſigning to every one of them a ſet number (as it were) of Inferiours, as *Subjects* or *Soldiers*. For according to *R. F. Georgi* the *Venetian*, of the *Order* of St. *Francis*, the *Talmudiſts* diſtribute the Armies of the *Angels* into *Mazaloth*, *El*, *Legion*, *Rihaton*, *Chirton*, and *Giſtera*. *Mazaloth* they ſay are Twelve, according to the XII Signs of the *Zodiack*. *El* are thirty *Bands* or *Regiments*, for every one of thoſe Twelve; and accordingly there are 360 *Bands* of *Angels*. *Legion* multiplies this Number of 360 by 30; whence doth ariſe the Number 10800. And this Number they multiply again by *Thirty*; which makes up *Rihaton*, conſiſting of *Three Hundred and Twenty five Thouſand*; which multipyed by *Thirty*, makes *Chirton*, conſiſting of *Nine Millions*, *Seven Hundred and twenty Thouſand*. Which they multiply again by *Thirty*; the Product whereof is *Giſtera*, conſiſting of *Two Hundred and Ninety one Million, and Six Hundred Thouſand*. The Sum Total of them all being, *Three Hundred and One Million, Six Hundred Fifty five Thouſand, One Hundred Seventy two*, as appears in the ſubjoyned Table.

12	12 *Mazaloth.*
30	360 *El.*
360	10800 *Legion.*
30	324000 *Ribaton.*
10800	9720000 *Chirton.*
30	291600000 *Gistera.*
324000	3016551 72 *Banns or Regiments of Angels in all,*
30	
9720000	
30	
291600000.	

Whether the *Talmudists* have truly assign'd this number of the *Angels*, cannot be decided by any evident reason: Wherefore we may conclude with St. *Gregory* on the 26. of Job, *Humane Reason cannot assign the Number of the Superiour Spirits: because it doth not know the Multitudes of those Invisible Beings.* And a little after, *The Number of the Spirits or Citizens above can only be counted by God, but are Innumerable, as to Men.*

V. *All the Angels are not of a different Species from each other,*

As to the Difference of *Intelligences*, the *THOMISTS* are of Opinion that all of them differ *Specifically*, and that Intellectual nature is their *Genus*. Their Reason is, because they make Matter the *Principle* of *Numerical Distinction*, and therefore suppose that all *Immaterial Things* must differ Specifically. But this is a mistake, forasmuch as *Numerical Distinction* doth not arise from *matter*, but from the *Essence* it self of every thing whereby it is Distinguisht from others. According to this Axiom, *Form gives the Being to a thing*, or *Essence* is that whereby a thing is principally known and differenc'd from others. *SCOTUS* therefore calls singular *Essence Hæcceity*. For who will say that two *Modes* in the same *Body*, or two *Perceptions* in the *Soul*, differ specifically only because they are without Matter? Besides, two *Humane Souls* are immaterial, their notion involving nothing besides *Cogitation*; and yet no *Body* ever asserted their *Specifical Distinction*: And why may not *Angels* as well differ only Numerically under the same *Species*, forasmuch as no Diversity is found in their *Nature*, which consists in *Cogitation*, nor any so great Distinction with Relation to their several *Offices*? For most of them have like *Offices*, and a common Operation. And therefore it is not to be question'd but that many of the *Angels* are of one *Species* and differ only Numerically.

VI. *Nothing hinders but that there may be many Species of Angels.*

Yet for all this, there may be many *Species*, for ought we know amongst the vast number of *Angels*, especially amongst those who are of a Different *Order* and *Hierarchy*. And this we shall be easily persuaded of by considering the several *Quires* of *Angels*, which seem to differ, as in their *Dignity* and *Offices*, so in their *Essence* also. For these *Functions* being proportioned to their several Natures, prove their different condition. Moreover, as the *Beauty* of this visible *World*, consists much in the Different Species of *Bodily Things*; so likewise we may with more reason conclude that the Invisible *World* is adorned and Beautified with the Diversity of *Spiritual Natures*. Tho' indeed this is a matter we cannot absolutely determine, whether the *Angels* differ *Specifically*, or only *Numerically*, and therefore must say with *Damascenus*, *That he only knows this who hath Created them.*

VII. *The Immense multitude of Angels is distributed into three Hierarchies.*

There is without *Question* an *Order* and *Subordination* amongst the *Angels*, which some call a *HIERARCHY*: This is a Greek Word and signifies *a Sacred Rule or Principality*; or a company of *Sacred Princes*, who with some Subordination constitute one *Body*. This *Hierarchy* is commonly said to be twofold, *Ecclesiastical*, or *Heavenly*; the *Ecclesiastical* consists of *Prelats*, Priests and *Ministers* of the *Church*; but the *Heavenly Hierarchy*, is the whole Multitude of *Angels*, which is divided into three *Hierarchies*, viz. the superior, which by *FLUD* in his *Philosophy*, is called *EPIPHANIA*, to which belong the *Seraphims*, *Cherubins* and *Thrones*; the middle-most, or as he will have it, *EPIPHONOMIA*, which contains *Dominations*, *Virtues and Powers*; and the Lowest or *EPHIONIA*, which consists of *Principalities*, *Archangels* and *Angels*; to all which he assigns several *Offices*. The First of these, because of their most pure *Essence*, he places before *God*, as his *Assisting Ministers*: The second he makes to preside over the *Celestial Spheres*, and to have the Dispensing of their Influences to the inferiour *World*: The Third he makes the Superintendents over *Sublunary things*, as being *Spiritual Creatures* diffus'd through *Bodies*, and Destinated to the Quickening and Moving of them, and are therefore call'd *Ministring Spirits*.

VIII. *The Three Hierarchies explained.*

But because our forementioned *Doctor* writes very Enigmatically, so as to stand in need of an *Interpreter* rather than a *Reader*, I shall endeavour to give a short Explication of every one of these *Hierarchies*. The *First*, *Hierarchy* therefore is so called from the Relation they have to *God*, as being, as it were, his *Grandees* and Honourable Prime *Ministers* and *Officers*, who being nearer to *God*, receive his Commands from his Mouth and impart them to Inferiors. They who are the *highest* in this *Hierarchy* are called *Seraphims*, that is, *Burning* or Flaming, from the fervour of Divine Love Burning in them; being *most pure* themselves, and greatly purifying others, and wholly aspiring to things that are on high. The *Middle* Order is that of *Cherubims*, so called from that Transcendent knowledg of all *Divine Mysteries*. The *Lowest* is that of *Thrones*, who as so many immovable Seats receive the Rayes of *Divine Glory*, and without any motion of their own, abandon themselves wholly to *God*.

IX. *The Offices of Angels of the Second Hierarchy.*

Dominions, who are the first Order of the *second Hierarchy*, preside over those things that are to be done by Inferiour Natures, and by disposing and ordering of them, bear sway in the Government of *Humane Affairs*. *Virtues execute with a masculine and unshaken Fortitude whatsoever they are charg'd with*, as *Dionysius* expresseth it, *Hierarch. cap.* 18. *Being always ready and prepared to perform the Divine will*. Those that are call'd *Powers*, resist *Devils*, and restrain their power, from setting upon Men, and from Tempting them beyond their strength.

X. *The Properties of the Third Hierarchy.*

The Third Hierarchy also hath its particular Properties. *Principalities* are destinated to have the superintendence over *Princes* and *Prelats*: *Archangels* over *Kingdoms*, *People* and Provinces; and Lastly, *Angels* have the care of particular *Persons*,

ſons, and are as it were *Miniſters* and *Meſſengers* between *God* and *Men*. Whence it appears that there are Nine *Quires* or Orders of *Angels*; *Seraphim*, *Cherubim*, *Thrones*, *Dominions*, *Vertues*, *Powers*, *Principalities*, *Archangels* and *Angels*. The *Talmudiſts* alſo agree in the ſame Number, tho they call the ſeveral Orders by other names.

CHAP. VII.

Whether Angels be in a Place.

I. *What Place is, and how many fold.*

BEfore we reſolve this *Queſtion* it will be neceſſary to Enquire what *Place* is, and how a thing is ſaid to be ſomewhere. *Place* is commonly taken for that ſpace in which things are; and it is twofold, either *Internal*, which is nothing but the ſpace it ſelf that every *Body* occupies, and which does not differ from its Extenſion, but by our manner of conceiving it, in that *Extenſion* in a ſpace or place is conſider'd in general, and as common to the *Air*, *a Stone*, *a Book*, &c. whereas in *Bodies*, that are ſaid to be in *Space*, Extenſion is only conſider'd Individually, and as Inſeparable from them. Therefore as a *Body* conſider'd in General conſiſts of three *Dimenſions*; ſo *place* is a Space Extended, according to the foreſaid Dimenſions; ſo that whereſoever there is a *Body* there muſt alſo of neceſſity be a *Space* or *Place*. *External* Place is the ſame with *Internal Place*, ſave only in that it denotes over and above the *Situation* and *Order* it keeps amongſt other *Bodies*; and is properly nothing elſe but the ſurface of a *Body*, that ſurrounds another *Body*, and which with reſpect to the *Body* it ſurrounds, is no more than a *Mode*, ſince it cannot be underſtood without the Conception of a *Body*.

II. *Angels are not in a Place.*

Theſe things being premis'd, I anſwer to the *Queſtion*, that *Angels* and all *Spiritual Subſtances* have no place, neither *Internal* nor *External*. Becauſe to be in a *Place* is the Affection of a *Body*, and therefore *Angels* being *Incorporeal*, and without any *Extenſion*, they cannot take up any place; and if they fill no Space, what *Situation* or *Order* can they have as to other *Bodies*? Wherefore *Spiritual things* can no more be ſaid to be in a *place*, than they can be ſaid to be of ſuch *a Colour*, *Taſte or Smell*, which denote *Bodily Modes*. So that to ſay that a *Thinking Subſtance* can become menſurate to a *Space*, is the ſame as if one ſhould aſſert it to be material.

III. *How we are to Underſtand that common ſaying, that Every thing that is, is ſomewhere.*

You will ſay, if *Angels* be not contained in any *place*, then they muſt be nowhere, which is contrary to that *Axiom* of *Philoſophy*, that *Whatſoever is, is ſomewhere*; *and that whatſoever is nowhere doth not exiſt at all*: But *Angels* do exiſt, therefore they muſt be in ſome place.

IV. *Anſwer.*

I anſwer, if by *Nowhere* you underſtand no Space Meaſurable by *Longitude*, *Latitude*, and *Profundity*, it may be admitted that *Intelligences* in this ſenſe are nowhere, as being devoid of all *Dimenſions*. But if by *nowhere* you mean, that *Immaterial* Beings do not exiſt at all, this cannot be admitted, foraſmuch as in this ſenſe they are *ſomewhere*, that is, they do exiſt. For it is not neceſſary that every thing that exiſts ſhould be comprehended in ſome *Space*, this being only proper to Extended *Beings* or *Bodies*. Yea, even the whole Univerſe, containing the Infinite Expanſion of all *things*, is not comprehended in any *Place*, but is *every where*, that is, we can imagin nothing that doth encloſe and ſurround it. And therefore the Category *Ubi* is only Attributable to the particular *Bodies* of which the Univerſe doth conſiſt, not to the Univerſe it ſelf.

V. *Angels being without Extenſion, cannot be ſaid to be in a Place.*

Foraſmuch therefore, as the *Angels* are deſtitute of all *Extenſion*, and do not concur as Parts to the Conſtruction of the *Viſible World*, as particular *Bodies* do, therefore neither can they be ſaid to be ſomewhere, that is, to take up ſome *Place*. For we are to avoid the perverſe *Cuſtom* of Common *Philoſophers*, who apprehend all things after a *Bodily* manner; by Attributing ſome kind of *Extenſion* unto them. And yet nothing appears more clearly to our Mind, than that *Cogitation*, which Conſtitutes the Nature of an *Intellectual Being*, is devoid of all *Extenſion*, and hath no commerce at all with Matter. Foraſmuch therefore as *Space* in its Conception Involves *Extenſion*, it is evident that it cannot be Attributed to *Spirits*.

VI. *How Angels can be ſaid not to be ſomewhere, ſeeing they are Finite.*

If you urge further, that *Angels* are *limited Beings*, which cannot be preſent to all places; and that which is not every where, is comprehended in ſome *Space*, and anſwers to the Determinate part of the *Divine Immenſity*; and that therefore the *Angels* are in ſome certain *place*.

VII. *Anſwer.*

I anſwer, that this *Argument* is true in one *Senſe*, and falſe in another. It is *true* as to the *Firſt Part*, that *Angels* are *Finite Beings*, as to their *Eſſence* and *Operation*, ſeeing that they are *Creatures*, that depend on their *Creator* both as to their *Conſervation* and *Production*. Yet can they not be ſaid to be *finite* as to *Quantity*, becauſe they are devoid of all *Extenſion*, and in that regard are neither *Finite* nor *Infinite*, and neither take up all *places*, nor are ſhut up in one certain *place*, foraſmuch as to be *Extended*, and to be in a *place*, are one and the ſame *thing*.

VIII. *How the Angels are contained in the Divine Immenſity.*

It is true alſo, as to the *Second Part*, that the *Angels*, as all other *Creatures*, are contained in *Gods Immenſity*; becauſe his *Immenſity* is nothing elſe, but his *Omnipotence*, by which he is preſent to all his *Creatures*, Producing and Preſerving them, as has been explain'd at large in the foregoing part. So that this *Omnipreſence* in *God* is nothing elſe but an *Extrinſecal Denomination* ſpringing from *Gods Operation*, which he works in all *Created Things*. But it is falſe that the *Angels* anſwer to any part of the *Divine Immenſity*, if the *Divine Immenſity* be conceived under the notion of *Infinite Extenſion*, including an Infinite *Quantity* of real or Virtual *Parts*: for ſeeing *God* is moſt *Simple* and free from all manner of *Extenſion*, he cannot be Co-extended to the many *Parts* of the *World*, nor fill any real or Imaginary Spaces.

IX. *The Angels are ſaid to be ſomewhere by their Operation only.*

Foraſmuch therefore as *Angels* do take up no places, and cannot be ſaid with reſpect to their *Subſtance* to be *Here*, *There*, *or Every Where*; it remains that their *preſence* is only determinable by their *Operations*. And this ſeems to follow from the Nature of an *Intellectual Creature*. For ſeeing that the *Angels* are *Active Beings*, and that the life of *Active Exiſtency* conſiſts in Operation, we can only ſay that they are there, where they Operate, *viz.* in a *Body*, or about a *Body*. For ſince things are ſaid to be *ſomewhere* according to their own Proper *Nature*, *Matter* being an Unactive Lumpiſh thing, is *Paſſively* Conſtituted in a *Place*

according to its *Length*, *Breadth*, and *Depth*: whereas a *Spirit* is said to be *somewhat Actively*, viz. by that force and Efficacy, whereby it governs and moves the *Body*, and carries it from one *Place* to another; and so is said to be present to that *Body* in which, and about which it immediately works.

X. *The Soul by its Operation is present to the Body.*

Accordingly in the *Fifth Part of this Institution* it will be declar'd that the *Soul* of *Man* is peculiarly present to the *Conarion* or *Glandula Pinealis*, Situate in the midst of the *Brain*; forasmuch as it Operates, and immediately exerts its *Powers* in the same. In like manner the *Divine Immensity* is deduced from his Operation about this *World*, so that before this Operation he could not be stiled *Immense*, no more than he could be called *Creator*, before ever he had Created any thing: Forasmuch as, according to what hath been said before, *Immensity* denotes only a respect between *Created Things*, and *Gods Operation* about them. And upon this account it is that when we *pray* to *God*, we assign his proper place in *Heaven*, because he there exerts his most wonderful *Operations*, and more Efficaciously manifests his *Power*.

CHAP. VIII.

How Speech is attributable to Angels?

I. *Speech is twofold.*

NOtwithstanding that *Angels* are simple *Beings*, and do not consist of *Soul* and *Body*; yet most *Metaphysicians* Attribute *Speech* to them, whereby they are capable of conversing with one another. For that is not only call'd *Speech*, which is performed by the outward *Organs* of the *Body*, but also that inward *speaking* of the *Mind*, whereby it *thinks* or *perceives*; according to that Expression of the XIV. Psalm. *The Fool hath said in his Heart, &c.* and suitable to that way of *speaking* we so frequently use, when we say to others *What saith your Heart to this or that?* And of this manner of *Speech Divines* are to be understood, when they enquire whether *Angels Speak*, and make known their Conceptions to one another.

II. *'Tis not necessary that Angels should speak to one another.*

This *Question* may be resolv'd from the Third *Chapter*; for seeing that *Angels* penetrate each others *Thoughts*, and Voluntary Determinations, they do not seem to need *Speech*, because this is only requisit for Communication, and mutual *Society*. For there are four things required to *Speech*. *First*, that it be free, according to the will of the *Speaker*. *Secondly*, That it be discovered only according to his intent and likeing; so as to reveal secrets to those to whom it is directed, and conceal them from others tho' present. *Thirdly*, that the *Speaker* be able to excite him whom he is about to *speak* to, tho' he may be busied about other *thoughts*. *Fourthly*, That he that *hears* may know from whom the *Speech* procceds.

III. *Angels cannot speak according to these Conditions of Speech.*

But how shall the *Speech* of *Angels* be Free, when their *thoughts* are always open to others? and seeing it is not in their *Power* to conceal their *thoughts* from others? How will they be able to chuse their *Auditors*, so as not to open their *Secrets*, but to whom they please, since it is not in their *Power* to hide them, and that their *Perceptions* are as Natural as their *Substance*? Moreover how will they be able to excite their *Auditors* to the understanding of what they have to *say*, since they have nothing new to manifest to them? Lastly, how shall the *Auditor* know him that *speaks* to him, and Distinguish him from others, if he be not call'd upon, and if from his knowledg nothing accrue to him? Wherefore we must conclude that *Angels* do not discourse together after the manner of *Men*; but that they so understand each others Conceptions, as that nothing is hid from them. Whence *Divines* tell us that *the Language of Angels is their Understanding*.

IV. *Some Scriptures explained which attribute Speech to Angels.*

Neither is it any contradiction to this, what the *Scripture* mentions of the *Discourse* and *Speech* of *Angels*, as that of the 7th of the *Revelation*, where an *Angel* is said to *call with a loud Voice to the four Angels*; and in the 6th of *Isaiah* tis said that *the Seraphims cried one to the other and said*, &c. And the *Apostle* saith in the 13 *Chapter* of the first Epistle to the *Corinthians*, *If I speak with the Tongues of Men and Angels*, &c. because the *Speeches* here spoken of are *Visionary* and only seem'd to be utter'd by the *Angels*. For *Spirits* do not discourse together by an outward *Voice* formed in the *Air*; neither do they discover their *thoughts* as we do by any outward *Organs*. Therefore these *Speeches* were seemingly heard by the *Prophets*, for their *Illumination*, and that Posterity *Reading* their *Writings*, might be acquainted with those *Mysteries*, and be assur'd of them by their *Testimony*. As to that Expression of the *Apostle*, who *Attributes Tongues* to *Angels*, this must not be understood of those *Internal Speeches* which *Angels* use amongst themselves; but of those which *Angels* in former times used amongst *Men*, to manifest their Conceptions unto them, which tho' they were known and understood by *Believers*, yet served only to strike *Unbelievers* with *Wonder, and Astonishment*. And that this is the Genuine Sense of the *Apostle* in this place, appears from the *Words* immediately following, *and have not Charity, I am become as sounding Brass, or a Tinkling Cymbal*; which is only applicable to outward *Speeches*, that is, to *Sounds* and *Voices* utter'd by *Bodily Organs*, which we know cannot be fram'd by *Angels*.

V. *The Manner how the Angels speak is inexplicable.*

Neither indeed can it be shewed, how *Angels Speak* or *Discourse*, since it may be question'd whether the *signs* wherewith they express their *Thoughts* be *Spiritual* or *Corporeal*. And again, whether those *Signs* be Natural, or Voluntary. Whether all *Angels* make use of the same *Signs*, or every one of them have *Signs* peculiar to themselves. How it comes to pass, that when one Angel *speaks*, all the rest (without any difference) do not hear his *Speech*? By what Artifice their *Communication* may be hindred? Whether against their Will they perceive the *Speeches* of others; or whether their *Consent* be required to the perception of them? Whether *Angels* can reveal their *Thoughts* to some, and hide them from and impose them upon others? Which things, and many other such like, cannot be attributed to these *Heavenly Spirits*, and therefore prove their Conversation to be different from ours.

VI. *Superior Angels inform the Inferiour of things unknown to them.*

It remains therefore, if *Speech* be attributable to *Angels*, that the same only belongs to *Superiour Angels*, with respect to such as are *Inferiour*: For seeing that *Speech* is the manifestation of something unknown, if any New thing be discovered to them, it must proceed from the *Superiour Angels*. Wherefore *Divines* admit *Illumination*, which is a kind of *Speech*, to be amongst *Angels*, whereby they

they reveal unknown *Truths*, received from *God* to one another. And accordingly *DAMASCENUS* tells us in his *Second Book of Faith*, Chap. 3. *It is evident that all the Superiour and higher Angels, do impart their Light and Knowledge to the Inferiour.* So that a more excellent *Angel* is as a Light to those that are under him, to illuminate them, and communicate new *Knowledge* to them.

VII. *Sometimes this Order is changed.* But tho' this manner of *Illumination* be the most ordinary and best agreeing with the *Angelical Orders*; yet it is not necessary that it should always be after the same way: For without doubt *God* may manifest a Mystery to some *Inferiour Angel*, which by him may afterwards be communicated to the Superiour; and accordingly some think it probable, that *God* communicated his purpose of being *Incarnate*, only to the *Archangel GABRIEL*, who was to carry the Message of it to the *Blessed Virgin*; notwithstanding that he belonged to the *Inferiour Hierarchy*. But according to the ordinary course, the *Superiour Angels* Speak, and the *Inferiour* Hear and Listen; the former, as *DIONYSIUS* tells us, being the *Guides* and *Teachers* of the latter.

CHAP. IX.

How Angels assume Bodies, and what Actions they exert in them.

I. *Apparitions of Angels have been very frequent.* IT cannot be question'd, but that *Angels* and *Devils* do really appear, and take up *Bodies* to make themselves Visible; this being a thing abundantly confirm'd by Profane and Sacred *History*. Thus the *Devil*, in the appearance of a *Serpent*, Tempted *Eve*, Gen. 3. *Three Angels appeared to Abraham*, Gen. 18. *Two Angels came to* Sodom, *Gen.* 19. The Angel *Gabriel* appeared to the *Blessed Virgin*, and brought her the Message of the *Divine Incarnation*. Neither can these *Apparitions* be ascribed to the Power of Imagination, or some Melancholy Humour, forasmuch as these *Bodies* can be felt, and manifest themselves by *Corporeal qualities*. Seeing therefore we cannot doubt of the Truth of these *Bodies*, it remains only to enquire, what kind of *Bodies* are fit for this use, and what Actions *Angels* exert in them.

II. *What kind of Bodies Angels do assume.* As to the first of these Enquiries, it seems probable that the *Angels* chiefly assume *Aery Bodies*, which they form by their own *Power*, and adapt them to their Intention; so as that from the Different Disposition of the *Parts*, Variety of Colours do arise, and the *Figure* of a *Man* or *Beast* be represented to the *Beholder*. For these *Bodies* having real Extension, and being variously terminated, may according to the various *Reflexion* or *Refraction* of *Light* appear of another *Figure*, *Situation* and *Bulk*, than indeed they are. In this manner, the *Devil*, according to the Relation of *William of Paris* in his last part of the Universe, deluded a *Souldier*, by assuming the *Dead Carkase* of a *Beast*, who supposing himself to have enjoyed a Beautiful *Young Woman*, found himself, in the embraces of a loathsome rotten *Carrion*: Which sort of Delusions are peculiar to *Devils*, who Understanding the Nature of *Bodies*, and being skill'd in Perspectives, can so order the matter, as to make things appear quite otherwise than they are.

III. *Angels can appear without Bodies.* Tho' this be the receiv'd Opinion amongst *Divines*, that *Angels* and *Devils* can assume true *Bodies* in order to their appearing to *Men*; yet I do not see but that they may visibly shew themselves without the taking up of *Bodies*. For seeing *Bodily things*, as *MAGNANUS* tells us in *his Philosophy of Nature Cap.* 33. have no other Power of Acting, than that of moving or resisting *Local Motion*, it will follow, that they appear to our *Senses* either by the Motions they impress upon them, or by their resisting of other *Motions*. Wherefore since we understand that a *Spirit* can exert all those *Motions* on our *Senses* which any *Bodily Substance* can, and likewise resist other Motion as well as any *Body* whatsoever; we may likewise conceive how a *Spirit* may be perceived by our *Senses* under the Corporeal Form of that *Body*, whose Manner and Measure of Motion, or Resistance of Motion, he shall purpose to imitate. Wherefore an *Angel* in Order to his appearing will not need to make himself a Body of such a *Colour*, *Figure* and other *Qualities*, as he intends to appear with; but it will be sufficient, if he only Refract and Reflect the *Light* in such a Manner and Measure, as that *Body* would, in whose shape he desires to appear.

IV. *How an Angel can make a sound to be heard.* In like Manner when an *Angel* has a mind to make himself *heard*, it will be sufficient, if he only so beat and agitate the *Air*, as that *Sounding Body* would do whose *Sound* or *Voice* he designs to imitate. For by this means the Agitated *Air*, will communicate the Motion it hath receiv'd from the *Spirit* to the *Drum* of the *Ear*; and consequently will perceive a *Sound* like to that which the *Body* would have caused. And by this means an *Angel* or Soul may at pleasure appear to one *Person*, and hide himself from another, which would be impossible for them to do, after having assum'd an *Aerial Body*; because such a *Body* would indifferently appear to all.

V. *Supposing Angels to assume Bodies, what they do with them, and work in them.* But forasmuch as both *Angels* and *Devils* do sometimes assume true *Bodies*, as hath been shewn from *Holy Scripture*, we are next to enquire how they are present to these *Bodies*, and what they *Work* in them.

VI. *Angels are not so intimately joyn'd to the Bodies they assume, as Souls are to their Bodies.* *Angels* are not in *Bodies* after the same Manner as *Souls* are, so as that the Motions of the assumed *Body* and *Spirits* should follow the Voluntary Determinations of the *Angels*, and that the *Angels* also should be affected by the *Bodies* assumed. For herein doth the Union of *Spiritual* and *Bodily Things* consist, as shall be shewed in the ninth part of this *Institution*. Because it is one thing for a *Spirit* to be present to a *Material thing*, and another to be united to the same: Whenever a *Spirit* is joyned to a *thing*, he is also present with it; but not on the contrary; for a *Spirit* may be present with a thing and yet not be united to it. Now that conjunction which is between an *Angel* and his assumed *Body*, is not much unlike that, whereby the *Master of a Ship* is present to his *Vessel*, a *Coach-man* to his *Coach*, and a *Rider* to his *Horse*. For as the *Master* of a *Ship* may leave it, and return to it again at his pleasure; so the *Angels* may when they please quit their assumed *Bodies*, and remove into others; which they could not do, in case they were substantially united to them, as *Souls* are to the *Bodies* they animate. And as many *Pilots* may be in the same *Ship*, so more *Angels* or *Devils* than one may be in the same *Body*, as appears from the *Gospel*;

Goſpel; but many *Souls* cannot be joyned to the ſame *Body*. The *Soul* is frequently againſt its Will united to a *Body*, and cannot at pleaſure be ſeparated from it, whereas an *Angel* is never unwillingly join'd with the *Body* it aſſumes. We conclude therefore that *Angels* are only accidentally, and as aſſiſting Forms join'd to the *Bodies* they aſſume.

VII. *Angels exert no Vital Actions in Bodies.*

From what hath been ſaid, it is evident what *Angels* can perform in the *Bodies* they take up, and what Actions they exert in them; for it is manifeſt that they can produce no *Vital Operations* in them; for tho' they be willing to *Eat* or *Drink*, yet are they never troubled with *Hunger* or *Thirſt*; and tho' they really *Eat* and *Drink*, yet have they no *Senſe* of it; and the like may be ſaid of other *Corporeal pleaſures*, which no more affect the *Minds* of *Angels*, than that of *Eating* or *Drinking*. For all theſe ſuppoſe the union of a *Spirit* with a *Body*; and do not ſo much belong to the *Mind* as to the *Body*. For he who reſolves for *the Love of God* to abſtain from *Eating*, hath no will to *Eat*, becauſe he is otherwiſe determin'd; and yet frequently feels the gnawing of his *Stomach*, and *dryneſs* of his *Throat*, and a natural deſire to *Eat* and *Drink*. And in like Manner *Venereal pleaſure* belongs to the *Animal* and *ſenſitive life* we have here, but not to the life we ſhall enjoy hereafter: *for in the Reſurrection*, as the *Scripture* ſaith, *Mankind ſhall be like the Angels, in Heaven and neither Marry, nor be given in Marriage*. Matth. 22. 30.

VIII. *Devils cannot generate.*

Whence it appears, that it is altogether irrational what ſome aſſert, that *MERLIN* was begot by a *Spirit*; that the People called *HUNNI* were begotten by *Satyres* on the Bodies of *Gothick Witches*; or that *CORCOTON* a *Dæmon* in *Hiſpaniola*, was us'd to beget on the *Bodies* of *Women*, Births in the ſhape of *Men* with *Horns* on their *Heads*. Theſe and ſuch like *Stories* I take to be meer *Fables*: For ſeeing that *Devils* are *immaterial*, they can neither yield any Matter fit for that purpoſe of themſelves, nor take it from any other *Body*, foraſmuch as it is a part of the *Living Body*, and the remainder of the beſt concocted Aliment.

CHAP. X.

Whether there be any Order amongſt the Devils; and what kind of Order that is.

I. *Since Angels have different Offices, there muſt be ſome order amongſt them.*

FOraſmuch as the *Devils* are deputed to different *Works*, and according to *TRITHEMIUS* his Opinion, are ſent abroad into divers parts of the *World*, they muſt of neceſſity obſerve ſome Order, and ſomewhat imitate the *Government* that is amongſt the *Angels* of *Light*. For ſeeing they perform various *Offices*, and inhabit the *Fire*, *Air*, and *Earth*, as alſo the *Waters* and *Bowels* of the *Earth*, and that in perpetual Darkneſs; it does not appear how they could be kept to their ſeveral *Tasks* and *Duties*, if there were not ſome dependence between them, and if they did not derive their Power from one *Head*. Wherefore, *LUCIFER* in *Holy Writ* is called the *Devil*, becauſe he is the *Prince* of all the *Devils*: And accordingly when the *Phariſees* told our *Saviour* that he caſt out *Devils* by *Beelzebub* the Prince of *Devils*; he replies: *If Satan be divided againſt himſelf how ſhall his Kingdom ſtand?* By which *Words Chriſt* himſelf ſuppoſeth that there is a Primacy, and conſequently a Government amongſt *Devils*.

II. *The Power that Angels have, is not proportion'd to their Perfection.*

The only difficulty here is to explain wherein the mutual ſubjection of the *Devils* is founded. Some fix it in the different Perfection of *Devils*, as ſuppoſing them to be endued with *Power*, according to the Proportion of their *Dignity*. But this ſeems to be ſaid without ſufficient ground; for there ſeems to be no Connexion between *Natural Perfection*, and *Command* or *Moral Præeminence*, except that the one ſhould neceſſarily follow from the other; or that one ſhould be the Rule of *Manners*; neither of which can have place in the *Devils*; for otherwiſe an Inferiour *Angel* would have as many *Commanders* and *Rulers*, as there are *Angels* more perfect than himſelf, which would be a moſt miſerable State of Slavery, and Incomparably worſe than any other.

III. *The Commonwealth of Devils is eſtabliſht by their mutual conſents.*

It ſeems more Rational to conclude that the Form of their *Commonwealth*, hath proceeded from themſelves, and been eſtabliſhed by their mutual conſent. For tho' the *Devils* be exceeding Proud, and each of them hath Ambition enough to aſpire to be *Governour* in chief; yet becauſe they are full of *hatred* againſt *God* and the *Envy* they bear to *Mankind*, they ſuppoſe they can take no better way to *Rob God* of his *Honour* and to deſtroy the *Souls* of *Men*, than by mutually agreeing to ſubmit themſelves to a *Government* ſetled by *Laws*. Wherefore the *Devils* choſe *Lucifer* the firſt Author of the *Rebellion*, to be their *Prince*, as *Robbers us'd* to do, who having join'd themſelves together, chooſe one from amongſt themſelves to be their *Captain*.

IV. *The Devils are divided into Nine Orders, like the Angels.*

But what kind of *Government* the *Devils* have amongſt themſelves, is not eaſily Determinable, except we aſſent to them who divide the *Devils* into three *Hierarchies* and nine *Quires*, like the *Angels*. For ſo *CORNELIUS AGRIPPA in his third Book of Occult Philoſophy* tells us, *that there are Divines, who diſtribute the Devils into Nine Ranks, as ſtanding in Oppoſition to the Nine Angelical Orders*. Whoſe Opinion he follows and ranks them ſo himſelf.

V. *The Firſt Order of Devils.*

The Firſt Order of *Devils* according to *Agrippa*, are the *PSEUDOTHEI*, or *Falſe Gods*, who Uſurping the name of *God*, preſume to be worſhipt like *God*, and to have *Sacrifices*, and *Adorations* made to them; like that *Devil*, who ſaid to *Chriſt*, *All theſe things will I give thee, if thou wilt fall down and Worſhip me*, ſhewing him all the *Kingdoms* of the *Earth*. And the *Prince* of theſe is he who ſaid, *I will aſcend above the height of the Clouds, and will be like the moſt High*; and who is therefore called *Beelzebub*, that is, the old *God*.

VI. *The Second Order.*

The *Second Order* are the *Lying Spirits*, ſuch as he was that entred the *Prophets* of *Ahab*, and was a *Lying Spirit* in their *Mouths*. And the *Prince* of theſe is the Serpant *PYTHON*, from whence *Apollo* is called *Pythius*, and that *Woman Pythoniſſa*, 1 *Sam.* 28. as alſo that Other in the *Acts* of the *Apoſtles*, *Chap.* 16. This ſort of *Devils* make it their buſineſs to delude Men by Ambiguous or falſe *Oracles*, *Divinations*, and *Predictions*.

VII. *The Third Order.*

The *Third Order* of them are *Veſſels of Iniquity* which are alſo called *Veſſels* of *Wrath*. Theſe are the Inventers of all *Wicked Arts*; ſuch as was the

Devil THEATUS mention'd by *Plato*, who taught Men to *Game* and *Play* at *Dice*; for from these all *Crimes* and Wickedness do proceed, according to that of *Jacob*, *Gen.* 49. 5. where detesting the cruel Massacre committed by his Sons *Simeon* and *Levi* upon the *Sichemites*, he saith, *Vessels of Iniquity are in their Habitation: O my Soul come not thou into their Secrets*, &c. The Psalmist calls them *The Vessels of Death*; Isaiah, *the Vessels of Fury*; Jeremy *the Vessels of Wrath*, and Ezekiel *the Vessels of Murther and Destruction.* Their Prince is *BELIAL*, which signifies without a Yoke or Disobedient, and is mentioned by St. *Paul* 11. *Cor.* 6. 15. where he saith, *What Concord hath Christ with Belial?*

VIII. *The Fourth Order.* Those of the Fourth Order are called *Avengers of Wickedness*, whose Prince is *ASMODEUS*, the Executioner of *Justice.*

IX. *The Fifth Order.* The *Devils* next to these are *Juglers*, so called, because they imitate *Miracles*, and assist *Magicians* and *Witches*, seducing the People by their seeming *Miracles*, as the *Serpent* seduced *Eve.* And their Prince is *SATAN*, of whom it is written in the *Revelation*, that *he deceives the whole world, working great Miracles, and causing Fire to come down from Heaven in the sight of Men, and deceiving the Inhabitants of the Earth, by the wonders he doth.*

X. *The Sixth Order.* The *Sixth Order* are those that are called *the Powers of the Air*; these are very busie in *Wonder* and *Lightning*; they corrupt the *Air*, and cause the *Plague*; and of this Number were those, of whom the *Revelation* mentions, that it was given to them *to hurt the Earth and the Sea.* And their Prince is *MERIZIM.* This is the *Noon-Devil*, the *Burning Spirit*, and the *Devil* that rageth at *Noon*; whom St. *Paul* in his *Epistle* to the *Ephesians* calls *The Prince of the Powers of the Air, the Spirit that Works in the Children of Disobedience.*

XI. *The Seventh Order.* The *Seventh Rank* or Order is that of *Furies*, the sowers of *mischief* and Dissension, of *Wars* and *Devastations*; whose Prince in the *Revelation* is called *APOLLYON*, and in Hebrew *Abaddon*, that is, the *Destroyer.*

XII. *The Eighth Order.* In the eighth Order are *Accusers*, whose Prince is called *ASTAROTH*, that is, a Spie; and in Greek *Diabolus*, that is to say a *Slanderer*; who in the *Revelation* is called *the Accuser of the Brethren, who accuseth them before the Face of God, day and night.*

XIII. *The Ninth Order.* The last Order of *Devils* are those that are called *Tempters*, or *Lyers* in wait, who do accompany Men continually to tempt them to *Evil*, and are therefore called *Bad Angels.* Their Prince is *MAMMON*, that is, *Lust* or *Concupiscense.*

XIV. *This Ordination of the Devils is not to be respected.* And tho' this Ordination of the *Devils* be no where else to be found but in *Agrippa*, yet is it not therefore to be the less esteemed, seeing that it imitates the Orders of the *Good Angels*, and is derived and descends from *Lucifer* the Prince of the *Apostate Spirits*: So that as *God* hath his *Angels*, so *Lucifer* hath his *Devils.*

CHAP. XI.

Of the Care of Angels about Mankind, and the things here below.

I. *There is a twofold care of Angels.* IT is manifest that *God* makes use of the *Ministry* of *Angels*, in the Ordering of things below; and there seems to be a twofold care in them; the one *General*, whereby they are concernd for the whole *World*; the other *particular*, whereby they watch over particular *Men.* Wherefore *NAZIANZEN* in his 6*th.* Poem writes thus concerning them.

Some with most Awful looks surround the Throne,
Ready and Girt t'obey the Holy one:
Others support the World, and lend their Aid
To all the Several Creatures God hath made.
Their Care is diverse, as are Gods Commands,
These govern Men, and Those Cities and Lands.

II. *The Opinion of the Ancients concerning the Guardianship of Angels.* Accordingly the Ancients tell us of *Universal Angels*, every one of which did preside over a whole Nation, and were called the *Angels* or *Genius* of such or such a *Nation*: And of *Particular Angels* that are singly appointed to take care of this or the other particular *Person*, and are more particularly called *Genii*, because they superintend the Generation of particular *Persons*, and as soon as they are born do inseparably assist them. Such an *Angel* as this is called by *Epictetus* a Keeper, Particular Overseer, a Domestick *Spie*, a Proper *Curator*, an intimate *Cognitor*, a Continual *Observator*, an Individual *Arbiter*, an Inseparable *Witness*, a Reprover of *Vice*, and an Approver of *Virtue.* *O ye Men* (saith he in *Arrian*) *take it for granted, that every one of us is committed to the care of a certain diligent and worthy Keeper: Whensoever therefore you shall have shut your Doors upon you, and shut out the Light from you, take heed you do not conceit your selves to be alone; for most certain it is you are not so; for God is with you; and so likewise is your good Angel.*

III. *The same confirm'd by Christians.* What the Ancients called *Genii*, the same the *Christians* call *Angels*, and do own both their General and special *Guardianship.* For all *Christians* hold it for an undoubted *Truth*, that they have *Angels* deputed by *God* to be their *Keepers* and Companions, to inspect their *Actions*, to divert Mischief from them, and to take care for their *Future Bliss* and *Happiness.* For thus much may be deduced from the *Offices* of *Angels*, who, as the *Apostle* tells us, are *Ministring Spirits*, whose duty chiefly it is to put by the *Devils* Snares, to exercise *Mens Minds* to *Virtue*, to raise up such as are fallen, to suggest good advice, and to present their *Prayers* and Wishes to *Almighty God.* Indeed for this very cause they are called *Angels*, as being a kind of *Messengers* betwixt *God* and *Men*, whom they are to direct as *School-masters* and *Pastors.*

IV. *The Angelical care is deducible from the Providence of God.* In this *Angelical* superintendency, the Providence of *God* most clearly appears, forasmuch as he *governs* and *rules* these things here below, by *Superiour Powers*, and *Administers* changeable *things*, by such as are *Spiritual* and unchangeable. *For as by the Prudence and Forecast of a Good Emperour* (saith *Chrysostom*) *all Cities, Towns and Castles, are furnisht with sufficient Garrisons against any Hostile Invasion, and all places so provided with Arms, that they may not stand in fear to be laid waste by a Barbarous Incursion: In like manner God, because the Devils with Barbarous and cruel minds are always hovering about us to overthrow our peace and happiness, appoints for our Safeguard the Hosts of his Angels, that by their presence, the stout boldness of the Devils may be repress, and the Grace of Peace vouchsafed to us.* For *Angels* are, as it were, the *Protectors*

of Men, ſpecially deputed by *God* for their Safety: Not as if *God* were unable to ſave them; but as a *King*, who orders his faithful *Officers* to cruſh the Deſign of his *barbarous Enemies*, and to Chaſtize the *Inſolence* of his *Subjects*.

V. *The ſame confirmed by Scripture.*

Scripture alſo confirms the ſame to us: *Do not deſpiſe one of theſe Little ones* (ſaith our *Saviour*,) *for their Angels continually behold the Face of my Father which is in Heaven.* Wherefore it nearly concerns us always to continue in the *Fear* of *God*, as being certain that we have *God*'s *Angels* about us, who obſerve all our *Thoughts* and *Actions*: And whenever we do that which is good, we cauſe great *Joy* to our *Angels*; whereas, if we do *Wickedly*, we drive them with grief away from us, and make way for the *Devils* to come to deceive and enſnare us.

VI. *The Effect of the Guardianſhip of Angels.*

We ſee therefore that the Aſſiſtance of *Angels* is of great advantage to *Men*, by procuring them much *Good*, and by diverting many *Evils* both from their *Souls* and *Bodies*. They greatly aſſiſt our Minds, by enlightning our *Underſtanding* to perceive *Truth*, and by exciting our *Will* to the exerciſe of *Vertue*, and to embrace the *Good* that is offered to us: They alſo put by many *Evils* which threaten our *Bodies*, whether from *Natural Cauſes*, or from *Free Agents*, as from *Men* that are our *Enemies*, and from *Devils*; and prevent them from hurting thoſe, whoſe Safety they take to heart. Sometimes alſo they ſend *Sickneſs* and *Adverſity*, to correct Mens *Vices*, and thereby to reduce them to a ſober and ſound *Mind*. Yea, and ſometimes may inflict *Death* alſo, and that in great Kindneſs; foraſmuch as it may be very profitable and neceſſary for ſome to be taken out of the *World*, leſt being overcome by the *Vanities* and *Luſts* of this *World*, they ſhould run themſelves into *Perdition*.

VII. *The Superintendence of Angels, extends it ſelf alſo to Countries and Cities.*

As there are *Special Angels* conſigned to the *Guardianſhip* of *Men*, ſo there are others who have care of *Cities* and *Countries* committed to them, who, as ſo many *Preſidents*, or *Lords Lieutenants*, do watch over them for their Good. And as a whole Nation doth in *Dignity* far exceed every particular Member of it; ſo do the *Angels*, that preſide over a whole *People*, excel thoſe who have the Care only of ſome particular *Perſon*. Now that *Nations* have their *Guardian-Angels* alotted them, is moſt evident from *Scripture*, Deut. 32. 8. *When the Moſt High divided to the Nations their Inheritance, when he ſeparated the Sons of* Adam, *he ſet the Bounds of the People according to the number of his Angels*, as the *Septuagint* expreſſeth it. Wherefore the *Ancient Fathers* believed, that the *Archangels* had the Care committed to them of the Government of the *Univerſal Church*. Thus we read that *MICHAEL* fought with the *Dragon*, ſtood up for the defence of the People of *Iſrael*, is the *Provoſt* of the *Church*, and aſſiſts particular *Angels*. What is more clear in *Scripture*, than that *GABRIEL* was ſent with a Meſſage to the *Bleſſed Virgin*, about the *Salvation* of *Mankind*? and that *RAPHAEL* was ſent to Succour *Iſrael*, and to exhort them to the *Fear* of *God*? All which are evident Teſtimonies of the *Publick Miniſtry* and *Adminiſtration* of *Angels*.

OF THE
INSTITUTION
OF
PHILOSOPHY.
VIZ.
GENERAL
Natural Philosophy.

CHAP. I.
Of the Essence and Certainty of Natural Philosophy.

I. *What Natural Philosophy considers.*

HAving considered the *Nature* of GOD, and enquired into his *Attributes*, as far as *Human Weakness* would permit, and afterwards examin'd the *Essence* of *Angels* and *Devils*, and discovered their *Faculties* and *Operations*; PHYSIOLOGY comes next to be considered by us, which contemplates *Natural Things*, and deduceth their *Causes* from their *first Original*. For the Order of *Nature* seems to require, that having laid down a *Supream* and *Universal Principle*, we should next proceed to the examining of its *Effects*, that *Affections* belonging to them may be discovered to us.

II. *What Natural Philosophy is.*

Natural Philosophy therefore, or *Physiology*, is *the Science of Natural Bodies, and their various Affections.* And therefore is called *Natural Philosophy*, because it enquires into the *Essence* of *Material things*, and treats of their *Properties*, *Accidents*, or *Modes*: And those are called *Natural Things*, or *Bodies*, which are endued with *Nature*, or that are compounded of *Matter* and *Form*, which are the inward Principles of their *Activity*, *Passibility*, and *Cessation*.

III. *The Word NATURE taken in a threefold Sense.*

The Word NATURE is of various Signification: First, and more strictly, it is taken for the peculiar Disposition of *Parts* in some particular *Body*: For when we say, that it is the *Nature* of *Fishes* to *live* in the *Water*; it is the same as if we said, that the Disposition of their *Organs* is such, as makes the *Element* of *Water* most suitable to them. *Secondly*, It is taken more largely for the Universal Disposition of all *Bodies*: And in this Sense it is nothing else, but *the Divine Providence, forasmuch as it governs and directs all things by certain Rules and Laws, accommodated to the Natures of things.* Wherefore *God* is said, to *cloath the Lillies of the Field*; to *send Rain upon the Good and the Bad*; and to *give Food to all living Creatures*; because, that by the *Rules* by him prescribed, all things conspire to the producing and maintaining such Effects as these. *Thirdly*, It is taken for the *Essence* of any thing, with the *Attributes* belonging to it: Thus we say, that it is the *Nature* of GOD to be *Good*, and the *Nature* of the *Soul* to *Think*.

IV. *Natural things do not differ from Artificial.*

Neither do *Natural things* differ from those that are made by *Art*, save only in this, that in the former, how mean soever they be, there appears a far more excellent *Artifice*, and more exact contexture of *Parts*, than in the latter. Yet this is common to them both, that they are moved from an inward *Principle*, and perform their *Functions* by their own Virtue. For a *VVatch* or *Clock* is no less moved of it self, by the Figure of its *VVheels* and *VVeights*, than a *Ball* of *Lead* is, whilst it falls down through the *Air*, towards the Center of the *Earth*. For every Natural thing is moved by a *Motion* deriv'd from another, and doth always retain the same, till it be put by by a stronger.

V. *Physiology is a true Science.*

Now that *Physiology* is a Species of *Science*, and is conversant about things that are True and Necessary, appears from the *Demonstrations* that are made of *Natural things*; the Certainty whereof depends on the Stability of the Things that are defined, and supposeth their determinate Essence. For Example, this way of Arguing; *Every Extended thing is Divisible*; *A Body is Extended*: *Therefore a Body is Divisible*, could never be esteem'd a Demonstration, if it were not most

certain

certain that *Extension* enters the Nature of a *Body*, and that *Divisibility*, as a Property, ariseth from it. Now it is notorious, that all certain and necessary Knowledge, is *Science*; since no such can be had, but where the *Effects* are demonstrated by their true *Causes*: And that many such may be had in *Natural Philosophy*, is not to be question'd. For we know that *Matter* is moveable, because it is a *Substance* extended in *Length*, *Breadth*, and *Depth*. We know that every *Body* may be carried on from one place to another; because it implies a Contradiction, for one and the same *Body* to be in two places at one and the same time. And innumerable such like, which a *Natural Philosopher* considers as so many unshaken *Truths*, that cannot be gain-said by any Person in his Wits.

VI. *Whether Natural things be discerned by the Senses.*

If you say, That the Certainty which is required to *Science*, cannot be had in *Natural things*, seeing that *Bodies* and all their *Attributes* are only perceived by the *Senses*; which being liable to Mistake, may represent False things to the *Understanding*: Whence it is that not only *Children*, but also *Men* of Age labour under so many Prejudices, which they being unable to correct, persevere in their *Errors* to their Lives end.

VII. *Material things are not discerned by the Senses.*

I Answer, It is False that *Material things* are known by the *Senses*, as I have shewed by the Example of *Gold*, in the *Second Chapter* of the *First Part* of my *LOGICK*; forasmuch as it continues always the same, tho' it puts on divers Forms, and appears variously to the *Senses*. For if we mind well how far our *Senses* reach, and what that precisely is, which they represent to our *Minds*; we shall find, that they give us no such Notions of *Material things*, as we in our *Minds* have of them: And indeed, to speak properly, nothing is conveigh'd from things without us, by the *Organs* of *Sense*, to our *Minds*, save only some *Bodily motions*, by which the *Idea's* of *Objects* are offer'd to them. For what doth our *Sight* exhibit to us, besides outward *Images*, or our *Hearing*, besides *Voices* and *Words*? So that if we do apprehend any other thing besides those *Pictures* and *Voices*, that is, their Signification; we may be sure the same is offer'd to us, not by our *Senses*, but by those *Idea's* or *Notions* that proceed from our *Thinking Faculty*.

VIII. *But are apprehended by the Understanding only.*

Wherefore, *Bodily things* are not known by the *Senses*, but by the *Understanding* alone: So that to be sensible of a *Material Substance*, is nothing else, but to have an *Idea* of it, which is not the work of the outward *Senses*, but of *Cogitation*. Neither must this seem strange unto us, seeing that *Certainty* is required to perfect *Knowledge*, which since it cannot be had from the *Senses*, as being subject to *Error*, we must have recourse to the Certainty of the *Understanding* that may correct our *Errors*, and represent the true *Image* of the *thing* to us.

IX. *Whether the Errors occasioned by our Senses, can be corrected by our Senses.*

If you urge further, that there are many Things that cannot be corrected by our *Understanding*, except our *Senses* be first well-disposed, and that our *Mind* borrows its Certainty from them; as appears by *a Stick standing in Water, which because of the Refraction seems to be broken* or *bent*, when indeed it is *strait* or *whole*; because this *Error* is not to be corrected by the *Understanding*, but by the *Touch*: And the same may be said of the other *Senses*.

X. *Answer.*

I answer, tho' by our *Touch* we know the *Stick* to be *streight*, yet is not that sufficient to correct the mistake of our *Sight*, but there is need of a *Reason* to persuade us, that in this case we are rather to give credit to the report of our *Touch*, than to that of our *Eye-sight*; which Reason cannot be ascribed to our *Sense*, but to our *Understanding* alone. It remains therefore that the knowledge of *Natural things* depends on our *Cogitation* and that they cannot be perceived by our *Senses* such as indeed they are.

XI. *An Objection against the certainty of Bodily things.*

You will object, that *Material Things*, of which *Natural Philosophy* treateth, do not continue in the same *State*, but are subject to various changes, quitting and assuming several *Forms*, which seems to be inconsistent with the Notion of *Science*, which is the knowledge of things *certain* and *Perpetual*. For what is more common than the Rise and Destruction of *Bodies*? For all things that consist of *Matter* and *Form* are subject to *Generation* and *Corruption*, and never continue long in the same state and condition.

XII. *The Certainty of Bodily things established.*

Nevertheless we must say, that *Natural Philosophy* is indeed a *Science*, because the *Nature* of a *Science* is not consider'd with respect to the things it treats of, but according to its *Axioms* of an undoubted *Eternal Truth*. For tho' the things which *Physiology* handles, be changeable; yet the *Judgments* we make of them are stable and firm; and consequently the Truth we have of them is *Eternal* and unchangeable. As for example, these are indubitable and constant *Truths*, that *all that is Bodily is changeable*; *that every Mixt Body is dissoluble*, tho' they be of mutable and changeable things. For as the knowledge we have of Matter is Immaterial; so we may have an immutable *Science* of changeable and corruptible things.

XIII. *The Object of Physiology.*

For as much as every *Science* hath a *Subject*, about which it is conversant, and to which, whatsoever is handled in the same may be attributed either as *Principles*, *Parts* or *Affections*; we say that the *Material Subjects of Physiology*, are natural *things*; and that *Magnitudes*, *Figures*, *Situation*, *Motion* and *Rest* are the *Formal Subject* of it; as under which, *Bodily* things are consider'd, and from whence they derive their force and *Virtue*, as shall be said in the 10th Chapter. Wherefore if a *Natural Philosopher* consider nothing in Matter besides these *Divisions*, *Figures* and *Motions*, and admit nothing for *Truth* concerning them, which is not evidently deducible from common Notions, whose *Truth* is unquestionable, it is altogether manifest, that no other *Principles* are to be lookt for in *Natural Philosophy*, than in *Geometry* or *abstract Mathematicks*: and consequently that we may have as well Demonstrations of *Natural Things*, as of *Mathematical*.

XIV. *Things are consider'd here in their natural State.*

But before I proceed any further, I must acquaint the *Reader*, that I undertake nothing here but the explication of *Natural Things*; and that my only design is to explain them by their *Effects* and *Causes*, that so I may contain my self within the Bounds of the *Science* I treat of. Wherefore I openly profess, that I consider *Natural Things*, in their *Natural State*, and that my purpose is not in the least to treat of them, as they pass the Bounds of *Nature*, and are put in a *Supernatural condition*. For it would be great Rashness in me to set Bounds to the *Divine Omnipotence*, by pointing out how far

far it can go. But rather as I acknowledge *God* to be the Author of the *World* and of all *things*, so likewise I own that *Infinite Things* may be produced by him, which the mind of Man cannot reach in the least.

XV. *Natural Philosophy is either General or Special.*

Natural Things are considered two manner of ways in *Physiology*, *viz.* either *Generally* or *Specially*; and accordingly *Natural Philosophy* is Distinguisht into that which is *General*, and that which is *Special* or Particular. *General Physiology is, that which considers a Body or Matter in General, that is, its Nature, Principles, General Affections and Differences. Special or Particular Physiology is that, which considers Matter as distinguisht into Species; and doth more particularly explain the Properties, Differences and Changes of those several Species.* Wherefore we are to begin with the most simple *Principles* of *Natural Things*, and from them proceed to the *Bodies* themselves, that are made up of them.

CHAP. II.

The Existence of Material Things Proved.

I. *We may question the Existence of Bodily things.*

FOR asmuch as it is lawful to doubt of every thing, whether or no it do Exist, as long as its nature is not clearly known to us; we may also question whether *Material Substances* be, beside our *Cogitation*, and if they be, by what *Argument* this may be proved: As to which thing every one will be able with great ease to satisfie himself in this matter, only by giving heed to the Conception we have of *Bodily Things*.

II. *The Notion of a Material thing frequently occurs to us.*

No *Philosopher* ever deny'd that we have the Notion of *Material Things*; yea, if we throughly examine their *Nature*, we shall find many *Properties* in them, which would not agree to them, if they had not some Nature. For we can Demonstrate of an *Extended Being*, that it is *Moveable*, *Divisible*, *Impenetrable*, &c. For since to be extended is nothing else but to have distinct *Parts*, it cannot happen by the *Power* of *Nature*, that the parts of *Matter* should take up the same place.

III. *God can do whatsoever can be clearly known, or apprehended by us.*

Moreover, we know *God* to be *Omnipotent*, and that he can do whatsoever can be clearly and Distinctly known by us. Yea, if we will reason aright, we must say, that nothing is impossible, but because it is inconsistent with our clear and distinct perception: But we do clearly and distinctly know *Matter* to be something extended *in Length, Breadth and Depth*: Therefore *Matter* must at least be producible by *God*.

IV. *The Actual Existence of Bodily things proved.*

Nor will it be difficult to prove that this *Material Substance* doth exist actually. For tho' our *Senses* be apt to deceive us; yet we cannot doubt of all the things they represent to us. Because we dayly experience and find in our selves many *Ideas* or *Species* of *Natural things*, which must proceed from some things or other without us, that are the *Causes* of such *Ideas*. For it doth not depend on our *Wills*, that we perceive by our *Senses* one *Substance* more than another; but that difference proceeds from the *Objects*, which produce such a Sensation in us. For oftentimes these *Species* occur to us without our heeding it, and before that we think of them by any reflex *Cogitation*. Wherefore we must conclude that these *Ideas* proceed from things, which consequently must exist in *Nature*.

Lastly, there is no *Man* who doth not perceive himself to be endued with an *Imaginative Faculty*, in that he doth almost every moment conceive so various and different *things*; now the *Imaginative Faculty* considers *Bodies* as present, and is altogether conversant about *Bodies*; wherefore it is necessary in order to its perfection that *Material Things* should exist.

V. *Tho' the Senses deceive us in the manner of their representing things to us; yet not with respect to the substance of things.*

If you object, that nothing of certainty can be gather'd from the *Senses*, forasmuch as they do frequently deceive us. For we find by experience that things are represented by them otherwise than they are, as when a *Square Steeple* appears round to us at a *distance*; or when a great *Brass Ball* at the top of a high *Steeple*, shews like a little *Apple* to our *Sight*.

VI. *Answer.*

I answer, that these *Errors* do not destroy the Truth of *Material Things*, tho' our *Senses* deceive us in their representing of them. For it may happen that that which I see with my *Eyes*, is quite another thing than I Imagin it to be; yet for all that it cannot be, but that which does appear to me must be something *Material*, which is sufficient to prove the *Existence* of *Matter*; because the variety of *Figures* does not take away the *Subject*, but rather doth manifest it, and forceth us to confess, that those *things* that appear to us under divers *Figures* are something that is *Material* or *Corporeal*.

VII. *The Motions we find in our selves prove us to be Corporeal.*

Neither do those things that are within us, less evidence this *Truth* than those that are without us: For if we give heed to the *Ideas* of *things* in our *Mind*, we shall find that besides the notions of *Intimate Consciousness*, *Perception*, *Judgment*, and *Affections*, we meet with others that consist of *Extended Parts*, diversified by *Length*, *Breadth* and *Depth*. Moreover, besides these, we experience many *Motions* in our selves, as *Hunger*, *Thirst*, *Pain*, which do not belong to our *Soul*, forasmuch as it is a *Thinking Being*; for the *Soul* of *Man* being *Immaterial* is incapable of any of these, and only perceives them as she is united to a *Material Substance*. For *Pain* doth not touch our *Mind*, save only so far as it is joyn'd to the *Body*; neither can it be vexed with *Hunger* or *Thirst*, save only so far as it is link'd to the *Stomach* and *Throat*, the one whereof is pinch'd with a *Vellication*, and the other with *Drought*. So that it cannot be doubted but that there are many *Ideas* of *Natural Things* in us which are not fram'd by our selves, but come to us from abroad, and present themselves to our *Imagination*.

VIII. *If there were no material things without us, God might be thought to impose upon us.*

For as the *Philosopher* discourseth in the last *Part* of his *Principles*, *Sect.* 1. We may enquire concerning the thing which is represented to us, whether it be *God*, or something distinct from him: But because we feel, or rather by Motions impress upon our *Senses*, do clearly and distinctly perceive a certain *matter* extended in *Length*, *Breadth* and *Depth*, whose various parts have diverse *Figures*, and are tost with several *Motions*, and are the cause of Diverse Sensations in us, as of *Colours*, *Smells*, *Pains*, &c. If *God* did immediately by himself represent the *Idea* of *Matter* to our *Mind*; or if he should cause the *Idea* thereof to be represented to us, by any thing wherein there was nothing of *Extension*, *Figure* or *Motion*, this would be to impose upon us. For we clearly understand *Extended Matter*, as a thing altogether distinct both from *God* and from our selves, that is, our *Minds*; and

we clearly seem to perceive that the said *Idea* proceeds from things plac'd without us: Now it is utterly repugnant to the *Nature* of *God* to impose upon us. And therefore we must peremptorily conclude that there is really *Existing* such a *thing* as is extended in *Length*, *Breadth* and *Depth*, and hath all those *Properties*, which we do clearly perceive do agree to such a *Being*. And this is that thing which we call *Body* or *Matter*.

IX. *The Order of things to be handled hereafter.*

But forasmuch as every thing is best known by its *Essence*, *Properties* and *Affections* or *Accidences*, to the end we may have a more perfect knowledge of *Matter*, whose *Existence* we have just now demonstrated, it must be our business to prove, wherein its *Nature* doth consist, what are its *Properties* and what *Accidences* it is capable of. Accordingly we will first enquire what it is that doth *constitute Matter*, and next what those things are that do inseparably accompany it, and lastly the *Accidences* that happen to it.

CHAP. III.

Of the Nature and Constitution of Matter.

I. *What Matter is, and how it differs from a Body.*

MAtter is a *Body*, in asmuch as it is a *Body* or a *Substance* extended in *Length*, *Breadth* and *Depth*: Wherefore a *Material* and a *Bodily* thing are *Synonymous Terms*, and do not differ, save by our *Mode* of considering them. That which consider'd absolutely is call'd a *Body*; the same with regard to that which is made of it, is call'd *Matter*: As for example, this extended *Mass*, consider'd as something undivided, and indistinguisht, is a *Body*; but if referr'd to those distinct *Bodies* that are made out of it, it is called their *Matter*.

II. *This Matter doth not differ from* Aristotles *first Matter.*

This is that *First Matter* about which there are so many Squablings in the *Peripatetick School*; and is nothing else, but an inadæquate Conception of a *Body*, as it may be conceiv'd by us without any *Figure*, *Hardness*, *Softness*, *Colour*, or any other Modifications, and only as Extended, and consisting of three *Dimensions*. For the further Explication of this *Notion*, and that the agreement of the *Cartesians* and *Peripateticks* in this matter may appear, I shall add these following *Propositions*.

III. *How Matter is said to be without Form.*

The *First Proposition*: The First matter is *without form*: For in this, the Notion of *Extension* is abstracted from all Modifications, that belong to the *Essence* of a *Body*.

IV. *How it is the same in all Bodies.*

The *Second*: The *Matter* of all *things* is the *same*; for all *Bodies* agree in this first or Primary *Attribute* of a *Body*, *viz. Extension*, neither is there any Distinction between them with relation to the *Matter*.

V. *How Matter is capable of all Forms.*

The *Third*: Every *thing* may be made of every *thing*; or, according to the *Peripateticks*, *Matter* is capable of all *Forms*: For since all *Bodies* agree in *Extension*, all their difference must be from their various Modifications; if therefore there be an *Efficient Cause* sufficient to alter these *Modes*, it may make every thing of Every thing. On this *Proposition* are grounded all those *varieties* which are observed in *Bodies*.

VI. *How it is ingenerable and incorruptible.*

The *Fourth*: A *Body* as such, or the First *Matter*, *is Ingenerable and Incorruptible*: that is to say, there is no new *Substance* created; neither is the least part of Matter annihilated; for only the *Modes* are changed, in all Alterations.

VII. *What we are to understand by the word Matter.*

Physical Matter therefore, or a *Natural Body*, is a *Substance* Extended in *Length*, *Breadth* and *Depth*; neither can any thing else be represented to the *Imagination* by the name of *Matter*: For *Extension*, as hath been said, is that Primary, *Intimate*, and *Radical Attribute*, which is conceiv'd or apprehended in every *Body*, and which in all alterations continues the same, nor can it be destroyed, but by Annihilation of the *Body*. So that we must stand to it as an undoubted Truth, that *Extension* is identified, that is, is one and the same thing with *Matter*, so that how much soever is taken from *Quantity*, so much is taken away from the Body; and on the other hand, whatsoever is taken from Body, the same is taken from the *Quantity* of it.

VIII. Aristotle *doth not oppose this Doctrin in his* Metaphysicks.

Most men I know are of *Opinion*, that herein we differ from *Aristotle*, who in his *Metaphysicks* tells us, that *Matter* of it self is neither *Quid* (something) nor *Quantum* (of any *Bulk* or *Quantity*) nor any other thing of all those, whereby a *Being* is determin'd. From which words they argue that *Aristotle* supposed *Matter* to be devoid of all *Extension*, yea that it did not exist in the nature of *things*.

To which I answer, that *Aristotle* indeed makes a distinction between *Extension* and *Quantity*, which we also freely admit, because *Matter* may be conceived without *Quantity*. For he that *Measures* a piece of *Land*, immediately conceives the *Extension* of it, but doth not know the *Quantity* of it, till after he hath measur'd it. Indeed *Quantity* is nothing else but *a certain mode of Extension*, or some Measure of it, by which we answer him, who demands what the *Quantity* or *Bigness* of a *Body* is. And so *Quantity* is an *Attribute* modally distinct from *Extension*. And in this *Sense* it is not repugnant to say, that *Matter* is an extended *Substance*, and yet that it is nothing of all those things which *Aristotle* in the foresaid place removes from it; forasmuch as they cannot be understood but of *Matter* determin'd by some particular Form. Thus we cannot say that *Matter* Universally taken, and as consider'd at first view, is either *Hot* or *Cold*, that it is of such a determinate *Measure*, or that it is some particular thing, as *Wood*, *Marble*, *Gold*, &c. much after the same manner as when we consider a *living Sensitive Creature* in General, we cannot say that it is a *Horse* more than a *Lion* or any other particular *Species*.

IX. *Extension is not the Mode of a Body.*

Neither do those argue at any better rate, who distinguish *Extension* from *Matter*, and consider it only as a *Mode* of it: As for example, whilst they mind the *Extension* of a *Table*, they will have the *Extension* to be the *Mode*, and the *Table*, the *Substance* whose *Mode* it is: For these talk as absurdly, as if one hearing another discoursing of the *City of Rome*, should imagine these to be two different things, whereof the one should be the *Mode* and the other the *Substance*; or as if one should go about to distinguish *Humanity* from *Man*. For as Humanity, or the Nature of *Man*, doth not differ from *Man* generally consider'd, but only as an Abstract and Concrete, so neither doth Extension differ from a *Body* in a general acception.

X. *Why the Natural Philosophy of the Schools is so barren.*

Those therefore who deny that *Extension* constitutes the Nature or *Essence* of *Matter*, will never be able distinctly to explain what they mean by the Word

Word *Matter*, nor wherein its *Essence* doth consist: Yea, they lay that down for a *Principle*, from which it is impossible for them to deduce any Consequence, which may illustrate the *Mind* of Man, or be of use towards the discovery of any *Truth*; and therefore they must not wonder to find their *Physiology* so barren as it is, and that they have not been able hitherto to explain the least product of *Nature* by means of it.

XI. *Whether there be no more Matter in a Vessel fill'd with Gold, than in one fill'd with Air.*

But they who estimate the *Properties* of *Matter* by their *Senses*, and by them measure the *Essences* of things, argue thus against this Opinion. If a *Bodily Substance* were something indistinct from Extension, it would follow, that wherever there was found some *Proportion* of *Matter*, there would also be the same of *Quantity*: But this is found to be false in two Vessels of the same bigness, forasmuch as more *Matter* is found to be in that which is fill'd with *Gold*, than in the other which is only fill'd with *Air* or *Water*. Therefore *Quantity* is not always proportionate to the *Body*, and consequently differs from it.

XII. *Answer.*

I answer, that there is no more *Matter* in the *Vessel* that is fill'd with *Gold*, than in the other that contains *Water* or *Air*, tho' indeed there be more Hardness and Weight in the one than the other: For the *Essence* of *Matter* doth not consist in *Hardness* or *Weight*, or any other *Qualities*; for *Fire* that is subtil, and melted *Wax* that hath lost its *hardness*, is never a whit less a *Body*, than the heaviest *Metal*; and therefore Matter precisely consists in this, that it is *extended in Length, Breadth and Depth*, which is found to be equal in both Vessels.

XIII. *The Nature of a Body doth not consist in Hardness.*

Conclude we therefore, that the *Nature* of Material things doth not consist in *Weight*, *Hardness*, *Colour*, or the like, but in this only that they are Extended *Beings*. For as to *Hardness* we can deprehend nothing else of it by our *Sense*, than that the *Parts* of hard *Bodies* resist the Motion of our *Hands*, when they run against them; for if as oft as our *Hands* are mov'd towards any place, all the *Bodies* that are there should give way, and remove thence with the same *swiftness*, as our Hands advance, we should never feel any *Hardness*. Neither can it be conceived, that the *Bodies* which thus remove or give way, should therefore lose the Nature of *Bodies*: wherefore the *Essence* of *Material Things* doth not consist in *Hardness*.

XIV. *Nor in Figure, Weight, Colour, &c.*

And in like manner it may be made out, that *Weight*, *Colour*, and other such *Qualities*, which by the *Senses* are perceiv'd in *Matter*, may be taken away from it self, remaining whole as before: For suppose the *Hardness* of *Ice* melted into *Water*, to be vanished; its *Figure* also to be quite changed; suppose also that *Water* to be rarified into *Vapors*, and having quit its Bulk and *Heavineſs* to disappear from our *Eyes*, by its extreme Tenuity and Thinness; yet it is evident that the *Bodily* Quantity or *Extension*, which is the Seat and *Subject* of all these mutations, does remain entire and untoucht, and altogether inseparable from the *Ice*, the *Water* and *Vapors*.

XV. *An Objection that Matter ought to be Defined by some Relation to the Senses.*

It may be you will say, that tho' a *Body* be not bound to one *Figure*, and may be deprived of a *Cubical*, *Triangular* or *Spherical Figure*, yet must it still have some *Figure* or other. In like manner tho' a *Body* be not necessarily either *Soft* or *Hard*, *Hot* or *Cold*, yet it is necessary that a *Body* should be sensible, or as *Lucretius* expresseth it, *Tangible*.

Besides a Body, as we see,
Nothing can Touch, or Touched be.

XVI. *The First Answer.*

To which I answer, *First*, that Sensibility is only one of the *Properties* of a *Body*, and not the whole nature of it; since a *Body* may really exist, tho' there should be no Men to whose *Senses* it might offer it self to be perceived; as we know that *Matter* was created before there were any *Sensas* made. Wherefore there seems to be no absolute Necessity that every *Body* should be sensible. On the contrary, we find that there is no *Body*, which may not become insensible, by being divided into so minute parts, as not to be able to move our *Nerves*, especially if those parts be also swiftly moved.

XVII. *The Second Answer.*

I answer *Secondly*, that a *Power to affect the Senses*, presupposeth something that is extended, and is no more than a Respect, and *Extrinsecal Denomination*, which must be grounded in some Internal or absolute *Attribute*.

XVIII. *Extension only belongs to the Essence of a Body.*

Extension therefore is that alone which constitutes the *Nature* of a *Body*, as agreeing *to all*, *only*, and *always* to them, so that nothing can be perceived in a *Body* before it. For it agrees to every *Body*, to *Earthly* as well as *to Heavenly*, to *the Sun*, *Fire*, *Air*, as well as to *Wood*, *Stone*, &c. It belongs *only* to a *Body*, because no *Intellectual Substance* is Extended and Divisible. And it agrees *always* to a *Body*; because tho' all other *Attributes* be taken from it, and be changed, yet the *Extension* continues as long as the *Body* doth. Besides, nothing can be conceived in *Matter* before *Extension*; for tho' *Matter* be *Divisible* into Parts, yet that is not the first affection we perceive therein; for therefore only a thing is Divisible because it is extended.

XIX. *That Quantity seems to be encreased in Rarefaction.*

Some are of opinion that *Quantity* may be encreased, without any encrease of the *Matter*: Thus in *Rarefaction* the *Quantity* seems to be augmented, tho' the *Substance* continue the same it was; and this they endeavour to prove by a *Pot* of *Water* on the *Fire* that *boils* over; at which time they suppose the *Water* to take up more place than it did before; now it cannot take up a larger place, without a greater degree of Extension.

XX. *Rarefaction is performed, by the introduction of another Matter.*

I answer, that *Rarefaction* is not performed by an addition of *Quantity*, but by the entrance of other little *Bodies* from abroad; so that those *Bodies* are said to be rarefied, whose *Pores* being opened are filled with the *Air*, or some other *Subtil Matter* entring into them; and they become close or compact again, when by the expulsion of those *Adventitious Particles*, those Spaces are narrowed again, and the parts come closer together. For certain it is, that nothing can be encreased in *Quantity*, but that at the same time its *Extension* must be encreased also. Of which I shall treat more at large when I shall have occasion to speak of *Rarefaction*.

XXI. *An Objection from the Nature of Space.*

But you will object, that *Space* is conceiv'd to be something extended in *Length*, *Breadth* and *Depth*: Yet *Space* is not a *Body*; therefore the *Essence* of a *Body* doth not consist in *Extension*. The *Minor* is proved, for that if space were a *Body*, then one *Body* would be in another.

XXII. *Answer.*

I answer, It is false to say that *Space* is not a *Body*; because the same *Extension* which constitutes the nature of a *Body*, doth also constitute that

that of *Space*. And therefore to say that a *Body* takes up such a *Space*, is no more than to say, that it is so great a part of the *World*; because *Bodies* bring their Spaces along with them, and when they remove, carry them away with them. And when *Bodies* are said to leave their *Spaces*, it is the same as to say that they quit the *Magnitude*, *Figure* and *Situation* they had amongst other *Bodies*. Wherefore the *Extension* of *Space* doth not differ really, from the *Extension* of a *Body*, and therefore we must conclude every *Space* to be *corporeal*.

XXIII. *Tho' God be immense or Infinite, yet he hath no quantity.* And whereas some say that *God* occupies or takes up all places of the *World*, as being *Infinite*, *Immense* and *Omnipresent*, &c. which cannot be conceived without some *Extension*; this is an objection of no moment. For tho' *God* be *Omnipresent*, yet this doth not prove him to be *extended*; because by an *Extended Being* all *Men* understand something that is *Imaginable*, of a certain *Figure* and *Magnitude*; whose parts are separate from each other, so that one of them cannot be in the place of the other; which cannot agree to *God*, or any *Spiritual Substance*, as being imperceptible to the *Imagination*, and apprehended by the *Intellect* only. When we say that *God* is *extended* through all the *World*, this is not to be understood of the *Extension of Substance*, but of the *Extension of Power*, so that the meaning only is, that *God* can exercise his *Power*, sometimes on a greater, and other times on a less part of *Matter*. For if there were no *Bodies*, we could not conceive a *Space*, to which *God* should be co-extended.

XXIV. *A Natural Body is the same with a Mathematical Body.* Wherefore with our *Philosopher* I profess my self to own no other *Matter* of *Bodily things*, than that which is altogether *Divisible*, *Figurable* and *Moveable*, which *Geometricians* call *Quantity*, and which they make the object of their *Demonstrations*; and that I consider nothing in it, besides those *Divisions*, *Figures* and *Motions* which are the properties of it. And tho' such a *Body* as I have here described, be by others called *Mathematical*, yet I take it here in this *General Physiology* for a true and *Real Body*. Indeed *Natural Philosophy* is one of the parts of the *Mathematicks*, and has the same relation thereto, as *Metaphysicks* have to the other *Disciplines*; the only Difference between them is, that the *Mathematicks* consider *Magnitudes* and *Figures* abstractedly, without being sollicitous whether they be such indeed, or only can or may be so. But *Physiology* considers the same as inherent in *Matter*, and as she finds them in the several *Bodies* that are in the *Universe*. Now this Abstraction doth not at all hinder, but that *Physical* or *Natural Matter* may be the same with the *Geometrical*, because the *Species* is not really distinct from its *Genus*.

CHAP. IV.

Of the Proprieties of Extended Substance, viz. *Mensurability, Divisibility and Impenetrability.*

I. *Mensurability, Divisibility and Impenetrability are the Properties of an Extended Substance.* THere are three *Properties* which accompany an *Extended Substance* or *Quantity*, viz. *Mensurability*, *Divisibility and Impenetrability*. *Mensurability is an aptitude in a Body, whereby it may be apply'd or conform'd to a certain measure. Divisibility is that disposition of a Body whereby it is conceiv'd to have Parts into which it may actually, or by thought, be divided.* Lastly, *Impenetrability is the distinction of one Extended Being from another, by which the Extension of one thing is different from that of another; so that two things Extended cannot be in the same place, but must of Necessity exclude each other.*

II. *From the Extension of Matter we may easily infer its Divisibility.* That a *Bodily Substance* is *Mensurable* and *Divisible*, may be easily gathered from what goes before; for since it hath a threefold Dimension, *Length*, *Breadth* and *Depth*, it must also admit a threefold *Measure*, by which its *Magnitude* may be determin'd. Its *Divisibility* also may be gather'd with the same evidence from its *Extension*, forasmuch as it hath Parts placed besides one another, so that we may easily conceive them to be separable, in which the very *Essence* of *Division* consists. But because many, who follow *DEMOCRITUS*, are of opinion, that there may be *Indivisible Bodies* out of which all other things are made, it will be worth our enquiry, whether the parts that constitute *Matter*, be *Indivisible*, or such as admit of further *Division*.

III. *Every Body is Divisible.* To which I answer, that *Matter* is not compounded of *Indivisibles*, that is, of parts that cannot be divided into others. This is the opinion of most *Philosophers*, and the reason is this, because the *Essence* of *Matter* is to have parts that are extended; and whatsoever is extended, is *Divisible*. For it cannot be conceived that a thing should be Extended, and yet not be *Divisible*; because *Extension* is nothing else, but an answerableness to divers points of *Place*, and such a disposition wherein one part is distant from another, not by actual separation, but by an aptitude to be separated, which is sufficient to make one thing not to be another.

IV. *There are no Indivisible Bodies.* Moreover, *Beings* are not to be multiplied without necessity; now there is none that forceth us to have recourse to *Indivisibles*: For *Points* are not the Parts of a *Line*, but smaller *Lines*; neither are the Parts of a Surface *Indivisible* Lines, but smaller *Surfaces*; neither are the *Parts* of a *Body Atoms*, or *Indivisibles*, but *Particles* indefinitely lesser, or Divisible without end. For in things extended we can never come to the very least Part, because as long as it is extended, it cannot but be conceiv'd Divisible. Whence proceeds that *Axiom*, that *no Quantity* or Magnitude *can be made of that which is not Quantitative*. If you say that the *Terms* or extreams of Magnitude cannot be explain'd without them; I answer, that every Extended *Being* is sufficiently terminated by the negation of any further Extension: Nor do I see, what can be more requir'd to the Termination of a *thing*, than that it is no further extended. If it be said that they are necessary to joyn the Parts of *Matter*. I answer that neither are they necessary upon that account, because the Parts of *Matter* sufficiently hang together without standing in need of a third to link them together

V. *An Argument to prove Atoms.* You will *Object*, that there are some Particles in *Bodies* so small, that they cannot be divided; and without question there may be such, as *Atoms*, and the like, which can by no human artifice be made less than they are; and yet no *Body* can deny

deny these to be *Corporeal Substances*; therefore it cannot be said that a *Body* is divisible into parts that are always further Divisible.

VI. *Epicurus his* Atoms *are Divisible.*

I say it is Impossible that any *Body* should have any parts so small as to be Indivisible, because the least part or *Atome* of a *Body* is extended, and therefore cannot be Indivisible. For *Bodies* as such are Extended, without which they cannot be conceived. For suppose an *Atome* lying on a Plain, or three *Atomes* join'd together on a Plain, they must be suppos'd to have Sides, whereby they touch both themselves and the Plain, which is their Extension.

VII. *How Matter is said to be Divisible.*

Matter therefore is Indefinitely *Divisible*; that is, the *Mind* of *Man* in the *Division* of *Matter* can never come to a *Term* where it is stopt from proceeding further; for the least *Particle* will always be extended, and whatsoever is extended must therefore be conceiv'd to have distinct Parts, and what is conceiv'd to have such Parts, must be conceiv'd *Divisible*; especially if we consider that *God* can do whatsoever we do clearly and distinctly conceive. And tho' *God*, it may be, will have it so, that some *Atomes* should not be actually divided by us, yet we must not say that he hath deprived them of the Power to be divided; for we clearly understand that they can be divided by *God*, as long as we suppose them to be Extended. Therefore *Indivisibles* cannot enter the Composition of a *Body*; forasmuch as nothing is found in a *Body*, that doth not consist of *Length*, *Breadth* and *Depth*.

VIII. *Matter is Indefinitely Divisible.*

But tho' the Parts of *Matter* be always *Divisible*, so as that we can never come to the very least of them; yet doth it not follow therefore that the Parts of Matter are *Infinite*, but only *Indefinite*. For it is one thing to say a thing is Infinitely Extended; and another, to say it is only Indefinitely so. That is *Infinite* in which there are no Bounds at all, and so *God* alone is *Infinite*: Whereas those things which in some respect only have no End, are better called *Indefinite*, than *Infinite*; such as *Matter* is, which divide it never so much, will still be further *divisible*. And herein *Magnitude* differs from *Multitude*, because in the latter we come by division to a *Unity* or Indivisible; whereas in the *Division* of the former, we may still go on, and divide for ever. Because a *Body* cannot be divided into so many *Parts*, but that every one of them will still be capable of a further *Division*; and therefore these parts are said to be *Indefinitely*, extended. This will appear more clearly by an *Argument* taken from *Geometry*, because in that *Science* it can be demonstrated, that there are some *Magnitudes* which have no common *Measure*, and therefore are called *Incommensurable*, as are the *Diagonal line*, and the sides of a *Quadrangle* or *Square Figure*.

IX. *What Quantities are said to be Commensurabe.*

Two Quantities are said to be *Commensurable*, when we can find a Third, which is a Part of both the one and the other, that is to say, which measures them both. Thus a *Pace* and a *Rod* are two Commensurable Quantities, because we can name a third Quantity, *viz. half a Foot*, which will measure both a *Pace* and a *Rod*; for the half Foot taken five times, will be equal to a *Pace*, and the same Measure taken twelve times will be equal to a Rod.

But if no such third *Quantity* can be found to *measure* them both, then those *Quantities* are called *Incommensurable*. Supposing therefore the Figure A B C D to be a *Quadrangle*, it is manifest by *Geometrical Demonstration* that the side of A B is in Commensurable with the *Diameter* or *Diagonal* A B.

X. *What Quantities are Incommensurable.* Fig. 1.

Divide we then in our *Mind* the Line A B into a thousand equal Parts, and every one of those again into a thousand more, and these last again into a thousand other equal Parts. This *Division* may be continued for a hundred years, and yet shall we never be able to come to Parts so small, that we can say that the Line A C contains a certain and determinate number of them. Which could never happen so, if *Extension* could not be Indefinitely prolonged. For after the *Division*, by *Example* of the *Line* A B into the least Parts into which *Extension* could be divided, it would necessarily follow that the *Line* A C contains a certain and determinate number of them. Wherefore we must conclude that every *Extension*, or determinate *Portion* of *Matter* is Indefinitely Divisible.

XI. *The Divisibility of Matter Demonstrated.*

It may be oppos'd to this *Demonstration*, that in case all *Bodies* were Indefinitely Extended, it would follow that two *Bodies* of unequal *Magnitude*, would have an equal number of *Parts*. Yea, moreover if it be granted that one *Part* of a *Body* be Indefinitely Divisible, there will be as great a Divisibility in one part as in the whole; For Example, in *a grain of Barley* as in the whole *Field* wherein it grew. But this seems very absurd, that there should be as much divisibility in the least part of *Matter* as in the vastest quantity; wherefore Indefinite Partition cannot agree to *Extension*.

XII. *An Objection against the Divisibility of a Body.*

To which I answer in the *first* place, that they are very much mistaken who attribute *Equality* or *Inequality* to a *thing Indefinite*, these being the Properties of *Finite things* only. For how can those things be call'd *Equal* or *Unequal*, which are Indefinitely divisible, and to the least part of which we can never come? Those things only can be call'd *Equal* or *Unequal*, which we can comprehend, and compare together; but not those which are Indefinitely Divisible, and which our Mind can neither apprehend, nor compare together.

XIII. *The First Answer.*

Secondly, supposing two *unequal* Bodies, should be divided into an equal number of *Parts*, yet would it not follow thence that those two *Bodies* were Equal; because the *Parts* of one *Body*, would proportionably be greater than the Parts of the other *Body*, and therefore the Divisibility of one *Grain* would not be so great, as that of the whole *Field* wherein it grew, tho' it be Divisible into as many parts.

XIV. *The Second Answer.*

Neither it a sufficient *argument* against this, that some say they cannot comprehend how the *least* Body should be Indefinitely Divisible; for who knows not that there is a vast number of *things* which cannot be comprehended by the *Imagination*? The famous *ROHAULT* proves this by two *Examples*, very pat to the purpose, *viz.* by the Division of *Gold* which is made by the *Gold-beaters*, and the partition of the same *Gold* made by the *Wire-drawers*.

XV. *The Incomprehensibility of the Divisibility of Matter is no Argument against the Truth of it.*

For the *Gold-beaters* of one ounce of *Gold* make 2790 Square *Leaves* of *Gold*, each side of which contains two *inches* and *ten* Lines; and if we deduct hence the Wast Pieces that are cut off,

XVI. *The Division of Gold by Gold-beaters.*

which almoſt reach to one half of it, the *ſurface* of every *Leaf* of *Gold* will be found to contain 1156 *ſquare Lines*; ſo that all of them joyned together ſide by ſide, will make out a *ſuperficies* of 3155880 *ſquare Lines*. And if we add to this the Third part thereof for the Loſs in the making, it will follow that the *Gold-beaters* out of one Ounce of *Gold*, beat 4270840 *ſquare Lines*. Seeing therefore this Number includes 159092, the quantity of the *Baſis* of the *Cube* of one Ounce weight, it is without doubt that that *Cube*, which contains only five *Lines* with a Seventh part in height, is at leaſt divided into 159812 *ſquare Segments*.

XVII. *The Diviſion of Gold by Wire-drawers.*

And tho' this Diviſion of *Gold* into *Leaves* be very ſurprizing, yet is it much Inferiour to that which is performed by the *Wire-drawers*. Theſe have commonly lying by them many pieces of *Gold* of a *Cylindrical figure*, being every one of them of 16 *Marks weight*; one of the moſt regular of which pieces was ſhewed to the foreſaid *Philoſopher*, the length whereof was of two *Inches* and nine *Lines*, ſo that the *Cylindrical ſuperficies* of it was of about 12672 *ſquare Lines*: This *Superficies* being cover'd with many *Leaves* of *Gold*, which put together weighed an Ounce and an half, was through the holes of a *perforated Plate*, drawn into *Wire* of the thinneſs of an *Hair*. Of this *Thred* he took 150 Foot, which he found upon exact weighing to weigh 36 *grains*, wanting a part of a *Grain*: So that the foreſaid *Cylindrical Maſs*, at this rate, muſt make a Thred of 307200 Foot long; whence follows, that it was drawn out 115200 longer than it was at firſt, and conſequently that its *ſuperficies* did exceed its firſt length above 340 times. If we add to this, That this thin *Thred* may be beaten into a *Leaf*, and thereby obtain a *ſuperficies* twice as big as it was before, and ſo will exceed its firſt Magnitude 680 times, and conſequently make 80616960 *ſquare Lines*: And that after the whole *Thred* is thus beaten into a *Leaf*, the *ſuperficies* of it is all cover'd with *Gold*: It follows thence, that one half Ounce of that *Metal*, whoſe *Leaf* is cover'd with *Gold*, is to that degree attenuated, that the *ſuperficies* of it conſiſts of 80616960 *ſquare Lines*. Wherefore ſeeing that quantity contains 325795 times 26 *Lines*, and $\frac{2}{49}$, which is the value of the *Baſis* of the *Cube* of *Gold* of one Ounce, it neceſſarily alſo follows, that the Thickneſs of *Gold*, which covers the *gilt Leaf*, is at laſt reduced to the $325795\frac{2}{49}$ part of the half of the *height* of one Ounce; ſo that the quantity of five *Lines*, with a *ſeventh part*, hath at this rate been divided into 651590 *equal parts*.

XVIII. *Every thing that we cannot comprehend, is not therefore impoſſible.*

And laſtly, If we conſider that this *Diviſion* of *Gold* might ſtill be carried further, if the *Metal* ſo extended were not deſign'd to certain uſes, which cannot permit any further attenuation of it; as likewiſe that there are many *Agents* in *Nature*, who carry their work to a greater degree of *Subtilty* and *Tenuity*, it will ſtill appear more clearly, that that is not impoſſible which our *Imagination* cannot perceive or comprehend.

XIX. Matter *is impenetrable.*

Another property of Matter is, *Impenetrability*, which tho' Negative, agrees to a *Body*, as well as *Diviſibility*. For ſince to be Extended, is nothing elſe but to have Parts diſtinct from each other, it implies a Contradiction, that one Part ſhould take up the place of another, or that one Part ſhould be contained in the other, or (which is the ſame) that one Part ſhould be another. For it cannot be conceived, for *Example*, that the Part *A* of an Extended thing, ſhould penetrate the Part *B* equal to it, without conceiving the middle Part of the Extenſion of *A* to be taken away or annihilated; now that which is annihilated cannot penetrate another thing. Beſides, ſince any *determinate Body*, *Ex. gr.* of a *Foot long*, hath all things neceſſary to the conſtitution of ſuch a *Quantity*, there can no other *Body* of a Foot long be added to it, without making an Extenſion of two Foot: And to reduce them by *Penetration* to one Foot, is not ſo much to joyn one *Body* to another, as to deſtroy it; and therefore we muſt conclude, that *Matter* is is impenetrable, and that *Penetration* and *Extenſion* can never agree together.

XX. *Menſurability, Diviſibility, and Impenetrability are the Properties of Matter.*

Whence it is evidently deducible, that *Menſurability*, *Diviſibility*, and *Impenetrability*, are the Properties of *Matter*, becauſe they always accompany it, and can never be ſeparated from it. For that I call the *Eſſential* Property of any *Subject*, which we conceive to agree with any *Subject*, and which neceſſarily follows it: As, it is the *Eſſential Property* of a *Triangle*, that *two of its ſides taken together are greater than the third*; Or, that *three Angles are aqual to two right ones*, becauſe theſe ſo agree to a *Triangle*, as neceſſarily to accompany and inhere in the ſame.

CHAP. V.

Of the Diviſion of Matter *into Senſible and Inſenſible Parts.*

I. *Matter is divided by Motion.*

THo' *Motion* be only the *Mode* of a *Body*, and cannot be conceiv'd to be without it; yet is it ſo much conducing to the *Beauty* and *Harmony* of the *World*, that all the Matter in it would be without *Form*, if it were not divided by *Motion*, and cloath'd with thoſe *Affections* we find in the ſeveral parts of it. Hence it is the *Philoſophers* tell us, That *Nature is the Principle of Motion and Quiet*, becauſe by means thereof *Material Subſtances* acquire that variety we obſerve in them. By *Motion* Bodies get *Heat*, and by *Reſt* they become *Cold*. But when *Philoſophers* define *Nature* to be the *Principle of Motion and Reſt*, they are not ſo to be underſtood by us, as if all the variety we find in *Matter* were the effect of *Motion* and *Reſt*, foraſmuch as that depends alſo on the *Magnitude*, *Figure* and *Scituation*; but only that they are the *Principal Attributes* of *Natural Bodies*. For there is no queſtion, but that from the Beginning, *Motion* made the diſtinction of *Bodies*, and gave them thoſe *Qualities* and *Affections*, which we find in them. And hence it is, that *Senſible* and *Inſenſible Parts* do ariſe.

II. *Of Parts, ſome are Senſible, others Inſenſible.*

Senſible Parts *are thoſe, which being made up of many* Inſenſible *ones, do affect the Senſes.* Inſenſible *are thoſe, which becauſe of their ſmalneſs do not fall under* Senſe, *and are only known by their Effects, or the Diſcourſe of Reaſon.*

III. *There are Inſenſible Parts in the World.*

Neither can we doubt of the *Exiſtence* of ſuch *Parts* in the *World*, if we thröly examin the *Nature* of a *Body*, and conſider the *Inſeparable Properties* that belong to it. For every *Body* is *Diviſible*, ſo as that we can never come to the laſt *Particle* of it; though it be certain, that by continual *Diviſion*, we

we shall at last come to a part, which because of its littleness, will not be perceived by our *Senses*, and yet will not therefore lose the *Nature* of a *Body*; because as *Division* doth not constitute the Nature of a *Body*, so neither can it destroy it. Wherefore, there are Insensible *parts* in *Matter*, which none of the *Organs* of our *Senses* can give us any notice of.

IV. *Fluid Bodies consist of many Insensible Parts.*

This appears most of all in *Fluid Bodies*, which consist of such small parts that no *sense* can perceive them. Thus we see that *Flesh*, *Bread* and other *things* are spoil'd by the *Air* and *Water*; but how this is done our Reason only can inform us: for we gather from the effects that some Insensible *Particles* of the *Air* and *Water*, insinuating themselves into the *Pores* of the *Flesh* and *Bread*, do there settle themselves in a manner contrary to their constitution as to *Figure*, *Motion*, *Situation* and *Rest*; wherein the Nature of *Corruption* doth precisely consist. For we cannot conceive any *Body* to be corrupted, but by the accession of some foreign parts, which are contrary to those of its first constitution: And forasmuch as these *small particles* are not discoverable by any of the *Senses*, they may well be call'd *Insensible* Parts.

V. *All Bodies cannot affect our Senses.*

Neither is it any matter of *Wonder*, that these *Least particles* do not affect our *Senses*; because our *Nerves*, by which we perceive external things, are like to so many small *Cords*, that are Compounded of many *particles*, less than themselves, and therefore cannot be shaken by the least of *Bodies*; and consequently cannot carry external *Bodies* to the *Brain*, where the chief *Seat* of the *Senses* is. And I suppose every *Rational Man* will own, that it is much better to judge of what happens in little *Bodies*, not subject to *Sense*, suitable to what our *Senses* perceive to happen in great *Bodies*, than to invent I know not what strange things, which have no likeness at all with the things we do perceive by our *Senses*.

VI. *From our Clothes, Iron, &c. Particles proceed, which no Sense can give us any notice of.*

Besides, we do daily experience, that a *Knife* loseth certain of its small *Particles* by being *Whetted*, and that many such like wear away from our *Clothes*, neither of which are perceived by our *Senses*. For the Polishing of hard *Bodies*, and the wearing away of *Woollen-cloth* or *Silks*, is done by the loss of such Parts, as our *Senses*, by Reason of their smalness, cannot discern. Wherefore it is most certain, that there are parts of *Matter* which cannot be discernd by themselves, tho' being joyn'd with others they can make up a sensible *Body*: This being a thing easily demonstrable by the growth of *Bodies*; and is acknowledged by Divine *PLATO* in his *Timæus* in these Words: *Concerning these little Bodies, we are to conceive thus, that if they be taken singly by themselves, none of them, because of their Parvity, can be seen by us, whereas when many of them are joyned, their Bulk presently appears.*

VII. *We are to Philosophize of Insensible parts after one and the same manner.*

Wherefore we are to *Philosophize* alike of Insensible as of Sensible *Parts*. For as we own some *Bodies* to be compounded of *Parts*, actually distinct from each other, (as we see small *Dust* in *Stones*, and *filaments* in *Flesh*;) so likewise it is consonant to *Reason*, to admit other parts of the same kind, which because of their *Smalness* cannot be perceived; and their *Analogy* persuades us to Judge and Discourse of them both after the same manner: Seeing that without them, the *Qualities* and *Operations* of *Bodies* cannot be explained. For how can I apprehend the cause why *Oil* is more easily congeal'd than *Water*, without conceiving the *Particles* of *Oil* to be hooked and Branchy, which makes them more easily to cleave together, than those of *Water*? And that *Water* is more hard to congeal, because its Parts are slippery, and united together, as *Eels* are, as shall be said hereafter. And yet no Body ever discern'd either the Parts of *Oil* to be *Branchy*, or those of *Water* to be figured like *Eels*. And therefore it is evident that in Natural things, there must be Parts allowed, that are only discernible by the *Understanding* or *Imagination*.

VIII. *Insensible Parts are not therefore to be accounted Atoms or Indivisible*

Neither are we from hence to infer, that such *Particles* as these, are *Atoms*, that is, altogether *Indivisible*: For being Parts of *Matter*, they must need include *Extension*; and it implies a Contradiction, that what is Extended should be *Indivisible*; for every Extended *Being*, hath Parts distinct from each other, and consists of Divers Dimensions, which cannot be said of *Atoms* or *Indivisibles*: Neither can we conceive any *Insensible Parts* to be so solid, as not to be *Naturally Divisible*: Nor is any *Body* so compact, but that by a strong *Motion* it may be dissolved; or if we should suppose this impossible to the *Powers* of *Nature*, yet we cannot deny *God* the Power to do it; seeing there is nothing else required to the Divisibility of a *Body*, but its Extension, and that it be Subject to those *Affections* which constitute a *Body*, as hath been said before.

IX. *They are Figured.*

Moreover these *Atoms* are of several *Figures*; now whatsoever is *Figured*, must have Parts, which Parts as they cleave together, whilst they are at *Rest*, so are they disjoyn'd again, whenever there is made an impulse upon them, strong enough to overcome their *Rest*. And this cannot but happen in that hurry, wherein the *Particles* of *Bodies* are continually tost to and fro.

X. *And are Indefinitely Divisible.*

Wherefore we conclude that there are no *Atoms*, or *Indivisible Parts* of *Matter*, but only *Bodies* of an Indefinite Littleness, which are continuous, and by the interposition whereof other *Bodies* touch one another. For the *Sensible Particles* do not properly touch one another, but are rather like *Baskets* made of Twigs, which cannot be immediately united together, but borrow all their continuity from the *Insensible Parts*, by the various Inflexion and Disposition whereof they become *Contiguous*, as shall be hereafter shewn at large.

CHAP. VI.

Of the Three-fold kind of Matter, and that there are no more than Three Elements of the World.

I. *In Sciences we are to proceed from Simple things to compound.*

THe exactest *Method* of handling *Sciences*, as to my Judgment, is to deduce the thing under Examination from its first Original, and diligently to search from what *Principles* it doth proceed. This is the common way of *Philosophers*, who do not begin their *Treatises* with Compounds, but Premising things that are simple, proceed from them, to those that are compounded, and the manner how they are made up of them. This is the way used by *METAPHYSICIANS*, who beginning with

with *Entity* in common, from thence come down to a *Body*, which is its *Species*, and afterwards divide it, into a *Terrestrial* and *Celestial Body*. And the same is observed by *GEOMETRICIANS*, who do not presently consider a *Body* as it consists of three *Dimensions*, but first of all Imagin an Indivisible *Point*, which by its course or the diffusing of it self makes a *Line*, which is a *Length* without *Breadth*. Afterwards they suppose this *Line* to move croswise, whence ariseth an *Extension* bounded by *Lines*; and to this they give the name of *Surface*, which is *Length*, and *Breadth*, without *Profundity*. And lastly from these multiplied ariseth a *Body*, extended in Length, Breadth and Profundity.

II. *God did not proceed thus in the Creation of the World.*

Which way of Teaching tho' it be very suitable for the Demonstration of *Natural* and *Metaphysical Objects*; yet did not *God* make use of it in the *Creation* of the *World*. For he did not first produce an *Entity* in General, then a *Body*, and last of all *Heaven*, *Earth*, *Plants*, &c. Neither did he first constitute a *Point*, from the *Motion* whereof a *Line* might arise, from *Lines* a *Surface*, and from multiplied *Surfaces*, a *Body*. But tho' I own that the *World* in the first moment of its *creation* was perfect, and that it was not increased by vicissitude of times, yet it will not be absurd for me to establish some *Principles*, whence we may suppose that *Natural Things* have been produc'd, tho' they were not in that precise manner created by *God*. Because those things are more clearly known by us, which are deduced from a *Principle*, and by a continual vicissitude are brought forth and encrease, than such as are consider'd in an absolute state of Perfection.

III. *Physicians do the same in their treating of Plants and Animals.*

Thus *Physicians* in order to their explaining of the Generation and growth of a *Chicken*, begin with the *Egg*, and shew what parts are daily framed therein, by the Incubation or brooding of the *Hen*. And so they who examine the nature of *Plants*, begin with their first Original and Propagation, and then proceed to the considering of them in their Sprouting, Growing, Blooming and bringing forth *Fruit*. For as *ARISTOTLE* saith in his *First Book of a Commonwealth, he that takes a view of things in their First Rise, will best of all perceive the Truth of them.*

IV. *The first thing suppos'd is, that at the Beginning the Parts of Matter were divided by Motion.*

Let us suppose therefore the Matter of the Universe to be put into *Motion*, and that it was divided by *God* into *Parts*, much of an Equal *Bigness*, not round (because many round *Bodies* put together, touch one another only in a point, and consequently leave many Empty Spaces) but into *Parts* of another *Figure*, and of a mean bigness between those that constitute the *Heaven* and the *Stars*, which we suppose to be whirl'd round about their own *Centers*.

V. *The Original of the First and Second Element.*

This being suppos'd, it will be easily made out, how the *Elements* came to be; for of whatsoever *Figure* we imagine the *Parts* of the *World* to have been, so they have but several *Angles* and *Sides*, it must follow that by running against one another, their *Angles* must by degrees have been worn away, and their *Figure* thereby chang'd to Roundness. For by an *Angle* we understand nothing else, but that Prominency which hinders a *Body* from being round; which *Angles* being worn of, a *Spherical Body* must thence arise. For *Bodies*, whirld by various motions for a long time together, do at last become round, as appears in those things that are turned. And the parts of this *Matter* are called *the Second Element*.

VI. *The Matter of the First Element, fills the Spaces that are left between the foresaid small Round Bodies.*

And forasmuch as a *Vacuum* implies a Contradiction, and that all spaces are fill'd with *Bodies*, there must be some more *subtil* Matter to fill the intervals that are found between those small round *Bodies*, which is performed by those *Particles*, which like *Shavings*, are rub'd off by Motion from *Bodies*; for they being very slender and flexible, easily accommodate themselves to the *Figures* of the *Bodies* they are contiguous to. Moreover by this *Attrition* or Rubbing against one another, they have obtained a very great degree of Swiftness; so as that by the meer force of their *Motion*, they are further divided into innumerable *Particles*, and are sufficient to fill up all the little spaces left between the *Globuli*.

VII. *The Parts of the First Element are not of the same Bigness.*

Now tho' this Matter be very subtile, yet we must not think that all the parts thereof, are of the same smallness, as appears in *Sawdust*, or in *Filings*. Wherefore the lesser of those *particles* will be more easily moveable than the thicker and bigger; and the *Particles of the First Element* will move more swiftly than those of the *Second Element*: For tho' they receive their *Motion* from these latter, yet because of the ways they must run through, their *Motion* must needs be accelerated: For whilst the *Globuli* of the Second *Element* pass through streight or right-on, and open ways, they thrust those through narrow and cross ways. And indeed we find by Experience that the narrowness of Passage conduceth much to swift Motion, as we find in a *Bellows*, whence the *Air* proceeds with great swiftness, by reason of the narrowness of its *Nuzzle*.

VIII. *The Rise of the Third Element.*

But tho' most parts of the Matter be *Round*, and that the *Particles* that are worn off from them, be such as I have now described, yet we must suppose that many parts of the Matter, having been bigger, and of more irregular *Figures* than the rest, it was more easy for them to join themselves with many others, than to become round; and these are they that constitute *the Third Element*, which we may call the *Element* of the *Earth*, because the parts of it have little or no Motion, whereby they might change their situation with regard to one another; in like manner as we may call the First, the *Element* of *Fire*, because of its subtilty, and the swift agitation of its Parts; and the Second *Element*, that of *Air*, because its Parts are bigger, and less agitated than those of the First *Element*.

IX. *How it comes to pass that the Matter of the First Element, doth not encrease continually.*

But from this supposition, that the Matter of the *First Element*, did at first arise from the hitting together of the *Globuli*, one difficulty does arise, *viz.* that it seems to follow from hence, that this Matter ought to encrease continually, because the *Globuli* of the *Second* hitting one against another incessantly, must needs strike off some *Particles* from each other, and that consequently the *Sun* and *fixt Stars*, which consist of this *Element*, must be encreased continually by reason of a never ceasing affluence of new Matter.

X. *Answer.*

This Difficulty may be easily answer'd, by considering the mutual *Conversion* of the *Elements* into each other. For from the Matter of the *First Element* sometimes a thick *Body* is made, as may be seen in the *Spots* that grow about the *Sun*, and

obscure

obscure some part of its light. For if we examine their first Original, we shall find that at the Beginning, they are very thin Bodies, which repel the impulse of the *Particles* of the First *Element*, which by running against them, cleave to them, and being condensed by the Motion of the *Suns Substance*, become big and Opake Bodies. And by this means the *First Element*, is turned into the *Third*, which being afterwards dissolved, becomes again the *First Element* by acquitting its former swift agitation, and by being divided into *Particles* of Indefinite Parvity.

XI. *The Number of the Elements.* Wherefore being resolv'd to deviate from the Sentiments of the *Antients*, since we want other *Latin Words* whereby to express them, we will distinguish the Names of these *Elements* only by Numerals, and call them the *First*, *Second* and *Third Element*.

XII. *What the First, Second and Third Elements are.* By the First Element, we understand with *Des Cartes*, *a most subtil* Matter *very swiftly agitated, fluid, and keeping to no certain figure, but which suits it self to the Figure of those bodies that are about it.* By the Second *Element*, *we mean very small Globules, that is,* Bodies *exactly round and very solid, continually whirl'd about, and which do not only like the First Element, fill up the Pores of* Bodies, *but also constitute the Purest Substance of the Æther and Heaven.* By *the Third Element we understand a* Matter *consisting of thicker and* Branchy *Parts, full of Angles and unfit for* Motion, *of which the* Earth, *Water, Air, and all mixt* Bodies *do consist.*

XIII. *The Definition of an Element in General.* An *Element* therefore Generally taken, is *a Formed Primordial Matter, whence the variety or difference of Bodies takes its rise.* Or it is *a simple Body, of which mixt Bodies are compounded, and into which they are resolv'd again at last. First*, an *Element* is said to be *a Matter Formed*, because *Elements* were at first made out of *Matter*, by the Introduction of certain *Modes* into it. It is called *Primordial*, forasmuch as *Elements* are the *Principles* of mixt *Bodies*, not made of any other *Bodies*, as mixt *Bodies* are, but immediately produc'd from the Matter *from which all variety of Bodies takes its rise*, as proceeding only from the various Modification and conjunction of the *Elements*.

XIV. *These three Elements are sufficient for the explaining of all Natural things.* It remains next to shew that these three *Elements* of the *World*, are sufficient to explain all natural effects whatsoever, and that therefore there is no need of feigning any other. This will appear if we consider the several kinds of *things* in the *World*, for according to their Diversity we are to settle the Distinction of *Elements*. And seeing all Bodies may be reduc'd to three General *Heads*, just so many *Elements*, and no more are we to look for in the *World*. Now Bodies are either lucid or shining, as are the *Sun* and *fixt Stars*: and these are made of the First Element; or Transparent as are the *Heavens*, which transmit the *Rays* of the *Sun* and *Stars*; and these do consist of the second *Element*: Or lastly, *Dark* and *Opake*, which reflect the *Rays* they receive from Lucid Bodies, such as are the *Comets* and *Planets*, and these consist of gross and corner'd parts, which as we have said, do constitute the third *Element*.

XV. *Why the Sun is called Lucid, and the Heaven Pellucid or Transparent.* For it cannot be doubted but that the *Sun* and the fixt *Stars* are Lucid Bodies, as coming near the Nature of *Flame*, and exactly resembling all the *Properties* of *Fire*, and therefore they cannot consist of any other Matter save that of the first *Element*: And the *Heavens* are said to be Transparent, and compacted of the *Globuli of the Second Element*, forasmuch as by means of them they transmit the *Light* to us. Now we must not imagine that these *Globuli* or *Pellets* of the second *Element*, are immediately joyn'd together, since that implies a Contradiction; but the subtil Matter runs between them, and takes up the places they themselves cannot fill because of their roundness. The same thing being also to be observed in other Bodies which reflect the *Light*, for a great quantity of the Matter of the *first Element* doth always pierce and permeate the *Earth* and the *Planets*.

XVI. *Things compounded of the Elements.* Wherefore three sorts of Bodies are chiefly to be consider'd in the *World*; the *Sun* and the *Stars* which consist of one only kind of Matter; the *Heaven* which includes both the first and second *Element*; and the last or lowest, which contains all the three kinds of *Matter*, as the *Planets* and *Comets*.

XVII. *Objection.* You will say, it may be, that it is an Argument of Rashness and Profaneness to set down another order of conceiving of things, than *God* himself hath observed in the making of them; and that we cannot look upon things to be the effect of certain feigned *Principles* of our own which we know were *created* by the sole Command and will of *God*.

XVIII. *Solution.* I answer, that it is no Argument at all of either Rashness or Profaneness, for a *Man* to distribute those things into many parts, which he cannot conceive all together, and to follow such an order of conceiving of things, as is consentaneous to the *Laws of Nature* establisht by *God*, tho' he knows that *God* did not make use of this Order in the *Creation* of things. For otherwise not only all *Philosophers*, but *Divines* also would be found blameworthy. For do not *Divines* divide *Gods Decrees* into *many*, which notwithstanding in *God* are only one most simple act? They link divers *Decrees* in a certain order together, and suppose some of them to have been before, and others after, tho' indeed there never was any such Series or Connexion of *Decrees* in *God*. But who has ever undertakn to blame them for this? Except it be some of those, who that they may seem to be wise, will not stick to find fault with *Heaven* it self. Now if this may be done without blame in the *Decrees of God*, which are *God* himself; much more will it be lawful for us to conceive the Universe of *Bodily* things (which is different and diverse from *God*, and made by him in the space of six days) as successively springing from certain *Elements* by the wise and Powerful disposing of *God*. And the rather, because if *God* had will'd to produce this *World* successively from *Elements*, doubtless he might have done it, without any prejudice to his Power or Wisdom.

XIX. *The Elements of the Chymists.* The *Chymists*, accounted by some the only *Philosophers*, and *Natures Secretaries*, hold five Principles, *Mercury*, *Sulphur*, *Salt*, *Caput Mortuum* or *Dead Earth*, and *Phlegm*; there being scarcely any *Body* out of which they cannot produce these several *Natures*, as they tell us. For that by the means of *Fire*, or some other *Analogous Agent*, they can so resolve things, that by separating the parts, whereof they were compounded, they can discern their several *Forms* and *Quan-*

lities. Wherefore the more subtil part which they draw off by *Fire*, they call *Mercury*, *Spirit* or *Aqua vitæ*; the Thicker and Fatter part they call *Oil* and *Sulphur*; and the most fixed, which is last of all extracted, they name *Salt*. Besides these there remains behind a certain *terrestrial matter*, being the dregs or dross of the Resolved *Body*, which they term the *Caput Mortuum*, or *Damned Earth*; and a watry and insipid liquor they call *Phlegme*.

XX. *The Principles of the Chymists cannot be said to be first Elements.*

These *Principles* of the *Chymists*, cannot be said to be the First *Elements* of things, as not being those things into which *Bodies* are resolv'd last of all, but such as proceed from them by a prior Resolution, after which they may be yet further resolv'd into much more simple parts, as the most experienced *Chymists* do confess. It hath been prov'd by a late Experiment, that *a thick Oil* distill'd from various *Plants*, hath been so rectified by many reiterated *distillations*, that at every Rectification an equal Portion of Common *Water* hath been added to it: And after many *Distillations*, they have got from it a quantity of *Water*, impregnated with much volatile *Salt*, besides a considerable portion of *Earth*, so that at last only a little *thin Oil* remained, of a great many *ounces*; which by more Rectifications might have been wholly resolved into *Phlegme*, *Volatile Salt* and *Earth*. So that neither the *Burning Spirit* of *Wine*, nor *Oil* it self, nor *Sulphur*, can be reckon'd amongst the *first Principles of things*, as being only secondary Concretions, which depend on such as are more simple.

XXI. *The Extracted Salts, are not simple.*

Neither can I persuade my self that the *Salts* extracted out of the *Ashes* of *Plants*, &c. are so simple as not to consist of some thing more simple than themselves. For when I consider that *Sea-fish*, which for a great part, are nourished with *Salt-water*, have not the least taste of *Salt*; and on the contrary that *Men* and *Beasts*, who do not so much feed on *Salt Things*, do void Salt *Urine*, *Sweat*, and sometimes *Spittle* too, I am very apt to persuade my self that *Salt* it self is not the first concretion of *Parts*, but only a secondary, and which depends only on a *Mechanical* contexture.

XXII. *The Chymists do not, in this their Enumeration, comprehend all Principles.*

These *Principles* therefore, notwithstanding they are so highly valued by the *Chymists*, do not comprehend all things out of which *Bodies* are compounded: For tho' they extract *Waters* by their *Distillations*, that is, the most slippery and flexible parts of *Bodies*, which they ascribe to *Mercury*: *Oils* also, that is, those Branch-like Parts that do easily entangle and hang together, which they attribute to *Sulphur*; and the remaining very thin parts, that are easily mixt with *Water*, and incorporate with it, which they refer to *Salt*: Yet all this while they make not the least mention of that subtil Matter, whose Existence we have here owned and asserted, and which is of absolute necessity to the composition of most natural things.

XXIII. *The Parts of Bodies are greatly changed by Distillation.*

Moreover, who would own those things to be the *Principles* of *Natural Bodies*, which are quite changed, and have got another nature? For *Fire* being extreamly active, cannot extract the parts of any compound, without violently agitating, and dividing them into less *Parts*, which Division cannot happen without a change of their *Figure*, and by consequence of their *Nature*. Now Experience proves that the nature of things is alter'd by *Distillation*; because that after all the *Parts* into which a mixt *Body* can be resolv'd, are put together again, that which thence ariseth is not the same with that it was before, but is quite of another Nature.

XXIV. *According to the opinion of the Chymists there are more than five Elements.*

We may add this also, that the *Chymists* deceive themselves by making only *five Elements*; because according to the Method and way whereby they have found out these, they may procure a vast greater number of *Elements*, yea such as the *Mind* of *Man* cannot reach. For the same *Mercury* is not drawn from all *Bodies*; nor the same *Sulphur*, seeing that which is drawn from *Wine* is very different from that they get out of *Oil*. Neither is it the same *Salt* they extract from all *Plants*, since that of the *Ash* hath a Caustick Virtue, which the *Salt* of *Oak* hath not. Wherefore we must conclude that *Mercury*, *Sulphur* and *Salt* are no *Elements*, because Elements are simple, and common to all mixt *Bodies*.

XXV. *The Chymical Principles presuppose a certain Texture of Parts.*

Moreover it is very probable that these five *Principles* do only differ by the Texture of their parts; neither do I think that *Oil* differs from *Spirit*, save only in this, that the Parts of *Oil*, are by a long Fermentation, divided into smaller parts, and furnisht with lesser branches, whereby they are less apt to adhere to *Bodies*, and with more ease flee away from them. That it is so indeed, we may conclude from this noted Experiment, that from *Plants* and *Juices* much *Oil* is got before *Fermentation*, but very little *Spirit*; whereas if you distill them after *Fermentation*, you shall have much *Spirit*, but a very small quantity of *Oil*.

CHAP. VII.

There are no Substantial Forms really distinct from Bodies.

I. *What the Peripaticks understand by substantial Forms.*

THey that follow *ARISTOTLE*, or rather his *Interpreters*, do all agree in this, that there are *Substantial Forms*, which together with the Matter constitute one Compound. By the name *Substantial Form*, they understand a certain *Substance united to matter, which together with it constitutes a meer Bodily compound.* Tho' both these parts are *Bodily* and *Divisible*, yet they assign a difference between them; as that the Form is more a Substance than the Matter, because they consider it as Subsisting by it self, and is therefore by them called *Actus* or Actuality; whereas they will have the *Matter* to be only *Potentiality*, which is perfected by the Form, from which also it derives all its *Existency*. Upon which account *Matter* is frequently call'd by *ARISTOTLE* a *Non-Entity*, a *Non-Quiddity*, and *Non-Quality*.

II. *There is no thing new in Nature which is not made by God.*

Tho' this Opinion be commonly approv'd of in *Schools*, and that they are accounted no less than *Hereticks* that reject it, yet Reason obligeth us to depart from it, and publickly to profess that *Substantial Forms* are of no use in *Natural Philosophy* for the explaining of the *Principles* or causes of natural things; yea, that all *Natural Effects* can better be explained without them. And the chief reason that persuades us to explode these *Substantial Forms*, is from their own nature. For there can be no substance that begins to be in the *Nature of Things*, which is not *created* by *God*; forasmuch as every thing, both as to its *Essence* and *Existence* depends on him; so that if there be any thing

thing that begins to be, we may truly say of it, that it is produc'd by *God*: But many *Substantial Forms* according to them do daily exist anew, and yet are not suppos'd to be created of *God* by those that admit them; therefore there is no ground at all for them.

III. *Substantial Forms can neither be produc'd nor annihilated by a created Agent.*

To confirm this; what becomes of *Substantial Forms*, when they are separated from *Matter*? Do they still continue, or do they perish? If they continue, whither do they betake themselves? What is their *Virtue*, or how do they work, being separate from *Matter*? If they *perish*, as all do own, by what force are they destroy'd or annihilated? Since *Annihilation*, as well as *Creation*, belongs to *God* alone; and that it is only the *Work* of an *Infinite Agent*, to reduce an *Existing Thing* to *Nothing*? For every single thing, always continues in the same state, except it be alter'd by an *External Principle*; now it is repugnant to the Goodness of the *Creator* to produce things, that have in themselves the *Principle* of their own *Destruction*.

IV. *There is no instance in Nature of Annihilation.*

And after all, none of the Asserters of *Substantial Forms*, can produce one single Instance that ever any *Substance* was wholly destroy'd; but will of its being chang'd into something else, and taking a new *Figure*. 'Tis for this cause only that the *Rational Soul* is said to be immediately *created* by *God*, because it is a *Substance*. For a *Material Accident*, according to their Opinion, is not *Created*, but produc'd from the Potentiality of the *Matter*, after the manner of *Substantial Forms*; wherefore, since these *Substantial Forms* are not suppos'd to be *created*, neither ought we to think them to deserve the name of *Substance*.

V. *These Forms being obscure nothing can be proved by them.*

This may also be proved another way. For *Substantial Forms* were only invented by the *Peripateticks*, to make out the *Causes* of all *Actions*, that are found in *Natural Things*, whereof they are the *Principles*, from whence they do proceed: But these *Forms* are of no use to the explaining of all these *effects*; seeing that they themselves own them to be *hidden*, and that their *virtues* are not known to them. For whatsoever is clearly perceiv'd in *Bodies*, the same according to them is deny'd to be the *Form*, which they say lies hid in *Bodies*, and which they own to be imperceptible by the *Mind* it self. Wherefore when they say that some *Action* proceeds from *Substantial Forms*, they may well be reproach'd for having recourse to a *Principle* of *Actions*, the nature whereof they do not conceive, and by consequence neither can any thing of certainty be gather'd from it: Which alone, in my Judgment, is sufficient to reject them altogether, forasmuch as nothing is to be admitted in *Philosophy*, which is not clearly and distinctly perceived and known. For what can be more unworthy of a *Philosopher*, than to make those the *Principles* of *Bodily Things*, which he can neither explain by *Definition*, nor demonstrate by *Experience*, nor conceive in his *Mind*?

VI. *Substantial Forms the Refuge of Ignorance.*

Would you take him for a *Philosopher*, who being asked about the *Nature* of *Fire* and *Water*, should tell you that *Fire* is Fire, and *Water*, *Water*? For is it not much the same thing, to say that *Fire* and *Water* are such by their *Substantial Forms*? Or would you think him to be an Interpreter of *Nature*, who being demanded about the *Phases*, or *Appearances* of the *Moon* or *Venus*, and the *Principles* of the *Stars*, would answer, that they proceed from *Forms*, as from their Inward *Principles*? What is this but to call all things by one name, and comprehend them under one and the same *Notion*?

VII. *By admitting Material Forms, it may be question'd whether the Rational Soul be not of the same Nature.*

But you'l say, it is dangerous to reject all *Substantial Forms*, forasmuch as this may be an occasion of doubting, whether there be any *Substantial Form* in *Man*, because we see the same operations in *Brutes*, which are perform'd in us. I answer, that the contrary ought rather to be inferr'd from hence; for by admitting *Bodily Substantial Forms*, and such as are subject to *Death*, it may doubted, whether such *Forms* be not also in us, as they hold to be in *Living Creatures*; whereas by utterly rejecting them, we extol the Dignity of *Souls*, by declaring them alone to be *Substantial Forms*, and that all the rest consist only in the *Motion* of the *Animal Spirits*, *Configuration* of *Parts*, &c. as shall hereafter be declared more at large.

VIII. *The Soul of Man being a Substantial Form, doth not prove that there are other Substantial Forms.*

But the *Soul* of *Man* being a *Substantial Form*, cannot be an *Argument* to prove other *Substantial Forms*; because the *Soul* of Man is a *Spirit*, wholly distinct from *Matter*; whereas other *Forms* are all of them *Material*, and consequently extended: whence we must conclude that they are *Modes* of *Matter*; or if any of them be *Substances*, they must be *Bodies* of a particular Nature, which united to other *Bodies*, constitute *Natural Compounds*.

IX. *Neither did Aristotle ever own them.*

Wherefore the *Schoolmen* certainly differ from *ARISTOTLE*, when they assert the *Forms* of *Natural Beings* to be *Substantial*. He indeed owns the *Form* to be οὐσία, but by this word he doth not mean *Substance*, which belongs to the *General* Nature of *Body*; but *Essence*, which relates to the *Special* Nature of a *Determinate Body*. As for example, the *Form* or shape of *Apollo*, is of the Essence of the *Statue* whereby *Apollo* is represented, but yet is not of the *Substance* of it, as the *Stone* or *Wood* is of which it is made.

X. *An Objection fetch'd from the Distinction of Living Creatures.*

But they will urge further, and say, that *Brute Animals* differ amongst themselves, but they cannot differ by the *Matter*, because that is the same in all *viz.* a thing extended in *Length*, *Breadth*, and *Depth*. Therefore there must be a *Form* by which they may be distinguisht from one another. The Major is proved from *Scripture*, which saith that *God created the Living Creatures according to their kinds, and the Fowl of the Heaven according to their kind.*

XI. *Solution.*

I answer, that we freely grant all this. For the names of *Genus* or *Species* do not always denote *Substantial Differences*, but sometimes only Accidental ones: And this way *Animals* do differ, who are differently disposed and moved; much in the same manner as *Clocks* may be said to be distinguisht, because they have various *Motions* according to the different ways after which they are made. For not only *Substances* differ by *Species* or by *Genus*, but also *Modes* and *Accidents*; for a *Round Figure* doth no less differ specifically from a *Square*, than *Beasts* and *Fowl* do; and yet no body will be so senseless to assert, that those *Figures* differ by *Substantial Forms*; since neither of them include any thing of *Substance*. And so likewise *Beasts* and *Fowl* are said to differ, because *Matter* is variously dispos'd and modified in them.

You

XII. *Another Objection drawn from the Difference of Bodies.*

You will say that there are many *Bodies* in the *Universe* which do essentially differ, as *Honey*, and *Wormwood*; and that this Essential Difference cannot proceed from any thing, but from *Substantial Forms*; seeing that the *Accidents* that are in *Honey* and *Wormwood*, as to their *Figure* or Disposition of *Parts*, may be changed, whilst the *Honey* and *Wormwood* still continue the same.

XIII. *Solution of the Difficulty.*

I answer that *Honey* is constituted such as it is by its *Form*, and so essentially differs from *Wormwood*: But that this *Form* is a *Substance* I utterly deny, because the difference of these two, is only from the different configuration, situation, *&c.* of their *Parts*. For tho' it be accidental to *Matter* in general, to have the configuration of the Parts of *Honey* or *Wormwood*; yet is it essential to *Honey* and *VVormwood*, to have such Modifications, to make them such *Bodies*. But of this more hereafter.

CHAP. VIII.

That there are no Qualities, or real Accidents distinct from Substance.

I. *What the Peripateticks Understand by Accidents.*

THE safest way to arrive to the knowledg of those things we enquire after, is to separate them from one another, and by this means distinguish what is obscure, from what is clear in them. But in the Observation of this *Rule*, we must have a care not to encrease the number of *Objects*, or to assign *Existence* to such things, which indeed cannot exist. Which some seem to have done by distinguishing *Qualities* and *Accidents* from *Substances*, and taking them for *Real Entities*, having a distinct Nature from the *Subjects* in which they are found. For they have defined them to be *Things adventitious to Subjects, and that are by Nature distinguisht from them.* And will have their *Essence* to consist not in an *Actual*, but *Aptitudinal inherence*, to shew that *Accidents* may exist separate from their *Subjects*.

II. *They Confound Substance with Accidents.*

But certainly they are in a great mistake, seeing that they confound the notion of an *Accident* with that of *Substance*, whatever they may say to the contrary. For every thing that is *real* involves an Aptitude to exist, and therefore is a *Substance*; seeing by a *Substance* nothing else can be understood, but a Thing, *which stands in need of the Concourse of God only to exist*; which how truly it agrees to an *Accident*, no body will deny, that owns an *Accident* to be something Real, and that it can exist separate from its *Subject*. Moreover, whatsoever is evidently and distinctly known by us, the same is true: But I clearly understand an *Accident* to be a *real thing*, and that it can exist independently of its *Subject*; Therefore an *Accident* is to be called a *Substance*; forasmuch as nothing else is contained in the Conception of a *Substance*. For no stronger Argument can be alledged to prove that two *Things* are the same, than that they have one and the same *Definition*.

III. *If Accidents be Real Entities they may exist by themselves.*

But you will say, that *Accidents* are very weak *Entities*, which stand in need of a *Subject* to support them, and that therefore they do not deserve the name of *Substance*. If this Answer were sufficient, it might as well be said that the *Animal Spirits*, and all insensible *Particles* of *Bodies*, ought to be reckon'd amongst *Accidents*, because they also want a *Subject* to support them, and from whence they have their permanency. It is sufficient to the nature of a *Substance*, that it be an Entity fit or apt to exist. Now forasmuch as *Natural Accidents*, which *ARISTOTLE* defines in his *first Chapter of Prædicaments*, are such *Entities*, and that *Existence* is no where to be found but in those *Entities*, we may well say that they subsist of themselves.

IV. *A Real Accident is a Substance, if the Definition of Substance agrees with it.*

And whereas they say that *Accidents* cannot naturally exist separate from *Matter*, but only by the *Divine Power*; this is nothing to the Purpose; for *Gods Power* doth not destroy the *Nature* of *things*, nor impart any new thing to them. Wherefore, if every thing that can Naturally be separated from its *Subject* be a *Substance*, then that also which by the *Almighty Power* of *God* can be without a *Subject*, may as well deserve the name of a *Substance*. And as to what they say that *Accidents* separated from their *Subjects*, do by a natural propensity require to be restored to them again, neither will this do them any service at all: For as a *Bodily Substantial Form*, which supernaturally can exist separate from its *Subject*, whence it is brought forth, doth not therefore cease to be a *Substance*, because of its natural propensity to be united to *Matter*; so neither doth an *Accident*, that admits the Definition of a *Substance*, cease to have the *Nature* of a *Substance*, tho' by a Natural Propensity it requires to be placed in a *Subject*. Neither will this Exigence ever be able to hinder an *Accident* from being look'd upon as *something Subsisting*, which is sufficient to constitute the *Nature* of a *Substance*.

V. *Real Accidents are useless in Natural Philosophy.*

I cannot imagin why the *Peripateticks* take so much pains to introduce *Accidents* into the *VVorld*, when if there were any such, they could not be perceiv'd by any of our *Senses*: For every Sensation is perform'd by *Contact*; now nothing but the *Superficies* of *Bodies* can be toucht; and that *Surface* which is touched, is not a *Real Accident*, as they falsly imagine, but only the *Mode* of a *Substance*, as consider'd without Profundity. But they will say that *Real Accidents* are to be admitted in order to the explaining of *Sensation*: But neither is there any Necessity for this; since nothing is requir'd to the moving of our *Senses*, besides the variously disposed *Superficies* of *Objects*: For we may easily understand how from the different *Magnitude*, *Figure* and *Motion* of the *Particles* of one *Substance*, divers *local Motions* may be produc'd in another: But we cannot conceive, how by them any such thing should be made as a *Real Accident* is, that hath power to produce local *Motions* in other *Bodies*.

VI. *This is illustrated by the Example of a Watch and Beaten Glass.*

The thing will become more evident by an *Example*: What is it in a *VVatch* that measures the *hours?* Is it any Faculty or Power distinct from the *VVatch* it self? Certainly 'tis nothing besides the *Magnitude* of the *Parts*, the *Fabrick* of the *VVheels*, the Figure of the Spring, and other *Mechanical* affections that produce all those certain and constant *Motions*. Is there any *virtue* superadded to beaten *Glass*, which wounds the *Membrans* of the *Guts*, and makes it *Poison?* Not at all: For the same *Glass* being ground to a very fine Powder may be taken into the *Body* without any danger at all; and the Power in *Beaten Glass* of hurting the *Bowels* proceeds only from the *Firmity* or hardness of its *Parts*,

Parts, and the *Figure* of them, not from any *Occult Quality*, nor from a Faculty distinct from it, proceeding from the *Glass* it self.

VII. *Whatsoever exists is Substance, not Accidenes.* *Real Qualities* therefore, as they call them, are not to be admitted by a *Natural Philosopher*, as being repugnant to sound *Philosophy*, and cannot be understood, even of those, who will needs have them distinct from their *Subjects* as if they were Real Entities. For who could ever conceive a thing to be distinct from another, in which it is, and yet to have no *Existence* but what is dependent upon it? For every thing hath its own proper *Existence*, and whatsoever hath *Existence*, is without our thinking, in the nature of things, and therefore is no *Accident*. It seems a contradiction in *Terms*, to say that a *thing exists*, and yet wholly stands in need of the help of another that it may be; as will be evident to him that minds his own *Thoughts* and *Conceptions*, rather than the *Words* that are tost in the *Schools*.

VIII. *Substance only, is an Entity.* Accordingly *ARISTOTLE* himself *Book 7. Metaph. chap.* 10. expresly asserts that *Substance* alone doth properly deserve the name of *Being*, or *Entity*; and that a *Quality* or *Accident* is not so much an *Entity* or *Being*, as the *Entity of an Entity*, or the *Mode of a Being*. For what is more contrary to Reason, than that that which hath no *Essence* of its own, but borrows its *Existence* from another, to which it is joined, should be reckon'd amongst *Entities*? For as one thing only is said to be sound or Healthy, *viz.* an *Animal*; and all other things are said only comparatively to be so, so far as they have any reference to the nature of an *Animal*; so likewise we are to suppose, that *Substance* alone, according to propriety of *Speech* is an *Entity*, and all other things *Analogically* only, and with reference to that. Wherefore *Quality* in General is thus to be defined: *A Mode of a Substance*, or a certain adaptation of the *Parts* of a *Body* according to *Motion*, *Situation*, *Figure*, *Magnitude* and *Rest*. Forasmuch as from these a *Body* is denominated such like, and the Question *What like a thing is*, may be fitly answer'd.

IX. *Wherein the Nature of Accidents or Modes doth consist.* I am not ignorant that the Asserters of *Real Qualities*, do support their Opinion by *ARISTOTLE*'S Authority; but I can never believe that so Great a *Philosopher* by *Qualities* did understand *Real Accidents*, but that thereby he only meant (as far as can be gather'd from the Examples he alledgeth) that there are divers dispositions of *Parts* in one *Body*, from what there are in another. In which sense I readily admit them, as supposing them only to consist in the *Motion*, *Rest*, *Configuration* and *Situation* of Parts. Thus *Heat*, for Example, is nothing distinct from the *Fire*, but is the very *Substance* of it, or the *Flowing* of its *Particles*, which penetrate and divide the *Wood* or any other *Matter*: So *Figure* is the *Body* it self, with regard to its being bounded by other *Bodies* from any further extension. So likewise *Hunger*, *Thirst*, *Standing*, *and Sitting*, are nothing else but various Affections or Mutations of a *Body*, which we consider as *Modes*, and not as *Real Accidents*, which may be separated from it.

X. *Agility, Soundness of Body and Beauty are not any* And the like we are to conclude concerning *Agility*, *Health*, *Beauty*, &c. For *Agility* is nothing else but a due Proportion of *Spirits*, and strength of the *Nerves*, that procure *Bodily Motion*. *Health* is nothing else, but a convenient Temperament of the *Humors*, and Aptness of the *Members* of the *Body*, in that state which Nature requires. *Beauty* is a fit disposition of *Members* and *Colours*, in a due Proportion to each other. And whosoever pretends *Qualities* to be any thing else, I dare aver that he doth not understand what he asserts; seeing they cannot afford him any notice towards the apprehending of them, or any particular *Idea* concerning them. Nay he cannot so much as know wherein they consist, as shall be made evident hereafter in the case of *Heaviness*, *Motion*, and such like. Except he looks upon them as certain little *Souls*, under the notion of *Spiritual Beings*, which belong to *Bodies*, and perform the same in them, that *our Souls* perform in ours, when they move them. *new things superadded to a Body.*

XI. *Habits are no new things superadded to the Souls* A Modern *Philosopher* explains this point, by the Example of a *Habit*, which is defin'd to be *an Adventitious Quality enabling the Subject to work with ease*. Or, to use his *Words*; The Vigor, Ability and Readiness of a *Natural Faculty*, acquird by repeated *Acts*, enabling one to do that better, more readily and certainly, which he hath several times tryed to do. For by frequent repeated *Actions* (or by an Extraordinary vigor communicated by *Gods Special Grace*) *Habits* are got, which are no new things superadded to our *Soul*, but only *Modes*, as when by frequent *dancing*, the *Feet* acquire a great degree of nimbleness, which Modifies the natural moving faculty.

XII. *The same thing shewed by the Example of a Watch.* We see in a *Watch* that when the *Wheels* are but newly made, and rough, they move more slowly, which afterwards when the Surface of them has been worn and made smooth by long continued *Motion*, move more swiftly: Whence it is that frequently old *Watches* do Anticipate the time, and make shorter *hours*. But who will say that by this smoothing of the *Wheels*, any thing hath been added to them, besides a Modification? since all the change that hath happened to them is, that the *Wheels* are become more smooth and polished, and their Motion swifter than it was before. And the same must be said of our *Mind*, when a *Habit* is added to it, that it can now understand that more readily and easily, which before it naturally did more slowly and difficultly, which plainly is nothing else but a *Modification*, and not any new thing added to our *Understanding*.

XIII. *If we admit Accidents to be Real, we shall not be able to know whether they belong to Matter or Spirit.* Besides, if *Accidents* be Real, we shall never be able to know what *Accidents* belong to a *Body*, and what to a *Spirit*. For if *Accidents* have no Affinity with their *Subjects*, save this only, that they inhere in their *Subjects*, and yet are really distinct from them, we shall not be able to gather from the Perception of an *Accident*, whether the *Substance* in which it is, be *Material* or *Spiritual*; that is, from the *Colour*, *Figure* and *Magnitude* we shall not be able to conclude that it is a *Body* rather than a *Spirit*; neither shall we from *Understanding* and *Willing*, which are the *Modes* of a *Spirit*, be able to conclude, that the *Substance* endued with these *Accidents* is a *Spirit*: No more than from the Nature of a *Body* to which the *Soul* is joined, we can conclude that the *Mind* is a *Body*, or the *Body* a *Mind*.

XIV. *Wherefore Qualities are to be rejected.* Forasmuch therefore as we are ignorant wherein the Nature of a *Quality* doth consist, and can frame no *Idea* of it, it is unbecoming a *Philosopher* to make use of that for the explication of *Natural*

Effects, which can neither be understood, nor defin'd, nor made out by *Experience*. But why then, may some say, are these *Qualities* admitted by the *Peripateticks*? Why, for no other reason but to mask and hide their own Ignorance, and that by fine words they may seem to know that, which indeed they do not. Accordingly if a *Man* ask them why such *Medicaments purge*, they will tell you, because of their *Specifick Quality*. Why doth the *Loadstone* draw *Iron*, or turns it self towards the *Pole*? Because such is its *Occult Quality*. How comes it to pass that the *Bones* of *Mermaids* stop *Bleeding*? Because they are endued with such a *Quality*. O excellent *Philosophers!* who know that the *Loadstone* turns it self to the *Poles*, that *Fire* is *Hot*, that a *Coal* is *Black*, *Honey* sweet, *Gall* Bitter, because of inbred Qualities, but altogether unknown and conceal'd from us.

XV. *What we are to Understand by the Name of Accident.*

What are we to understand then by the word *Accident*, if they be not things distinct from the subject wherein they are? I answer, It is that which happens to an *extended Substance*; and therefore an *Accident* is not any *thing Real*, but a *Mode* depending on the *Substance*. Thus because we conceive the Roundness of a Piece of *Wax*, as having a dependent *Existence* on the *Wax*, we call it a *Mode* or an *Accident*. These *Accidents* have got several names, according to the several ways of our considering them; for as *Substances* are affected and alter'd by them, we call them *Modes*; as from them they are denominated *such like*, they are call'd *Qualities*, and when we only generally consider them as being in any *Substance*, we name them *Attributes*.

XVI. *An Accident or Mode cannot exist without its Subject.*

Whence it is evident that an *Accident* or *Mode* cannot exist without its *Subject*, nor pass from one *Subject* into another: for if that could be, it would follow, that when it was in the first *Substance* it did not absolutely depend on it, which implies a contradiction.

CHAP. IX.

What Intelligible Forms may be attributed to Natural things.

I. *Matter being Passive of it self, must have some Forms by which it may act.*

MAtter being of it self sluggish and idle, and *Substantial Forms*, and *Real Accidents* having been rejected by us, we must take care to furnish it with some *Forms*, that may give to it variety and Distinction. For since *Matter* is a *Passive Principle*, we are to procure it some *Principles* whereby it may be enabled to procure its effects: Which we shall easily meet with, if leaving the *Schoolmen*, we shall betake our selves to the *Mathematicians*, and build our *Philosophy* on their *Principles*.

II. *What are the Forms of an Extended Being.*

For having defin'd a *Body* to be a *Substance extended in Length, Breadth, and Depth*, it remains, that in Imitation of them we consider in it *Magnitude*, that is, a determin'd Measure, which is call'd *Continuous Quantity*, or the number of its parts which is *Discrete Quantity*. Secondly, *Figure*, or the bounding Extremities of the *Matter*. Thirdly, its *Situation*, or diposal amongst other *Bodies*. Fourthly, its *Motion*, or change of *Situation*. Fifthly, its *Rest*, or abode in the same place. So that *Quantity* or *Magnitude*, *Figure*, *Situation*, *Motion* and *Rest* are the *Intelligible Forms* of all *Bodies*, whence their *Rise*, *Nature* or *Essence*, and *Properties* do depend. *A material Form* therefore is nothing else, but *a Complexion of Affections and Modes, that are accommodate to a thing, and to its performing several Actions.* Which *Form* in a sound sense may also be call'd *Substantial*, as being the Form of a *Substance*, that is, of the *Matter*, which it informs and perfects. For *Forms* give to all *Natural Bodies Substance*, and *Essential Difference*, and are the Springs of the operations of every thing, and therefore may well be called *Substantial*: They are contained in these Verses.

Mind, Measure, Rest, and Motion,
With Figure, and Position,
To Matter join'd, the Causes be
Of all what here below we see.

III. *From these the Distinction of things and their Actions do proceed.*

The *variety* of these *Modes* is the Mother of Different things, and their *Conjunction* the *Dispositive Principle* of all *Actions*; which Art the Imitation of *Nature* abundantly teacheth us: For *Artificial things* do no otherwise differ from *Natural*, than that these for the curious contrivance, multiplicity and fitness of *Organs* do exceed the Former, and thereby witness the Transcendent excellence of the *Artificer* that made them.

IV. *The Conditions of true Forms.*

Now that these *Modes* are the *Forms* of *Material things*, will appear more clearly, by assigning those conditions to them, which belong to *Forms*.

The *First* is, that the *Form* be proportionate to the *Matter*, so as to Determine and Define the same, which some call *Actuating*.

The *Second*, That as there is but one and the same *Matter* of all *Bodies*; so likewise there be but one common *Form* to them all, and such as shall affect them all alike.

The *Third*, That as all do own *Matter* to be a thing Extended and Divisible; so the *Form* also may be a thing known to all, and of the *Existence* whereof there can be no doubt.

The *Fourth*, That the nature of it be so clearly defined, that the notion may be as distinct, as is that of the *Matter* which it affects and distinguisheth. For it is the nature of *Principles* to be so clear and evident, that when the mind heedfully considers them, it cannot question their *Truth*.

V. *These Conditions agree to Quantity, Motion, and the rest.*

Now that these I have mention'd are the true Forms of a *Body*, or that they impart a certain *Mode* of *Being* unto the *Matter*, will appear from hence, because all the foresaid conditions of *Forms* agree with them. As to the *First*, it is evident, that *Matter* derives its Distinction from *Quantity*, *Motion*, *Figure*, *Situation* and *Rest*: According as more or fewer of these are found in it. For the Diversity of *Matter* depends on *Motion*, without which there can be no separation of *Parts*. From *Quantity* it derives the *Mode* of its Extension. *Figure* furnisheth it with proportionate *Extremities*. To *Situation* it ows its position amongst other *Bodies*, whether upward or downward, forward or backward. Lastly, by *Rest* it continues in the same place, till by a stronger it be remov'd.

VI. *Magnitude, Motion, &c. are common to all Bodies.*

As to the second condition it appears also that these five *Forms* are common to all *Bodies*, because they affect and diversifie not only *Earthly*, but also *Heavenly Bodies*. For *Heavenly Bodies* have their *Magnitude*, observe their distance and *Situation*,

tion, some of them being moved about their *Axis*, others about their own *Center*, and are bounded by *Figures*, which by the justling of other *Bodies* against them they change and vary.

VII. *Forms exist in Matter.* And according to the Third Condition, these *Forms* are apparent to, and own'd by all, to be in *Natural Things*, as being plainly discernible by us. For who is so dull and stupid as not to discern the *Magnitude*, *Figure* and *Motion* that is in *Bodies*, which are so obvious to his *Senses*? Neither in this do unlearned Men differ from those that are learned, since both own them alike; only the Unlearned considering chiefly their outside, judg them to be *Affections*; whereas the Learned searching more deeply into the Works of *Nature*, find them to consist in the insensible structure of the *Parts*, that by their smallness are not subject to our *Senses*.

VIII. *The Definitions of Forms are Evident.* As to the Fourth Condition, we cannot question but that the Definitions of these *Modes*, are easily deducible from this discourse, and are obvious and evident, not only to our *Senses* and *Reason*, but experience also.

IX. *Tho' these forms are not Substantial, yet are they Essential to some Bodies.* Tho' these *Principles* be only *Modes*, and like *Accidents* are attributed to a *Body* generally taken, yet may they be said to be *Essential* to the *Works* of *Nature*. For it is no contradiction to say that the same thing may be Essential and Accidental in diverse respects: Thus *Wisdom* is Accidental to a *Man*, but *Essential* to a *Wise Man*. *Sense* is the *Property* of an *Animal*, and yet is a *Genus*, with respect to the *Sight*, *Hearing*, *Smelling*, &c. In like manner, tho' *Quantity*, *Figure*, *Motion*, *Situation*, and *Rest* happen to *Matter* in Common, yet this doth not hinder but that they may be Essential to some Portion of it. Thus it is *Accidental* to *Iron* to be terminated by several *Figures*, as to be Round, Square, Sharp, or Blunt; whereas in a *Knife* the *Figure* constitutes its *Form*, and distinguisheth it from other things. For tho' *Iron* may be conceived without this or the other particular *Figure*, yet a *Knife* cannot be a *Knife* except it have such a determinate *Magnitude*, *Figure*, &c. So likewise *Roundness* is accidental to *Wood*, but is Essential to a *Wooden Bowl*. And in a *Clock*, *Magnitude*, *Figure*, *Situation*, the *Motion* of some parts, and the *Rest* of others, are accidental to the *Brass* or *Iron*, because without them they are still *Brass* or *Iron*; but a *Clock* can never have that name, without them.

X. *The Difference of Bodies depends on the Modification of their Parts.* So that the whole *Difference* of *Bodies* doth depend on the Modification of their *Parts*, which are distinguisht according to the variety of their *Magnitude*, *Figure*, &c. as their Identity or sameness consists in the agreement of those *Modes*, and their observing the same Proportion amongst themselves. Wherefore, tho' a *live* Man, and the *Statue of a* Man, be alike in outward appearance, yet cannot they be said to be the same, because besides the *Soul*, which is in a *Living* Man, there is also great diversity of *Parts*, not only as to their number, but in respect of their *Magnitude*, *Figure*, *Connexion*, *Rest* and *Motion*.

XI. *Objection, that the operations of Matter do not depend on these Accidents.* But it will be objected, that these *Modes* cannot produce so many *Effects*, forasmuch as all *Actions* are attributed to the *Subjects* themselves, and not to the *Accidents*, which only operate by vertue of the *Substance*.

I answer, that we acknowled no other *Subject*, but *Matter* furnisht with *Magnitude*, *Figure*, &c. for *Matter* being passive, cannot operate, but by their efficacy. And tho' indeed *Matter* do not derive its *Essence* from these *Modes*, that is, tho' they do not make it *to be a thing*, yet do they cause it *to be such a thing*. Thus that a *Pen* is fit to *write* withal, and a *Key* proper to open a *Lock*, proceeds only from their *Disposition*, *Figure*, *Motion*, &c. for when these are taken away, they are no longer useful. Wherefore, Accidents do not operate, by *Virtue* of their *Substance*, as the Schools will have it; but the *Substance* rather works, by a *Vertue* borrow'd from its *Accidents*. Thus diverse *Weights* are lifted up by a *Beam*, according to the Difference of its *Situation*: Neither would *Iron* cut, if it were not provided with a fit *Figure* and *Magnitude*.

XII. *Answer.*

If you object that these *Principles* are not sufficient to explain all the *Phænomena* of *Nature*, because it cannot be made out by them, how *Warm Water* grows *Cold*, forasmuch as this change cannot proceed from the Different Disposition of the *Water*.

XIII. *How hot water becomes cold.*

This change may very well be explain'd by our *Modes*, supposing *Heat* to be nothing else but *a strong and various Agitation of Particles*: For the *Water* by communicating its *Heat* to the *Air* and the Neighbouring *Bodies*, easily loseth it, except other succeed in the room of that which is lost; for by this means the *Water* is at length depriv'd of its strong agitation, and consequently returns to its former *coldness*.

XIV. *Answer.*

Hence it is evident that the *Powers* of *Bodies*, or their *Faculties* of *Acting*, are nothing else but the *Magnitude*, *Figure*, *Contexture*, &c. of the *Parts* of *Bodies*: For by these all the effects we see in Nature are produced.

XV. *Natural Power consists in the Disposition of Parts*

The *World* therefore is to be consider'd as a wonderful, and most Artificially contriv'd *Machine*, not the parts of it taken severally, but as joined and orderly complicated together. For as in a *Watch* we see many *Motions* performed only by the Contexture of its *Parts* and *Wheels*; in like manner all the Agreement or Likeness and Difference of *Bodies* proceed from their Mechanical *Affections*, viz. *Motion*, *Figure*, *Magnitude*, &c. As for example the Power the *Sun* hath, of attenuating *Water* into *Vapors*, of softning *Wax*, and Hardning of *Clay*, and of producing many other *Effects*, is not deriv'd from any new *Entities* added to it, or Distinct *Qualities*, but from its *Heat* only, which consists in the swift Motion of its Insensible *Parts*, which produceth several *Effects*, according to the different contexture of the *Body* it works upon.

XVI. *The World is to be look'd upon as a Machine.*

It is evident from what hath been said, that there are only two *Principles* of *Natural Things*, viz. *Matter*, which is the same in all *Bodies*, and the *Form* whereby one *Body* differs from another; since it is certain that *Privation*, which the *Peripateticks* add to the two foregoing *Principles*, doth not deserve that name, as being a Non-entity, from which consequently nothing can proceed.

XVII. *There are no more than two Principles of Natural things.*

Hitherto we have consider'd the *Nature* of a *Body* in *General*: We must next enquire into its *Affections*, which are nothing else but *Qualities*, *Attributes* and *Modes*, which agree to *Bodies*, according as they are said to be in this or the other state or condition; such as are those which we are

XVIII. *Of the Affections of Bodies.*

next

next to treat of, *viz. Rarity*, *Density*, *Heaviness*, and *Lightness*, &c. wherewith a Body is variously affected or indued.

CHAP. X.

What Rarefaction is, and how it is performed.

I. *Rarefaction cannot be performed without the entrance of new Matter.*

IT appears from what goes before, that *Extension* is something that is not distinct from *Matter*, and that the one cannot be encreased, but the other must be so likewise. Hence it follows, that in *Rarefaction* and *Condensation* the Constitutive *Quantity* of *Bodies*, is neither encreased nor diminished; but only that in *Rarefaction*, the parts that were before United, are distended, so as some intervals are left between them, which are fill'd up by the entring in of some fluid and moveable *Body*; as is manifest in a *Spunge* swell'd with *VVater*; and that on the contrary in *Condensation*, the separated parts are more closely united, by expulsion of those Bodies that fill'd up the Intervals; as appears in a *Spunge* out of which the *VVater* is squeez'd.

II. *What a loose and, what a close Body is.*

A *Thin* or Loose *Body* is that whose parts are intercepted by *Spaces* fill'd with some *forein Matter*, which afterwards may become a *Close Body* again by expulsion of the more *subtil Matter*, entred from without, by which means the parts come close together. Thus *Boiling VVater* is rarefied in a *Pot* over the *Fire*; for we find that when it begins to *boil*, it swells up into *Bubbles*, which could not be, but by the entrance of some *External Matter*, causing them to swell and be extended: and the same is the case with *VVater*, when it is turned into a *Vapour*.

III. *An Objection rais'd from the Rarefaction of Water.*

You will say, that in this case of a *Vapour* we perceive indeed that *Extension* is encreas'd, but no access of any new *Matter*: Wherefore it is without ground to say that *Rarefaction* is performed by the addition of some other *Body*.

IV. *Answer.*

I answer, that in a *Vapour* there is no more *Extension* or *Quantity* perceived, than there was in the *VVater* before its *Resolution*, because in this change nothing else happens but *a Solution*, *Division* and *Separation* of those *parts*, which before were more closely joined together; For he who at a distance beholds the *Vapours* that rise from *boiling water*, takes them to be a continuous *Body*; but if he take a nearer view of them, he will find them to be nothing else, but a crowd of innumerable small *Particles*, which separate and come between many other *Heterogeneous Bodies*. Wherefore where we find any *Body* dilated, we must conclude that it is by the access of some new *Matter*.

V. *The Bodies which enter the Pores of Bodies are of the same nature with those that strike our Senses.*

But what kind of little *Bodies* are these, which enter the *Pores* of *Rarified Bodies*, and which are expell'd when they become close and hard again?

I answer that they are the same in *Substance* with those *Bodies* which are seen and felt by us; save only that they are more subtil and fluid, and so are fit to penetrate and fill the *Pores* of other *Bodies*. For according to our *Hypotheses*, there are some *Particles* in the *Air* and other *Bodies* so subtil, as to be able to pierce *Gold*, *Diamonds* and the most *Solid Bodies* that are.

VI. *There are Bodies that are not perceptible by the Senses.*

You will say, that we do not find that the *Pores* are dilated in *Rarefaction*, nor that any New *Bodies* enter into them. But to this I answer, that all *Bodies* do not affect our *Senses*, by reason of their extream littleness. We know that a *Vine* in the Spring grows, and becomes extended to a further Length; which Extension could not be, but by an addition of *Bodies*, which dilate and stretch but the *Substance* of the *Vine*. And yet no *Man* ever perceiv'd these *Bodies*. We never saw the *Air*, and yet know that it is extended throughout the whole *World*. Wherefore neither in *Rarefaction* are we to deny *Bodies* to enter into the *Pores*, because we do not see them; but are to judge of what happens in these little *Bodies*, by what we see happens in the greater.

VI. *Why Metals are not rarefied.*

From this Explication of *Rarefaction* it is evident, why *Metals* and other Hard *Bodies* are not rarified without difficulty, but soft *Bodies* very easily, because the parts of them are readily separated and admit other *Bodies*, whereas hard *Bodies*, as *Iron*, &c. are not without great violence dissolved, and by that means hinder other *Bodies* from entring between their parts, wherein the Nature of *Rarefaction* doth consist.

VIII. *It is not necessary that all the Parts of Matter be rarefied.*

You'l say that in *Rarefaction* not only that *Body* is rarefied whose *Pores* are dilated; but also all the subtil *Matter* that enters them, which cannot be without the introduction of other *Bodies*, and these again by the Introduction of others, and so to infinity, which is not to be admitted in *Natural Causes*.

IX. *There are some Particles that do not admit Rarefaction.*

I answer, there is no inconvenience to say that *Bodies* that have *Pores*, become rarefied by the Intromission of others, and these again by the Intromission of other lesser *Bodies*, so we do but admit that there are some *Bodies*, which because they have no *Pores* cannot receive other *Bodies*, and that there are such is not to be doubted, especially by them who hold *Quantity* to be indefinitely extended: For they must acknowledge that the *Parts* of *Matter* may by Division be made so small, that they cannot be further divided but by our Thought.

X. *The Distinction between a Pure and a Rarefied Body.*

You'l say that the more loose or *Rarefied* a Body is, the more *Pure* it is also; as the *Air* is, when it is free from *Clouds* and *Vapours*: But now the *Purer* any *Body* is, the less it admits the mixture of any *External Bodies*; therefore *Rarefaction* is not made by the Introduction of other *Bodies*.

XI. *Answer.*

The *Major* of this Argument is to be deny'd; for *Pure* and *Rarefied* are not one and the same thing: That is *Pure* which is free from any mixture of forein *Matter*: As the *Air* is said to be pure, when it is not obscur'd by *Clouds* or *Exhalations*. But a loose or *Rarified Body* involves the mixture of *External Bodies*, and cannot be understoood without it; as a *Spunge* that is swell'd with the Intromission of *Water*.

XII. *Fire is the ordinary Cause of the Rarefaction of Bodies, whether they be liquid or solid.*

The ordinary Cause of *Rarefaction* is *Fire*; for the subtil *Particles* whereof it consists, being in continual *Motion*, easily enter the *Pores* of other *Bodies*, and dilate them. Hence it comes to pass that *Water*, which hath long boiled over the *Fire*, is more easily congeal'd than *cold Water* newly taken out of a *Well* or *River*, because the most subtil parts of it, which by their *Agitation* and *Motion* hinder'd *Congelation*, are evaporated in the *Boiling*. Neither are *liquors* only, but *Metals*, and other solid *Bodies* somewhat distended by *Heat*. Thus we find that *melted Metals* swell somewhat; and

and that it is common with *thread* dipt in *Brimstone* to cut off *Glasses*, because the Parts of *Glass* being put in *Motion* by *Heat*, require a larger *Room*, which they cannot obtain, without driving away the parts that are continuous to them.

XIII. *The first Corollary from what hath been said before.*

From what hath been said it is evident First, that the *Rarefaction of Air*, *Smoak*, *Vapor* and such like *Bodies*, are nothing else but a separation of the *Terrestrial Particles*, caused by a swift Motion, and the ingress of New *Cælestial matter* into the Spaces left by them. And that the *Condensation* of them, consists in a more intimate union of the said *Particles*, caused by the decrease of Motion or *Heat*, the Intervals whereby they were separated growing lesser, or being taken away, which when ever it happens, the *Body* thereby becomes so close and compact, that it cannot be made closer.

XIV. *The Second Corollary.*

Secondly, we may infer hence that a greater or less *Extension* in *Bodies* that are rarefied and condensed, doth not belong to the *Essence* of a *Body*, but is only a new *Modification* of it, which supposeth a change of *Figure*, and the presence of another *Body* filling the *Pores* of it.

CHAP. XI.

Concerning the Heavinesse and Lightness of Bodies.

I. *What Gravity and Levity is.*

HEavinesse and *Lightness* are the *Qualities* of *Bodies* with respect to their aptness to move upwards and downwards, in the *Sphere* of their *Gravitation*. Where by the name of *Aptness*, we are not to understand any Inclination or Active *Principle*, but only such a disposition of *Parts* which is capable of receiving the force of *Heavinesse* or *Lightness*. And by the *Sphere of Gravitation*, I understand the whole space comprehended between the *Center*, or that which is lookt upon to be the middle, and the uttermost bounds of the cause of depression. Which *Sphere* is not only to be fixed about the *Earth*, but also about the other *Planets*, which being much of the same nature with our *Earth*, it follows, that the union of their Parts proceeds from the same or a like cause to that which keeps the Parts of the *Earth* together.

II. *The opinion of the Peripateticks rejected.*

The *Peripateticks* hold *Heavinesse* and *Lightness* to be innate *Qualities*, proceeding from the Form of *Bodies*, for their Conservation. Accordingly they say that *heavy things* tend downwards, from the foresaid Appetite they have to be preserved in the *Center*, and so be moved by a certain Law of *Nature*, whereby all things are disposed in their proper places, or by a *Motion* impresst by the *Author* of *Nature*. But this *Opinion* is grounded on a false *Hypothesis*. For, *First* it supposeth the *Earth* to be the *Center* of the *World*. *Secondly*, that *Bodies* that are put in *Motion* tend to *Rest*, tho' it be certain that nothing tends to its own destruction. *Thirdly*, that *Heavy Bodies* are preserved in the *Center*. *Fourthly*, that there is an Appetite or desire of this Preservation in *inanimate* things, when it is apparent that a desire is only competible to *living Creatures*.

III. *The opinion of Gassendus rejected.*

Others, amongst whom is *GASSENDUS*, hold that *heavy things* tend downwards by the *Magnetick Virtue* of the *Earth*, which draws them down to it. But this opinion also is built on a false supposition, in that in the *First* place it takes for granted an attractive *Motion*. *Secondly*, in that it supposeth the *Loadstone* to draw *Iron* to it, by its out-flowing *Particles*, which is not so, as will appear hereafter when we come to speak of *Magnetical Operations*. *Thirdly*, the *Magnetick Virtue* is communicated by the *Poles*, and *Lines* parallel to the *Poles*; whence it must follow, that the greatest *Gravitation* would be under the *Poles*, or near them, less in the intermediate places, and least or none at all under the *Æquator*. *Fourthly*, a common *Loadstone* has greater force, than the *Earth* it self, at least with us; whence it must follow, that it would be of greater strength also to the drawing of *Heavy Bodies* downwards; and then a piece of *Iron* cast upwards, would not in a right Line descend to the *Earth*, but towards the *Magnet*.

IV. *Des Cartes his opinion concerning the Heavinesse of Bodies explained.*

The Third opinion is that of *Des Cartes*, who holds that *Heavy Bodies* are driven downwards by the *Cælestial Matter*. For the better understanding of which, we must in a few words explain his *Hypothesis* concerning the *Diurnal Motion* of the *Earth*. He supposeth therefore the *Earth* together with the *Atmosphere* to be pois'd in the midst of a little *Vortex*, which is whirld round from *West* to *East*; whence it necessarily follows by the Rules of *Motion*, that the *Earth* hanging in this *Fluid Body*, must be whirld about with the same motion, by the *Heavenly matter* running against its *Pores*; yet so as that the *Earth* in its *Motion* is not separated from the *Fluid Body* that compasseth it, but as it were *swims* in it. To illustrate this, let us suppose a *Wooden Bowl* in the midst of a *Vessel* with *Water*, if any one make the *Water* whirl round, that is, in the Circumference or near the sides of the *Vessel*, it is notorious that the *Bowl* will turn round likewise, by the *Particles* of *Water*, that dash against the outside of it; and in like manner, is the *Earth* with the *Atmosphere*, *Whirld* about by the *Cælestial circumfluent matter*, not by any motion of its own.

V. *The force of the Cælestial matter drives heavy things downwards.*

And forasmuch as the *Cælestial matter* being very solid and agitated, hath more *agitation* in it, than is required to the *whirling* about of the *Earth*, and is hindred by the *Earth* from continuing its motion in *Right Lines*; what will follow hereupon? It is evident from the *Laws* of *Motion*, that its Motion cannot perish, and therefore will persue its course, what way it can best; that is, it will have a Power of rebounding upwards. Now we know that nothing can move upwards except something move Downwards at the same time; and accordingly that will move downwards, which hath not so strong a force of Agitation, which is the case of all *Earthly Bodies*, except something else should intervene and hinder it.

VI. *An Example taken from a Vessel fill'd with various matter.*

Any one may Experience this by filling some round *Vessel* with small *leaden Bullets*, and amongst them, some pieces of *Wood*, or any other Matter lighter than *Lead*: If this *Vessel* be whirld round swiftly about its *Center*, all the pieces of Wood which have less Agitation will be driven to the Middle by the *Leaden Bullets*, which with greater force recede from the *Center* of their *Motion*.

VII. *Heavy things do not tend*

The same was lately experimentally demonstrated by a *Mathematician* at *Paris*, in a *Vessel* with *Water* agitated, into which if the *Powder* of *Sealing-wax* be cast, the little Particles thereof

downwards of themselves but are driven down.

will be seen driven towards the sides of the *Vessel*, for that by reason of their roughness they are easily carried that way by the strong agitation of the *VVater*. But when that agitation begins to cease, and the *Particles* of the *Water* are more softly moved, this *Dust* or *Powder* is driven to the midst. The *Cause* whereof is this, because as long as any *Agitation* is continued in the *Water*, its parts endeavour to recede from the *Center*, in which recess they force the particles of *VVax* towards the *Center*, and as it were appoint their place to them. Whence it appears, that Bodies are not of themselves carried, but are driven downwards by the Matter that surrounds them.

VIII. *A particular Explication of the Heavinesse of Bodies.*

But to the end that the Action of the *subtil Matter* may be more distinctly perceived, let us imagine all that is included in the *Circle* A B C D to be a Mass consisting of the *Earth*, *VVater and Air*, the Center whereof is E, where the little *Circle* F G H I represents the *Earth*. Then let us imagine this whole *Mass* to be divided into many *Pyramids*, which with their Extremities reach to the Center, one whereof let be A E B. Having supposed this, we shall find first, that tho' all the several *parts*, which make up so many *Pyramids*, strive to withdraw from the *Center* E, yet can they not recede all at once, because there is no empty space about that *Mass* which they constitute, whither they might retire, and the subtil Matter hinders them from moving out of their place. Moreover we shall find that not one of these *Pyramids*, by Example, A E B, can recede whole and entire, enlarging it self in its extremity A B, and driving away from it the adjoyning matter, and making it to come closer to the *Center*: Because the *Pyramids*, which surround the *Pyramid* A E B, do with a like endeavour recede from the same *Center*, and for which they have no less force, than the *Pyramid* A E B. But if we suppose some *Terrestrial Body*, as L. in the *Pyramid* A E B. without any in the Neighbouring *Pyramids*; we shall easily conceive, that it will have less force to recede from the *Center*, than the others, that are about it, by how much the *Body* L hath less force than the subtil *Matter*, whose place it takes up. Whence we must conclude that the Matter of some of the *Pyramids* will recede from the *Center*, and drive the *Body* L nearer to it, after the same manner, as they who hold all Bodies to be Heavy, suppose the *Water* to lift up a piece of *Cork*, and force it to the *Surface* of it.

Figure 11.

IX. *Wherein the Heavinesse of Earthly Bodies doth consist.*

The *Heavinesse* therefore of *Earthly* Bodies consists in this, that the *Globuli* of the *Cœlestial Matter*, being whirld about in their *Vortices*, endeavour continually to recede from their *Centers*, about which they are turn'd; but forasmuch as they cannot exert this their strife and Propension, except in their mounting upwards, they thrust down other *Bodies* into whose place they may succeed: Wherefore they must needs at the same time depress the *Particles* of *Earthly* Bodies that are in the *Air*, as well because of their *Resistance*, as because of the *want* of *Cœlestial matter* in their *Pores*; both which hinder the *Earthly* Particles from having so great a Propension of receding from the *Center* of the *Earth*, as the *Heavenly matter* that every way surrounds them, hath. Wherefore the *Lightness* of the *Cœlestial* Matter is nothing else but the force or strife it hath to recede from the *Earth*; as the *Heavinesse* of the parts of the *Earth* consists in their being such, that this highly *agitated* Matter exerts its power upon them in thrusting of them downwards,

X. *By the name of Heavenly matter we are also to understand the First Element.*

When it is said, that the *Heavinesse* of *Bodies* is caused by the *Heavenly matter*, we do not only understand the *Globuli* of the *Second Element*, but also the Matter of the *First* mixed with it: For this being extreamly agitated, exceeds the Matter of the second *Element* in the force it has to drive *Bodies* downwards. Neither are the *Particles* of the *Air* to be rejected from having any share in this performance, seeing that they accompany them in their Course, and being joyn'd with the *Globuli* of the second *Element*, exert their force, and do not a little conduce to the driving down of *Bodies*.

XI. *The Cause of the Descent of Heavy Bodies is Twofold.*

We may therefore alledge a double *Cause* of the Descent of *Heavy* Bodies; the one *Primary*, *viz.* the *Heavenly* Matter, by its strife upward, not from any innate Appetite, but to continue its Motions according to the *Laws* of Nature. The other *Secundary*, viz. any *Earthly* Body carried upwards, whether it be obsequent to the Motion of the *Heavenly* Matter, *as Air*, *Vapours*, *Exhalations*, and any other lesser *Particles*; or whether it be driven upwards by any other Cause: So *Smoak* agitated by the *Fire*, hath a Power of depressing the *Air*: Thus when any one casts a *Stone* upwards, he at the same time thrusts down as much *Air* in its place; which *Air* because of the *Heavenly* Matter intermix'd with its *Particles*, and its Agitation thereby caused, as likewise its *Elastick force*, will first resist the Motion of the *Stone*, next hinder its *Ascent*, and at last depress or thrust it downwards.

XII. *Whence the various Heavinesse and Lightness of Bodies doth arise,*

You will object, if the *Heavinesse* of *Bodies* depend on both these *Causes*, it will follow that all *Bodies* would be of the same *Weight* or *Heavinesse*, since both the *Heavenly* Matter, and the small *Bodies* carried upwards, do press them after the same manner.

I answer, that the Nature of *Heavinesse* and *Lightness* in *Bodies*, consists herein, that as much *Heavenly* Matter as there is in any *Body*, so much cause of *Lightness* they have, which being substracted, all the rest will come under the notion of *Gravity* or *Heavinesse*. As for Example, *Water* is Heavier than the *Air*, because if you substract the *Æthereal* interspersed Matter from them both, there remains more *Earthly* Matter in the *Water*, than in the *Air*. So that this may be laid down as a General *Rule*, That the more *Heavenly* Matter there is in any *Body*, by so much the *Lighter* it is, that is, the more apt it is to be carried upwards; and the less there is of it, the *Heavier* that *Body* is, that is, the apter to be thrust downward.

XIII *Solid Bodies are more Heavy than soft Bodies.*

Thus *solid* Bodies are more *Heavy* than *soft*, because they have more Matter of their own, and therefore are called *close* Bodies, having less *Pores*, which can only admit the *Subtil* Matter, or the *Globuli* of the second *Element*, such as are *Gold*, *Silver*, *Quicksilver* and *Steel*. But *soft* or less *Solid* Bodies, contain more *Heavenly* Matter; and have greater Pores, and are therefore *Looser* Bodies, such as *Wood*, &c. Wherefore tho' all the *Heavenly* Matter, with all its force strives to recede from the *Center*; yet the more close and compact Bodies have a greater Power to resist, and do more difficulty recede from the *Center* of their Motion:

Motion; whereas *Bodies* of a more looſe Texture, have more of the *Heavenly Matter* than of their own, and a greater Propenſion of receding, and therefore do leſs reſiſt the *Agitation* of the *Heavenly Globuli*, or little round *Bodies*.

XIV. *Whence proceeds the variety of Heavineſs.*

This is the reaſon why the *Water* is placed on or above the *Earth*, and the *Air* above the *Water*; becauſe the parts of the *Earth* being more ſolid than thoſe of the *Water*, and the parts of the *Water*, than thoſe of the *Air*, they are more ſtrongly driven down to the *Earth*, by the *Æthereal Matter*; much after the ſame manner, as *Corn*, that is mixt with *Chaff*, is by the Agitation of a Fan caſt off further, leaving the *Chaff* behind it.

XV. *How it comes to paſs that a Stone towards the end of its motion comes down faſter than at the Beginning.*

It may be objected againſt this, that the *Globuli* of the ſecond *Element*, do ſtrike with a greater force againſt *Bodies*, before they begin to deſcend, than in their falling down; and therefore they ought to thruſt them down more ſwiftly at the Beginning of their *Motion*, than towards the end of it; which notwithſtanding is contrary to experience; for a *Stone* moves ſwifter towards the end of its Motion, than at the Beginning; and therefore the Deſcent of *Earthly Bodies* is not to be aſcribed to the *Subtil matter*.

XVI. *Anſwer.*

I anſwer, that the reaſon of the Difference of the *Stones* Motion is this, becauſe the *Stone* in its Deſcent, retains the Force of the foregoing *Motion*, and beſides receives an encreaſe from the Impulſe of the *Subtil* Matter that follows it; for the *Subtil Matter* is ſwifter than it. Now the cauſe why *Deſcending Bodies* are leſs forceably driven down by the Subtil Matter, towards the *End*, than at the Beginning of their *Motion*, is this, becauſe there is not ſo great a difference of ſwiftneſs between their *Motion*, and that of the *Subtil Matter*.

XVII. *How Bodies can move in the Air ſeeing they are preſt on all ſides by the Fluid Matter.*

But you will ſay, ſeeing that the *Bodies* that are ſurrounded with *Fluid Matter*, are equally preſt upon on all ſides, they are not like to move at all, but will remain hanging in the *Air*. I anſwer, that this indeed would follow, in caſe the *Fluid Body* be ſimply conſider'd as Fluid: But ſince the caſe is otherwiſe here, and that the whole *Fluid Matter*, becauſe of the Reſiſtance of the *Earth*, ſtrives to get free from its Neighbourhood, this is ſufficient to determine the *Motion* of *Groſs Bodies* downwards, as being much more unfit for *Motion*, than the *Heavenly* Matter, and *Fluid Bodies*, in which they are carried, are.

XVIII. *This opinion doth moſt appoſitely explain all the Phænomena of Gravity.*

How Appoſitely this opinion ſolves all the *Phænomena* of *Heavineſs* will appear from the following particulars.

Firſt, This force will exert it ſelf every where throughout the *Earth*, becauſe the Celeſtial *Matter* will find reſiſtance every where, that is, it will be determined upwards as well towards the Poles, as about the *Æquator* and Lines *Parallel* to it.

Secondly, All things fall down perpendicularly to the *Horizon*; becauſe the *Cæleſtial Matter* hitting againſt the *Earthly Particles*, will rebound back with infinite variety, becauſe of their different meeting, Figure and Situation of their Parts, that is *on every ſide* equally, at leaſt to *Senſe*; and conſequently will make all thoſe things Fluid, which are fit to follow its motion; and whatſoever is impulſt by the *Fluid Maſs*, will fall perpendicularly, becauſe it is with equal force preſt on all ſides.

Thirdly, The *Sphere* of Gravity becomes terminated, where this force of receding, becauſe of the too great diſtance, is not ſtrong enough.

Fourthly, Here we find the reaſon, why every *Planet* hath its *Sphere* of Gravity, becauſe nothing elſe is required to this, but its ſwimming in the midſt of *Fluid Matter*.

XIX. *Heavineſs is either abſolute or Reſpective.*

From all that hath been ſaid it is obvious, that *Heavineſs* is nothing elſe, but the ſtrife or effort wherewith a *Body* is puſht towards the *Axis* of the *Earth* by other *Bodies*, which ſtrive to recede from it. That *Abſolute Heavineſs* is that by which every *Body* is puſht downwards by a Column of the ſecond *Element* equal to its own; and that *Reſpective Heavineſs* is that which belongs to a *Body*, only with reſpect to other *Bodies*.

CHAP. XII.

Concerning Place.

I. *What Place is.*

HAving examin'd the *Rarefaction* and *Condenſation* of *Bodies*, and inquir'd into the Reaſon of their *Heavineſs* and *Lightneſs*, it remains now to conſider why *Bodies* are ſaid to be in a place, and what order they keep amongſt themſelves. Now *Place* is nothing elſe, but *a reſpect of the Situation of a Body, which it hath amongſt other Bodies, to which it is either near or far from.* So that when we ſay that a *Body* is in a place, we only intimate thereby that it hath ſuch a *Magnitude*, *Figure* and *Situation* amongſt other *Bodies*, with reſpect to its nearneſs to them or remoteneſs from them.

II. *What Place is according to the opinion of the Common People.*

True it is, that the Common People diſtinguiſh *Place* from a *Body*, and ſuppoſe *Place* to be the *Space* that receives a *Body*, and contains it. For they perſuade themſelves that *Place* is a kind of *Space* which Exiſts before the entrance of the *Body*, and remains after it is withdrawn. But this conceit ariſeth from a Popular error, by which they imagine that there were ſome extended empty *Spaces*, before that there were any *Bodies* in Nature, and which were afterwards to receive them. As ſome *Philoſophers* now ſince the *Creation* of the *World* fancy that there is a kind of empty *Space* beyond the *Bounds* of the *World*, which they call *Imaginary Space*, becauſe it hath only *Extenſion*, without containing any *Body* at all.

III. *Space is the ſame with a Body.*

But theſe *Philoſophers* ſpeak very improperly, ſince whatſoever is extended *in Length Breadth and Depth*, and wherein *Parts* can be aſſigned, by the intervals whereof *Bodies* may be ſaid to be near or far off from one another, cannot be ſaid to be a thing Imaginary, but a true and real *Body*. For the *Nature* of a *Body* conſiſts in *Extenſion*, and the *Idea* of *Extenſion* is the ſame with the *Idea* of a *Body*. Seeing therefore the *Imaginary Space*, as they call it, hath *Length*, *Breadth* and *Depth*, it muſt needs be a *Body*. Whence it is apparent how improperly they ſpeak, who tell us that *Bodily things* are in a *Space*; for ſince every *Space*, becauſe of its *Extenſion*, is diſtinguiſht from the *Dimenſions* of the *Body*, that is in the *Space*, and that Penetration of Dimenſions is impoſſible, ſhould we ſuppoſe a Space to receive a *Body*, this would be a *Penetration* of *Dimenſions*. Now *Bodies* are therefore

fore said to be *impenetrable*, because they have their peculiar *Dimensions* which exclude any other, and do not suffer them to be contain'd in the same place; and since a Space is measur'd with the same *Dimension* as a *Body*, therefore a *Body* cannot be said to be in a *Space*.

IV. *In what Sense a Body is said to be in a place.*

But you'l say, how then is a *Body* said to be in a *Place*, if a *Place* be extended as well as a *Body*, and that one of them exclude the other? I answer that a *Body* is said to be in a *Place* by the *Situation*, *Magnitude* and *Figure* it hath amongst other *Bodies*; so that we must not conceive any thing as extended, but only the *Body* that is in the *Place*, and all the *Space* or Expansion that is conceiv'd to be there, must be attributed to the *Body* only. For to speak properly, *Place* or *Space* is nothing else, than something that is extended *in Length Breadth and Depth*, which is the same with *Matter*; neither can it be distinct from it, but by our way of conceiving. Wherefore when a *Body* is said to take up a *little* or *great place*, the meaning of it is only this, that such a *Body* hath a greater or less Extension amongst the *Bodies* that surround it. This gave occasion to *St. AUSTIN* to say *Epist. 52. ad Dard. Take away Spaces from Bodies, and they will be no where, and being no where they will not be at all.*

V. *Space is not Really distinct from a Body.*

Wherefore there is no Real Difference between a *Space* and a *Body*, but only according to our way of *Thinking*, viz. because we consider the Extension of *Space* as *Common* and *General*, but the Extension of a *Body* in a *Space*, as *Individual* and *Singular*. As for Example, when a *Stone* is taken up out of its *place*, we suppose its extension to be removed also, because we look upon it as singular and inseparable from it; but yet we conceive that the Extension of the *place* in which the *Stone* was, still continues, and is the same, tho' the *Stones Place* be now taken up by another *Body*, viz. *Wood*, *Air*, *&c.* Because this Extension is consider'd in General, and suppos'd to be one and the same, whether of the *Stone*, *Wood*, *Air*, or any other *Body*, provided it be of the same *Bigness*, and have the same Situation amongst those *Bodies* that determine and bound that Space. Wherefore it is evident that the *Inward Place*, which is taken up by any *Body*, doth not differ from the *Body* it self, no more than the nature of the *Genus* or *Species* differ from the *Individual*. And tho' a *Body* may be said to change its *Place*, this is not to be understood of the *Inward*, but only of the outward *Place*, that is, of the Superficies of those *Bodies* that surround it, to the different parts whereof, it may be diversly apply'd.

VI. *Place is twofold, Inward and Outward.*

This will be more evident by distinguishing *Place* into Inward and Outward; *Inward Place* is nothing else but the *Matter* it self extended in *Length Breadth* and *Depth*, or the *Body* it self: *Outward Place* is the *Superficies* of the *Body*, which immediately surrounds the thing Placed. And this *Place* is neither a *Body*, nor any thing of a *Body*, but only a *Mode* of it, or the limit wherein the *Body* is contained. For by the name of *Superficies*, no part of the *Ambient Body* is understood, but only the Boundary or limit, that intervenes between the *Ambient Body* and the *Body surrounded*, which is only a *Mode*. Or we understand thereby a *Superficies* in common, which is no more the part of one *Body* than of another, only is suppos'd always to be the same, because it retains the same *Magnitude* and *Figure*. For tho' every *Ambient Body* together with its *Superficies* be changed, yet is not the thing it surrounds therefore supposed to change its *Place*, provided it keep the same Situation amongst other *Bodies*, which are consider'd as *immoveable*. Thus we do not say that a *Tower* changeth its *Place*, when the Ambient Air leaves it, because we suppose that still other *Air* comes in the room of it, and accordingly the Superficies is neither a Part of the *Body* containing, nor of that contained, but only an intermediate term or limit, which indeed is nothing else but a *Mode*.

VII. *A Body in the Imaginary Space, is neither here nor there.*

Moreover it is evident, that, if there were any such *Imaginary Spaces*, the *Bodies* contained in them could not be said to be in a *Place*, forasmuch as in them there is no *outward Place*, neither can any parts be assigned to them; and therefore a *Body* cannot be said to be *here* or *there* in them, notwithstanding that it really takes up a *Place*. But a *Body* being consider'd as something consisting of *Parts*, and consequently contiguous to other *Parts* of *Bodies*, according to this *Notion* there can be no *Body*, which hath not a determin'd *Place*, with respect to its *nearness* or contiguity to some other *Body*, by which its *External Place* is designed.

VIII. *The Difference between External Place, and Space.*

The difference therefore between *External Place* and *Space* is only this, that *Place* more expressly denotes the *Situation* of a *Body*, than its *Magnitude* or *Figure*; whereas *Space* refers rather to these two latter. For we often say that a *thing* comes into the place of another, tho' it be not exactly of the same *Bigness* or *Figure*; but at the same time deny it to take up the same *Space*: And so whenever the Situation is changed, we see the *Place* is changed, tho' the same *Bigness* and *Figure* do remain. And when we say that a *Thing* is in a *Place*, we mean nothing more than that it hath such a *Situation* amongst other *Bodies*; and when we say that it fills such a *Space*, we understand thereby its being of such a determinate *Figure* and *Magnitude*. All which will be further cleared by the following *Rules*.

IX. *The First Rule.*

When a *Place* is said to be equal to the *thing placed*, this is either understood of the *Inward Place*, and then it is the same, as to say, that a *Body* is of such *Dimensions*, or equal to it self; or else of the *Outward Place*, and then it imports, that the bounds of the Ambient, do exactly answer to the *Superficies* of the *Body* surrounded or contained, but not as if they had equal *Dimensions*: in like manner as the *Rule* is said to agree with the thing ruled, tho' it do not agree with it every way, as to its threefold *Dimension*.

X. *Second Rule.*

Two *Bodies* cannot be in *the same place at once*, that is, they cannot at the same time have the same respect of distance to the same *Bodies*; for if so, they must penetrate each other, and there would be a *Multiplication* of *Extension*, without supposing any new *Parts*, which is contradictory to the Notion of a *Body*.

XI. *Third Rule.*

One *Body* cannot be in two *Places* at the same time, that is, it cannot be placed between these and other contiguous *Bodies* at the same time, because a Plurality of *Places* infers a Plurality of *Bodies*; for *Place* is only the *Mode* of a *Body*: Or thus: *Space* is not distinct from a *Body*, therefore the *Body* that is in diverse *Spaces*, is both another and the same thing at the same time.

Fourthly,

XII. *The Fourth Rule.* Fourthly, a *Body* is said to change its *Place* when it changeth its respect to other *Bodies*; and forasmuch as we can have regard to different *Bodies*, the same thing may be said to change its *Place*, and not to change it, under a different regard; tho' most properly a thing is said to change its *place*, with respect to those Contiguous *Bodies*, that are considered as immoveable.

XIII. *How the Inward Place is distinguish'd from the Outward.* Whence it appears that the *Inward Place* of a *Body*, or the Space it takes up, consists in the *Body* it self, consider'd as bounded by other *Bodies*, which immediately touch it; and that the *Outward Place* consists in the first *Surface* of the *Bodies* that surround another *Body*.

CHAP. XIII.

The supposing of a Vacuum in Nature, implies a Contradiction.

I. *What a Vacuum is according to the Sense of the Common People.* IT cannot be denied but that the common way of *Speech* doth frequently differ from *Truth*, and that they are lyable to mistake, who mind *words* rather than their own *Notions*; as they seem to do, who by the word *Vacuum*, understand the absence of some *Body*, which ought to be in such a *Place*. As when they say, that a *Vessel* is *Empty*, which is not fill'd with *Water*, *Wine*, or the like; or a *Purse* is *empty*, in which there is no *Mony*, and *a Space* empty in which there is no sensible *Body*.

II. *What a Vacuum is according to the sense of Philosophers.* But learned *Men* allow nothing to be empty, but what is devoid of any *Body* whatsoever; and therefore they commonly define it a *Place void of Body, yet fit to be filled.* This *Vacuum* is twofold, *Disseminate* or *Coacervate*.

III. *What a Disseminate Vacuum is.* A *Disseminate* or interspers'd *Vacuum* they call small *Spaces*, which are suppos'd interspers'd between *Material Things*.

IV. *What a Coacervate Vacuum is.* A *Coacervate Vacuum*, is a sensible *Space* void of *Body*, such as they suppose to be in a Pipe of *Glass* after the removal of the *Quicksilver* in the *Torricellian* Experiment.

V. *That neither the one, or the other of these Vacuums can be admitted, appears First from the Nature of a Body.* That neither of these *Vacuities* can be found in the *Universe*, may be prov'd by many *Arguments*. First because every *Space* imports *Extension*, which is of the Essence of a *Body*; for it implies a Contradiction that *nothing* should have an *Extension*, and therefore there cannot be any *Space*, in which there is not a Corporeal *Substance*. For as we suppose a *Body* to be there, where we find *Extension*; so for the same Reason we must conclude, that a *Body* must be in a *Space*, because we clearly conceive *Dimensions* in it: So that it is not more impossible to conceive a *Mountain* with out a *Vally*, than to conceive *Space* without *Matter*.

VI. *Secondly from the Definition of a Vacuity.* Secondly, a *Vacuum* is defined to be *A place devoid of Body*: Now this also implies a contradiction, supposing the notion we have already given of *place* to be clear and distinct; for where there is no *Body*, neither can there be any *Mode* of a *Body*; yea, the very empty *Space* it self, will be no less in a *Place*, than any *Body* whatsoever, as is evident to him that considers it well: And what can be more unworthy for a *Philosopher*, than to accommodate this *Idea* to a *Non-Entity*, which altogether agrees to a *Real Being*?

VII. *What would follow, if whatsoever is in a Space should be taken out of it by God.* You'l say that *God* can take away all the *Substance*, that is contain'd between the *Walls* of a *Chamber*, and keep any other *Body* from entring it; upon which supposition a *Vacuum* must follow.

VIII. *First Answer.* I answer in the *First Place*, that this or the other *Body* may be taken out of a *Chamber* or any *Vessel*; but it is impossible that they should be without any *Body at all*. For where there is no *Body*, there is no *Extension*, where there is no *Extension*, there is no *hollowness*, capacity or interval, and without these there can be no *Vessel* or *Chamber*.

IX. *Second Answer.* *Secondly* I say, that supposing all intermediate *Bodies* to be taken away, the *Chamber VValls* would touch one another, because nothing would be between them; for we cannot conceive one thing to be distant from another, without some Middle thing to separate them; because *distance* is a *Mode* of *Extension*, and therefore follows a *Bodily Substance*, without which it can neither be, nor be conceived.

X. *To conceive a space without Extension, implies a Contradiction.* But you will say, that the *Body* which is conceiv'd to be in the *Chamber* or *Vessel*, is something different from the sides that surround it, and therefore the one may be separated from the other by the *Divine Power*, forasmuch as we clearly and distinctly understand the one, not to be the other.

I dare not say that any thing is impossible to *God*, or that he cannot make a *Mountain* without a *Valley*: But this only I assert, that *God* hath made my *Mind* such, that I cannot conceive how a *Mountain* should subsist without a *Valley*; or how *Five* and *One* should not make *Six*. And the same may be applied to that *Space* which is imagin'd to be between the *Sides* of a *Chamber* or *Vessel*, because the same cannot be conceived without extension. And since *nothing can have no Properties*, that *Space* cannot be said to be a *Vacuum* that is void of all *Matter*. Or if that should be, the *sides* of the *Chamber* or *Vessel*, must be suppos'd to touch each other. For if God should annihilate all the *Air* that is in a *Chamber*, there would be no *Space* left between the *VValls*; for if any *Space* be left, there must be *Magnitude* also; and if *Magnitude*, then *Quantity*; and if *Quantity*, *Matter*, and consequently a *Body*, because *Space*, *Magnitude*, *Quantity*, *Matter* and a *Body* are one and the same thing.

XI. *If Bodies be taken away, all distance is taken away likewise.* For what can be imagin'd more absurd than to assert that the distance of *Bodies* is owing to an Imaginary *Space*, or *nothing*, seeing that when the intermediate *Body* is taken away, all distance must of necessity be taken away likewise? Who will say that *nothing* can be *measur'd*, when it is evident, that not only *Extension*, but any other Propriety whatsoever, must be remov'd from *Nothing*? For if I may say that a *Space* (which is nothing) is of such a length, I see no reason why I may not as well ascribe other *Properties* to it, such as *Hardness*, *Softness*, &c. It remains therefore that *Nothing* cannot make a Distance between *Bodies*. For suppose we a *Square Vessel* A B C D, and the *Hollow* of it to be empty, I say that the same cannot be measur'd: For tho' if it be enquir'd by what thing the sides A B, D C are distinct from one another, it may be readily answer'd by the *Straight Lines* A D, B C. Yet I cannot return the same answer to him that enquires the distance between the opposite *Angles* D B: for if I should say they are kept at a distance by the *Straight Line* D B, how can this be true, seeing nothing at all is in the *Vessel*, and therefore no *Length* or *Measure* can be apprehended in it?

Figure 3.

XII. *There is a necessity for the Connexion of Bodies.* This Conclusion may be confirmed from the necessity there is of a Connexion of all the *Bodies* that do constitute the *Universe*, and that they be so

joyned together as not to be separable from each other. Which yet is not so to be understood, as as if there were such a Connexion, between this *Chamber* suppose, and the particular *Air* that is in it, that they cannot be separated from each other; for we see that this *Air* is driven out by the *Wind*, and that other comes into its *place*; but only thus much, that there is a necessary *Connexion* between this *Chamber*, and *Quantity* in General, forasmuch as there can be no *Distance* or *Interval*, but must be fill'd with some *Body* or other.

XIII. *Supposing a Vacuity, two Round Bodies would totally touch one another.*

The same may be farther prov'd from the Absurdity which would otherwise follow; because supposing a *Vacuum*, *Round Bodies* would touch one another after the same manner as *Flat Bodies* do, that is, totally. For those *Bodies* are said totally to touch each other, between which there is no intervening *Medium*; but betwixt two *Round* Bodies in a Vacuity there can be no Medium assign'd; therefore they touch with their entire *Superficies*. It is not sufficient for the solving of this, to say, that a Possible *Substance* mediates between them, because a Possible *Substance* cannot be an *Actual Medium* dividing and separating *Bodies*: For otherwise nothing in the *World* could be said to be *united*; since between the Parts of *Bodies* that are united there is some Possible Medium that may divide them.

XIV. *An Objection, that Distance is nothing else, but a negation of contact.*

If you say that *Distance* is no Real *Thing*, because two *Bodies* may be conceiv'd to be *distant*, only by the Negation of their contact; and that it is not necessary for any thing to intervene between *Bodies* to make them distant from each other.

XV. *The Objection answer'd, and distance prov'd to be Extension.*

I answer, seeing Distance is a *Relation*, which must be between more than one, it belongs to *Opposition* or *Distinction*, the *Essence* whereof consists herein, that one thing is not the other. But forasmuch as there is no *Real Distinction*, which hath not its *Foundation*, because *nothing can have no affections*, therefore the *Foundation* must consist in something that is different from the things between which there is a *Distance*, which since it cannot be *Spiritual* (for then it would be void of Extension) it must be *Material* or *Corporeal*. For it would be a very improper Answer to the Question, why *London* is at a distance from *Paris*, to say, Because they do not touch one another; for this would be the same thing as to say, that *London* and *Paris* are at a distance, because they are not near one another, which is to explain an unknown thing, by another thing equally unknown. We conclude therefore, that *Distance*, besides the *Negation* of *Contact* doth necessarily include *Extension*, by means whereof remote *Bodies* are said to be distant from one another.

XVI. *Nature doth not abhor a Vacuum.*

Hence it appears how falsely the *Schools* assert, that *the motion towards mutual Contact*, is prevalent above all others, as being ordained for the Conservation of the *Universe*, by the avoiding of a *Vacuum in Nature*: For how can *Nature* be said to avoid a *Vacuum*, seeing that an *Empty Space* implies a contradiction? For those things are us'd to be forbid by the *Laws*, which may be done, and not such whose being implies a contradiction.

XVII. *Water condensed in a close stopt Vessel, doth not leave a Vacuity.*

All other *Arguments* made against this opinion are of no force at all against us, who assert the *Extension* of *Space*, not to differ from the *Extension* of a *Body*, forasmuch as it includes *Length*, *Breadth* and *Depth*. What they object of a *Vessel* fill'd with hot *Water*, which tho' it be close *stopt*, yet the *Water* that is in it, is reduc'd to a less *Space*, and consequently must leave a *Vacuum*, is of no Moment at all, because the Space which they imagine to be void, is fill'd with the subtil Matter penetrating the Pores of the *Vessel*; for it is a meer vulgar Errour, to believe those things to be Empty, which we do not see to be fill'd with *Bodies*.

XVIII. *A Body is no less fill'd with one Body than with another.*

It is evident from what hath been said, that a *Vessel* doth not contain more Matter when it is fill'd with *Gold*, than when it is fill'd with *Air*, forasmuch as there is as much extension in the *Air* as in the *Gold*. A *Vessel* indeed may contain more *Gold*, than it can of *Pumice Stone*, because in this latter there are many *Pores* which are fill'd by the *Air*, and not with its own *Substance*.

CHAP. XIV.

Of the Vulgar and Philosophical Definition of Motion.

I. *Local motion only is to be admitted of in Philosophy.*

BY the name of *Motion* we only understand that which is *Local*, as being the only *Motion* that is found in *Nature*, and to which all the rest are to be referr'd. For tho' *ARISTOTLE Lib. 8. Physic. cap. 7.* reckons up three kinds of *Motion*, viz. *Motion in Magnitude*, *in Affection*, *and in Place*; *yet he asserts that the latter of these must needs be the first of all Motions*, and concludes, that *Generation* and *Corruption*, *Accretion* and *Diminution*, and last of all, *Alteration*, cannot be without *Local Motion*. For what else is the Motion of *Generation* and *Corruption*, but *Local Motion*, whereby the sensible and insensible parts, are fitly, or unfitly joyned together, according to the *Essential Constitution* of *Bodies*? So likewise in *Accretion* and *Diminution* there is a *Local Motion*, whereby several parts are united to the *Body* growing; or whereby those that have been joyned with it, are now separated from it. And as to *Alteration*, we find for Example, that *Calefaction* or *Heating* is perform'd by *Local Motion*, it being nothing else but the swift agitation of the *parts* of some *Body*; as in *Refrigeration* or *cooling*, the said parts are more slowly moved, or have no *Motion* at all. Tho' indeed if we would speak strictly, all the other *Species* of *Motion* that are commonly reckon'd up, are rather changes made by *Motion*, than *Motions*.

II. *All other Motions are but the Differences of Local Motion.*

Wherefore seeing that all these kinds of *Motion*, are only certain *differences* of *Local Motion*, denominated from their various effects of *Generating*, *Corrupting*, *Encreasing*, *Diminishing* and *Altering*, we should multiply *Entities* in vain by going about to establish any other sorts of *Motion*, besides *this*.

III. *Motion examin'd according to the sense of the Common People.*

But that we may the more clearly discover the nature of *Motion*, we will first enquire what is understood by this *Word*, according to the vulgar acception of it, and then come to explain the true and *Philosophical Notion* of it.

IV. *What the Common People understand by Motion.*

The Common *People* by *Motion*, understand the *Action whereby some Body is remov'd from one place to another.* This is that which they do mean by *Local Motion*. And therefore they suppose that a *Body* may at the same time be moved, and not be moved, as a *Master* of a *Ship*, who is said to be moved, if the Shoar be consider'd as immoveable; and not to be moved, with relation to the *Stern* of the

Ship

Ship where he sits. *Secondly*, by this action the Common *People* imagine, that a greater force is required to produce *Motion* than *Rest*. Which *Judgment* they make, because they find that the *Command* of their *Will* is required to the moving of their own *Bodies*, whereas they *Rest* by their own *Weight*, without standing in need of any other thing to stop them. But they may be easily convinc'd of their error by putting them in *Mind*, that very often there is as much action required to stop the *Motion* of *Bodies*, as there is to move them: For there needs as much force to stop a *Stone* that is tumbling down from a *Mountain*, as to tumble down a *Stone*, that lies still on the top of it.

V. *Five things to be consider'd in Motion.* There are five things to be consider'd in every *Motion*; the *mover*, the *moved*, the *Term from which*, and the *Term to which*, and *Succession*. The *mover* is that which doth move; the *moved*, is the *Body* that is *moved* by the Action of the *mover*; the *Term from which*, is the Neighbourhood of those *Bodies* which it quits; and *the Term to which*, is the Neighbourhood of those *Bodies* to which the *Body* comes; and *Succession* is that progress whereby the thing moved is continually in a different manner apply'd to the various *Parts* of *Ambient Bodies*.

VI. *Wherein Motion properly doth consist.* Now to the end that this *Progress* or *Succession* may be the better understood, we are to observe, that *Motion* may be consider'd three manner of ways: *First*, as it proceeds from the *mover*, as by example, from a *Man* who throws a *Stone*, and so in the *mover* it is call'd an *Action*. *Secondly*, as it is receiv'd in the thing *moved*, at the first moment of its impulse, whilst it is yet joyned to the *mover*, Ex. Gr. in the *Stone*, which a *Man* casts, and so it is a *Passion*. *Thirdly*, forasmuch as it is in the *Body* moved, separated from the *mover*, as in *a Stone*, when it is carried through the *Air*, and so it is a certain *Mode* or state opposit to *Rest*; and in this last Sense *Motion* is here taken: And accordingly *Motion* is defin'd to be, *the Translation of a Definite Body from the Neighbourhood of Bodies that immediately touch it, to the Neighbourhood of other Bodies*. Or it is the successive application of one *Body*, to the *Parts* of *Bodies* immediately touching it.

VII. *Why Motion is called Translation.* It is call'd a Translation in the *first* place to shew that *Motion* is not a thing subsisting, but only a Mode of *Substance*: For a *Body* is otherwise when it is moved than when it rests. *Secondly*, to distinguish it from the *Action* that translates it, or the Cause of its Motion: For that *Rule* of *Logick* is sufficiently known, that *the cause cannot be the Genus*: For we do not say that a *sound* is the motion of the *Air*, but a *Quality* arising from the *Motion* of the *Air*. And in like manner we must not say that *Motion* is an *Action*, but a *Translation* caused by some *Action* or force, which will more clearly appear, when we shall shew hereafter, that the Moving force is not a *Mode* of the *Matter*, but the *Action* of *God*.

VIII. *And from the Neighbourhood of Bodies that touch it.* It is said to be *the Translation of one Body out of the Neighbourhood of Bodies Immediately touching it*, &c. not from one place to another, because by the word *Place* nothing of certainty is signified, forasmuch as with respect to diverse things, the same thing may be said to change its *Place*, and not to change it. So he that sits in a *Ship*, changes his *Place* with regard to the *Shoar*, which he leaves, and does not change it regard being had to *the parts of the Ship*. Now by defining *Motion* to be a *Translation from the Neighbourhood of contiguous Bodies*, we denote that the *Body* is moved by its own proper *Motion*: So that tho' many common *Motions*, may be at the same time attributed to the same *Body*, yet one of these only is its *Proper Motion*, *viz.* that whereby it is separated by *Bodies* contiguous to it. As he that sits in a *Ship*, tho' he participate of the various *Agitation* of the *Ship*, yet is he not moved with any proper *Motion* of his own, because he abides fix't and unmov'd as to the contiguous *Bodies* that are about him.

IX. *What is meant by one Body in the Definition.* By *one Body* is understood all that which is transferred; tho' it may consist of many parts, which have other *Motions*. Because these Motions are not really distinct; it being a difficult thing to understand so many *Motions* together: As for Example, when the *Body* of an *Animal* is moved, his *Tongue*, *Hands*, *Blood*, and *Spirits* are moved also; all which *Parts* have their particular *Motions*, besides the common *Motion* of the whole *Body*, which they partake of.

X. *How Bodies are moved, since there is no Vacuum into which they may be received.* But the Difficulty is since there is no *Vacuum* in *Nature*, and that all the *Bodies* of the *Universe*, have proportionate places which they fill up, how can *Bodies* be moved when there is no empty space to admit them?

XI. *Answer.* I answer that *local motion* may very well be performed notwithstanding the absolute Plenitude of the *Universe*, not by means of any *Compression* and *Dilatation* of the Fire (as the *Peripateticks* tell us) but by a circular yielding of *Bodies*; so that when a *Body* is moved, it thrusts the next *Body* in its way out of the *Space*, which it enters into, and that again thrusts out another, and so to the last; which enters upon the place which the first *Body* has left, at the same instance that it leaves it. This we see in a round *Pipe* fill'd with *Bullets*, that the first of them cannot be moved, except the last by the impulse of the intermediate ones do succeed into its *Place*. Thus our *Philosophy* rejects all *similiar*, *Magnetical* and *Electrical Attraction*, and every motion which is not performed by the impulse of *Bodies*, according to the *Rules* hereafter to be mentioned.

XII. *How it comes to pass that liquor doth not run out of a Tasting Pipe.* So that whenever this *Circular Motion* of *Bodies* is hindred, there can be no Motion at all; as may be seen in a *Tasting Pipe* used by *Wine Coopers*, represented by A B C, the upper Orifice A, being shut, and the inferior C, open. For tho' the *liquor* that is contain'd in it be much heavier than the *Air*, that is without; yet because the *Air* that is prest by the *liquor* ready to run out of the under *Orifice* C, cannot recede, because the upper *Orifice* A, is stopt from receiving the *Air* that should succeed instead of the *liquor* running out of C, therefore the *liquor* continues in the *Pipe* as finding no place to receive it, because the circular *Motion* of *Bodies* is hindred, by the stopping of the upper *Orifice* of the said *Pipe*. Figure 4.

XIII. *A Body is more swiftly moved through a narrow Passage.* Thus may we see that the *Motion* of *Bodies* may very well be explained without *penetration* of *Dimensions*. And if it chance to happen, that the *Circle* through which the *Body* is to pass be unequal, that is narrower in one part than another, it must necessarily follow that the *Body* must be more swiftly moved where its passage is narrow, and so compensate the straitness of the place, by the celerity

rity of its *Motion*. For it is one of the *Laws* of *motion*, *that when any liquor passeth from a large place to a straiter, the swiftness of its motion encreaseth proportionably to the decrease of the wideness of its passage.* This may be shewed by many examples: Thus *Winds* are more vehement in a narrow *passage*, than in a wide *Street*; a *Bellows*, tho' but leisurely compress't, sends out the *Air* through the *Nuzzle* with great swiftness and force; and *Waters* otherwise gliding gently, when they pass through *Sluces* run violently; and this because it is necessary that the whole *Circle* of *Bodies* should move all at once.

XIV. *Plato"s way of explaining how all motion is made by a Circle.*

This opinion is thus explain'd by *PLATO* in his *Timæus*: *Forasmuch*, saith he, *as there is no Vacuum any where, into which any thing that is moved can enter; and yet our breath continually goes out from us, it is apparent to every one that it goes not into an empty space, but drives the Air next to it, out of its place, which again drives away the next to it; and according to this necessity whatsoever is driven into the place, whence the breath came forth, doth follow it. And all this is perform'd at once by a certain Revolution, since there is no vacuity any where. Wherefore as soon as the Breast and Lungs have let out the Breath, they are immediately fill'd again with the Air that surrounds and penetrates the Pores of the Body. And again the Air flying out of the Body, and the let out breath, forceth us to draw in our breath again, by the Passages of our Mouth and Nostrils.*

XV. *Motion is not contrary to Motion, but to Rest.*

One *Motion* is not contrary to another *Motion*, because when two *Bodies* of the same *Bigness* and *swiftness* meet, they do not lose their *Motion*, but are only reflected, and then so continue their *Motions* again. But *Rest* alone is contrary to *Motion*: And tho' a *slow Motion* may be said to be opposit to a *swift*, that is only because a *slow Motion* partakes of *Rest*.

XVI. *What Rest is.*

For *Rest is a Continuance of a thing in the same place*, or *an adhæsion to the same Contiguous Bodies*. This is an *Affection* proper to *matter*, which consider'd simply in it self: without any force from without impress't upon it, continues unmov'd, that is, hath its parts *continuous* to it self. Now this *Rest* or *Quiet* is something *Positive* as well as *Motion*: For *Rest*, according to its *Magnitude*, resists *motion* more or less, alters the determination of *motion*, and keeps the parts of continuous and hard *Bodies* close together, which could not be done by that which is meerly *Privative*. And indeed forasmuch as *Rest* is something stable and permanent, if compared with *motion*, which *is flowing and passing*, we cannot deny it Reality.

XVII. *Rest is opposit to Motion.*

Rest therefore is oppos'd to *motion*, not Privatively, as *Habit* and *Privation*; but *Positively*, as two contraries, whereof the one is contrary to the other; for *Rest* is adverse to *motion* by resisting it, and that either by diminishing it, or reflecting it.

XVIII. *Motion and Rest are only Modes of Things.*

Motion is not a *Real Quality*, as the *Peripateticks* suppose, but only a *Mode* which is not distinct from the *Body*. For we cannot conceive it to be any thing else, but the *change* whereby a *Body* is translated, or withdraws from some other *Bodies* that immediately touch it. As when standing on the *Bank* of a *River*, we see a *Fish* for some time continuing over against the same *place*, without being carried away by the course of the *Water*, which on all sides surrounds it, we must conclude it to be really *moved*, because the whole outside of the *Fish*, is successively apply'd to diverse *parts* of the *Water* that do immediately touch it; and because we find all that in it which happens to another *Fish* that *swims* in a *Pond*; and moreover the effort he useth makes him successively to correspond to different parts of the *VVater*. And on the contrary when we see a *Stick* driving in the *VVater*, so as to be always apply'd to the same parts of the Water, we must say that it doth not move, but lye still, forasmuch as the said Stick is without any *Action* of its own, and doth not correspond successively to divers Parts of the *VVater*, because a *Stick* in this case, and the *VVater*, make up but one thing, which is really moved.

XIX. *Motion and Rest are the Modifications of a Body.*

As we cannot conceive an Application to be made to different *Parts*, without conceiving a *Body* that applies it self to them; therefore we are to judg, that *Motion* is not an Absolute *Entity*, as hath been said before, but only the Modification of a *Body* that is moved; and so *Rest* likewise the *Mode* of a *Body resting*. Whence it appears, that *Motion* and *Quiet* superadd nothing more to a *Body* moved or *Resting*, than *Figure* superadds to a *Body* figured. And seeing that a *Body* may either be moved, or not moved, we must conclude, that *Motion* and *Rest* are Accidental to *Matter*.

XX. *There is no violent Motion in Nature.*

We may also infer from what hath been said, that there is no violent *Motion* in *Nature*, since it is as connatural to *Bodies* to push forwards one another, as to rest and lye still. For *Matter* consider'd in it self, being idle and unactive, and receiving its motion from an *External Principle*, it follows that *Motion* equally agrees to all *Bodies*. Neither can the *Motion* of a *Stone* cast upwards, be said to be violent, any more than the *Motion* of a *Ball* when it falls down perpendicularly to the *Earth*: For as the *Motion* of a *Stone* cast up into the *Air*, proceeds from the force of him that casts it up; so the descent of a *Ball* proceeds from the subtil matter which carrieth the *Earth* and compresseth all its parts towards the *Center*. For the word *Violent* hath reference only to our *Will*, which is said to be forced when any thing happens to it, which it resists and strives against.

CHAP. XV.

Of the Principle of Local Motion.

I. *There are two Principles of Motion.*

FOrasmuch as Matter hath no power to attribute any *motion* to it self, or to remove another *Body* out of its place (as shall be said in the following *Chapter*) we are to enquire here what is the *Cause* of *motion* in the *Universe*. In which enquiry, that we may follow the order we see in the *World*, we shall *pitch* upon two *Principles* of *motion*; the one *General*, on which all *motions* in the *world* do depend; and the other *Particular* or secundary, to which all singular *motions* are attributed.

II. *God is the first Cause of Motion.*

The *First* and *Universal Cause* is that which first put *matter* into *Motion*, and is no other but *God* alone, who bestowed *Motion* upon the *matter* he had *created*, and preserves the same by the same *Action* by which he produc'd it at first; and because it is agreeable to *Right Reason*, and the *Idea* we have of

of *God*, that he should conserve his *Creatures* in the most simple way; it seems more than probable that *God* continues the same *Agitation* in the *Universe*, which he impresst on it at first, yet so as that he can always whensoever it pleaseth him change these *Laws*, which he hath establisht.

III. *The Second Cause is the meeting of other Bodies.* The *Second* or Particular *Cause* is the meeting of *Bodies*, by which means it happens, that this *Divine Action*, which preserves *Motion*, exerts it self sometimes in these, sometimes in other *Bodies*: Whence the difficulty which ariseth from the Communication of *Motion* may be easily solved; for tho' *Motion*, as being only the *Mode* of a *Body*, cannot remove from one *Subject* to another, which *Regius* unwarily asserts; yet the agitating force, being no *Mode* of a *Body*, may by removing shew it self sometimes in this, sometimes in the other *Body*.

IV. *The Communication of motion is performed according to the Laws at first set by God.* Whensoever therefore *DES CARTES* speaks of the Communication of *Motion*, he is to be understood of that *Power*, which preserves *Natural Things* in the same condition wherein they were constituted at first, and all effects order'd according to the *Laws* appointed for them, and suiting to their *Natures*.

V. *Three Laws of Nature.* There are three *Laws* of *Nature*, which are founded in that most simple Concourse, whereby *God* preserves all *Bodies*, which are very conducive to understand the *Nature* of *Motion*.

VI. *The First Law of Nature.* The *First* is this; *Every Natural thing, if it be simple and undivided, always inclines to continue in the same state wherein it is*: So that no change can happen to it, but from some outward *Principles*. Thus a *Round Body*, always keeps its Round *Figure*, neither is the same destroy'd, but by some supervening foreign *Agent*. And supposing the same *Body* to be *moved*, it will still proceed further, except it meet with some impediment that puts a stop to its *Motion*. And according to this *Rule*, we say, that a *Body* once put into *Motion*, for example, a *Ball* struck by a *Racket*, doth not stop at the *Wall* from whence it is reflected; for should we suppose any interruption in its *Motion*, we should be at a loss to find the *cause* that excites a new *Motion* in it again. Wherefore we must conclude that that which is *moved*, is always *moved*, and that which *rests*, rests always. And for this cause it is that a *Stone* continues its *Motion*, after it is let go out of the *hand* of him that throws it.

VII. *The Reason of the Foregoing Rule.* This *Rule* may easily be gather'd from what we shall say in the following *Chapter*: For seeing that a *Body* cannot move it self, it follows, that that which rests, must persevere so, except by some outward force it be driven out of its *place*. And in like manner, when a *Body* is once put into *Motion*, no reason can be assign'd why it should not continually proceed therein, with the same *swiftness*, as long as it meets with nothing that stops its career. For since nothing can be done without a *Cause*, the state of a *Body* cannot be changed without the *Action* of a *Cause*. Hence it is that a *Leaden Bullet* being let fall from the top of a *Mast*, notwithstanding the swift course of the *Ship*, yet falls down straight to the bottom; for the *Motion* of the *Bullet* being a Compound of *progressive and descensory Motion*, and both of them continuing in the same state, it is evident that the *Bullet* can fall no otherwise than it doth.

Wherefore we shall meet with no change in *Bodies*, as to *Motion* or *Rest*, *Swiftness* or *Slowness*, *Figure*, *Situation*, *Magnitude*, &c. which do not proceed from without, the searching out of which *Causes* is the particular task of *Natural Philosophy*. *Water* indeed doth by degrees lose its *Heat*, but then it is no *simple*, and undivided *Body*; for it derives its agitation from without, and retains it as long as the agitating *Cause* continues; but forasmuch as the *Cause* ceaseth, and the more thin parts of the *Water* Evaporate, and communicate their *Motion* to the Neighbouring *Bodies*, by this means the *Water* becomes reduc'd to its former state of Coldness.

VIII. *Every change proceeds from outward Causes.*

You'l say, a *Stone* cast up into the *Air*, doth after a short time fall down again to the *ground*, which would not be, if a *Body* once moved, were inclin'd to continue its *Motion*; for according to this *Rule*, it ought continually to proceed, tending upwards.

IX. *Why a Stone after some time, falls down again to the ground.*

I answer, that a *Stone* falls down to the *ground*, not because it willingly desists from its *Motion*, but because it is hindred by the *Bodies* it meets with on its way from proceeding any further. For the *Air* and *fluid* Matter that is in it, do not without difficulty admit the entring of other *Bodies*; yea and besides do very much resist them, as is obvious to our sense of *Feeling*. For the subtil *Matter*, which thrusts *Bodies* downward, hinders the *Stone* from being carried up to Heaven. So that we our selves, when we leap up from the *Earth*, should still continue in the same *Motion* mounting upwards, if the subtil *Matter* which surrounds the whole *Earth*, did not drive us downwards.

X. *Answer.*

XI. *No body moves circularly but by the intervening of outward force.* What hath been said of a *Stone* falling to the *Ground* must likewise be understood in General of all other *Bodies*: Wherefore if we see a *Body* in its *Motion* describing the four sides of a *Square Figure*, we must conclude that at every one of the said *Angles* where it changeth its determination, it hath been forc'd to it by the meeting of some other *Bodies*, which have oppos'd its *Motion* and determination. And forasmuch as a *Circle* is Equivalent to a *Figure* of an infinite number of *sides*, it follows, that a *Body* which is circularly moved, must suffer a continual violence by meeting with several other *Bodies*, for without this it could never move in a round *Line*.

XII. *Another reason why Bodies persevere in their motion.* But the chief reason that moves us to assert, that a *Stone*, or any other *Body* would persevere in its *Motion*, if we were not hindred by other *Bodies*, is, because *Rest* is contrary to *Motion*, and nothing by its natural Propensity tends to its contrary, that is, to its own *Destruction*; and consequently a *Body* if once *moved* will move always, or if at *rest*, will always continue so. And in this *Principle* alone we place the *Power* of the *Action* and *Resistance* of *Bodies*. For as a thing that is *united*, hath a Power to resist its being separated from that which *rests*, to oppose that which would put it into *Motion*; so that which is moved hath a *Power* to continue in its *Motion* with the same Swiftness, and towards the same place.

XIII. *Why a Body ceaseth to move.* Thus a *weight* hanging at the end of the *Packthread* A *B* which by outward force is mov'd this way and that way, if it were tranfmitted to G, would fall down thence, and mount up to D, and always retain this *Equality* of *Motion*; neither would it ever, by slackning of its *Motion*, come Figure 5.

down to E and F, but that the *Air* hinders it from continuing its begun *Motion* from G to D. Forasmuch as no reason can be assign'd, why that which is, should cease to be, except a more powerful thing do hinder and oppose its force.

XIV. *The Second Law of Nature.*

The *Second* Law of Nature is this: *Every Body in Motion, of it self tends to prosecute its Motion according to a right line, and not according to a crooked line.* Notwithstanding that, many *Bodies* are forc'd to turn aside by their meeting or justling against other *Bodies*, and that, as hath been said before, the whole *circle* of *Bodies* moves together in every *Motion*. This *Rule* is infer'd from the Definition of *Motion*, because it affirms nothing concerning *Motion*, save only that it is *a Translation of one Part of Matter, out of the Neighbourhood of those Bodies that do immediately touch it*, &c. *into the Neighbourhood of other Bodies*. So that except this Translation be most simple, that is, by right *lines*, and not crooked, we have attributed something to *Motion*, which is not contained in the *Essential Notion* or *Definition* of it, and so consequently that which doth not belong to its *Nature*. For whatsoever is moved, in every moment of its *Motion*, is determin'd *to continue its Motion* to some part or other, in a *Right Line*. Forasmuch therefore as *God* preserves *Motion* in the most simple manner that may be, and every *natural thing* continues in the state wherein it is, the *Body* moved will always continue its *Motion* in a *Right line*, except it be hindred from without.

XV. *Why every Motion tends to a Right Line.*

If you demand why every *Motion* tends to a *Right Line*, and not to a crooked? I answer, because all the least parts that are found in a *Crooked Line*, are right *Lines*; and since the circulating *Body*, ultimately exists in one of them, it follows according to the former *Rule*, that as soon as it is restor'd to its Liberty, it perseveres in the same state, and continues its *Motion* in that *Right Line* which there toucheth the *Circle*. But if the least parts in the *Circle* were *crooked*, the moved *Body* being continually carried along them, and afterwards left to its Liberty, according to the foregoing *Rule*, would pursue a *crooked Motion*, conform to the *crooked particle* of the *Circle* where it was last: But since this doth not happen, it is manifest that every *Circle* in Nature is a *Polygon*, or a *Body* of many *Angles*.

XVI. *Both these Laws demonstrated from the Divine Immutability.*

This *Rule* of *Nature*, as well as the foregoing, may be domonstrated from the consideration of the *Divine Perfection*, that is, from the *immutability* and *simplicity* of that operation whereby *God* conserves *Motion* in the *Universe*. For as *God* preserves *Motion* in any *Body*, by making that *Motion* which now is, to continue to exist, without any regard had to the state wherein the *Body* was before; so he likewise continues to direct the *Body* moved to that *Term*, to which it is directed, at the present instant of *time*. But there is never any instant of *time* wherein it is not disposed to continue its *Motion* in a *Right-Line*, tho' before it was carried in a *crooked line*, and accordingly will pursue its motion in a *Right-Line*. This is clearly made out by *DES CARTES* in the 2d part of his *Principles*, *Artic.* 39. by the example of a *Stone* A, whirld about in a Sling A E, which tho' it be turn'd round in the *Circle* L A B F, yet withal hath a tendency towards the Tangent *Line* A C G. For tho' the *Stone* first proceeds from L to A by a *crooked line*, yet nothing at all of that Obliquity can be understood to abide in it, whilst it is in the *Point* A. Because tho' the *Stone* be moved round, yet forasmuch as in every moment of *time*, parts may be assign'd that have no crookedness at all, it cannot be suppos'd to retain any obliquity, when the detaining force ceaseth.

Figure 6.

XVII. *The Circular Motion of a Body proceeds from a Cause External.*

Hence it follows, that no *Body* of it self is moved in *a Circular Motion*, forasmuch as that always proceeds from an outward *cause*, which hinders the *Body* moved to pursue its *Motion* in a *Right Line*. Upon this account it is also that *Wooden Bowls* dashing against one another, are often whirld round; and so *Water* likewise, when it is hastily poured into any *Vessel*: Yea, in every motion there is a circulation of *Bodies*, as shall be shewed hereafter.

XVIII. *Every Body that's whirld round, endeavours to recede from its Center.*

Another Consectary is, that all *Bodies* circularly moved, do either actually recede, if they be not hindred; or endeavour to recede, if they be, from the *Center* of their *Motion*: Because, as soon as the detaining force ceaseth, they begin to move in a *Right Line*. This is the reason why the *Water* doth not fall down out of a *Bucket* of *Water* as long as it is whirld round; and that it strives to recede from the *Center*, we may gather from hence, because upon making a *Hole* in it, the *Water* runs out immediately. This Rule is of very great use for explaining of the *Heavenly Phænomena*. Now this strife of receding from the *Center*, is either greater or lesser, proportionable to the *Agitation*, as ony one may plainly perceive in the whirling about of a *Sling*.

XIX. *And that which is strongest doth the more recede from the Center.*

Forasmuch therefore as all *Bodies* moved round, strive to continue their *Motion* in *Right Lines*; it follows, that when many *Bodies* are so moved, every one of them must strive to move by the *Tangent* A C G of the *Circle* which it describes; and really move by the same *Line*, as soon as the *causes* that have hindred it be taken away. It is visible also that the most strongly moved *Bodies*, must at the same time describe longer *Tangents* than those that are more weakly moved, and consequently more withdraw themselves from the *Center* of their *Motion*, and by the same means force the weaker *Bodies* to approach to the *Center*.

XX. *The Third Law of Nature.*

Another *Rule* is; *Whensoever the Moved Body, meets with another Body in Motion, if it have not as great a force to pursue its course by a Right Line, as there is in the other Body to hinder it, then it is turn'd out of its way, but yet continuing its Motion, loseth only the Determination of it.* As it is evident in *hard Bodies*, which when they dash against another *Body*, don't therefore cease to move, but are reflected to the opposit part. But if one of them have a greater force than the other, then it pusheth it along, and as much of its own force as it imparts to this other *Body*, so much it loseth; as when a *hard Body* meeting with a *soft*, by communicating its own *Motion* unto it, ceaseth to move and lies still. Wherefore we are not to suppose that when a *Ball* is thrown into a *Heap* of *Sand*, that its *Motion* is lost, but that it is communicated first to the *Particles* of *Sand*, next to the *Air*, and other neighbouring *Bodies*, notwithstanding the said communication be not visible to our *Eyes*.

The

XXI. *The Reason of the Third Rule.*

The Reason of this *Rule* is to be fetch'd from the *First*; for seeing every thing inclines to continue in the state wherein it is, it will follow that that which is weakest must be changed by the stronger, as experience teacheth.

XXII. *From this Law arise those changes which happen to Bodies upon their meeting one another.*

From this *Third Law* ariseth almost all the changes we find in *Bodies*, caused by the various resistance and occurrence of other *Bodies*; the effect of which occurrence will be different. *First*, according to the magnitude of those *Bodies*. *Secondly*, according to their *Superficies*, whereby they press upon each other. *Thirdly*, according to the swiftness and force of their *Motion*. *Fourthly*, according to the *Rest* and contact of *Parts* in that *Body* against which another dasheth, as shall be more amply shewed Part V.

XXIII. *How to measure the Quantity of motion.*

The *Quantity* of *Motion* in a *Body* is known partly by the *length of the Line* which the *Body* moved runs through; partly from the *quantity of its Bulk*, which is transferr'd together with it. Thus a *Square* Body of one *Foot*, being moved the length of 10 *Ells*, is said to have a certain *Quantity of Motion*, which would be double, if an equal way, were added to the former length, which that *Body* shall run through. Again, if a *Square Body* of one *Foot*, should run through the space of 10 *Ells*, there would be a double portion of *Motion* in it, with respect to a *Square Body* of half a Foot. Whence it follows, that *Bodies* of different magnitudes, may have the same *quantity* of *motion*. Thus the *Square Body of one Foot*, and that *of half a Foot* would have the same *quantity* of *motion*, supposing the former to run through a *Line* of *five Feet*, and the other a *Line* of *ten Feet*.

XXIV. *Unequal Bodies may have an Equal quantity of motion.*

From hence it is evident, that to the end two *Bodies* of different *magnitude* may have an equal *quantity* of *motion*; it is necessary that the *Lines* they run through, be reciprocally taken according to their bigness. As supposing one *Body* to be thrice as big, as another, it is necessary that the *Line* it describes by its *motion*, be only the third part of the *Line*, the lesser *Body* runs through. And upon this ground we may build these four following *Maxims*.

XXV. *The First Maxim.*

Two equal *Bodies*, have equal *Quantities* of *motion*, when in equal *time*, they describe equal *Lines*.

XXVI. *Second Maxim.*

Two equal *Bodies* have unequal *quantities* of *motion*, when in *equal time*, they describe *unequal Lines*.

XXVII. *The Third Maxim.*

Two *unequal Bodies* have equal *quantity* of *motion*, when in an equal space of *time*, they describe *Lines*, which are of a reciprocal Proportion to their *magnitude*.

XXVIII. *The Fourth Maxim.*

Two *unequal Bodies* have unequal *Quantity* of *motion*, when in equal time they describe *Lines* which are not reciprocal to their *Bulk*.

CHAP. XVI.

A Body can neither move it self, nor another Body.

I. *Motion is something distinct from the force that moves.*

TO know whether the *Body* moved hath its *motion* from it self, or whether it receives it from some outward *Cause*, we are to suppose two things in *motion*; the one residing in the thing *moved*; and the other in the *mover*: The former of these is the successive application of the *Body* moved, to the different parts of the *Body* that doth immediately touch it; and the second is, the force that causeth this application. *Motion* in the *thing* moved is nothing else but a *mode*, as hath been said in the foregoing *Chapter*; and consequently cannot pass from this *Body* into another, because every *mode* is inseparably tyed to its *Subject*. But *motion* consider'd with spect to the *mover*, is not a *mode* of the *Body* moved, because we find by experience that it passeth from that *Body* into another; so that *motion* in the first Sense, is only *modally* distinct from the *Body*, whereas the efficient *mover* is *Really* distinct from it.

II. *Every Body is moved by another.*

It is evident therefore that a *Body* hath not its *motion* from it self, in the first of these *Senses*, because this *motion* consists in an *Application* which is *Accidental* to the *Body*; and that every change which happens to any *Subject*, proceeds from an *External Cause*. Neither can it give it self the *Efficient motion*; because this *motion* likewise is Accidental to the *Body*: Wherefore it follows that the *Body* must receive its *motion* from something that is without it.

III. *A Body may not be moved at all.*

Moreover, a *Body* cannot be said to have that of it self which it may lose, without ceasing to be what it is; now it is evident that every *Body* can wholly lose its *Motion*, without ceasing to be a *Body*: Wherefore we must conclude that no *Body* has any *motion* of it self.

IV. *If a Body were mov'd of it self, it would be in perpetual motion.*

If a *Body* of it self had the *Power* to move it self, this *Power* would be *Essential* to it, and consequently the *Body* would move always, and with the same force, which is contrary to experience, which teaches us that a *Body* sometimes moves more, and sometimes less, and sometimes not at all: Wherefore it receives its force to move from something without it. Now there is nothing without or external to *matter* but *Spirit*; it is *Spirit* therefore that moves the *Body*, that is to say, *God*, who makes the parts of *matter* apply themselves successively, as to their outsides, to other parts that *immediately* touch them. Wherefore, since *God* cannot produce *motion* without acting, nor act otherwise than by his *Will*; we must own that the moving *Power* is nothing else, but the *Will God* hath to move the *matter*. Whence it follows also, that as the *Will* of *God* is unchangeable, the quantity also of the moving force must always continue the same, and that if it change by encreasing or diminishing, this is not with respect to its *Principle*, but with respect to the different *Bodies* on which *God* exerts that *Power*, as we have already shewed.

V. *Neither can a Body move another Body.*

From whence we gather this Conclusion also, that no *Body* can move another. For how shall it move another *Body*, seeing it cannot move it self?

VI. *The Power of moving differs from the thing moved.*

If you say that the *Power* of *moving* is not distinct from the *thing moved*, and that therefore it is not repugnant for a *Body* to apply it self to divers places: If it were so, it would follow that the *force* whereby *God* produceth *motion* in the *Universe*, must include the notion of *Extension*; and seeing the same is not distinct from *God*, it would follow, that *God* is *Corporeal*.

VII. *Aristotle teacheth that no Body can be moved by it self.*

Wherefore, *ARISTOTLE* 8 *Physic. Chap.* 4. tells us, that *no Body can be moved by it self*, and consequently that *Heavy* and *Light Things* are not moved of themselves, but by others. For if they could move of themselves, they might also stand still of themselves; for whatsoever is a cause of *walking* to it self, is also the cause of not *walking*; wherefore if *Fire* of it self did move upwards,

it

it would also be able by its own strength to move downwards. *For it is not*, saith he, *agreeable to Reason, that those things should only be moved one way, that do move themselves. Moreover, how can it be that a continuous thing should move it self? For as far as any thing is one and continuous, it is not capable of Passion: But as soon as it is separated, then one can act and the other suffer. Nothing therefore moves it self, because every thing is one and connext; nor another, that is one continuous thing with it, but in every thing it is necessary that that which moves, should be divided from that which is moved.*

VIII. *Bodies have only a Dispositive Principle to motion.*

And tho' *ARISTOTLE* in the place before quoted, seems to own a *Principle* of *Motion* in *Inanimate Bodies*, this is only to be understood of a *Dispositive*, and not of an *Active Principle*; after the same manner as a *Knife*, *Sword*, *Leaver*, or any other *Engines*, are fit or disposed to act something, and do moreover act and move, when they are employ'd by an *External Agent*, but never can set upon a work of themselves.

IX. *The moving force is different from the moved.*

To make this the more evident, let us suppose that all the parts of *matter* from the *Beginning* were destitute of all *motion*, and to have lain mingled together, having Extension only. Which of all these think you, would have begun to move first? Or what force could they have had to move either themselves or others that touch'd them? Seeing therefore we can conceive nothing there, besides *Extension*, and that *Motion* is not an effect of *Extension*, we must say, that none of them could have the *Power* either of *moving* themselves or other *Bodies*. And what we conclude of the several *parts* of the *matter* contained in the *Chaos*, the same we must conclude of the whole: For whither could that vast *Body* move, seeing that it is indefinitely extended, and we can conceive no *Bounds* or *Limits* in it?

X. *Supposing things to be without motion, there is nothing whence they should be moved besides God.*

We must conclude therefore, that no *Body* can move *it self*, since the force of moving is distinct from it; nor *another Body*, since a *Body* that moves another must lose as much of its own *motion*, as it imparts to the other *Body*: But how shall it impart that which it hath not? Wherefore *God* must be concluded to be the *Author* and *Principle* of all *motion* in the *World*.

XI. *How Animals move themselves.*

If you object, that *Animals* do move themselves, without requiring an *External Cause* by which they might be moved. *I answer*, that the *motion* of *Animals* depends on that of *the Animal Spirits* which being of a *fiery nature*, and carried through the *Body* like a *Flame* or *Wind*, do easily move the *Members* of it. For in the *Animal Spirits*, besides the thinnest and most moveable *Particles* of the *Blood*, is also contained much of the *Cœlestial matter*, which because of the extream subtilty of its *Parts*, is perpetually and necessarily agitated. Forasmuch therefore as these *Spirits* being either simply moved or determin'd, or besides also altered, do easily diffuse themselves into the *Nerves*, which are extended from the first Original of *Sense* and Motion to the *Muscles* and parts to be moved; it is not difficult to conceive how the *Figure* of the *Muscles* being changed by the *Influx* of *Spirits*, by their contraction or extension, do contract or extend the parts to which they are joyned, and consequently can be moved with innumerable different *motions*.

CHAP. XVII.

Concerning those Motions which commonly are ascrib'd to Nature's avoiding of a Vacuum.

I. *'Tis absurd to attribute knowledg to Bodily things.*

SOme are so liberal as to allow *Knowledg* indifferently to all *things*, and suppose *Inanimate Things* to be indued with a kind of *Intuitive Perception*. For if you demand of them why a *Stone* tends downwards, why *Water* gathers up it self into round drops, why *Plants* delight in such and such ground; they have a cause ready at hand, *viz.* That *a Stone* tends to the *Center* of the *Earth* to rest there; that *Water* affects a Round *Figure*, to preserve it self from its *Enemy*; and that *Plants* delight in such a *Soil*, because they know their convenient *Aliment*; and that *Water* mounts up on high, to avoid a *Vacuum*, and to preserve the *Union* that is between *Bodies*. Yea, we shall hear some boldly asserting, that the *Earth* for no other *Reason*, took to it self a *Sphærical Figure*, than that it might be able, to resist the impulses, of the *Heavenly Bodies*; and that as with an *Army* in *Battle-array*, it might be in a better condition to oppose its Adversaries which on all sides press in upon it.

II. *The improper Answer of some Men.*

Thus they tell us, that the *Water* mounts upwards in *Hero's Fountain*, because *Nature* abhors a *Vacuum*. Which way of speaking hath always appear'd very strange to me, and much like that, as when a *Man* being demanded why *Coals* are brought to *London* from the *North* parts of *England*, should answer, *for fear of Cold*: For these answers do not in the least satisfie the Question, which is not concerning the *Final*, but the *Efficient Cause*. Neither indeed can the *Avoiding of a Vacuum* be said to be the *Final cause* of the *Waters Ascent*; First, because the *Fear of a Vacuum* is vain; neither can Nature abhor that which cannot be; and consequently a vain cause is ascrib'd to those *Natural Effects*, which are supppos'd to proceed from this *fear*. *Secondly*, forasmuch as this *Fear* is perpetual, and that there is a continual necessity that all *Bodies* be united together, therefore the *Water* ought to ascend perpetually, which is contrary to experience; for we find that in *Spouts* and *Pumps* the *Water* ascends only to a certain degree, *viz.* to *thirty one Foot* and an half, where its stops, and can rise no higher.

III. *Why Water can only rise to a certain measure.*

Now the Reason why *Water* can only be raised to a certain height, is this, because the weight of the pressing *Air*, is then, as it were of an equal poise with the weight of the *Water* that is driven upwards; so as that the force of resisting in the *Water*, becomes equal to the pressing force that is in the *Air*. Thus by Example, from the *waters* mounting continually in *Pumps* to the height of about 31 Foot and an half, above the *Surface* of the *Water* in which the end of the *Pump* is dipt, they conclude that a *Column of Water* of that height weighs as much as a Column of *Air* of the same bigness, how high soever it may mount.

IV. *No Body is moved but by that which immediately toucheth it.*

Now to the end that the Cause of these *motions* may be the better understood, we'l take for granted what hath already been proved, that no *Body* moves it self, but must be moved by another *Body*, that immediately toucheth it, pushing against it: And forasmuch as in all the *Instances* we shall here alledg, nothing is found besides the *Air*, that toucheth

toucheth the *Bodies* moved, we must conclude that they are pusht on by the *Air*. Moreover considering that the *Air* always retains a great *Quantity* of *watry Particles*, which tho' dispersed in divers places, do notwithstanding retain their own *Heavinesse*, we cannot doubt that the *Air* is *Heavy*, and that by its weight it presseth the *Bodies* it lies upon. As may be seen in a *Syringe*, out of which if we draw the *Sucker* a little way, it of it self runs to the bottom again, because the *Air* that is above it, and immediately toucheth it, by its *weight* presseth it down to the bottom.

V. *In every Motion the whole Circle of Bodies moves.*

Moreover, we are to suppose, that seeing there is no *Vacuum* in *Nature*, when one *Body* is moved, the same must come into the place of other *Bodies*, and that which is driven out, must at the same instant take up the place of another *Body*, and so consecutively one after another, till the last *Body* enters into the place which was left by the first; so that all *Motions* in the *World* are in some sort *Circular*.

VI. *How those Motions are performed which are commonly ascribed to the fear of a Vacuum.*

These things so far understood, it will be easy to apprehend, that all *motions* which are ascribed to the fear of a *Vacuity*, are produced, for that some *Body* being pusht out of its place, does as much for the *Body* that is next to it, and so on, till the last *Body* enters into the place left by the first *Body*.

VII. *How the Water comes to ascend by a crooked Pipe.*

This *motion* is evident in a *Bent* or *crooked Pipe*, the shorter leg whereof B A D being put into the *Vessel* E, fill'd with *Water* (for it is supposed that the *Liquor* which is in the part of the *Pipe* F D, as standing in a liquor of equal *Heavinesse*, is not at all pressed by it, and therefore has no gravitation at all) and the longer Arm B C being extended towards the *Earth*; The *Water* that is inclos'd in the longer *Arm*, being heavier because of its *greater Quantity*, than that which is in the short Arm B A D, it must needs by reason of its *Weight* fall out of the *Pipe* B C into the *Air*, and by driving that out of its place, presseth the surface of the *Water* D, and makes the *Water* to ascend by the short *Arm* D A B, from whence it is carried to that *place*, which the *Water* falling down out of the *Arm* B C, hath forsaken. For seeing that the surrounding *Bodies*, have no place whither to withdraw themselves, they hinder the *Water* and *Air* from entring. But in the longer *Arm* B C whence the *Water* falls down, room is made, which the *Water* thrust down by the pressing *Air*, may take up at the same instant.

Figure 7.

VIII. *How long this ascent and descent continues.*

And the *Water* runs in this crooked *Pipe*, as long as the shorter *Arm* B A D, is depressed, or not of an equal height above the surface of the *VVater* with the other *Arm* B C. But when both the Arms are of an even height, the outflowing of the *VVater* will cease, for being equal, the one cannot prevail over the other. And if then the same ascent and descent of the *VVater* should continue, it would follow that there must be a greater quantity of *VVater* in the *Arm* B C, than in the *Arm* B A F, which is contrary to our supposition.

IX. *Why the flux of the water is by little and little diminished.*

This shews clearly why the *flux* of the *liquor* from these Pipes is swiftest at the first, and afterwards decreaseth by degrees, because the *Arm* from whence the *Water* runs out, is at first higher than the other, which height being continually lessen'd by the *efflux* of the *Water*, the swiftness of the *motion* of the liquor must be proportionably diminished. And when both the *Arms* are of an equal height, the *efflux* must cease, and the *Water* be at a stand in them both.

X. *The Motion of Water through a Pipe cannot be perpetual.*

Wherefore no wonder that they lost their labour who endeavoured by the *weight* of the *Water* in a crooked Tube A B C to find out a *Perpetual Motion*. For observing that much *Water* was contained in the wider *Arm* A, and that the longer *Arm* C contained only a little *Water*, they hoped that the *Water* enclos'd in the *Arm* A, because of its quantity and *weight*, falling down through the hole F, would have sufficient force to press the Air G, and by means thereof also pressing the surface of the *Water* D, contain'd in the Tube E, might drive the Water through the longer Arm C, into the Arm A, and from thence falling down again through the Hole F, of the wider Tube, into the Tube E, might produce a perperual *motion* of the ascending and descending *Water*.

Figure 8.

XI. *The Reason of the former assertion.*

But this was but a vain attempt of theirs; for tho' all the *liquor* contain'd in the wider *Arm* A, be much more heavy than what is in the longer *Arm* C, yet because the *Water* that is contain'd in the *Globe* A, doth not with its whole *Body* press the subjacent *Air*, but only with that part of it which perpendicularly answers to the *Hole* F, it cannot remove the *Air* that is under it out of its place, and consequently neither can it repel the *Water* contain'd in the *Arm* C B, into the other *Arm* B A, because the *Water* in C B exceeds that in weight which in the *Arm* A perpendicularly answers to the *Hole* F. And the reason why the whole *liquor* which is contained in the *Arm* A, cannot press all the subjacent *Air*, is, because the other parts of the *Water* contain'd in the longer *Arm*, falling down perpendicularly, tend directly to the parts of the *Arm* H I, diametrically under them, and therefore no wonder if they cannot press the subjacent *Air*; otherwise the *Water* F B, which is the lighter, would by its pressure raise up the heavier D C B, which no *Naturalist* can admit.

XII. *How water is drawn out of a vessel by a Filter.*

The same *cause* that makes the Water ascend by the foresaid *crooked Tube*, raiseth it likewise by a long shred of *Cloth* or *Linnen*. For first of all the *piece* of *Cloth* must be well dipt in the *Water*; because as long as that part which hangs down without the *Vessel* is dry, no *filtration* will follow: Now the outward parts of *Water*, wherewith the Cloth is made wet, do so insinuate themselves between the Threads of it, as to make a kind of *Tube* or *Pipe* (but into which no *Air* can enter) and in the mean time the consequent parts of the *Water*, which are contained in the said *Pipe*, flow towards that part of the *Cloth*, which hangs lower down on the outside of the *Vessel*, in like manner as it happens in the *crooked Tube* or *Pipe*.

XIII. *How the Air is drawn into a pair of Bellows.*

Thus likewise we see how a *Bellows* by being distended, becomes filled with *Air*; for seeing all places are full, and no Vacuity is found in the *Universe*, by distending the *Bellows*, the *Air* is driven out of its place, and finding no other passage, is forced to enter by the *Nuzzle* of the *Bellows*.

XIV. *How the Air in Breathing enters into our Breast.*

Respiration also is performed in us much after the same manner: For the *Air* entring into our *Bodies*, dilates the same by means of the *Muscles* of the *Breast* and *Stomack*; whereupon the neighbouring *Air* because of its fluidity is easily turn'd

out of its place, and consequently drives before it that also which is next to it, and thus the *Air* being pusht by the *Breast*, and other subsequent *Air*, is thrust down through the *Winde-Pipe* into the *Lungs* and *Breast*, and from thence also does return the same way. For *Respiration* is nothing else but an Alternate expansion and contraction of the *Breast*, by which the *Air* is thus driven to and from the Lungs.

XV. *Respiration cannot be performed by Attraction.*

By this experiment we may solve all, or most at least of those *Phænomena*, which *Philosophers* have attributed to *Attraction*. For it cannot be understood how in *Respiration* the *Air* is suckt in, or by what means the *Lips*, *Lungs* or any other part of the *Body* can hook in the little *Particles* of the *Air* and attract them: But when the inward parts are dilated, we easily apprehend that at the same time they push away the neighbouring *Air*, which partly by this *pressure*, and partly by the *Elastick virtue* caus'd by the Agitation of its *Particles*, is driven into the *Breast*, and afterwards expell'd again, *viz.* when the *Lungs* subside again and are contracted.

XVI. *How the Flesh of mans Body comes to rise up into the Cupping glasses.*

We must not omit here the Experiment of *Cupping Glasses*, by means whereof the *Flesh* is raised in order to *Scarification*, and by force driven into them. For the *Air* being in a manner wholly expell'd out of the *Cupping Glasses*, by the intromission of *Fire*, it must thereupon be condensed, and its parts more closely prest together, than is consistent with its temperament: And therefore whilst the *Subtil Æther* crouds in betwixt its *Particles*, this External *Air* strives to dilate it self again, and to return to its natural state: And in this strife it presseth all the *Bodies* that do surround it, which as long as they strive against this force, no *Bodies* are turn'd out of their *Places*. But when the *Air* in the *Cupping Glasses* begins to grow cold, it hath no power any longer to resist the pressure of the *Air* striving to dilate it self, and therefore suffers the outward *Air*, by pressing the *Flesh* to thrust it into the *Cupping Glasses*, and to drive out the *subtil matter* which was contained in them through the *Pores* of the *Glass*.

XVII. *Much in the same manner as the water mounts upwards.*

Almost in the same manner as we see the *Hand* in a *Pneumatick Engine* (after that the *Air* is exhausted out of the *Recipient* or *Glass Vessel*) to swell and spread. And for the same reason, a *Viol* with a narrow *Mouth*, if the *Air* by sucking be drawn out of it, and afterwards you stop the Hole of it with your *Finger*, and so dip it into the *Water*, it will become fill'd with it; because the Ambient *Air* by its weight pressing the *Surface* of the *Water*, drives it into the Viol, in which the *Air* that remains, being rarefied, for the want of the *Air* that is extracted, retains only a weak *Elastick force*, and so cannot oppose the pressure of the outward *Air*.

XVIII. *How Infants suck Milk out of their Mothers Breasts.*

Hence it also appears how improperly *Infants* are said to *suck Milk* ont of their *Mothers Breasts*: For if we consider how a *Child* draws *Milk*, we shall find that he doth not attract it by *Sucking*, but that it is driven into his *Mouth*: For the *Child* when it is about to *Suck*, doth dilate his *Cheeks*, and lay hold of the *Nipple*, wherefore the *Air*, that is next to his *Cheeks* must be driven out of its place, which pressing the *Breast* of the *Mother* or *Nurse*, drives the *Milk* into the *Childs Mouth*. And accordingly also *Nurses* use to press their *Breasts*, to faciliate the Expulsion of the *Milk*. And the same doth yet more clearly appear in *Brute Animals*; for *Lambs* use to thrust their *Heads* against their *Dams Dugs*, thereby to squeeze out the *Milk* into their *Mouths*.

CHAP. XVIII.

Of the Determination of Motion both Simple and Compound.

I. *What the swiftness, Determination and Quantity of motion is.*

HAving explain'd the Nature of *motion*, and determined the *Causes* of it, it remains now that we discover its *Properties*, and the *Accidents* that accompany it. The inseparable Properties, of *motion* are *Determination*, *Swiftness*, and *Quantity*. For every *Body* that is moved, moves some way or other, runs through a certain *Space* in a certain time, and that *Space* may be divided into certain degrees. Insomuch that the respect which *Bodies* moved have to the Coast towards which they are moved, is called *Determination*; the respect which they have to the *Space* they run through in a certain time, is called *Swiftness*, and this *Swiftness* distinguisht into degrees, that is, into equal *Parts*, is called the *Quantity* of *motion*.

II. *What the Determination of Motion is.*

The *Determination* of *motion* is that whereby the *Body* moved, is directed from the *Term à quo*, to a certain Term: Such as is that disposition in a *Stone*, whereby it tends rather to the *Center* of the *Earth*, than towards any other part whatsoever. We shall the better understand its *Nature* by dividing *motion* into *Straight*, *Circular* and *Mixt*. *Straight motion* is a Translation by the shortest way that can be, *viz.* by a *Right Line*. *Circular* motion is a *Translation* about a *Center* and *Axis*. And *mixt motion* is that which is compounded of a *Circular* and *Straight Motion*, or of two straight ones, or innumerable other various *motions*. As the *motion* of a *Knot* in a *Wheel* about the *Axle-tree*, which is circular, and also straight with respect to the way along which it goeth.

III. *How a mixt motion may be compounded of two straight motions.*

And that a mixt *motion* may be compounded of two *right motions*, is evident, when in the square Figure A B C D, the uppermost side A B, is moved with a straight *motion* towards the opposite side C D, and that at the same time the point A, of the upper side A B, be moved towards B, the other extremity in a straight *motion*. For by this means the *point* A, will not describe a Perpendicular A C, but a Transverse *Line* A D, yet a straight one, which *Geometricians* call a *Diagonal*, when it reacheth the opposite side C D. Figure 9.

IV. *Determination is a Mode distinct from Motion.*

These things being thus briefly laid down, I say, that *motion* consider'd in it self differs from *Determination* towards any Coast; which I thus prove. Whatsoever can be taken away from any thing, without impairing of it, that doth not constitute the nature of that thing: But *Determination* may be taken away, the *motion* still continuing whole and entire: Therefore *Determination* doth not constitute the nature of motion. The *Minor* is thus proved: Suppose the *Body* A, to move towards B, and to be hindred by the *Body* B, from going any further, A according to the *Laws of motion*, will retain its own *motion* entire: But when it pursues its *motion*, it is no more carried the same way it was before, because it is hindred by the *Body* B: Wherefore its *motion* abiding entire, and having Figure 10.

having loſt its firſt Determination, it will begin to move the contrary way: And therefore *motion* is diſtinct from Determination.

V. *The Determination of motion may be changed, without any change of motion.*

This may be proved; for that *motion*, as was ſaid before, is not contrary to *motion*, neither do they ever deſtroy one another in the ſame *Subject*; whereas one *Determination* is contrary to another, and the one deſtroys the other: Wherefore they are different. For proof of the *Minor*, ſuppoſe the *Body* A, to be bigger than the *Body* B, and to daſh againſt the *Body* B, either reſting, or more ſlowly moved, A moving more ſwiftly, will alter the *Determination* of B. But if A and B be ſuppoſed equal in bigneſs, and that with a different Determination and equal ſwiftneſs they approach to one another, they will fly back from each other the contrary way, with the change of both their *Determinations*, whilſt the ſame *Quantity* of *Motion* ſtill continues in them. Moreover, *Motion*, and its *Determination* are two *Modes*, one whereof may be ſuperadded to the other in the ſame *Subject*; after the ſame manner as *Swiftneſs* and *Slowneſs* happens to *Running*. And therefore as *Swiftneſs* may be taken away from the *running* of a *Stag*, and is actually taken away, when he runs ſlowly: So likewiſe can the Determination of *motion* be eaſily changed, the *motion* it ſelf ſtill continuing.

VI. *Motion, and the Direction of it to a certain part, have different Cauſes.*

This will appear unqueſtionable, if we conſider that the cauſe of *Motion* and *Determination* is not one and the ſame. For that force whereby the mover ſtrikes a *Ball* with a *Racket* from C towards B, is not that, by which it is determin'd to tend this way rather than another way, but wholly diverſe from it. The force of the *Racket* is that which moves the *Ball*, and could as well move it towards any other parts, as towards B. But the Determination depends on the *Situation* of the *Racket*, which ſo diſpoſeth it, as to make it to be carried to B, and might have diſpos'd it after the ſame manner, tho' it had been ſtruck another way. And therefore the Determination of the *motion* of *Bodies* does not ſo much depend on the force of the *mover*, as on the Situation of the *mover*, and circumjacent *Bodies*. Wherefore it is manifeſt, that it may happen that the *Ball* being ſtruck from C towards B, may be turn'd aſide by meeting with the *Earth* E F, *viz.* by a change of its diſpoſition, by which it tended towards B, the force of its *motion* all this while continuing the ſame, there being nothing common between them.

Figure 11.

VII. *There is no Reſt in the Point of Reflection.*

Thoſe who do not diſtinguiſh the *Determination*, from *motion* it ſelf, nor one *Determination* from another, do ſuppoſe that the *Motion* of *Reflexion* is contrary to direct *motion*; and inſtead of owning no other contrariety, but what is between *motion* and *reſt*, they aſſert, that between *reflex motion* there is a moment of *reſt*, which is abſolutely impoſſible. For this *motion* being interrupted, there would be no cauſe aſſignable, by which it might be excited anew; but rather having obtained a new way of *Exiſting*, according to the *Laws of Nature* it ought to continue in the ſame condition, as much as if it had been at *reſt* for many ages together. Neither is there any more neceſſity why it ſhould begin to move again, than why a *Triangular Body*, which by *motion* is become *Spherical*, ſhould not retain that *Figure*, as much as if it had receiv'd it from the *beginning*. Becauſe *every thing, as far as in it lies, continues in the ſame ſtate wherein it is.*

VIII. *Determination is either Simple or Compound.*

Determination is double, *ſimple* or *compound*. *Simple Determination* is that, whereby a *Body* after a ſimple manner tends to the *Term* to which it is directed. Such as is the *Determination* whereby the *Body* A, from the ſame point A, by the *right line* A B, moves towards the *Body* E F diametically oppoſite to it.

IX. *A Body falling perpendicularly upon another Body, muſt be perpendicularly reflected.*

But when a *Body* falls directly and perpendicularly from A to B, on another hard and unmoved *Body* E F, it is evident that it muſt fly back by the ſame *line* B A, ſeeing there is no reaſon why it ſhould tend to one ſide more than to another. Yea, foraſmuch as the Determination of the *Body* A, is direct from A to B, and is *ſimple*, it is neceſſary according to the *Laws* of the unchangeableneſs of *Nature*, that it always continue in the ſame ſtate, without altering.

X. *What compound Determination is.*

Compound Determination is, when the *Body* moved is after a compound manner directed to another *Body*: As when the *Body* C, from the *Point* C, by the Tranſverſe Line C B tends to the *Body* E F obliquely oppos'd to it. For the *Mode* of this tendency is compounded of a *Lateral Progreſſive* motion C G in length, and a *deſcenſory* C B in height: Becauſe every *motion* that depends on two or more cauſes, is *compound*. Wherefore, a *Bullet ſhot* out of a *Canon*, doth not deſcribe a ſtraight, but a *crooked line* only, becauſe two divers cauſes concur to its *motion*; the one driving out the *Bullet*, which by degrees grows leſs, ſince the *Bullet*, as it proceeds, communicates its *motion* to the Air, which it thruſts out of its *Place*; whereas the other motion, which is deſcenſory, is encreaſed, daily experience teaching us that *Heavy Bodies* move more ſlowly at the beginning of their deſcent, than in the progreſs of it.

CHAP. XIX.

Concerning Reflexion and Refraction.

I. *What Reflexion and Refraction is.*

FRom what hath been ſaid, may be eaſily gather'd what it is for a *Body* to be *Reflected* or *Refracted*. For ſince in *Compound Determination* the *Body* moved, meeting with another *Body*, tho' it keeps the ſame *motion*, yet only retains one part of its *Determination*; it ſo happens that becauſe it cannot go forwards, it ſuffers an *Oblique Reflexion* towards the oppoſite part; but if it can, then *Refraction*. Hence *Reflexion* may be deſcrib'd, The *Regreſs or Return that happens to a moved Body, becauſe of the meeting of another Body, which it cannot penetrate*. And *Refraction*, is *the incurvation, or change of Determination in the Body moved, which happens to it, whilſt it enters or penetrates the Medium*.

II. *Sometimes a Body is directly reflected.*

Thus if a *Body* moved directly, meets with another that is unmoveable, it muſt be reflected by the ſame *Line* by which it is directly moved, there being no cauſe to oblige it, to deſcribe any other. For example; if the *Body* G be mov'd directly by the *Line* G B, towards the Earth C E, which I ſuppoſe unmoveable, it will not be reflected by the *Lines* B A, or B F, but by the Line B G. The Reaſon whereof is, becauſe the *Determination* of the *Lines* B A and B F is *compounded*, and that no cauſe can be aſſigned, that ſhould oblige the *Body* G,

Figure 12.

G, which was moved with one only *Determination* toward the *Earth* C E, to retire from thence with two *Determinations*.

III. *Sometimes obliquely.*

But if the *Body* A be mov'd obliquely by the *line* A B, and that it meet with the *Earth* C B E, which is suppos'd unmoveable, it will be reflected by the *line* B F, which is diverse from the *line* A B. To prove this, draw through the *Points* A and B, the *lines* A C and H B, perpendicular to C E. This done, consider in the first place that the *Body* A, moving towards B, doth at the same time approach to the *lines* C E and H B, that is to say, that its *Determination* from A to B, is compounded of its *Determination* from A to C, and from A to H; or that which is the same thing, of its *Determination* from above to beneath, and from the *left* to the *right*. Consider in the second place, that the *Earth* C B E opposeth it self to the Determination from A to H, and by consequence that the *Body* A, when it meets with the *Earth*, must take a quite contrary *Determination* to that which it had, by which in an equal space of time, it must advance equal quantities; that is to say, if within a *Minute*, the *Body* A, descended by the *line* A B, to the *line* C B E, it must in another *minute* remount again from the *line* C B E by the *line* B F.

IV. *The Angle of Reflection is equal to the Angle of Incidence.*

But that we may know more distinctly to what part the *Body* or *Ball* struck, must rebound, let us describe a *Circle* from the *Center* B, at the Interval B A: For all the *Points* which are distant the same Interval from B, as A is, do meet in this *Circumference*. Now to be able particularly to determine this *Point*, let us with *Des Cartes Chap. 2. Dioptr.* erect three *perpendicular lines* A C, H B and F E, upon C E, so as there may be the same distance between A C and H B, as between H B and F E. Next let us say, that in the same space of time, in which the *Ball* hath been moved towards the *right* from A, one of the *Points* of the *line* A C, into *B*, one of the *Points* of the line H B, it must move from the lines H B, to some point of the *line* F E. For all the *Points* of this *line* F E, have in this respect the same Distance from H B, as all the *Points* of the *line* A C, and it is also as much determined to move that way as it was before. Now so it is, that it cannot arrive at one and the same time to any point of the line F E, and to some point of the circumference of the Circle A F D, save only at the point D, or at F; because there are none but these two, where they intersect one another: So that the Earth hindring it from passing towards D, we must conclude that it must infallibly move towards F. And thus you may easily see how *Reflection* is made, to wit, according to an Angle, which is always equal to that which is call'd the *Angle* of *Incidence*. As if a Ray, coming from the point A, to fall upon the point B, on the surface of a flat Looking-glass C B E, should so reflect toward F, that the Angle of *Reflection* F B E, be neither greater nor less, than the Angle of *Incidence* A B C.

V. *The Angle of Reflection is sometimes less than the Angle of Incidence.*

Yet it is not necessary that the *Angle* of *Reflection*, should be always equal to the *Angle* of *Incidence*, forasmuch as sometimes it may be greater and sometimes less. For suppose the *Body* A, to descend by the *line* A C, towards the *Body* D E, and to reach the *Center* C, in the space of one *Moment*; and that the swiftness of this *Motion*, be diminished one half in the *Point* of *Contact* C; it is evident that the *Body* A, being reflected from the opposite *Body* D E, in its *Center* C, cannot in one moment run through an *equal line*, since it is supposed to have lost one half of its *swiftness*, and therefore spending two Moments, in running through an *oblique line*, it will by *Reflection* arrive at the *Point* of the *Circle* B, and will there make the *Angle* of *Reflexion* B C E, less than the *Angle* of *Incidence* A C D. This *Reflexion* is commonly call'd from a *Perpendicular*, because the *line* of *Reflection* B C doth more deviate from a *Perpendicular*, than the *line* of *Incidence* A C. Figure 13.

VI. *When the Angle of Reflection is greater than the Angle of Incidence.*

But if the *Body* B, be carried to the opposite *Body* D E by the *oblique line* B C, and arrive at the *Center* C, in the space of two *Moments*, and that its *Motion* be encreased in the point of *Contact*, so as to become twofold swifter, it is evident that the *Body* B, rebounded by the opposite *Body* D E, must in the space of one Moment, in its ascent run through an equal oblique line, and arrive at the point A of the *Circumference* of the *Circle*; and so the *Angle* of *Reflection* A C D, will be greater than the *Angle* of *Incidence* B C E. And this *Reflection* is call'd *Reflection* to a *Perpendicular*, because the *line* of *Reflection* A C, doth less deviate from a *Perpendicular* than the *line* of *Incidence* B A.

VII. *What Refraction is, and how it is made.*

What has been said is sufficient to explain the nature of *Reflection*: We proceed now to *Refraction*, which is when a *Body* passing from one *Medium* to another doth deflect from the straight line it described. So that by the *Refraction* of *Motion* nothing else is understood, but the *Deflection* or turning aside, which a *Body* suffers in passing from one *Medium* into another. For the understanding of this *Refraction*, we are to consider, first, whether the second *Medium* resists the *Motion* more or less than the first, and whether the *Body* moved do meet it directly, or obliquely; for if it meets it directly, whether it resist more or less, it is without doubt, that the *Body* moved must in no wise change the determination of its *Motion*, in penetrating of it.

VIII. *A Body directly falling into a medium suffers no Refraction.* Figure 14.

To prove this, let us suppose the *Body* L descending in the *Air* by the *Perpendicular line* L B, and that it directly meet the *Water* which is under the *surface* C B E, which separates the two *Mediums*: This being so, I say that the *Body* L having pierced the *surface* C B E, will tend directly towards G, because the *Water* that is under that *surface*, doth resist it equally on all sides, and that there is nothing but the inequality of that resistance, that can make it turn aside.

IX. *But if it falls obliquely it is refracted.*

On the contrary, if the *Body* moved meets the second *Medium* obliquely, then of necessity it must deflect either to the *right* or *left*, according as the second *Medium* resists its Motion more or less than the first; as by example, let us imagine a *Ball* struck with a *Racket* from A, obliquely to B, to meet there, not with the *Earth*, but with the *Water*, whose *surface* is bounded with C B E, the *Ball* in this case doth not directly tend to D, but towards I, and this bending or *deflection*, which is measur'd by the Quantity of the Angle B D I, is call'd *Refraction*.

X. *The cause of Refraction.*

The Cause of this *Refraction* is the Resistance it meets with: For seeing that every thing as much as in it lies continues always in the same state, we

we can give no reason why any *Body* should deflect from the *Straight* way in which it began to move, but because it meets with some hindrance in that part from whence it rebounds. Thus when the *Body* A, after it is arriv'd to the *Point* B, is turn'd aside, and tends towards I, we must conclude that it meets with more resistance towards the left side of B, than on the right; and if it be turn'd aside towards D, that it finds a greater *Resistance* from the *right side* of B, than from the left. And therefore if we perceive that the *Water* doth more hinder the motion of the *Ball* than the *Air*, we may easily judge that the *Ball* which in the *Air* is moved from the *Point* A to the *Point* B, that from thence it may pass into the *Water*, must pursue its course towards I, and deflect from a Perpendicular.

XI. *How a Body comes to be variously refracted.*

This may be apply'd to all *Bodies* and all the *Mediums* they pass through. Wherefore this may pass for a *Maxim*, that as often as a *Body moved*, passeth from one *Medium* into another, that doth resist it more, it must be *refracted*, by declining from a *Perpendicular*. And that on the contrary, when it passeth from one *Medium* to another where it finds less *Resistance*, there it must deflect towards a *Perpendicular*.

XII. *It is requided to Refraction that a Body fall obliquely upon another Body*

I have already said that it is necessary to *Refraction* that the *Body* fall obliquely upon the surface that separates both *Mediums*, that so it may be deflected or turn'd aside. For if it should proceed *Perpendicularly*, without any *Declination*, seeing it would not be hindred on the one side more than on the other, from proceeding in a straight line, it could not suffer any *Deflection*, and consequently must continue its right motion, as hath been said.

XIII. *Requisits to determin the quantities of Refractions.*

To Determine the *Quantity* of *Refractions*, we must attend to the particular constitution of *Bodies*, whether they do more or less resist the passage of *Bodies* moved. For suppose we that the *line* C B E separates two *Mediums*, the upper whereof is *Air* and the undermost *Water*, and that the Water doth as much again as *Air* resist the motion of the *Ball* A. Suppose we likewise that the *Ball* A, having past the *oblique line* A B in one moment, to meet with the *Point* B, there obliquely to enter the *Water*: And that neither the *Bigness*, *Weight*, or *Figure* of the *Ball* do hinder it from so doing; Yea, and that its motion in the *Air* hath been always equal, and that having lost the one half of its swiftness, by meeting with the *Water*, it loseth now no more throughout its whole Course, how deep soever it may enter the Water; because this is nothing to the purpose, since the *Deflection* happens only in the *Surface*, and the *Water*, which resists equally on all sides, can only make the *Ball* to spend a greater or less space of time in its motion, but cannot make it to deflect from the *Line*, which it had begun to move in.

Figure 14.

XIV. *How much the Motion of a Ball is retarded by entring the Water.*

These things being observed, that we may know what way the *Ball* A must take, we are to consider that tho' the motion of the *Ball*, be lookt upon as *simple*, this doth not hinder but that its Determination in the *line* A B, with respect to the *Surface* of the *Water*, is compounded of two other *motions*, the one whereof presseth it from A F to C E, and the other at the same time presseth it from the left A C, to the right F E, so that both these together lead it to the *Point* B, by the right *line* A B.

Moreover we are to observe, that of both these *Parts*, whereof we understand that this *Disposition* consists, the one only is changed by the *Surface* of the *Water*, viz. that which drives the *Ball* downwards, whereas that which pusheth the *Ball* towards the right hand continues still the same.

XV. *Where the variation is in the Body moved.*

Having therefore described the *Circle* A F D from its *Center* B, and having describ'd upon C B E three *Perpendicular Lines* A C, H B, F E, so as that the space between them F E and H B, is the double of that which is between H B and A C, we shall find this *Ball* will go on to the *Point* I: for seeing that the *Surface* of the *Water* C B E, doth exactly take away one half of its swiftness, it must take up a double proportion of the time in which it passeth from A to B, in passing from B to any point of the *Circumference* A F D. And seeing nothing is lost of the Disposition whereby it was carried towards the right hand, in the double proportion of that time, wherein it proceeded from the line A C to H B, it must go twice the length towards the same part, and consequently approach to some point of F E at the same Moment in which it draws near to some point of the *Circumference* of the *Circle* of A F D, which would be impossible if it did not advance to I.

XVI. *How must the Balls motion is fore-showed when it passeth through the Water.*

We are also to take notice that the more obliquely a *Ball* dasheth against the *Surface* of the *VVater*, the more it is turn'd aside by it; so that if it be directed to right *Angles*, as if it were struck from H to B, it proceeds in a right *line* without any *Declination* to G, as hath been said already. But if it be driven along by a right *line*, as A B is, and lie so obliquely on the *Surface* of the *VVater* C B E, that the drawn line F E, cannot intersect the line A D, then will it not penetrate the *VVater*, but will rebound from the *Surface* B into the *Air* towards F, after the very same manner as if it had lighted on the *Earth*. As we see in those Stones wherewith *Boys* make Drakes in the Water; and as *Bullets* which (according to the Relation of those who have been in Sea fights) being obliquely shot out of *Cannons* rebound from the *VVater*, and hit Men standing on the *Decks*.

XVII. *The more obliquely a Ball falls on the Water, the more is it deflected.*

CHAP. XX.

Of the Force of Acting and Resisting.

I. *The force of acting and resisting taken in a two-fold sense.*

THe force of acting and resisting may be understood two several ways, either *Metaphysically*, for the Faculty or *Power* which any thing hath to act or resist. And this is nothing else but a *Non-Repugnance* to act or resist. So he who saith that a *Needle* can *prick*, thereby means nothing else, but that *Pricking* may Coexist with a *Needle*. Or else it may be taken *Physically* for *Reaction*, as when any thing that is moved upwards, is driven down by some other *Cause*, and thus resistance is called *Positive*; as when two *Bodies* in motion, meeting together, beat back one another; as two *Bullets* or *Bowls* meeting together, by their contrary Determination. Or it is also precisely taken for the force it self of Resisting, as when a *House* resists the *Wind*, or a *Stone* the *Ball* that is cast against it. And this is commonly called *Negative* or *Formal*. And it is of these two that we enquire here, *viz.* to know wherein the force a *Body* has to act upon another, or to resist it, doth consist.

II. *Wherein the Power of Acting or Resisting doth consist.*

All the Power any *Body* hath to act upon another, and every Faculty, whether *Positive* or *Negative*, of any *Action*, consists in this alone, That according to the forementioned Law of Nature, *Every Body, as far as in it lies, continues in the same state wherein it is*, whether in *Rest* or in *Motion*; because every state of *Bodies* may be referr'd to one of these. So that those *Bodies* which are joyned together by *Rest*, have a power to hinder themselves from being separated, as well as those that are *separated*, have a Power to continue so; and they that are *moved*, have a Power to continue their *motion*, according to the same degree of Swiftness, and towards the same Coast: As that which Rests in any place, hath a force to abide there, and to preserve its *Rest*. And this is the only cause of the *motion* of *Things that are* cast or *thrown into the Air*; concerning which we have more reason to enquire how they come to cease from *motion*, than how they continue it so long as they do.

III. *This Force ariseth first from the Bigness of the Body.*

Now this *Force* may be attributed to several Particulars: As first, to the *Magnitude* of the *Body* in which it is found. For it cannot be questioned, but that a *Great Body* exceeds a Less in the faculty of Acting and Resisting, because in regard to the *Parts* of which it is compounded it hath more *Motion* and *Rest*; and seeing every *Body* hath a proportionate Affection answering it, therefore the *Quantity* of these must be answerable to the *bulk* of the *Body*. Hence is that common Saying amongst *Naturalists*, that *a thing of greater Quantity, hath the greater Virtue*: Which *Virtue* is to be esteemed according to the force of *Motion* that is in the whole *Body*, or its firm *adhering* and *abiding* in a place. Thus *Fire*, the more it is extended in *bulk*, the more violently it *burns*; and the more fixedly any *Bodies* continue in one place, with the greater difficulty are they thrust out of it. Thus *Round Bodies* are the strongest both in Action and Resistance, as appears in *Pestils*, *Millstones*, *Cylinders* or *Rowling-Stones*, and other such like *Instruments*, which are the more proper to bruise *Bodies*, and making them smooth or even, because their force is altogether directed to one Line. Thus also a *Hammer*, with a long Handle, strikes the *Anvil* with a greater force than that which hath a short one.

IV. *Secondly, from the Bigness of the Surface.*

The Power of *Acting* and *Resisting* is also taken from the largness of the *Surfaces* of *Bodies*; for the *broader* the *Surface* of two *Bodies* is, the more firmly do they cleave together; as appears in *two Wooden-boards*, *well plained*, lying upon one another: Whereas on the contrary, where the *Surfaces* are narrow or little, by so much the less firmly they stick together. Thus *Sphærical Bodies* less stick together, because their *Surface* is the least of all *Bodies* with respect to their *bulks*, and they touch each other only in a *Point*. And certain it is that *Lead* made up into a great *Bullet*, is more solid than that which is distended into a thin *Plate*, or made hollow. Wherefore the greater quantity of *Matter* is contained under a little *Surface*, the more *solid* it is, and of the *greater* efficacy to resist; as is evident in *Gold*, *Lead*, *Iron*, and other *Metals*, which being once put into *Motion*, retain a greater force to preserve and continue it, than either *Wood* or *Stones* of the same *bulk* or *figure*. But on the contrary, *Triangular Bodies*, and such as have more *Surface* than other *Bodies* proportionably to their Extension, are more difficultly *moved*, and have less force to continue the same, or to resist other *Bodies*.

V. *Thirdly, from the Swiftness of Motion.*

The said Faculty of *Acting* and *Resisting* may likewise be estimated, from the *swiftness* or *slowness* of *Motion*. For a little force resists *Bodies* that are swiftly moved; as when we lash the *Water* with a *Rod* or *Wand*, we find the *Water* to resist the *Rods* entrance. Because (as hath been hinted heretofore) the Strife of Material things in *Acting* and *Resisting*, depends on the determination of the *Motion* towards some certain *Part* or *Coast*, and its meeting with a *Body* resting there, or otherwise moved. And a *Body* is then taken to be otherwise moved, when it is either moved more slowly, or another way.

VI. *Fourthly, from the Meeting of Bodies.*

This *Force* may also be gathered from the nature and contrariety of the *Mode* or *Manner* whereby divers *Bodies* meet with one another. For according as they are variously oppos'd to each other, so they have a different force of *Acting* and *Resisting*. Thus a *Stone* slantingly thrown on the *Surface* of the *Water*, so as to leap from it, cannot divide the Top of the *Water*, as if it had been downright cast into it.

VII. *A threefold Difference is incident to Motion.*

From these Four Particulars, to which all *Action* and *Resistance* of *Bodies* may be referr'd, we may determine how *Bodies* do increase, or diminish their *Motions*, or change the determination of them, (for there is this threefold difference in *Motion*;) only we are to observe how much *Force* there is in every *Body*, either to move or resist *Motion*, and certainly conclude, that *that which is strongest, always takes effect*. Thus the *Motions* of Great *Bodies* have their Force from the *Agreement* of their *Parts*, though their *Motions* have but few degrees. So *Stones*, and even *large Buildings*, are oft forc'd to give way to a *River* that runs but slowly. And upon the same account, in other *Bodies* also the *motion* may be strong, tho' it be not swift: And on the contrary in less *Bodies*, there may be a considerable swiftness of *motion*, and not any great *force*. As if the *Body* A (for Example) should be moved as swiftly again as B, and the *Body* B should exceed A in bigness in a double Proportion, in this case we must estimate as much *Motion* to be in one, as in the other; because the Extrusion which is found in the *Greater Body*, is by its *bulk* equivalent to the Intension of *Motion* in the other.

VIII. *That which is strongest always obtains its effect.*

Now in the *opposition* or *meeting* of *Bodies*, this *Rule* always holds good; *Whatsoever exceeds another thing in strength, obtains its effect*, whether it be in moving another *Body*, or in resisting its *Action*. And therefore of those things that tend to the same place, if it be not large enough to contain them all, the strongest only do get thither, leaving the weaker behind them. Thus the most lively and vehemently moved *Particles* of the *Blood* are received into the Cavities of the *Brain*, the weaker being hindred by the stronger from arriving there; because the Passages of the *Brain* are too narrow, than that all the *Particles* of the *Blood* can get up thither.

CHAP.

CHAP. XXI.

Of the State of Bodies; *and first those that are Hard, Fluid, Frangible, Friable, Soft, Ductile, and such as may be cut or slit.*

I. *Whence the Hardness of Bodies proceeds.*

AMongst the *Principles* of *Natural things*, *MOTION* and *REST* only are opposed to each other, not *privatively* (as some would have it) but *contrariously*, as two *Modes* really distinct. For *Rest* or *Quiet* is not a *Privation* of *Motion*, but a true *Form*, whereby Stable and *Hard* Bodies are distinguish'd from such as are *Fluid*, and whence they receive the force of *Acting* and *Resisting*. For those Bodies are accounted *Hard*, whose *Parts* by a firm Union lye still together; or whose *Parts* do so closely cleave together, that they cannot without difficulty be separated. Which close Union is perceptible to the *Senses*; for if we touch any of these *Hard* Bodies with our *Hands*, or any other part of our Body, they resist them, and oppose their entrance; as we see in *Marble*, *Wood*, *Stone*, *&c.* for if, when they are handled by us, they give way, we should perceive no Sense of *Hardness* at all; as appears by the *Air*, which is not felt by us, because it gives way to our *touch*.

II. *What is the Cause of the variety of Hard Bodies.*

The *Hardness* of Bodies is various, according to the variety of *Rest*; for wheresoever there is more of *Rest*, there also is more of *Hardness*; and so contrarily. *Clay*, when the *Water* is evaporated from it, grows *hard*, because the *Rest* of its Parts is by this means increased, its *Earthy parts* being delivered from the *Agitation* of the *Fluid parts*, interpos'd between them; whereas *Wax* being heated, becomes *soft*, because the *Rest* of its Parts is lessened, by reason of the *Oily Particles*, which being benum'd before, are by the *Heat* put in motion.

III. *What Hardness is.*

When we say that *Rest* is the Cause of *Hardness*, we mean the *Formal*, not the *Efficient Cause*; for the *Efficient Cause* of *Hardness* consists only in the *force* wherewith the *Air*, or other *Subtil Matter*, compresseth the Parts of *Hard* Bodies. To the end therefore that we may have a distinct *Idea* of *Hardness*, we must conceive it to be nothing else, but *the Rest of many parts of* Bodies, *caused by the Pression of the Air, or the Subtil and Æthereal Matter, which acting from without, drives these parts inward in such a manner, that they cannot be separated afterwards, without making us sensible of their Resistance.*

IV. *What is the Cause of the Fluidity of Bodies.*

Fluid Bodies, on the contrary, readily yield to the *motion* of other Bodies, and therefore do not resist our *Hands* when we touch them, as appears in the *Water* and *Air*. The Cause of which difference consists only in *Rest* and *Motion*: For if we enquire why some Bodies cannot but by force be thrust out of their *places*; whereas others without any difficulty yield the *place* they are in possession of, to others, we shall find that the Reason is, because their *Parts*, which resist those Bodies that approach to them, lye still and *Rest*; whereas the *Parts* of other Bodies, that without any force do leave their *places*, are in *motion*. So that *Hard* Bodies are such, whose *Parts* lye still and cohere together; but *Fluid* Bodies are divided into many little *Parts*, which are variously moved. For the *Parts* of *Water*, or any other *Liquor*, are agitated every way by the Subtil and *Æthereal Substance*: And accordingly those Bodies are called *Fluid*, whose *insensible parts* have such various Motions.

V. *How it appears, that the Parts of Fluid Bodies are agitated every way.*

Now that the *Parts* of a *Fluid* Body are moved, and that equally *every way*, appears from hence, that in what part soever of a *Fluid* Body we do move our *Hand*, or a *Stick*, it always goes on with the same easiness, which could never be, if the Determination were stronger one way, than it is another. Tho' it cannot be deny'd, but that some Resistance is found in a *Fluid* Body, if we swiftly lash any thing against the *Parts* of it; because a Body slowly moved, comes under the Notion of a Body at rest, when compared with a Body that is much more swiftly moved, and consequently will resist it.

VI. *Fluid Bodies have no certain figure, as Hard Bodies have.*

Hence it is that the *Figure* of *Fluid* Bodies is undetermin'd, because they are so easily divided and diffus'd, that they cannot keep themselves in their own *bounds*. But *Hard* and *Stable* Bodies being hard to be divided, easily retain their *Figure*, and are easily comprehended within their own *limits*; as appears in *Lead*, *Iron*, *Silver*, *Gold*, *Wood*, *Marble*, *&c.* which according to their several degrees of *Solidity* preserve their *figure* and *Bulk*. That therefore we call a *Fluid* Body, whose Parts being divided into many small *Particles*, and these again into less Indefinitely, are variously agitated. But that is called a *Hard Body*, whose Parts by *Rest* do so closely cleave together, that they cannot be separated, but by a Force sufficient to overcome their coherence.

VII. *The various kinds of Fluid Bodies.*

The smaller and lighter the *Parts* of any *Fluid Body* are, the greater is its *Fluidity*; and the thicker and more Branchy they are (if Contact doth not hinder) so much the less is it. Hence arise the diverse kinds of *Fluid Bodies*, according as by the lightness and smalness of their *Particles*, they are more, or according to the Thickness and Branchiness of them, less yielding to the *Cœlestial Matter*, which is the Cause of their *Fluidity*. Upon this account it is that the *Air* is more *fluid* than the *Water*; because the *Parts* of *Water*, tho' they be smoother, yet are thicker than those of the *Air*. And *Water* is more *fluid* than *Oil*, because the Parts of *Oil* are more thick and branchy: Lastly, *Oils* are more or less *fluid*, as their *Particles* are more or less *thick* and *branchy*.

VIII. *How Fluid Bodies are said to be in Motion.*

When I say that the *Nature* of *Liquid Bodies* consists in *Motion*, it is not so to be taken, as if the whole *Liquid* Body were moved out of one place to another, for this happens also to *Hard* Bodies: For a *Bowl* of *Brass* is easily rowl'd from one end of a *Table* to the other, and for all that persists to be a *Hard Body*; but in this, that the *Particles* into which they are divided, are moved and variously agitated, some of them being tost *to the Right*, others *to the Left*; some *upwards*, others *downwards*; some *forwards*, and others *backwards*: Which *Motions* of the *Particles* must be different. For if they were all of them carried one way, they would in a short time cling together, and make up a *stable* or *hard* Body.

IX. *Why Ice is carried with a greater Force, than the Water.*

And tho' the Course of a *River* be directed to one particular part of the *Land*, it does not therefore lose the *Name* or *Nature* of a *Fluid* Body; forasmuch as the various Motion of the *Particles* of the *Water* is preserved, notwithstanding the said

said Course of the *River*, as much as in a still *Standing Water*. Hence it comes to pass, that *Ice* driving on the top of the *Water*, because of the firm clinging together of its *Parts*, doth with a greater force pursue its way, and with more violence set against the *Banks*, than the *Water* it self which carries it; because the *Parts* of *Water* being tost with various *Motions*, weaken the force of it, and therefore cannot tend with that vehemence to one part, as the *Ice*, which is a *solid* Body, doth. By which Example it is evident, why *Fluid* Bodies easily give way to other Bodies, but *solid* Bodies not; because *Fluid* Bodies are always in *Motion*, and therefore do not oppose the entring of other Bodies into the places they are in, but readily and easily quit them. Whereas *Hard* Bodies rest, and according to the *Law* of *Natures* immutability, strive to continue in the state of Conjunction, except they be disturbed by some strong *Motion*.

X. *How the Parts of Solid Bodies are joyned together.*

This Sentiment will not please some *Philosophers*, who suppose no two Bodies can be joyned without some intervening Third, distinct from them both; which they imagine to be as the *Glew* that holds the parts together, that the *Union* may be the more firm: But since nothing is to be admitted in *Natural Philosophy*, which we are not convinc'd of by *Reason*, we must consider first, what kind of *Glew* this can be, before we appropriate it to this use. Without doubt it must be either a *Substance*, or the *Mode* of a *Substance*, seeing that amongst *Natural things* nothing else is to be found besides *Substances* and their *Affections*. If it be supposed to be a *Substance*, it cannot be understood why the *Parts*, which because they are *Substances*, cannot be united by themselves, should yet stand in need of an adventitious *Substance* to unite them. If it be a *Mode*, then without doubt none can be more properly assign'd to this purpose than *Rest*, since that which makes the *Parts* to be united together, must be most opposed to *Motion*, by which they are divided from one another. For *opposit Things must have opposit Principles*; but nothing is more contrary to *Motion* than *Rest*, as being the contrary Affections of *Material Substances*.

XI. *The Motion of the Particles of Fluid Bodies, is discernible from their Effects.*

You'l say, *How may we know that the* Parts *of* Fluid Bodies *are in continual Motion?* I answer, That tho' the smalness of those *Particles* doth not permit us to discern their *Agitation*, yet may the same be easily discovered by the *Effects*. There is no body but perceives, that some parts of *Water*, evaporate in *boyling*, and that in the *Summer* time *Ponds* are lessen'd or dryed up, which could not be, but that some Parts of the *Water*, being separated from one another by *Motion*, steam away into the *Air*. Moreover, how else comes it to pass that the *Particles* of *Water*, do so readily mix together? Or, how could they insinuate themselves into the *Pores* of *thick* Bodies, if their Parts did cling together by mutual *Rest*?

XII. *The Motion of Parts causeth their Division.*

For the *Division* of *Parts* depends on their *Motion*, *Agitation* being that which separates one thing from another. This is very evident in *Flesh*, which is soon corrupted by the *Air*, the *Particles* whereof being agitated either by the *Sun*, or some other way, thrust themselves into the *Pores* of *Flesh*, and by dilating of them and spoiling their Natural situation, do at last dissolve and putrifie it. The ready and thorough mingling of *Liquors* discovers the same thing, it being evident that th s easie mingling cannot be done without *Motion*, whereby the Parts of two *Liquors*, as for Example, *Water* and *Wine*, run together.

XIII. *Bodies would not be distinguish'd from one another, if some were not moved.*

Besides, what *diversity* would there be amongst Bodies, if all their *Parts* lay still together, and were equally united? *Cold water* would not differ from *Ice*; *Crystal* and *Milk* would be the same thing; nor would any Cause be assignable, why *Crystal* resists our touch, or why *Milk* yields to the approach of *Hard* Bodies.

XIV. *Parts of a twofold sort are found in Liquid Bodies.*

Wherefore we may conceive twofold Parts in *Liquid* Bodies; some at it were *flying*, by reason of their swiftness, such as the Parts of *Smoak*, the *Steam of boyling Water*, and *Flame* are, which are tost so forceably that our Senses can discern their *motion*: And others, as it were, *creeping*, because of the slowness of their *motion*; as the *Particles* of *Oil*, *Milk* and *Wine*, whose *motion* is so slow and leisurely, that our *Senses* cannot perceive it. So that when it happens that one *Liquid* Body is not sufficient to dissolve another, or that it can exercise its force more upon one Body than another; the Reason thereof chiefly is, because its *Parts* are more or less agitated, or because the *Pores* of those Bodies are not open alike.

XV. *What Soft Bodies are,*

Soft Bodies approach to the Nature of *Liquid*, and are such whose *Particles* do not cling so close and firmly together, as the Parts of *Hard* Bodies, nor are agitated with so swift a *motion* as *Fluid Bodies*, but partake of both their *Natures*, being middle things between *fluid* and *stable* Bodies, such as are *Sand*, *Wax*, *&c.* The softness of *Sand* is caused, for that something intervenes betwixt their separated *Parts*: And *Wax* is soft, because its *Particles* terminate in flexible branches, which twisting together lightly, joyn the said Parts.

XVI. *Frangible, are reckon'd amongst Hard Bodies.*

Of *Hard* Bodies some are *Frangible*, others *Friable*. For whatsoever can be broken must have such a degree of stiffness, that its outward Parts when struck, may be neither dilated, nor admit any ingress of *parts* into *parts*; but that the *surfaces* being broken, the *inward parts* likewise be divided and broken asunder. Of which Nature are *Flints*, *Earthen Pots*, *Stones*, and the like, which according to the diversity of their contexture, are more easily or hardly broken.

XVII. *Friable Bodies.*

Thus *Friable* Bodies must have so much stiffness, that they cannot be stretched or bended; but upon any force pressing upon them, do crumble into *Dust*. Of which Nature is the *Sand-stone*, which is easily dissipated into small *parts*, and those again easily crumbled to *Dust*.

XVIII. *Ductil Bodies resort under Soft Bodies.*

Amongst *Soft Bodies* are reckoned those that are commonly called *Ductil* (that is, Bodies that suffer Drawing or Extension) such as *Gold* is, one *grain* whereof may be drawn into a *Thred* of four hundred Foot long; and consequently one *Ounce* to the length of 230400 Foot. The Cause of which vast discussion is commonly attributed to its extream *Compactness*, the *Thinness* of its Parts, and their intimate *Union* and *Connexion*. Of which we shall speak more at large hereafter.

XIX. *Bodies that may be cut or slit, belong to Soft Bodies.*

Some reckon *Bodies that may be cut* or *slit*, also amongst *Soft Bodies*; because whatsoever is cut, must have so much flexibility, that the Part which is prest (suppose with an *Ax*) can give way downwards, at the same time that the Collateral parts yield to the dividing *Instrument*. And whatsoever *can be slit*, must be so *flexible* or *bending*, that

that when the *Parts* in a certain place, begin to be pull'd asunder, a Compression may be successively made, in whatsoever places the rest are to be gradually separated from each other. *VVood* is said to be Cut, when it is divided *Cross-wise*; but to be slit, when divided *Long-ways*, or with the *Grain*.

CHAP. XXII.

What Loose and Close, Rough and Smooth, Contiguous and Continuous Bodies are.

I. *Whence proceeds the Loosness or Closeness of Bodies.*

AS *Stable* and *Fluid* Bodies are constituted as such by *Rest* and *Motion*; so *Loose* and *Close* Bodies are made such by their *Figure* and *Situation*, not *outward*, but *inward*. For the *Loosness* or *Closeness* of *Bodies*, is not to be considered according to the outward Space in which *Bodies* are dilated or contracted; seeing that a *Body*, whose Essence consists in three *Dimensions*, cannot take up a greater Space at one time, than at another; but according to the *Intervals* which are understood to be betwixt their *Parts*; and which are said to be *distended*, when they are fill'd with any foreign Matter; or to be *contracted*, when by Removal of that *Matter*, they are either lessened, or quite taken away.

II. *Loose Bodies are made such, by the Ingress of Matter; Close Bodies by the Egress.*

For we must not imagin, as many do, that the *parts* of *Loose* Bodies are so separated from one another, that nothing extended comes between them; For no such *Vacuum* can be in *Nature*; but that the said *Intervals* are fill'd with other *Bodies*; as is apparent in *New-bak'd Bread*, which being put into *Milk* or *VVine*, presently swells up into a much greater *bulk*; because the Pores of the *Bread* are distended by the intruding *particles* of the *VVine* or *Milk*. So that all the New Extension we find here, is not to be attributed to the *Substance* of the *Bread*, but to the *fluid* Body that hath insinuated it self into the *pores* of it. Which is evident not only to *Reason*, but to the *Senses* themselves: For if a man behold the *Steam* that riseth out of a Pot of *boyling VVater*, or the *Smoak* that proceeds from a *Torch* at a distance, he will suppose the *parts* of them to be contiguous; but when he comes nearer, and views them more wishly, he will find that there is neither *Continuity* nor *Contiguity* between the *parts* of them, but that they are separate from one another, by means of a foreign intervening *Matter* that divides them.

III. *Examples of Loose and Close Bodies.*

A *Body* becomes *close*, when the *parts* of it being nearer together, leave few *Intervals*, or none at all. Of the first sort are *Snow*, *Hay*, and *Wool*, when they are compress'd, as also a *Sponge*, when the Water is squeez'd out of it; for then by the expulsion of the *Liquor*, its *Pores* are narrowed, and few *Intervals* are left in it, to receive any outward *Bodies*. Of the latter sort are those *Bodies*, which have no *Pores* at all into which any *External Body* can enter; and when it is so close, then it cannot be further condensed by any *Power* of *Nature*.

IV. *What Rough and Smooth Bodies are.*

As with respect to the *Figure* and *Situation* of its *Inward parts*, a *Body* is distinguish'd into *Loose* and *Close*; so with regard to their *Outward figure* and *situation*, Bodies are said to be *Rough* or *Smooth*. Which *Modes* are of great efficacy in *Natural things*; as appears in a *Knife*, wherewith the *Hardest Bodies* are cut; and in a *Pen*, with which an infinite variety of *Characters* may be made.

Rough Bodies are such whose superficial *Parts* are unequally disposed, so as that some are prominent and others depress; as *Rusty Iron*. But *Smooth* or *Polish'd Bodies* are such, whose Extream parts are equally situated, as *Ice*, a *Whetstone*, &c. *Smooth Bodies*, because of their Surface, have more force to Act or Resist, than *Rough Bodies*. For a *Sword*, whose *Edge* and Extream parts are polish'd and even, cuts deeper than another *Sword* of the same bigness that is *Rusty*; and a *Ball* rebounds more strongly from *polish'd Bodies*, than from *rough*.

V. *All Bodies are not Smooth, which appear to be so.*

Yet we are not to imagin, that all those *Bodies* in which neither our *Touch* nor *Eyes* can discover any inequality, are altogether *smooth*; forasmuch as even *Glass* and *Crystal*, which appears very *smooth*, have a *rough Surface*. For tho' *Glass* be made of *Salts*, which by Melting are resolved into very small *Particles*; yet because those *Particles* still retain their former *figure*, they can never make a *polish'd Surface*. What appears to our *Eye* more smooth than *Paper*? And yet by the help of a *Magnifying-Glass*, we perceive it to be very rough and uneven. Hence it is manifest, that in what part soever of the *Medium* the *Eye* be placed, it receives the various *Rays*, which come from and represent the Object.

VI. *What a Contiguous and Continuous Body is.*

The two Remaining *Species* of *Bodies* are *Continuous* and *Contiguous*. A *Body* is said to be *Contiguous* with respect to the *situation* it hath amongst other ambient *Bodies*. Thus a *Tree* surrounded by the *Air*, is said to be *Contiguous* to it. And accordingly a *Contiguous Body* is thus defin'd by *Plato* in *Parmenides*: *That which is to touch something, plac'd by it self, must be next to that which is to be touched; neither is there any Third thing that is a Medium between both these.* A *Continuous Body* is that which besides the situation it keeps amongst *Circum-ambient Bodies*, becomes united to them, and by *Rest* is joyned with them. Thus a *Stone* is said to be a *Continuous Body*, being considered whole and undivided, and before any change happen to it by *Motion*. But this *Contiguity* of *Bodies* is not in all their *parts*, but only in those that are Insensible, since such only have an immediate *Contact* with one another.

VII. *Wherein the Nature of Contiguity and Continuity consists.*

The *Continuity* therefore of *Bodies* consists in this, that their *parts* do cleave together by an Immediate Connexion, and rest together. So that *Continuous Bodies* cannot be dissolved, but by such a *Motion* as prevails over the *Rest* of their *Parts*. The *Contiguity* of *Bodies* consists in this, that their *Extream parts* lying still together, nearly touch one another, yet so as that a most thin subtil *Matter* flows and runs between them; and by reason of this Interfluent Subtil Matter, the *parts* of *Contiguous Bodies* are more easily separable.

CHAP. XXIII.

That there are Pores in Hard Bodies, as well as in those that are Fluid and Soft.

I. *Supposing Bodies to be moved, it is nec*

THO' it is not denied, but that the *VVorld* was *Created* in the *Beginning* with all that Order and Beauty which we find it to have at present, and that all the *Bodies* contained in it had the same *perfection* which we see they now have;

G. Freman. fe. I. Kip Scul.

To ye Right Worshipfull
Brafferton hall in ye
Yorke shire Knight, &
Daughter & Cœheyre of
Yarington in Oxford

Shire Baronet
Dedicated by Richard Blome

little *Particles*, to the end it may be able to exert its *Force*, and to thrust it self into other *Bodies*. But yet we are not to imagin, that all the *Pores* of *Consistent Bodies*, have their *Pores* hollowed after the same manner, or disposed in the same *situation* and *figure*: For they who in *Winter time* put on a Wastcoat over their Shifts, find themselves less subject to *Cold*, than when they wore nothing besides their *Shirts*; which would not be so, if the *Pores* of the *Shirt* and *Wastcoat* did answer to one another in their *figure* and *situation*.

X. *How the Pores of Bodies come to be destroyed.* As *Pores* do arise by the *Generation* of *Bodies*, so by their *Dissolution* they are destroy'd. Thus the *Pores* are destroy'd in *Wood* that is *worm-eaten*, and in Clothes that are *Moth-eaten*. Or if the *Pores* be wider, as in *woollen Cloth*, and other such like, they may happen to be divided in the midst, and afterwards be made whole again by being joyn'd to other *Pores* of a like *figure*. Another way whereby *Pores* are destroyed, is that of *Obstruction*, when the *parts* of *Bodies* become so closely united, as to make one *Continuous Body*; as when by means of Condensation the *Pores* are lessened, or quite taken away; or when some supervening Matter remains in them, and hinders any other *Matter* from entring them: So when the *Pores* of the *Sails* of a *Ship* are fill'd with *VVater*, it hinders the *VVind* from passing through them, notwithstanding that the *VVind* have a far greater agitation than the *VVater*.

CHAP. XXIV.

Concerning Duration, and its Species, Time and Eternity.

I. *Duration agrees to all existing Beings, and is only notionally distinct from them.* FOrasmuch as *Natural things* exist, and take up certain places, it cannot be doubted, but that they are *Sometime*, and that they have *Duration* and *Continuance* in their Existing. For *Duration* is the Consequent of *Existence*; and whatsoever is not made, and destroyed in the same *moment*, must be considered as enduring, so that *Duration* may be defined, *An Attribute under which the Existence of Created things is conceived, in as much as they persevere in their Actuality.* From whence it is evident, that *Duration* is not really distinct from the *Existence* of a thing, there being only a Notional distinction between them. Because as there is no *Body* so little, but that it doth consist of parts, and may be measured with three *Dimensions*; so there is nothing in Nature of so short a *Duration*, but that we can measure it; neither can any thing be taken from its *Duration*, but as much must be taken from its *Existence*.

II. *The Definition of time* *Time* therefore is nothing else but *the Measure of the successive Duration of Bodies, according to the equal Motion of the greatest* Bodies, viz. *the Sun, Moon*, &c. *Aristotle* defines *Time* to be *the number of Motion, according to Former and Latter*. But this Definition stands in need of another to make it *Intelligible*, except by *the number of Motion according to Former and Latter*, he means only thus much, that by *Time* we number the successive *Duration* of *Bodies*, in which there is Former and Latter according to the *Motion* of the *Sun*.

III. *The three Differences of time.* There are commonly three Differences of *Time* reckoned, *viz. Past*, which hath already been; *Present*, that which now is; and *Future*, that which shall be. By the *Present time*, we are not to understand an Indivisible *Instant*; for no such can be found either in *Time* or *Motion*, the Nature of them both being successive; but all that part of *Time*, which the *Mind* represents to it self as Present: Thus we say, the Present *Hour, Day, Month, &c.*

IV. *Time is the Measure as well of Rest as of Motion.* From the foresaid *Definition* of *Time*, it is apparent, that *Time*, being the Measure of the successive *Duration* of *Bodies*, must Measure *Rest*, as well as *Motion*. For we say as commonly, that a thing hath *rested*, as that it hath *moved* so long. The same is manifest also from this Example, If a *Dog*, in half an hours time, run three Miles, and a *Tortoise* in the same time go only the length of one *Pace*; the Measure of the *Time* will be the same in both these *motions*, when yet there is much more *motion* in the *Dog*, than in the *Tortoise*. And therefore *Time* is nothing else, but the Duration of a Creature in whatsoever State it may be.

V. *Succession is included in every Duration.* For we find *Succession* in every *Created Being*, and we can Measure the same by *motion* properly so called, or at least by the thoughts of our *Mind*, which seeing they do not exist all at once, must needs involve Succession. Wherefore, neither can the *Duration* of an *Angel* or the *Mind of man*, be said to be altogether at once, as the *Duration* of *God* is, because we clearly understand succession, both in our own thoughts, and those of an *Angel*; for *Angels* do not think all things together and at once. But such a *Succession* cannot be admitted in the *Divine thoughts*, *God* being an *Act* altogether *Simple, Complete*, and liable to no *Vicissitude*. Wherefore also *Gods Eternity* is his very *Nature* and *Essence*, forasmuch as he is most sufficiently of himself. And so *Time* is the same with the *Created things* themselves, forasmuch as they receive their finite perfections successively, that is, the one before the other.

VI. *An objection taken from a thing that exists only one Moment* You'l say, suppose a *Creature* should only continue one *Moment*, that thing would exist in the *World*, but without any *Succession* of *Existence*; therefore *Succession* is not involved in the conception of *Duration*.

VII. *The answer that all Moments are divisible.* I answer, that *Duration* cannot be understood without *Continuation*, and therefore no part of *Duration* can be assigned so small, but that there must be continuance in it: Since no *Moment* can be conceived, which is not divisible into other *Moments*. Wherefore those are mistaken, that make the present *Time*, to be an Indivisible; for since every *Duration* is *Greater* or *Less*, that is, consists of more or less *Parts*, no real *Particle* of it can be assigned, which hath not a quantity of its *Duration* distinct from another. Wherefore as every *Particle* of a *Body*, may be divided into other *Parts*: So likewise the present Time is compounded of *Parts*, and is divisible into other Moments.

VIII. *Time is only an Entity of Reason.* Whence it follows, that *Time* is not an Affection of *Created things*, but a mere *Mode* of *Thinking*, or an *External Denomination*, which we call an *Entity of Reason*. For as *Things*, from the the *Operations* of our *Mind*, are said to be Known, Understood, Defined, *&c.* of which *Operations* they are only the *Objects*; so *Time*, whereby we Measure the *Existence* of *Created things*, is no more with regard to them, but an Extrinsecal Denomination, and a *Mode* of *Thinking*, made use of for the explaining of *Duration*. Hence *LUCRETIUS* saith Book I.

Time

Time of it self is nothing, but from Thought
Receives its Rise, by labouring Fancy wrought
From things consider'd, whilst we think on some
As Present, some as Past, or yet to come.
No thought can think on Time, that's still confest,
But thinks on things in Motion or at Rest:

GASSENDUS from these Verses of *LUCRETIUS*, concludes *EPICURUS* to have been of the Opinion of *ANTIPHANES*, who held, that *Time was something that had no real Existence, but only in the thought of Man.* which *ARISTOTLE* also seems to insinuate, whilst he defines *Time* by *Number*, which cannot exist without the understanding of the Counter or Numerator. *It is not in vain*, saith *GASSENDUS*, *that* EPICURUS *warns us, that we are to speak otherwise of Time, than of other things, which are in a Subject; thereby intimating to us, that time is in a Subject only by the help of our thoughts; forasmuch as the Mind of Man considers a thing not to cease to be, at the same moment it begins to be, but to abide and continue, and to keep its Existence for a longer or shorter space of time.* So that that it is evident that *EPICURUS* would not have any thing further to be inquired of *Time*; than what the Mind at first sight conceives of it, that is, a stay or continuance, whether it be longer or shorter. And if any Man should demand what *Time* is, we may answer him with *DEMOCRITUS*, that *Time is just such a thing, as is the space of Day and Night.*

IX. *What Duration is called Time.*

Wherefore to the end we may Measure the *Duration* of all things, we compare it with the *Duration* of some particular *Beings*, which have a certain and most equal *Motion*, by which *Days* and *Years* are made, and this *Duration* we call *Time*. Wherefore they who suppose the *Sun* to be whirld about the *Earth*, or the *Earth* to turn round about its own *Axis*, attribute *time* to the *motion* of either of them, as being its proper Measure, according to *Former* and *Latter*: But as for the *Duration* of other things, they will have them to be measured by *time*, only by means of an external Application of our *Mind*. Thus when we say, that *Nestor* lived 300 years, we mean that he lived so long, as that Motion lasted, wherein the *Sun* performed 300 of its yearly Courses, or the *Earth* 1095 Circuits about its own *Axis*.

X. *How time is said to flow, or to be successive*

If any one urge, that that there are many things agreeing to *time*, which cannot be attributed to an *Entity* of *Reason* or an *Extrinsecal Denomination*, as when we say, that *Time flies, Time teacheth Men many things*, that *Time comes, follows, &c.* which cannot be spoke of a thing that doth not exist at all, but only depends on our thoughts.

XI. *Answer.*

I answer, that these are *Metaphorical Speeches*, and which agree only to the things that pass away, are taught, come, follow, &c. For Time is said to *run*, or pass away, when things by an outward Application of our *Mind*, with respect to the *motion* of the greatest *Bodies*, which can be observed by all Men, are understood to exist for some time. *Time* is said to *teach* all things, when those things which heretofore where hidden from Men come to be known; and upon the same account Time is said *to come, to succeed, to vanish, &c.*

XII. *Whether upon the ceasing of the Motion of the great Heavenly Bodies time ceaseth also.*

If any Man should infer from hence, that therefore upon the ceasing of this universal and equal *motion*, of the *Sun* or *Earth*; Time must cease also, and be no more, because then our *Mind* will be no longer able to compare the *Duration* of *Created things*, with the *Duration* of certain equal and stable *motions*.

XIII. *Answer.*

To this I answer, by denying the Consequence, because *Former* and *Latter* is not only in *motion*, but also in our *Thinking Mind*, since that in it we find a true succession of *Thoughts*; for we cannot at once and altogether *Think* of all *things*, we can think of. And therefore, tho' all *motion* should be taken out of the *World*, yet would not that put an end to succession, but *Created things* existing in our *Thoughts*, would be still commensurate to *Former* and *Latter*.

XIV. *What Eternity is.*

Having thus explained the Nature of *Time*, it remains that we speak a few words of the other species of *Duration*, viz. *Eternity*, which they call the *Duration* of a *thing*, without either *Beginning* or *End*, and which belongs to *God* alone. And which *BOETHIUS* defines to be, *The All at once, and perfect Possession of an Interminable Life.* The word *Life*, is here taken for the existence of a *thing*, endued with all the *Perfections* it is capable of. The words *all at once* intimate, that *Perfection* does not agree to the *Eternal Being* successively, but that he possesseth them all at the same time. Whence we may infer, that no Creatures, whether *Material* or *Incorporeal*, could ever be *Eternal*, because it implies a contradiction for them to possess at once all the *Perfections*, *Qualities* and *Modes* which they are capable of.

XV. *All Beings are either Permanent or Successive.*

From all that hath been said it appears, that there are some things whose *Essential Parts*, can exist together, or all at once; and that there are others to whom this cannot agree. The better to distinguish these, I call those things successive, whose *Essential Parts* are in a continual Flowing. Thus *Time* is a successive *Being*, because *Present*, *Past* and *to come*, which are the *Essential parts* of it, are never all at once. And I call those *Permanent*, all whose *Essential parts* are together. Thus a *Triangle* is a *Permanent Being*, because the Content and the three *Sides*, of which it is composed, do exist all at once, or at the same time.

CHAP. XXV.

The Ends of GOD *are not to be enquired after in Natural Philosophy.*

I. *It is a piece of Rashness to enquire concerning the ends of God.*

THO we own GOD to be the *Efficient Cause* of all *things*, and that all *Creatures* depend on him alone, yet we have no mind to enquire, for what end they were produced by *God*, and what *Reasons* he propounded to himself, in calling them out of the *Abyss* of *Nothing*. Who knows not that the *Secrets* of *God* are unsearchable, and past finding out? And as it is not the part of an *Earthen Vessel*, to dispute the Point with the *Potter*, why he hath made him such; so neither does it become *Mortal Man*, to question with his *Maker*, why he hath done so and so. And indeed this *Reason* alone taken from the *Divine Majesty*, and our Littleness and Meanness, may be sufficient to restrain us, from enquiring into the *Ends God* hath proposed to himself in the making of *Natural things*.

For

II. *Our Human Infirmity ought to restrain us from enquiring into the Divine Secrets.*

For tho' in the Contemplation of *Natural things*, it be permitted to us to enquire, from what *Principle* they proceed, what their *Matter* is, and with what *Forms* they are perfected; yet is it a piece of Rashness and Arrogance in us, to dive into *Gods Counsels*: Whereas we ought rather to consider that we are weak *Creatures*, of limited *Perfections*, and not fully Masters of our own *Actions*; whereas *God* on the other hand is *Immense*, *Infinite*, *All-wise* and *Omnipotent*, so as to be able to produce innumerable *things*, the *Reason* whereof could never enter into our *Thoughts*.

III. *The things which are done in the Earth are not known.*

For if we are not able to give an account, of what use those *things* are to us, which in such great abundance are hid in our *Earth*, and cannot assert but that they have been destinated by their Author, to ends altogether unknown to us: How then shall we dare to pry into the *Arcana* of our most *Good*, most *Powerful* and most *Glorious Creator*? As if we were familiarly acquainted with his *Mind*, and as if we had been his *Privy Counsellours*. Is it not much better for us to adore his *Goodness*, without determining of those *things*, which it is not allowed Man to *know*, nor permitted to *search* into.

IV. *The Divine ends in Moral things may be searched after, but not in Natural things.*

I own that in *Moral things*, where Conjectures are of more Authority, it may be conducive to *Piety*, to enquire into, and determine the end *God* hath proposed to himself in *Creating* the *World*. Therefore *Preachers* to excite the *Divine Love* in us, set before our Eyes the several uses and advantages, which the *Creatures* afford us, telling us that they were made for our *Sakes*. But in *Natural Philosophy*, where nothing is to be admitted, which is not built upon the most unshaken *Reasons* and *Arguments*, it seems to be a foolish thing to guess at any *end*, that *God* should have proposed to himself, in the *Creation* of the *World*.

V. *Objection, that all things were made for Mans sake.*

But some will tell us, that according to the *Scripture*, all things were made for our *Sake*, because they are of some use to us. And therefore say, that the *Sun* was *Created* to give us *Light*; that the *Soul* of Man was made by *God*, to Contemplate him; yea, that the whole *Universe* was *Created* for *Mans Sake*, seeing that all *Creatures*, are some way or other serviceable to him: And that Consequently *Gods ends* may be known by us, as well as any other *Causes*.

VI. *The First Answer.*

To this may be answered, *First*, That true indeed it is, that the six days of the *Creation* are so described in *Genesis*, as that Man seems to be the chief end of them: But it may be said, that this *History* of *Genesis*, was penn'd for *Man's Sake*, and that therefore the *Holy Spirit* was pleased chiefly to set down those particulars which have reference to *Man*.

VII. *The Second Answer.*

I answer *Secondly*, That it doth not appear at all, that all things were Created for the Sake of Men. For how do we know, *what* and *how many things*, *God* hath made besides this *Earth* which we Inhabit, in the *Stars* and elsewhere? How do we know, but that there may be other *Creatures*, specifically distinct from any of those which we see, other *Animals*, other Men, or at least *Creatures Analogous* to Men, in some other places? These things are unknown to us poor Mortals, because the *Divine ends* and *Counsels* are hid from us. When it is said therefore, that all things are *Created* for *Man's Sake*, we are not so to understand this, as if *they* had no other use, save what they render to *Mankind*; but only this, that Man can and must *exercise* his *Wit* and *Understanding* about them. Now it is a quite different thing to say, that Man was *Created*, that he might *Celebrate* and *praise God* for the excellence of his *Works*; and to assert that all these *things* were *Created* for *Mans sake* alone. For in the former, *Mans Duty* is intimated, but in the latter, the end and aim of the *Creator* in making the *World* is determined.

VII. *It seems a great piece of Rashness to assert that all things were created for Man's sake.*

Besides, it is an absurd thing to imagin, the *Sun* to have been *Created* for no other end, save only to enlighten us: And that the *Stars* and *Plantes* were ranged in their several *Vortices*, only to assist and pleasure us; since we are the very least part of the *Earth*, and the very *Earth* it self (in respect of the *Heavens*) is no more than a small *Grain of Sand*, compared with a *Mountain*. Wherefore let us take heed of entertaining such presumptuous Thoughts of our *selves*, as if all things were made for our *use*, *profit* and *advantage* only; when there may be an infinite number of *Creatures*, that by many degrees exceed us, whose Nature and Excellence is altogether hid from us. Have not we much more reason to have such *thoughts* as these, than to entertain those other presumptions, when we consider the immense *Power* and *Widom* of our *Infinite Creator*?

IX. *The Glory of God was not the Reason why the World was created.*

Some, pretending Zeal for the Honour of *God*, tell us, that his own *Glory* was the end and aim he proposed to himself, in the *Creation* of this *Universe*; as if *Gods* aim in the Production of this *World*, had been only to display his *Magnificence*, and to exalt his own *Glory*. But who can believe this? Shall we say, that *God* could not have provided for his own *Glory*, by other things different from these? Would his *Honour* have been ever the less, if he had *Created* another *World*? You must then own, that his *Glory* was not the sole motive he proposed to himself in creating of the *World*. Moreover, how can it be said, that *Glory* was the *Creators end*, seeing it is a thing extraneous to him, and which doth not at all belong to his *Essence*? For *God* can never be said to be determin'd in his *Actions*, by any thing that is without him, neither can any *thing* that is without him, be a motive to him.

The Fifth Part
OF THE
INSTITUTION
OF
PHILOSOPHY.
VIZ.
SPECIAL
Natural Philosophy,
CONCERNING THE
WORLD
AND
HEAVEN.

CHAP. I.

Of the Unity and Perfection of the World.

I. *What is meant by* Special Physicks.

HAving examin'd those things that belong to GENERAL PHYSICKS, and thereby consider'd a *Body* or *Matter* in *General*; that is, its *Nature, Principles, General Affections* and *Differences*; we proceed now to SPECIAL PHYSICKS, or that Part of *Natural Philosophy* which takes a view of *Matter*, as distinguish'd into *Species*, and lays open their several *Species, Properties, Distinctions*, and *Mutations*, in a more particular manner.

II. *The Species of Bodies may be considered two ways.*

Now the *Species* of *Bodies* may be consider'd after a twofold manner, *viz.* either *Jointly* or *Separately*; or, as others express it, *Collectively* or *Distributively*. The *Species* of Bodies are *Collectively* consider'd, when they are view'd all together, as the Parts that constitute one Whole or Entire *Being*. *Distributively*, when the chiefest *Species* of *Bodies* that compose the *World*, are in a convenient Order particularly examined.

III. *The Definition of the* World.

The whole which contains all the *Species* of Bodies, is called the *World*; and is the Comprehension of all *Natural* Bodies Created of GOD, and for GOD, by the most free *Motion* of his *Will* most beautifully *Adorned*, and most wisely *Governed*, and powerfully *Preserved*. And is thus defin'd by ARISTOTLE; *The Structure of Heaven and Earth, and of the several Natures comprehended in them.* Lib. *de Mund.* Cap. 2.

IV. *The World contains all things.*

For the WORLD comprehends all and every thing that can fall under our *Thought*. Whatsoever *Rhetorick* commends, or *Philosophy* admires, is a part of it. And therefore the *Ancients* have told us, That the *World* consists not only of *Animals* and *Men*, but of *Gods* also; and that accordingly the *World* is a *Kingdom* or *Commonwealth*, compos'd of the *Gods*, *Men*, and *Animals*: Which Saying of theirs is true enough, save only in that it imparts the Name of *God* to many, which is due to none but One alone.

V. *There is but One World, and no more.*

The WORLD is but *One only*, neither can a Plurality of *Worlds* be conceived without a Contradiction; for there can be no more than one *Universal* comprehension of Bodies, seeing that many *Worlds* cannot be conceived without *Distance*, neither can *Distance* be without *Extension*, nor that without a Body, which mediating Body would then joyn both *Worlds* together; for the conjunction of the *Parts* of the *VVorld* consists in nothing else but this, that all the Bodies in it touch one another. But to imagin two *VVorlds* separated by a *Vacuum* or *Imaginary Space*, that is, two

Ge. Bickham. Inv.

I. Kip. Sculp.

two *Bodies* diſtanced from each other by Nothing, is meer Folly; becauſe to this diſtance by Nothing would belong *Extenſion*, *Diviſibility*, and *Menſurability*, and it might be either nearer or farther off.

VI. *Plurality of Worlds implies a Contradiction.*

However, if any one ſhould queſtion, whether there may not be another *VVorld* diſtinct from this. My Anſwer in ſhort is, that they who hold a Plurality of *VVorlds* not to imply a Contradiction, ſay, that ſuppoſing there were a *VVorld* diſtinct from this we live in, it might be placed in that Space which we imagine to be beyond the utmoſt *Heavenly Sphere*; but it is impoſſible that any *Bodies* ſhould be there, ſeeing it is ſuppoſed to be *Nothing*, or ſomething *Imaginary* only, and which conſequently can have neither *Parts* nor *Effects*, and therefore cannot place any thing. For *Place* being nothing elſe, according to *Ariſtotle*, but *the Surface of the ambient* Body, how ſhall we find a place there, where no *Bodies*, nor *Surfaces* are to be found?

VII. *Many Worlds cannot be united together.*

Moreover, if beyond the *higheſt Heaven*, there ſhould be another *VVorld* like to this, either they would touch one another, or be ſeparate. If we ſuppoſe them ſeparate, there muſt be ſome *Medium* that may wholly ſurround them both, and ſo neither of theſe *VVorlds* would be utmoſt, as having ſtill ſomething beyond them; and if they touched one another, being *Round Bodies*, there muſt be a *Vacuum* left between thoſe parts, that did not touch; but we have proved a *Vacuum* to be an Impoſſibility in *Nature*, in our *General Phyſiology*. Beſides, the *Space* which we imagine to be betwixt theſe two *VVorlds*, is not a meer *Nothing*, but a *Body*, ſince nothing but a *Body* can make a *Diſtance* betwixt two *Bodies*: For we cannot conceive one thing to be diſtant from another, without ſome real *Medium* that ſeparates them, which ſeeing it can be nothing elſe but a *Body*, it will joyn both *VVorlds* together, and ſo inſtead of ſeparating theſe two *VVorlds*, it will unite and make but one of them.

VIII. *Whatſoever we imagin to be Extended, is a Body.*

But to put an end to this Diſpute, we ſay that this *VVorld* hath no Bounds of its *Magnitude*. For ſeeing every *Space* is ſomething extended, and that no *Extenſion* can be without a *Body*, we conclude that nothing can be conceived by us beyond the *Heavens*, but what muſt be Real; and conſequently that there can be no other *VVorld* beſides this. And yet it cannot be inferr'd hence, that the *VVorld* is *Infinite*, but only that it is *Indefinitely Extended*, becauſe we cannot conceive ſo great an Extenſion in the *VVorld*, but we may ſtill imagine Greater, foraſmuch as all imaginable *Spaces* are fill'd with *Matter*.

IX. *The World is not Infinite, but Indefinitely extended.*

You'l ſay, If the *VVorld* be *Indefinite*, thas is, if we can imagine no *Bounds* or *Ends* of its Extenſion, it muſt be *Infinite*, becauſe *Infinite* is nothing elſe, but that which hath no *End*.

X. *The firſt Anſwer.*

I anſwer, *Firſt*, All grant that there are *Indefinite Parts* in every *Body*, ſo that it is impoſſible to come to the laſt of them; and yet no body ever aſſerted, that therefore a *Body* was *Infinite*. So tho' we admit an *Extenſion* in the *World*, the end whereof we cannot imagine, yet is not the *World* therefore to be reputed *Infinite*. For I do not ſee how that which hath *Finite Parts* can be accounted *Infinite*; nor how any *Maſs* or *Bulk*, which *GOD* can take ſomething away from when he pleaſeth, can be called *Interminate*.

XI. *The ſecond Anſwer.*

I anſwer, *Secondly*, that there is a great difference betwixt that which is *Infinite*, and a thing *Indefinite*; for we cannot aſſert any thing to be *Infinite*, except we have a Reaſon whereby we can demonſtrate it is ſo: Whereas to aſſert any thing to be *Indefinite*, it is ſufficient, if we have no Argument which proves it to be *Finite*. Which cannot be proved of the *World*; for it cannot be underſtood, that the *Matter* of which the *World* is made ſhould have any *Bounds*, ſeeing that whatſoever we imagine beyond the *Heavens*, we ſtill conceive it as an extended *Space*, which hath Length, Breadth and Depth, which conſtitute a *Body*. Of which we ſhall ſpeak more fully in the *Third Chapter*.

XII. *The World is Perfect.*

We cannot doubt of the Perfection of the *World*, if we conſider either the *Author* of it, who is *Infinite*, *All-wiſe*, *All-powerful*, *&c.* or the *Harmony* of the *Parts* of the *World*, the *Diſtinction* of *Natures*, and *Difference* of *Bodies* that are in it; becauſe we meet with nothing in it which is not Compleat and Perfect.

XIII. *The Imperfection of Parts, takes not away the Perfection of the whole.*

And tho' the *World* doth not conſiſt of things that are all beſt in their kind; becauſe all particular things that are in the *VVorld*, if conſidered in themſelves, cannot be ſaid to be *Perfect*, but only with reference to the whole *VVorld*, whoſe *parts* they are. For all things that concur to the conſtituting of any thing, muſt not be of one and the ſame Order. What would become of a Republick, if all the *Members* of it were *Senators*? What would the *Body* of *Man* be, if it were made of nothing but *Eyes*? What would *Muſick* be without *Diſcords*? So likewiſe the *Beauty* of the *VVorld* conſiſts in the *Diverſity* of *Kinds* that are in it; and things *Imperfect*, as well as *Perfect*, contribute to its orderly and moſt excellent Conſtitution.

XIV. *The Harmony of the World conſiſts in its Variety.*

Wherefore this admirable Structure of the *VVorld* would want much of its *Beauty*, without that Viciſſitude and Inconſtancy which we find in it. Hence it is that all things made by *GOD* are ſubject to *Corruption*, neither is any *Body* ſo firm, which in continuance of Time is not changed. Thus it hath been obſerved of late, that *VVorms* are generated not only in *Stone*, but alſo in *Glaſs*; ſo that we may well conclude, that there are no *Bodies* in the *VVorld* that are altogether exempt from *Corruption*.

XV. *It is no Argument againſt the Perfection of the World, that ſome hurtful things are found in it.*

But you'l ſay, Why are there ſo many Excrements of the *Earth*, *Air*, *&c.* in the *World*? Why were *Worms*, *Flies*, *Serpents*, *&c.* Created? ſince theſe frequently are miſchievous; and other *Creatures* again periſh, without having been of any uſe at all? I anſwer, that none of theſe things are *Superfluous* in the *World*, ſeeing that they are Inſtances of the *Power* of *GOD*, and if *Men*'s Induſtry be not wanting, may be employ'd to many good uſes. The very *Poiſon* of *Venemous Creatures*, by preparation and due exhibition, become great *Antidotes*; neither is there any thing ſo deformed in the *World*, which doth not add to its *luſtre* and *beauty*, as *Shadows* ſet off a *Picture*.

CHAP.

CHAP. II.

The Creation of the World proved by Natural Reaſon.

I. *Ariſtotle ſuppoſed the World to be Eternal.*

THE Authority of *ARISTOTLE* hath of a long time been ſo prevalent in the *World*, that it hath been lookt upon (and is ſo ſtill by ſome) as a great Error to depart from his *Opinions*: Which is more particularly evident in the matter beore us; For he ſuppoſed the *World* to have been from Eternity, and could not conceive how it could be produced, ſeeing that between *Entity* and *Non-Entity* there was an *Infinite Diſtance*. Some of his *Followers* have aſſerted the ſame thing, grounding their Opinion on their *Maſter's Foundation*, that *out of nothing, nothing can be made*, and that it was a plain contradiction, to ſuppoſe any thing to be made, but from *Præexiſtent matter*. Wherefore to overthrow this Opinion, ſo derogatory to the *Glory* of the *Creator*, I ſhall prove that *Creation* is *Naturally Demonſtrable*, and that it may eaſily be proved, that all things proceeded from *God*.

II. *What Creation is.*

By *Creation* we underſtand, that *Action whereby God immediately produceth any thing*. And that he hath in this manner produced all *Subſtances*, I prove thus.

III. *Everything that exiſts muſt have a Cauſe aſſigned it.*

There is nothing in the *Univerſe*, whereof we may not enquire whence it *Exiſts*; or what is the *cauſe* of its *Nature*, and the efficient of its *Exiſtence*. And this may not only be enquired concerning things *Created*, but likewiſe of *God* himſelf; who tho' he be *Independent*, *Infinite* and *Omnipotent*, yet it may be ſaid, that his *Immenſity* is the cauſe or *formal Reaſon*, why he needs no cauſe for his *Exiſtence*. But foraſmuch, as nothing like this is found in all other things, but rather the greateſt Limitation and Infirmity, we muſt conclude, that they never proceeded from themſelves, but from an *outward Principle*, and that they derive their whole *Eſſence* and *Exiſtence* from another. For it is moſt evident, that *nothing* (if I may ſpeak ſo amongſt *Philoſophers*) preceded their *Natures*, and that they came to be, by the Goodwill of the *Creator*, which is to be *Created*, and to proceed without dependence upon any other Cauſe whatſoever.

IV. *Since the World cannot preſerve it ſelf, it did not make it ſelf.*

The ſame may be proved from the *Preſervation* of all *things*: For it cannot be conceived, how a thing that cannot preſerve it ſelf, ſhould proceed from it ſelf; for if a thing be ſuppoſed ſufficient to afford it ſelf a *Being*, we cannot but conclude, that it would beſtow upon it ſelf, all thoſe *Perfections* it hath any *Idea* of; and ſeeing Conſervation is one of theſe, neither would he deny it ſelf this. For it is the ſenſe of *Philoſophers*, that *Conſervation* differs only notionally from *Creation*; and that it is the work of the ſame *Agent*, to produce an effect at firſt, and to preſerve it by a continual influx. Now it is evident by Experience, that no *Created things* can preſerve themſelves, therefore neither can they produce or *Create* themſelves.

V. *The parts of Time do not depend on themſelves.*

This will appear more clearly if we divide *Time*, by ſeparating the ſeveral *moments* of it from each other: For it is evident, that there is no *Union* between them, and that each ſingle part of it, hath no dependance at all upon the reſt. For it doth not follow, that becauſe I was the laſt *year*, therefore I ſhall be the next *year*, ſeeing that I may *die*, in the very moment that I am writing this. Conclude we therefore that that *Being* cannot produce it ſelf, which cannot preſerve it ſelf; ſeeing that *Conſervation* is nothing elſe, but a kind of continued *Production*, which is only by our Underſtanding diſtinct from *Creation*.

VI. *If the World had not been made, it would be God.*

All this *Diſcourſe* is very accommodate to our way of conceiving. For if it be true, that that *Exiſts*, which we underſtand to be without its Cauſes; then that alſo will be *poſſible*, which is clearly and diſtinctly known by us to be ſuch: But we clearly and diſtinctly perceive, that it is poſſible for the *World* to have been *Created*; therefore we muſt conclude, that it was actually *Created*, ſince nothing is found in the *Univerſe*, which is not dependent. For if *Independence* did belong to the *Sun*, for Example, or the *Earth*, the *Sun* and the *Earth* would be *God*, becauſe *Independence* cannot be without *Infinity* and *Omnipotence*. Whence it follows, that either *Creation* muſt be admitted, or we muſt expoſe our ſelves to one of theſe two Abſurdities; either that there is ſomething in the *World*, that had no *Maker*; or that in the ſubordination of *Cauſes*, there may be a proceſſion to *Infinity*, both which are inconſiſtent with Reaſon. It is abſurd to admit any thing in *Nature*, which was neither of it ſelf, nor produced by another. For whatſoever the *Mind* of *Man* can conceive, is either of it ſelf, and then it is *God*, ſince in the Conception of *God* all manner of Independence is included: Or is *from another*; and of that other we muſt enquire again, whether it be of *another*, or of *nothing*; if it be ſaid from another, we muſt further enquire of that other, until at laſt we come to that one *Principle*, which hath brought forth all things.

VII. *Things are not ſo connexed as to have no dependence upon the firſt principle.*

For we are not to imagin with ſome *Atheiſts*, that the *Creatures* are joynd together like *Links* in a *Chain*, which tho' they be all linked together, yet is there no neceſſity that the *Chain* made by them, ſhould be united to another *Chain*; becauſe the parts of a *Chain* are not produced of themſelves; but only keep ſome order amongſt themſelves. Now it is not in the leaſt contradictory, that two diſtinct *things* ſhould be united together. We know that all things *produced*, are cauſed by another, and that therefore it is neceſſary, that one thing as to its *Exiſtence* ſhould be before another; for the *Effect* is after its *Cauſe*, as receiving its *Being* from it. And thus of neceſſity we muſt at laſt come to one *Primary Cauſe*, which produced thoſe *effects*, or elſe muſt proceed to *Infinity*, which is the greateſt abſurdity in *Philoſophy*, ſeeing that nothing is more evident than that a Determinate *effect*, muſt come from a Determinate *Cauſe*: But how can this be, if we can never come to the *Firſt Efficient Cauſe*, but ſtill a further cauſe may be aſſigned, from whence the effect proceeds? Wherefore we muſt conclude, that there is ſome *Determinate Cauſe*, from which all other things flow and are produced.

VIII. *The Philoſophers owned the Creation.*

This *Truth* was owned by the Antient *Philoſophers*, who clearly perceived that the *Mind* of *Man* and *Intelligences* in their Production, did not depend on any *Præexiſtent matter*, as being altogether different in their *Nature* from it.

Moreover,

IX. *It implies a Contradiction that there are more Independent Beings than one.*

Moreover, who sees not that it implies a contradiction, that there should be more than one *Being of and from it self*, that is, *Infinite, Omnipotent, Immense, &c.* For whatsoever *Being* is of it self, must include all *Perfections*; and consequently, if all the things we see in the *World*, were their own *Makers*, there will be so many *Infinite Beings*, as we conceive that there are *Independent things*: Which is contrary to the order of things, and to the *Light* of *Nature*. Wherefore *ARISTOTLE attributes* to his *Heaven*, Immutability, the highest *Perfection*, and *Divinity* it self: As is evident to him that reads his Book, *de Cœlo. cap.* 2. & 6. *Ethic. cap.* 7.

X. *Many matters of Faith may be manifest by natural Reason.*

Neither doth it thwart what hath been said, that the *Creation* of the *World* is one of the *Articles* of our *Faith*: For *Faith* is not contradictory to *Reason*; yea, we may search out many *things* by *Reason*, which we embrace with a *Firm Faith*, from the *Divine Revelation*.

XI. *Three sorts of Questions.*

And that we may the better distinguish these Points, from those things which are *matter* of *Faith* only, we are to observe that there are three general *Heads* of *Questions*: Some are such as we first assent to by *Faith* only, such are the *Mysteries of the Trinity* and *Incarnation*. Other *Questions* are such, which tho' they belong to *Faith*, yet may be searched out by *Reason*, as *the Unity of God, the Creation of the World, the Existence of God, and the Immortality of the Soul Man*. And the last sort of *Questions* are such, as do not at all belong to *Faith*, but *Human Reason*: Such as are about *Gold* to be made by the *Art* of *Chymistry*, the *Squaring of a Circle*, and such like. As to the first sort of *Questions*, tho' they exceed the *reach* of *Mans understanding*, yet we are to believe them to be most true, because revealed to us by the *Holy Ghost*: Such points as these are indeed above *Reason*, tho' not contrary to it. Concerning the middle sort of these *Questions*, *Philosophers* may enquire, and shew that they are so far from being contrary to Reason, that they may be found out, cleared, and confirmed by it. As appears in this *Question* of the *Creation* of the *World*, in the handling whereof, I think, I have made it evident that the *World* could have no other *Original* but that of *Creation*.

XII *Whether the World could have been sooner Created than it was.*

Some curious person may enquire, why the *World* was Created just *at such a time*, and neither sooner nor later?

I answer in the *First* place, that before the *Creation* of the *World* there was no *Time*: For seeing *Time* is the measure of successive *Duration*, I do not see how possibly it could have any *Being*, before the Existence of changeable *things*. And therefore St. *Austin Lib.* 5. *de Genes ad Litt. cap.* 5. saith, *It is in vain to look for Time before the Creation, as if Time could be before the Creature was. For if there was no motion of any Spiritual or Bodily Creature, by means whereof future things might succeed to things that are Past, by the present, there would be no Time at all; nor could the Creature be moved before it was. Wherefore Time rather had its Beginning from the Creature, than the Creature from Time, and both of them from God.* Therefore to speak exactly, the *World* did not begin to be in *Time*, but had its *Beginning* with *Time*: And consequently, they speak very improperly, who say, the *World* might have been *sooner* or *later* produced, because these expressions denote *Parts* of *Time*: Now it is apparent that *Time* presupposeth the *World* and the *Creatures*, and is a concomitant of them.

CHAP. III.

The World is not Circumscribed by any Figure or Bounds.

I. *Some deny insensible parts in Bodies, because they cannot see them.*

THOSE who derive all Knowledge from their *Senses*, cannot conceive that there should be any sensible parts of *matter*, of which *Bodies* are framed, only for this Reason because they cannot see, or perceive them by any of their *Senses*. For they think it to be an absurd thing, that any thing should be represented to the *Mind*, which comes not in by the *Senses*.

II. *Some suppose the World to be of a Round Figure.*

There are some of these, who after that they have asserted, that all the *Bodies* in the *World* consist of three *Dimensions*, and that none of them can be imagined so small, but that they consist of various *Sides* and *Surfaces*, do conclude the *World* to be of a *Round* or *Spherical Figure*, so that all the *Lines* drawn from its *Center* to the *Circumference* are equal. The chief ground of this their assertion is, because a *Round Figure* is the most perfect of all, and most conservative of the *Body* to which it belongs: And that the *Universe*, as being the most noble of all *Creatures*, must needs have the most excellent and useful *Figure*. And they defend their Opinion by *ARISTOTLES Authority*, who saith, that nothing is corrupted but by its *contrary*; and that seeing the *Heavenly Bodies*, are *Ingenerable*, and *Incorruptible*, it was necessary they should have such a *Figure* whose *motion* hath no contrary.

III. *A Round Figure conduceth nothing to the Incorruptibility of Bodies.*

But *ARISTOTLES Authority* must not be more prevalent with us than *Reason*; for if a *Round Figure* were conducive to the everlasting Permanence of things, it would follow, that things of that *Figure* must be *Incorruptible*: Yea, it would depend on our Will to make things *Incorruptible*; since it is in our Power to make *Wood*, *Wax* and such like *Bodies* of a *Round Figure*. Nay, if this were true, there would be no *Bodies* in Nature, but what would be Incorruptible, forasmuch as all of them have some kind of *Roundness*; because a *Circular Figure* lies hid under their *Angles*; and therefore a *Cubical* or *Square Body*, as to its *Spherical Figure* would be *Incorruptible*, whereas its *Angles*, which cover the said *Roundness* would at the same time be Corruptible.

IV. *A Round Figure is not the best of all other.*

Neither is a *Round*, more excellent than any other *Figure*; for seeing that every *Figure*, especially those that are Regular, have their *Beauty*, yea, and that those are lookt upon to be more curious, which have most of variety, why should not a *Body* of 8, 12 or 20 *Sides*, be more excellent as to its *Figure*, than a *Globe*? Or shall we think a *Round Figure* to be most beautiful because it is most smooth, and most even? If so, why are not all precious *Stones* rather formed into a *Round Figure*? And why is not Man, who is the most excellent of all other *Creatures*, of the same Shape? Wherefore I will conclude with VELLEIUS; *I Wonder at those who will have the World to be a Living Creature, Immortal, Happy and of a Round Figure, because* PLATO *denies that any Figure is more Beautiful than it; whereas in my Mind, that of a*

a Cylinder, or a Square, or a Long Figure, or Pyramid do exceed it.

V. *No Bounds can be assigned to the World.*

But if we consider the *Nature* of a *Body* or *Matter*, we shall be convinced, that no *Figure* can be ascribed to the *World*: For the *essence* of a *Body* consists in *Extension*, so that whatsoever hath three *Dimensions* must be a *Body*. Which being granted, it will follow, that the whole *World* cannot be terminated by any *Figure*, because whatsoever we can imagin without the *Bounds* of that *Figure*, must be a *Body*, neither can it otherwise be conceived by us, than as extended in *Length Breadth* and *Depth*: For *Nature* abhors a *Vacuum*, neither can any space be assigned, which is altogether empty, that is, devoid of any *Corporeal Substance*.

VI. *That the World is immense.*

Wherefore we cannot represent the *World* so great to us, but that we may still conceive it greater; for tho' we may conceive that probably there are many *Bodies* like the *Earth*, that may be inhabited by diverse *Animals*, yet is it impossible for us to conceive many *Worlds*, forasmuch as that wherein we are, takes up more space than we can imagin.

VII. *An Objection fetched from the Termination of the Parts of the World.*

Some endeavour to prove the *World* to be *bounded*, because it consists of divers *Parts*, whereof some one begins its *Magnitude*, and some other terminates it; and seeing that all the *Parts* of *Matter* are *bounded*, that which results from them must needs be terminated also; because *every thing that is Divisible is Finite.*

VIII. *Answer.*

This *Argument*, how much soever they may value themselves upon it, is very inconsiderable, and more thwarts their own sentiment, than ours. For no *Philosopher* ever denied that *Matter* was Partible, since *Divisibility* is its property; yet no body ever acknowledged, that by dividing *Matter*, we can ever come to its last *Particle*. Wherefore they infer wrongly, that the *World* is *Finite*, because it hath *Parts*; for the inference from hence rather ought to be, that the *World* is *Indefinite*, seeing that beyond all the Bounds we can possibly assign it, we still find extended spaces, nor can our *Imagination* ever reach to any last or utmost limit that might bound it.

IX. *What we are to understand by the name of Space.*

This matter will be further cleared, if we consider what Space is, and how it differs from a *Body*. By the name of *Space* we understand all that Extension, which we conceive as reaching in *Length*, *Breadth* and *Depth*; so that Space properly speaking is nothing else, but *Internal* Place, whereby the *Magnitude*, *Figure* and *Situation* of *Bodies*, amongst other *Bodies* are determin'd. And Space thus described doth not indeed differ from a *Body*, but according to our way of conceiving; because we conceive the Extension of Space, as something *common* and Generical; whereas we consider the Extension of a *Body*, as something *Individual* and *Singular*. As for Example, when a *Tower* is taken away, we imagin that its extension is also taken away, because we conceive the same as *Singular*, and belonging only to it, and suppose the Extension of the place, wherein the *Tower* was contained, to remain the same, tho' another Building be erected in the same place, or some other like *Body* be placed there. Because here Extension is considered in common, and is lookt upon to be the same, whether of a *Building*, the *Air*, or any other *Body*, so it be but of the same *Bigness* and *Figure*, and in the same Relation, of Distance or Nearness, to those External *Bodies* which determin that place.

X. *Space and Body are the same.*

We see then, that it is the same *Extension* that constitutes the *Nature* of a *Body* and *Space*, and that there is no other difference between these two, but that which there is between a *Genus* or *Species* and an *Individual*, that is, between the Nature of a *Man* considered in *General*, and that of *Anthony* or *John*. And as we say, that a *Whole* includes all its *Parts*, and all the *Parts* united together, comprehend the *Whole*: So tho' Space be said to include a *Body*, and a *Body* to be placed in a *Space*, yet cannot a *Space* and *Body* on that account be said to be really distinguisht, seeing that the *World*, which comprehends all things, is not conceived really distinct, from all the *Parts* contained in it.

XI. *That there are no Bounds beyond the World.*

Forasmuch therefore as we can imagin no *end* to *Extension* or *Matter*, but that beyond it we still conceive further Spaces, we must needs assert this *World* to be *Indefinitely extended*, and that it cannot be bounded by any *Figure* whatsoever. And tho' we will not arrogate so much, as to suppose our Mind to be the measure of *Truth*; yet we say, that it must be the measure of whatsoever we do affirm or deny. For it is absurd for us to pass our Sentence concerning any thing, whose Nature we know we cannot reach. Wherefore we make no difficulty, to assert the *World* to be *Indefinitely extended*, seeing we can conceive no Bounds in it.

CHAP. IV.

The matter of Heavenly and Earthly Bodies, it one and same.

I. Aristotles *Opinion concerning the matter of Heavenly and sublunary things.*

IT hath been a frequent Controversy amongst *Philosophers*, whether the *Matter* of *Heaven* were the same with that of *Sublunary things*. *ARISTOTLE* supposing the *Heavenly Bodies* to be *Incorruptible*, will have their matter to be distinct from ours; so that, according to him, there are two parts in the *World*, the one *Elementary*, the other *Cœlestial*. He makes the matter of *Heaven* to be *Ingenerable* and *Impassible*; whereas the *Elementary* is subject to *changes*, capable of all *forms*, and craving those it wants. For if we may believe him, the *Heavens* never suffered any *change*, and continue still in the same state wherein they were *Created*. Because *Generation* and *corruption* are only found amongst *contraries*; and seeing nothing is contrary to the *Heavenly Body*, because its *motion* is such, as to be contrary to none; for one *motion*, according to him, can only be opposite to another *motion*; and since *motion* upwards, is contrary to that which is downwards, it is necessary that *Circular motion*, which is proper to the *Heavens*, must have no contrary, and therefore that *Body* which is so moved must be *Incorruptible*.

II. Aristotles *Argument returnd upon him, and confuted.*

But what if we should grant the *Heavenly Bodies* to be *Ingenerable* and *Incorruptible*, yet would it not follow from thence that they are not subject to any changes, which we may prove by *ARISTOTLES* own Argument. *Those things may be generated and corrupted, that have their Contraries; but that which is Ingenerable and Incorruptible, is contrary to that which is Generable and Corruptible; therefore the Cœlestial Orbs are Corruptible*

ruptible and Generable. But to leave these *Reasonings*, let us see what may be alledged against *ARISTOTLES Opinion.* For asmuch as the *Modern Astronomers*, have more exactly viewd the *Stars* than the *Antients*, I question not, but that were *ARISTOTLE* now alive, and made use of our *Telescopes*, he would be of their Opinion. For they observe that the *Sun* is frequently obscured by *Spots* which obscure its face, and that these at some certain times are so condensed, that the Light of the *Sun* for some Months together, appears much weaker. Now that these are generated, cannot be denied, since almost every day they change their Form; they are sometimes of a *Black colour*, at other times they seem to have a *Dusky* appearance of *Light*; yea sometimes they are of that loose texture, that they exceed the *Sun* in *Brightness*. All which could not be without *Generation* and *Alteration.*

III. *The Planets subject to changes.*

The changes which happen to the *Planets* confirm the same thing; for what is more instable than these *wandring Stars*? The *Moon* almost every day gives a various Representation of herself. *Saturn* seldom appears with the same *face.* How frequently is *Jupiter* clouded with *Spots*, which interrupt its *Light* from coming to us? *Venus* is continually changing, and if we may give credit to the information of the *Telescope*, we must assert her to have several *Faces*; since she does not only change her *aspect*, but also her *Bulk* and *Figure*, as *Astronomers* tell us it happend, in the time of *King Ogyges.* Moreover, how many *Comets* and *New-Stars*, do there appear in the *Heavens*, as the *Star in Cassiopæa*, and others that appeared in the Heavens in 1572 and 1604, above the height of the *Planets.* All which *PHÆNOMENA* may be sufficient to make the followers of *ARISTOTLE* to reject this foolish Opinion of their *Master*, and to acknowledge the Corruptibility of the *Heavens.*

IV. *The Mathematicians have descried many new Stars.*

Neither are we to be moved by what *ARISTOTLE* tells us, that he never perceived any such thing in the *Heavens*, where he saith; *This is likewise abundantly confirmed by Sense; seeing that according to the Records of all past time, never any such change hath happened in the whole utmost Heaven, nor in any of its proper parts.* Well, let us be so favourable to *ARISTOTLE*, as to take this to be true; but can it be inferred from hence, that no further observations could be made for time to come? For we read that *HIPPARCHUS*, 200 years after *ARISTOTLE*, found out a new *Star*, by the motion whereof he began to question, whether this might not happen more frequently, and whether the *fixt Stars* also might not have a *motion* of their own. We know likewise that *TYCHOBRAHE* descried the foresaid Star in *Cassiopæa* in the Region of the *fixed Stars*, above *Saturn.*

V. *Wherein the Essence of Matter doth precisely consist.*

But we may put the Point beyond all Controversy, considering wherein the *Essence* of a *Body* doth consist, and by removing from it whatsoever is Extraneous to it. Thus in the *first* place it appears, that sensible *Qualities* are no constituents of it, since it can be without them, and loseth nothing when they perish. *Air*, which is soft to the *Touch*, doth not change its *Nature*, when by being shut up in a *Bladder*, it appears hard. A *Bean* is of considerable *Hardness*, as long as it abides whole, but when reduced to Flower, it becomes soft. But the *Air* and the *Bean* continues *Bodies* for all that. Neither do *Figure*, or *Motion* conduce any thing to the constitution of *Matter*, since the *World* which is of no *Figure* at all, or at least cannot be conceived by the *Mind* of *Man*, under any *Bounds*, still continues to have the *Nature* of a *Body.* And the *Heavens*, which are considered as *immoveable*, do not therefore cease to be material. And the same may be said of *Heat* and *Cold*, and other like *Qualities*, which may be absent from a *Body*, its Nature continuing whole and entire.

VI. *The matter of Heaven and Earth consists in Extension.*

We conclude therefore, that nothing but *Extension* constitutes the *Essence* of *Matter*, since that *alone* cannot be separated from it, and is Reciprocated with it. For if you take away *Extension*, the *Body* is gone, as when you take away the *Body*, the Extension is no more.

VII. *The matter of the Heaven and of Sublunary things is the same.*

Forasmuch therefore as the *Matter* of the *Heavens* in *Length*, is extended in *Length Breadth* and *Depth*, and that no thing but this Extension is included in the Conception of it, we conclude that the matter of *Heaven* and *Earth* is one and the same, and consequently that the *Matter* of the *Heavens* is as well subject to Corruption and Changes as that of the *Earth* is.

VIII. *Objection that the matter of Heaven and Earth is not under the same Forms*

You'l say, that the *Heavenly Matter* is not under the same *Forms* as *Sublunary things* are, because it was never known that *Heaven* was generated of the *Air*, or that a *Star* was changed into an *Earthly Body.*

IX. *There are no Forms but may inform Cœlestial Bodies, as well as Terrestrial.*

If by the name of *Forms*, in the Objection, be understood those *Substantial Principles*, which have a different *Being* from the *Matter*, and together with it constitute a *Natural Compound*, I say, that such Forms as these are meer *Fictions*, and useless to the explaining of *Natural Effects.* For such *Forms* must be either *Material* or *Immaterial.* If *Immaterial*, of what use can they be to *Matter*? How can they perfect it, and communicate to it their *Essence*, since *Matter* (according to them) is *meer Potentiality*, which derives all its *Existence* from these *Substantial Forms.* For how can that which hath no Parts, constitute the *Essence* of a *Material thing*? But if they suppose these *Forms* to be *Material*, then must they of necessity be constituted by *Extension*, and must be subject to the self same *Modes* of Variation, which all other *Bodies* are. For it cannot be conceiv'd that a thing should be extended, without being liable to the change of *Figure*, *Motion*, *Magnitude*, *Rest* and *Situation*: And forasmuch as *Generation* is nothing else but a congruous Adaptation of the *Insensible* or *Sensible Parts*, according to the foresaid *Modifications*, we must conclude, that all *Matter* is subject to Changes, and consequently, the *Elementary Matter* doth not differ from the *Heavenly.*

CHAP. V.

What the Form of the World is: Whether it be the Soul, that is, the Spirit of Nature, or the most excellent Disposition of its Parts.

I. *The Opinion of Pythagoras and Plato, concerning the Soul of the World.*

THere is nothing that hath been more controverted amongst the *Ancients* than this *Question*, Whether the *World* be endued with a *Soul*, and vivified by an *Internal Spirit*, diffus'd throughout all its Parts. *Pythagoras* and *Plato* have compared the *Universe* to *Man*, and maintain'd it to be

be furnish'd not only with *Life* and *Sense*, but also with *Understanding*. For they could not conceive, how that which was devoid of *Sense*, should produce Sensible things. And therefore as there is in us a Power whereby we *live*, are *sensible*, and *move*, they thought that so likewise in the *World* there must be a *Principle*, from whence all its Operations flow; which the *Poet* describes thus,

The whole, an Inward Spirit doth maintain,
And a great Soul infus'd through ev'ry Vein
Th' unweildy Mass doth move.

II. *What the Soul of the World is, according to* Plato.

Tho' *Plato* suppos'd the *Soul* of the *World* to be like that which is in *Animals*; yet he holds it not to be a *simple Substance*, but compounded of two *Parts*; the one purely *Intellectual*, the other more *Impure*, tho' *Pure*, if compared with the Grossness of *Bodies*; and this he makes a kind of Vehicle of the *Immaterial part*. So that he makes a distinction between the *Mind* and the *Soul*; the *Mind* being a *Substance* void of all *Matter*, which is the Higher part of the *Soul* of the *World*; and the *Soul* being nothing else but the most *subtil Æther*, by means whereof the *Mind* is brought and united to the *Body*.

III. *In what sense this Opinion of* Plato *may be admitted.*

Tho' this Opinion of *Plato* at first sight appears strange and absurd; yet in a sound Sense it may be asserted. For if by the *Soul* of the *World* he meant nothing else but *GOD* himself, who holds together the dispersed *Parts* of the *World*, animating, governing and cherishing them, it contains nothing contrary to *Faith* or *Reason:* Provided always, that *GOD* be understood not to be the *Informing Soul* of the *World*, that is, a Constitutive part of it; but an *Assistant form* only, that is, the *Ruler* and *Governour* of *Nature*. For *GOD* is the *Moderatour* of all Things, and is present to all Things, whether *Intellectual* or *Bodily*, operating in them, and by them, according to that of the *Acts* 17. 28. *In him we live, move, and have our Being.*

IV. *Absurdities consequent to* Plato's *Opinion.*

But if *Plato*'s meaning was, That this *Universe* was endued with a true *Soul*, and accordingly was a *Real Animal*, from whence all other *Animals* are generated, nothing seems more absurd, than to suppose an *Animal* compounded of an infinite sort of other *Animals*, which feeds upon it self, and yet is destitute of *Sight*, *Hearing*, and the other *Senses*. What, are the *Stars* nourished with terrene *Exhalations?* Or is the *Earth* supported by Emanations from the *Body* of the *Moon?* Who will believe such stuff as this? If the *Earth* be sensible, what shall we say of those hard-Hearted *Husbandmen*, which do cut and wound it with their *Plough-shares?* Besides, if we grant the *Earth* to be *Animate*, must not *Stones*, *Iron* and *VVater* be so likewise; yea, all other things of the *VVorld?* But you'l say, *Living Creatures* are generated out of the *VVorld*. What then? Must I thence conclude that the *VVorld* is an *Animal?* Why may not I as well conclude the *VVorld* to be all *Stony*, because *Stones* are generated out of it? Or of *Iron*, because its *Bowels* produce *Iron?* Yea, why may I not with equal ground conclude the *VVorld* to be a *Fidler*, or a *Mathematician*, because such are born in it? For tho' whatsoever hath its Original in the *VVorld*, doth derive the same from something that is in the *VVorld*; yet not therefore from the *Soul* of the *VVorld*, that is diffused throughout it, seeing that the *VVorld* contains all manner of things, whether *Animate* or *Inanimate*.

V. *Supposing one common Soul of the World, all Men would feel the same thing.*

But to urge this with more *Philosophical Arguments*, I say, that upon this Supposition of a *Soul* being diffus'd throughout the whole *World*, it will follow that there can be no Passion of *Joy* or *Sorrow* in the *World*, but what all *Men* must be sensible of, and that no Body can *wound* or *strike* another, without feeling the same himself. For if one *Sensitive* and *Rational Soul* governs and animates the *World*, there must accordingly be but one *Animadversion*, that is, one part of it must perceive whatsoever the other parts do. But we experience the contrary to all this, and therefore must conclude, that there is no such common *Soul* in the *World*.

VI. *And would remember things they never had perceived.*

For otherwise we should not only apprehend things offer'd to our *Mind*, but we should also remember those things, which were never committed to our *Memory:* For seeing that this Universal *Soul* contains all things, and is diffus'd through all, nothing of all the things that are acted any where, could be hid from it; and therefore since by it we perceive *Objects*, and remember them, it must necessarily follow that the *Mind* must behold those things as present, which it never enquir'd after; that is, it must remember those things, which it never perceived.

VII. *Yea, and would remember those things as done in one Part of the World, which were done in another.*

Moreover, if we suppose the *World* to be whirl'd about its *Axis* in 24 Hours time, it will follow, that whatsoever I set about when the *Earth* is in the Beginning of *Aries*, I shall remember to have done the same when the *Earth* is in the Beginning of *Libra*; tho' that Portion of the *Soul* of the *World*, which informs my *Body* at that time, be then as far from me, as the *Earth* is from the *Sun*. Which *Arguments* sufficiently prove, that there cannot be a *Soul* common to all Men.

VIII. Henry More's *Opinion of the Spirit of Nature.*

Doctor *More*, tho' he doth not defend *Plato*'s Opinion concerning the *Soul* of the *World*, and thinks it absurd, that a Substance endued with *Sense* and *Reason* should be mingled with all the *Parts* of the *World*; yet he admits of a *Spirit* of *Nature*, which penetrates all the *Matter* whereof the *World* consists, and exerts its *Power* in it; which *Spirit* he describes to be (in his *Third Book* of the *Immortality of the Soul*) *an Incorporeal Substance, but destitute of Sense and Animadversion, penetrating the whole Matter of the Universe, and exercising a Plastick virtue in the same, according to the various disposition of the Parts in which it operates, directing the Parts of Matter, and their Motions, and discovering those* Phænomena *in the World, which cannot be resolv'd into meer Mechanical Causes.*

IX. *Experiments to prove the Spirit of Nature.*

The *Arguments* that persuaded the *Doctor* to admit this *Spirit* of the *World*, were the *Trembling* of an *Unison String*; *Sympathetick Cures*; the *Sympathy* there is between *Heavenly* and *Earthly Bodies*; *Monstrous Birds*; the *Magnetick Attraction* of *Iron*; and lastly, the *Sphærical Figure* of the *Sun*. For he could not apprehend how the *Unison Strings* of different *Instruments* do all of them shake, if *One only be touched*, without the assistance of this *Spirit* of the *World*. How by the *Weapon-Salve* a VVound can be Cured at a great

great distance. How the *Heavenly Bodies*, which are assumed by *Magicians* and *Witches*, do communicate their Affections to *Earthly things*; and how it comes to pass, that the same things that hurt those, do mischief to these also. How *Monstrous Birds* come to be generated in a *Human Womb*. How it comes to pass that *Iron* is attracted by the *Loadstone*, and of it self, without any impelling *Cause* is carried towards it. How the *Sun* attain'd its *Round Figure*, except this *Spirit* of *Nature* be admitted, *permeating* all the *Matter* of the *World*, into which all these *Phænomena* may be resolved.

X. *Why an Unison String trembles at the shaking of another on a different Instrument.*

But I see no necessity of having recourse to a *Spirit of the World* for the explaining these *Phænomena*, since it may better be done by *Mechanical Principles*. For, as to the *First*, the *Trembling* of an *Unison String*, upon the *striking* of another, whilst all the other Strings remain without any *Motion*; this is caused by the vibration of the *String* struck, which *moving the Air*, the *Air* reacheth the *String* that's wound up to the same pitch, and makes it tremble; the *Trembling Motion* being easily communicated to a *Body* disposed for such a *Trembling*; and therfore no wonder if it give forth the very same *Sound*. Whereas if the *Trembling Air* rusheth against a *String* that is differently *wound* up, by giving several hits against it, it hinders it from reverberating; so that it is impossible for it to sound as the other doth. Yet we must not imagine, that only those *Strings* which are tun'd alike do shake, since they do all, or most of them shake; tho' those only do *sound*, which are in *Unison* or *Diapason*, or some other Concord with the *String* struck.

XI. *Whether Wounds are Cured by the Sympathetick Powder.*

As to the *Cure* of *Wounds* by the *Sympathetick Ointment*, or the *Powder* of *Calcin'd Vitriol*, and that at a great distance; this is a thing which may very well be question'd. For what is there in *Vitriol* to perform this, save only an *Adstringent virtue*, whereby it is proper to stop *Blood*, and to bring it to a *Scar*? But by what means shall the outflowing *Particles* thereof be guided to the *Wound*, since they only exert themselves to a very small distance? Whence the *Doctor* concludes, they are directed to the *Wound* by this *Spirit of Nature*. But forasmuch as this *Spirit* is diffus'd throughout all the *World*, and indifferently present to all *Wounds*, why doth it rather heal that whence the *Blood* came, than all the rest, since it is destitute of *Sense* and *Animadversion*, and is no more present to that *Wound*, which it is supposed to *Cure*, than to any other? Wherefore when a *Wound* at a great distance happens to be Cur'd this way, the *Cure* is not to be ascribed to the *Powder* or *Weapon-Salve*, which is apply'd to the *Instrument* that made the *wound*; but it seems to happen, because the *wound* is kept clean and wash'd with *Urine*; as is prescrib'd in this case: For *Salt of Urine* is very detersive and adstrictive, and therefore readily closeth the Mouths of the *Veins*, consolidates the Parts, and *skins* them over.

XII. *There is no sympathy between Heavenly and Earthly Bodies.*

As to that particular of *Mens Souls* sometimes quitting their *Bodies*, and appearing in the shape of a *Cat*, *Dog*, *&c.* and that whatsoever is inflicted on these assumed *Bodies*, doth redound to the hurt of their true *Earthly Bodies*; this I take to be impossible, and therefore think it in vain to trouble my self about searching out the Reason of it.

XIII. *How Monstrous Birds are framed in the Wombs of Women.*

As to those *Monstrous Birds* and *Animals*, that sometimes proceed from the *Wombs* of *Women*, there seems no necessity to put this drudgery upon this *Spirit* of *Nature*, when it may be more commodiously explicated by a propension in the Matter apposite to the *Forming Power*, and the intention of *Nature*. Thus we find that the Seed of *Coleworts* degenerates into *Turneps*; and why may not we as well suppose that the Parts of an *Animal* may be perverted, by manifold defects of the *motions* and *humors* of the *Womb*, discomposing and altering the *Seed*. And indeed, what wonder is it for a *Woman* to bring forth a *Monster*, when we see the *Body* of *Man* familiarly to breed *Lice*, which are dreadful Monsters when beheld with a *Microscope*. Seeing therefore that *Lice* and *Worms* are apt to be *generated*, especially where the Parts of the *Body* are ill affected; it will not seem strange that in a depraved state of the Womb *Monsters* should be generated. But of *Monstrous Births*, see more in my *History of Nature*.

XIV. *Magnetick virtue in the Loadstone, elsewhere handled at large.*

The Reason of the *Loadstone* drawing *Iron*, shall be treated at large in the *Tenth Chapter of the Sixth Part*. And so likewise the Cause of the *Round Figure* of the *Sun*, and *Fix'd Stars*, will be handled in the *Fourteenth Chapter* of this *Part*; to which I refer the *Reader*, to avoid Repetitions.

XV. *The Form of the World consists in the most excellent Constitution of its parts.*

Forasmuch therefore as the *World* is not endued with a *Soul*, or any *Spirit of Nature*, there being no need of either of them for explaining any *Natural Phænomena*, we conclude, that the Form of the *World* is nothing else, but the fit disposition of all its *Parts*, and their intimate Union. For such is the constitution of the *Parts* of the *World*, that tho' they be different, and at a distance from each other; yet they have a mutual *Relation* and *Reference*, and are joyned together by a *virtue* that penetrates them all. But what *virtue* is this that unites them? I answer, that it is the *Subtil* or *Æthereal Matter*, which permeating all *Bodies* is the cause of this *Union* and *Harmony*, as LUCRETIUS seems to hint, *Lib.* 5.

The Fluids are all differently Light,
And therefore reach'd the less or greater height.
Then Liquid Æther did the farthest rear,
And lies on softest Beds of yielding Air.

CHAP. VI.

That GOD, as he is the Efficient and Conserving Cause of Matter, so likewise of Motion.

I. *Nothing in the World is annihilated.*

HAving thus explain'd the *Nature* of the *World's Matter*, and enquired of the *Soul* that acts it, it remains now that we consider, whether the same *quantity* of *Matter* always remains in the *World*, or whether it be increased or diminished. Some are so stupid as to imagin, that when *Fire* is extinguish'd, it wholly perisheth; not considering that GOD is the *Creatour* of all things, and that the *Creatures* cannot destroy any thing, which his *Omnipotence* hath produced. For tho' the subtil *particles* of *Fire*, may by a *Fan*, *Bellows*, or the *blast of ones Breath* be dissipated; yet are not they therefore annihilated, but being sepa-

rated exiſt in another manner than they did before. For as *Diviſion* doth not make *Matter*, ſo neither can it deſtroy it: Wherefore, *Matter* divided loſeth nothing of its *extenſion*, but only ceaſeth to be ſuch a *Body*, and becomes changed into another. It is a great miſtake to ſuppoſe, that thoſe things which ceaſe to affect our *Senſes*, are altogether deſtroy'd and annihilated.

II. *Matter is neither ſubject to Generation, nor Corruption.*

Matter, according to the Opinion of all *Philoſophers*, is neither *ſubject to Generation*, nor *Corruption*: Wherefore, we muſt conclude, that there is always the ſame *quantity* of it. For indeed how can any *new Matter* enter, ſeeing there is no *Vacuum*, and that the *penetration* of *Bodies* implies a Contradiction? For if any one part of the *Eyes* ſuppoſe, ſhould be taken away or annihilated (as they fancy of the *Fire*, when it goes out) it is certain a Space muſt be left in the room of it, which foraſmuch as it hath *length*, *breadth* and *depth*, we muſt ſay that another *Body* ſupplies the place of it. For it becomes the *Infinite Power* of GOD, to act in the moſt *conſtant* and unchangable manner, by preſerving that which he hath produc'd without increaſe or diminution.

III. *How New Bodies are brought forth in the World.*

But you'l ſay, That we daily ſee new Parts of *Matter* appearing, which were never before: Thus *in Spring time many Herbs and Flowers ſhoot forth from the Earth; and in Autumn, the Trees are loaden with Fruits, which did not exiſt before.* Wherefore we may conclude, that the *Subſtance* of *Matter* is increaſed.

This Difficulty may be eaſily ſolved, by diſtinguiſhing between the *Firſt* and *Second Matter*. By the *Firſt Matter* is underſtood a *Body* in its general Notion, as it includes three Dimenſions. By the *Second Matter* is meant a *Body*, which beſides *Extenſion*, is endued with *Figure* and other Modifications, by which it comes to reſort under one or other of the *General Heads* of *things*. Wherefore a *Body* in this ſenſe is not to be called *Simple Matter*, but ſomething compounded of an *Extended Subſtance*, and one or more *Modifications*. Thus a *Tulip*, for Example, *beſides Extenſion*, *implies ſuch a conformity of Leaves*, *which at different Seaſons riſe and periſh*. And this *Second Matter* admits ſome kind of *Latitude*, and may be multiplied or diminiſhed. But the *Firſt Matter* is Indiviſible, ſeeing that all Bodies agree in *Extenſion*; the *Soft* and *Inſenſible*, as well as the *Hard* and *Senſible*. And ſuch *Matter* as this, is neither ſubject to *Generation* or *Corruption*, and conſequently can neither increaſe or be diminiſhed, being only capable of admitting different *Modifications*, and of aſſuming divers *Forms*.

IV. *GOD is the Cauſe of the Motion that is in the World.*

And the ſame is the caſe with *Motion*, foraſmuch as all things proceeding from GOD, depend on him in a peculiar manner, and have nothing of *Truth* or *Goodneſs*, but what they have received of him: And that *Independency* is the neceſſary *Attribute* of a moſt *Perfect Being*, as *Dependency*, as to *Being* and *Conſervation* is the *Attribute* of all *Creatures*. For who can believe that the *Motion* of the *Stars* about their ſeveral *Centers*, the Courſe of *Rivers*, the daily *Ebbing* and *Flowing* of the *Sea*, and the *Earths* being poiſed in the *Liquid Air*, are cauſed and continued by *Chance*? It implies a Contradiction to ſuppoſe theſe *Regular Effects* to be produc'd by any Power, beſides that of a moſt *Perfect Being*, who not only *created Matter*, but alſo imparted *Motion* and *Reſt* unto it. And ſince the Conſervation of any thing is a continued *Creation*, we muſt conclude, that GOD is the Preſerver of that *Motion*, which at the Beginning he imparted to the *VVorld*.

V. *That GOD, as he continues the ſame Quantity of Matter in the VVorld, ſo likewiſe of Motion.*

So that as GOD preſerves the ſame *Quantity* of *Matter* which he *created*, ſo likewiſe of *Motion*, and that without increaſe or decreaſe; which is a remarkable *Proof* of GOD's *VViſdom* and *Unchangableneſs*. And as for *Matter*, as it could not move *it ſelf* at firſt; ſo it being once put in *motion*, it never ceaſeth from it, but continues in the *ſtate* wherein it is put. So that if the *Motion* that is in the *VVorld* ſhould either be diminiſhed, or ceaſe altogether, this muſt be from the *Divine VVill* appointing it ſo; but no ſuch *VVill* of GOD appearing, it is certain the ſame *Quantity* of *Motion* muſt ſtill continue in the *VVorld*.

VI. *In what ſenſe it is to be underſtood, that the ſame Quantity of Motion is ſaid to continue in the VVorld.*

When I ſay, that the ſame *Quantity* of *Motion* is preſerv'd in the *Univerſe*; this is not ſo to be underſtood, as if all Bodies that were firſt put into *motion*, continue in the ſame *motion*; and that thoſe that were left at *Reſt*, do perſevere in the ſame; but that the ſame *meaſure* of *Motion* is preſerved in the whole *Univerſe*, tho' it may be varied and alter'd in the particular *Parts* of it, with reſpect to the diverſe *Bodies*, on which it exerciſeth its *force*. Much in the ſame manner, as we ſay, that in a certain *Kingdom* there is ſuch a determinate *quantity* of *Mony*, tho' ſome Men have more of it, and others leſs, and tho' it be in a continual Relation from one to another. So likewiſe we muſt conceive, that the ſame *quantity* of *Motion* is found in the *Univerſe*, tho' the ſame be variouſly poſſeſt by the particular *Parts* of it.

VII. *God makes uſe of the ſame Force, in applying Motion to divers Bodies.*

GOD alone can be the *Cauſe* of this ſo conſtant *Motion* in the *Univerſe*. For if we conſider *Motion*, we find nothing by which it ſhould be increaſed or diminiſhed, for having not produc'd it ſelf, neither can it increaſe or deſtroy it ſelf; nor can the *thing moved*, or *matter*, conduce any thing this way, becauſe it is meerly Paſſive, and conſiſts only in *Extenſion*. Wherefore, we muſt conclude GOD to be the Total and Univerſal *Principle* of *Motion*; who at the firſt inſtant of the *Creation* of *Matter*, put *Motion* into it, and maintains the ſame by the ſame *Action* wherewith he preſerves the *Matter* it ſelf; that is, he makes uſe of the ſame *moving Force*, without increaſe or decreaſe, which removes from one *Body* to another, according as GOD applies the ſame to divers *parts* of the *World*. For it might ſeem to be an *Argument* of *Inconſtancy* in GOD, if he did not maintain the ſame *quantity* of *Motion* in the *World*, as well as of *Matter*, and this by one and the ſame Concourſe. So that the *Force* whereby *Matter* is moved, is nothing but GOD himſelf, who being moſt *Wiſe* and moſt *Powerful*, acts in the moſt ſtable manner; and therefore on his part, this *virtue* can neither increaſe or be diminiſhed, but ever continues the ſame, tho' in particular *Subjects* it may be various.

VIII. *An Objection taken from God's free Action.*

But you'l ſay, GOD is a *Free Agent*, and that Things that are done in the *Univerſe* proceed from his *Will*. For who knows not, that the *Number* of Men depends on his *good Pleaſure*, who produceth and preſerves more or leſs of them, as he pleaſeth? So that there ſeems no reaſon, but that there may be an unequal *meaſure* of *Motion* in

in the *World*, seeing that according to the *Free Will* of the *Creatour*, it may be increased or diminished.

IX. *The First Answer.* To which I Answer, *First*, That those *Things* which depend on the alone good Pleasure of *GOD*, cannot be known but by *Divine Revelation*; wherefore the Consideration thereof does not belong to *Natural Philosophy*, wherein nothing is to be admitted, but what may be discovered by *Reason*.

X. *The Second Answer.* In the *Second* place I Answer, That as *GOD* acts freely, so likewise he acts *constantly*, and *immutably* preserves whatsoever he hath once produced. So that we are not only to consider the *Liberty* of *GOD*, but the same in conjunction with his other *Attributes* of *Wisdom*, *Unchangableness*, *&c.* which all together do constitute his one *Eternal* and *Permanent Nature*. And as his *Liberty* appears in the vast Variety of the *Things* he hath made, so his *Unchangableness* is demonstrated by his conserving the same *Quantity* of *Motion* and *Rest* in the *Universe*. For *Conservation* being a continual *Production*, it would seem to argue *Changableness* in *GOD*, if either any *new Motion* should arise, or præexistent *Motion* should perish.

XI. *There can be no Inconstancy in Motion, neither in respect of GOD, nor of the World.* We acknowledge indeed, that such is *GOD*'s absolute *Power* of all *Things*, that he can destroy, lessen or increase, whatsoever he hath made, according to the pleasure of his *Will*: But as long as such his *Will* is not discover'd to us, we cannot assert any thing concerning it. And seeing that with respect to the *World*, no Reason can be given for the increase or decrease of the *Motion* that is in it, we must conclude that the same *force* which at first put the *Matter* in *Motion*, doth still continue in it.

XII. *Whence so many Motions arise in the World.* It remains now, that we explain how this *Motion*, or rather *Virtue*, that *moves* the *Parts* of the *Universe*, does indivisibly continue the same, when so many *New Motions* are seen every day: As when *Men*, and other *Animals*, that rested in the *Night time*, are all in *motion* in the *Day*; and when *Guns* are discharged, it is certain that the great Concussion caused thereby, was not before in the *World*; wherefore, it seems there must needs be more *Motion* in the *World* at one time, than at another.

XIII. *A Body moved, dashing against another, doth communicate some part of its motion unto it.* But this will be easily answered, if we consider that *every Body whilst it pusheth on another, doth lose as much of its own motion, as it transfers to that Body it pusheth forwards.* As appears in *hard Bodies*, which by dashing against any soft *matter*, transmit all their *motion* to it, and are reduced to *Rest*. Hence it is, that a *Stone* falling down from on high to the *ground*, doth not rebound, but lies still, because it communicates all its *motion* to the *Earth*. And in like manner, when *Men* or other *Animals* are moved, we must not suppose that they produce *new Motions* in the *World*, when the agitation of their *Spirits* is transmitted to their *Members*; because the more *motion* the *Members* receive, the less the *Spirits* retain.

XIV. *The Concussion of the Air by Guns, does not prove a greater* Neither can we infer, that the *Quantity* of *Motion* is increased by the Concussion of the *Air*, caused by the discharge of *Canon*: For tho' there may be more of that *motion* which we call *sound*, yet is there no more *motion* simply taken: For tho' the commotion of the *Air* be at first made more vehement, because of the narrowness of the *Space*; yet by degrees afterwards it becomes more remiss, as it spreads into wider *Intervals*, because the *Air*, having communicated its *motion* to the Neighbouring *Bodies*, doth lose as much *agitation* as it imparts to them. *Quantity of Motion.*

CHAP. VII.

Of the Action of Bodies, and the Communication of Motion.

I. *There is a manifold Communication of Motion.* FOrasmuch as the *Matter* of the *Universe* is divided into innumerable *Parts*, and every one of them have their *proper Motions*; it cannot be doubted but that they must frequently run against one another, and by contrary *motions* be either hindred, retarded, or wholly reduc'd to *Rest*. Hence, according to the variety of their pushing against each other, the manifold *Action* of *Bodies*, and Communication of *Motions* ariseth: *First*, When two *Bodies* by *Contrary motions* run against each other: *Secondly*, When the *Body* moved, runs against a *Body* that is at *Rest*: *Thirdly*, When two *Bodies* are moved the *same way*, but with a different degree of *Swiftness*. For it is impossible that *Bodies* should push against one another, but that some change of *Motion* or *Rest* must follow thereupon.

II. *Wherein the Communication of Motion doth consist.* The *Communication* therefore *of Motion* consists in this, that *according to the Will of the First Mover, the Body that doth exceed the Body it meets with in the Force of moving forward, doth carry the same along with it, and loseth as much of its Motion, as the other receiveth: So that the same Quantity of Motion always continues in the World.*

III. *In the Communication of Motion, an Accident doth not move from one Subject to another.* Neither must we infer from hence, that upon this Supposition an Accident must remove from one *Subject* to another; because the *Body* that is at *Rest*, doth not receive the same *Numerical Portion* of *Motion*, from the *Body* that runs against it: But forasmuch as according to the Will of the *First Mover*, a *like motion* only ariseth in that *Body*, which upon the impulse of another, begins to move (as has been before explain'd, *Part* IV. *Chap.* XV.) it cannot be said, that in this case an Accident removes from one *Subject* into another.

IV. *In order to the exact Determination of the Action of Bodies, it is required that they be perfectly hard.* This *Communication* of *Motion* will be the better apprehended, if we suppose the *Bodies* that are moved to be perfectly *Hard*, and so divided from all the rest, that their *motion* be neither hindred nor promoted by any circumjacent *Bodies*. For except *Bodies* were perfectly *Hard*, they would not be able to act upon one another; and if they were not separate from all others, so as not to be retarded or turned aside by *Ambient Bodies*, the proportion or difference of *Motions* would not be discernible.

V. *And that the Medium in which they are moved, be no hindrance to their Motions.* In the *Second* place, we are to suppose, that the *medium* wherein the *Bodies* move, be such as doth neither hinder nor promote the *motion* of them. For if the way through which they pass be either *soft* or *fluid*, it will hinder their *motion*, turn it aside, or wholly take it away; and so no exact account could be taken, what the Force of each *Body* is in *acting* or *resisting*.

Thirdly,

VI. *A Body is not changed but from an External Cause.*

Thirdly, We are to suppose, that every *Body*, forasmuch as it is simple and undivided, doth as much as in it lies, continue in the same state; nor is it ever changed, but by some *External Cause*. These things being thus far setled, we are, *first*, to enquire, what must happen at the meeting of two *Bodies*? For every one knows by Experience, that *Bodies*, whether *Moved* or *Resting*, variously change the condition wherein they are, according to the different Nature of the *Bodies* they meet with. Thus, for Example, a *Body* moved changeth its state, by meeting a *Body* that is at *Rest*, otherwise than it would by meeting with a *Body* in *motion*. It also variously changeth its *motion*, in meeting with a *hard* or *liquid* Body. And the *Rules*, according to which these Changes happen, are properly that which we call in general, the *Laws of Motion*.

VII. *What Direct Motion is*

Lastly, We are to presuppose, that *Direct motion* is the Translation of a *Body* out of the Neighbourhood of one that is consider'd as *Resting*, into the Neighbourhood of another, by a right line, which is the shortest of all others, and equally stretch'd out between two *Points*.

VIII. *The First Rule.*

Suppose we therefore the two *Bodies* A and E *to be equal, and to move directly towards one another with the same swiftness; when they come to* D, *they will both rebound back the contrary way,* A *towards the Left, and* E *towards the Right, with the very same swiftness wherewith they came to D.* For these *Bodies* being supposed altogether *equal*, must consequently have equal force of *Moving* and *Resisting*. And seeing that *Motion* is not contrary to *Motion*, there is no cause that can reduce them to *Rest*: Wherefore we must conclude that they must reflect or rebound with the same swiftness, their *Motion* continuing whole and entire.

Figure 15.

IX. *The Second Rule.*

But if the Body A *be somewhat Bigger than* E, *and both be moved with the same swiftness,* A *towards the Right hand, and* E *towards the Left, when they meet together in* D, E *alone will rebound, and afterwards both of them proceed to move, with the same swiftness towards the Right.* The Reason is, because every *Body* that hath less Force, to proceed in a *right line*, than the other hath to resist, loseth the Determination of its *Motion*: And it being supposed that the *Body* E hath less force to proceed forwards, towards the Left, then A hath to proceed to the Right, it follows that E, must lose its Determination, that is, must *rebound*; but because A and E, are supposed to move with the same swiftness, and this swiftness cannot be changed by any *External cause*, therefore it remains in the same state wherein it was before. And accordingly E, will move towards the Right, with the same swiftness it had at first; and A retaining the same swiftness, without changing its Determination, will move the same way, and follow E, yet without being able to push it forward.

X. *The Third Rule.*

Again, *if these two Bodies* A, *and* E, *be supposed equal in* Bulk, *but that* A *moves somewhat swifter than* E, *then not only* E *will rebound backwards, but* A *will also communicate to* E, *the one half of its swiftness, wherein it exceeds* E. That is, if before there had been six degrees of swiftness in A, and four only in E, after their meeting, they would both tend to the *Right*, with five degrees of swiftness, and so proceed to move the same way with the same swiftness. For seeing that the *Body* E, hath less force to resist, than the *Body* A, against which it pusheth, hath to move it, it is agreeable to Reason, that it should give way and reflect, and suffer something from the *Body* A, and that so the *Body* A should immediately follow E. But seeing that A hath more *Swiftness*, it cannot follow E, and proceed the same way with it, without pushing it forward, and imparting so much of its *motion*, which being added to that which was in E before, makes both their *motions* to be equal. So that if A hath six degrees of *Swiftness*, and E but four; let the two degrees whereby A exceeds E, be divided into four Parts, and then let one part be communicated to E: But because thus the *motion* of A is still *swifter* than that of E, let the second also be communicated. And seeing that upon the Communication of these two Fourths, the *motion* of the *Body* E, is made as swift as that of the *Body* A, it will not be able to receive any farther increase from A, and therefore will retain the remaining two Fourths; and so both of them, with the same swiftness, that is, with five degrees of *swiftness*, will move towards the *Right* hand.

XI. *The Fourth Rule.*

But if the Body E *be wholly at Rest, and somewhat bigger than* A, *then with whatsoever swiftness* A *may be supposed to move towards* E, *it will never be able to move it, but will be beaten back by it, still retaining its motion entire.* For a *Body* at *Rest* doth more resist a greater degree of *Swiftness* than a less, and that according to the degree of the Excess of the one above the other; and consequently there will always be a greater force in E to resist, than in A to push forwards. For a Body *at Rest*, doth as much as in it lies continue in its *Rest*, and must by some outward force be driven out of its place, before it can tend any way. Wherefore such a *Body* doth not only, with all its Parts joyn'd together, resist the *motion*; but also proportionably to its *bulk*, whereby it exceeds other *Bodies*, it is made more strong to withstand others that oppose it. And therefore the *Body* E, because of its greater Bulk, hath a greater Force to resist, than A hath to move. By which means it comes to pass, that it is not changed by A, but with the same Force continues in *Rest*, wherewith the whole *Body* A will be moved, and dash against it.

XII. *A Body that is at Rest, doth more resist a greater Swiftness than a less.*

Now, that a *Body* at *Rest* doth more withstand a greater degree of *Swiftness*, than a less, and that according to the excess of the one above the other, is demonstrable from the most common Law of *Nature*; that *every thing, forasmuch as it is simple and undivided, continues (as far as in it lies) always in the same State, neither is ever changed but by outward Causes.* Now the state of the *Body* E, is *Rest*, and in the swifter *Body* A, the state is quite contrary, and that proportionably to the Excess of *swiftness*. For the slower the *motion* of A is, the less contrary is it to the state of the *Body* E, which is at *Rest*, because slowness of *motion* partakes of the Nature of *Rest*. Wherefore, if A with the greatest degree of *swiftness* be carried towards E, *Resting*, E will also have an absolute power of Resisting; and forasmuch as it resists, it will with a greater force of Action, resist the greater force that pusheth it, than a lesser.

XIII. *The Fifth Rule.*

If the Body at Rest E, *be less than* A, *then tho' A move never so slowly towards* E, *it will carry it along, and communicate to it such a part of its motion,*

motion, as that both of them afterwards may move with the same swiftness. As for Example, If A be as big again as E, it will communicate to E the *Third part* of its *motion*, because that one Third part will move E, as swiftly as the Two remaining parts will move A, because it is as big again. And since whatsoever accrues to the one, is the loss of the other, it is necessary that after this meeting A move one Third part slower, than it did at first, that is, in the same time wherein before it run through the distance of *three Foot*, it will only move *two Foot*.

In like manner, if A were *thrice* as big as E, it would communicate the Fourth part of its *motion* to it. If it were *four times* bigger, it would impart a Fifth part of its *motion*; and so on. But if A should only a Third part exceed E, and consequently should have the Relation to it, not of Two to One, but of Three to Two, then two *fifth parts* of the *motion* will be transferr'd from A to E, and three *Fifths* will still continue in A. If E be one *Fourth* bigger, and have the same Relation to A, as Four to Three, three Seventh parts of its *motion* will be communicated to E, and so four Seventh parts will remain to A.

This account will be more evident, if we express the foresaid Fractions by whole Numbers: Saying, if A be to B, as 3 to 2, then of the *five* degrees, into which its *motion* may be distinguish'd, two must be communicated, which will have the same proportion to E, as the three remaining to A: And if A be as 4, and E as 3, out of the seven degrees of its *motion*, *three* must be communicated, which will have the same proportion to E, as the remaining 4 to A. And if A be to E as 5 to 4, of the 9 degrees into which its *motion* may be distinguish'd, 4 will be communicated, and will have the same Proportion to E, which the Five remaining have to A. And thus we may proceed to Infinity; for tho' the excess of *Quantity* in A, above *that* which is consider'd in E, does by this means grow less, yet it will always be something; and since we may always take so many degrees of *motion*, as there are parts considered in the *Body moving* and *moved*, taken together, we find no Reason why A should move E along with it, seeing the difference is of one Sixth, Seventh, Eighth, or even of a Hundredth or Thousandth part, and so on.

The account will proceed in the same manner, whether you reckon the *Parts* of *Motion* to be so many, as there are consider'd in the Bulk of both *Bodies*, *viz.* the *Moving* and *Moved*, or whether you attribute two, or three, or four Parts or Degrees, and so on, of *motion*, to every one of the *Parts* of *Bodies*; because the same Proportion will continue every where between the *Motion* that is communicated, and that which continues in the *Mover*. Thus we may say, that if A be one Third bigger than E, of the 10 parts into which its *motion* may be distinguish'd, 4 will be transmitted to E, the remaining 6 continuing with A: Or, if we suppose 15 parts of *Motion*, then 6 will be communicated and 9 will remain; if 20, the *Body* E being a Third part less than A, will receive 8 of them, and A will retain the other 12. For all these Numbers, 12 to 8, 9 to 6, 6 to 4, have the same Proportion together which they ought to have, which is 3 to 2; and therefore it is all one which of them you take, and you may increase them to Infinity. And how slow soever you suppose the *motion* in A to be, it will still in the same proportion act upon E, that is, will always communicate to it only such a *part* of its *metion* as shall bear the same proportion to E, as the remaining part hath to A. And thus, if A be as big again, whether it be swiftly or slowly *moved*, it shall always transfer a Third part of its *motion* upon E; if thrice as big, only a Fourth, and so on.

XIV. *The Sixth Rule.*

If the Body E, *Resting, be exactly equal to the Body* A, *moved towards it, it will partly be push'd forward by it, and partly beat it back to the opposite side.* So that if A should come towards E, with four degrees of Swiftness, it would communicate to E one degree, and with the three remaining parts would rebound to the contrary side.

For seeing that both these *Bodies* are supposed of *equal bigness*, they must also have the self same Force of *Acting* and *Resisting*: Now this Force to Resist in E, is not only *Negative*, but *Positive*, or, if you will, *Reactive*; because E so admits the *motion* of the Agent A, as to cause some change in it, to wit, by *Reflecting* it, and communicating some part of its own *Rest* unto it. And by this means the *Body* E obtains the half of its effect. But the *Body* A, because of its inequality, transfers a part of its *motion* to E, not the whole; for so it would tend to its own destruction, by losing all its *motion*. Thus if the *Body* A should move towards E with four degrees, in meeting with the *Body* E, it would impart one degree to it, and would rebound back with the three remaining parts. If with eight degrees, it would impart two of them to the *Body* E, and rebound with the other six. If it mov'd forwards with twenty degrees, it would communicate five of them to E, and fly back with the remaining fifteen, and so both would obtain the half of that effect, the whole of which they would have, if either of them were greater or less.

XV. *The Seventh Rule.*

Suppose we now the Bodies A *and* E, *to move the same way,* E *more slowly, and* A *following it more swiftly, so as at last to overtake and touch it: Suppose we also* E *to be greater than* A, *but* A *to exceed in degrees of swiftness the Greatness of* E; *in this case* A *will communicate so much of its Motion, as that both of them afterwards shall move with an equal degree of swiftness the same way.*

That A must overtake E, appears from the Supposition of its being mov'd more swiftly than E; and that it must act upon it, and push it on along with it self, is also evident, because upon examining the proportion of *Magnitude* and *Swiftness* that is between them, we find that the Excess of *swiftness* is greater in A, than the Excess of *Greatness* in E; and therefore by reason of the inequality of *Action* and *Resistance*, it must follow that A, by communicating some part of its *motion* to E, must push it forwards; and so both of them with the same *swiftness* move the same way.

XVI. *The Eighth Rule.*

But *if the Excess of Swiftness be less in* A, *than the Excess of Greatness in* E, *it will rebound back, and retain all its motion.* The Reason is, because that which is the stronger in *Action* and *Resistance*, must needs obtain its effect. Now seeing

the *Body* E, by its Greatness or Bulk, exceeds the swiftness of A, and has more force to *Act* and *Resist*, it must push forwards the *Body* A, and make it rebound backwards. But forasmuch as every thing inclines to continue in its state, except it be hindred by an outward *Cause*, and this *Cause* is found in E, *viz.* an Excess of *Magnitude*, above the Excess of *Swiftness* in A, which changeth the *determination* of A, but doth not destroy or diminish the *Motion* it self, therefore it happens that A, by rebounding, loseth nothing at all of its own *motion*.

But if the Excess of *Bulk* be greater in E, than the Excess of *Swiftness* in A; that is, if E be as big again as A, and yet A be not moved with a double degree of *swiftness*; then when A comes to dash against E, it will reflect the contrary way, without communicating any thing of its *motion*. Lastly, if the *Body* E doth equally exceed A in Bigness, and that it be as big again, which is just as much as A exceeds E in *swiftness*, and therefore hath a *motion*, that is, as swift again, it will follow that A must communicate some part of that its swifter *motion* to E, and with the residue rebound back from it.

CHAP. VIII.

Of the Ptolomaick, Copernican, and Tychonick Systems of the World.

I. *What a System is, and how many there are.*

A *System* in *Natural Philosophy* is that, whereby a thing *acts* after a certain manner, by virtue of its *Composition*, and those Dispositions which constitute its *Nature*. Thus we call the *System of the World*, the Order or Disposition wherein we conceive, that all we see in the *World* is performed, by supposing it to be compos'd of certain *Parts*, the Nature and Connexion whereof is such, that thence results whatsoever is, or is done in it. Amongst the *Systems* of the *World*, invented by *Astronomers*, there are Three more famous than the rest, *viz.* those of *Ptolomy*, *Copernicus*, and *Tycho Brahe*, to which all the rest that have been invented by the *Ancients* may be referr'd.

II. *The Ptolomaick System.*

Figure 16.

PTOLOMY placeth the *Globe* of *Earth* and *Water* in the *Center* of the *World*, and supposeth it destitute of all *motion*. Next to the *Earth*, he placeth the *Air* mingled with *Vapours* and *Exhalations*, which raising it self only a few Miles above the *Earth*, is called the *Atmosphere*. Next below the *Moon* he placeth his Element of *Fire*; the several Spaces above which he divides into *Eleven Spheres*, in the first Seven whereof he ranks the *Planets*: In the first ☽, the *Moon*; in the second ☿, *Mercury*; in the third ♀, *Venus*; in the fourth ☉, the *Sun*; in the fifth ♂, *Mars*; in the sixth ♃, *Jupiter*; in the seventh ♄, *Saturn*; which he calls *Wandring Stars*: Not that they wander at Random; but because they are carried with an *unequal motion* within the *Zodiack*, so as not to keep the same Distance from one another, if compar'd with the *fix'd Stars*. In the *Eighth Sphere* he placeth the *Firmament*, in which the *fix'd Stars* are supposed to be fastned.

After these follow two other *Spheres*, which he calls *Crystalline*, or the Heavens of *Libration* and *Trepidation*; the first Moving from the *East* to the *West*, the other from the *North* to the *South*. The Eleventh and highest *Sphere* he calls the *Primum Mobile*, or *First moved*. This Description of the *World* is by the Common People generally approved and maintain'd; who look upon the *Heaven* as a *Vaulted Roof*, equally distant from us, who are as in the *Center* and suppose all the *Stars* that appear in it, to be in the said Circumference of the *World*.

III. *The System of* Copernicus.

NICOLAUS COPERNICUS, a *Physician* of *Thorn*, and Canon of *Frassenburg*, who flourish'd not much above an hundred years since, introduced another *System* in Imitation of the *Pythagoreans*, who attributed a *motion* to the *Earth*, and plac'd the *Sun* as the *Soul* of the *World*, in the *Center* of it; and consequently assigns the same place to the *Earth*, which *Ptolomy* allows the *Sun*, that is, betwixt the Planets *Venus* and *Mars*. The *Earth*, according to *Copernicus*, hath two *motions*; the one *Diurnal*, which in 24 Hours space is performed about its own *Axis*, from *West* to *East*; which Motion makes *Days* and *Nights*, as shall be said hereafter. And this *Motion* performs the same Service, which the *Primum mobile* doth in the *Ptolomaick System*, to wit, by effecting that all the *Stars* seem to move from *East* to *West*; much in the same manner as a *Ship*, which sailing from the *Shoar*, or towards it, makes the Shoar it self seem, as if it drew near, or withdrew from the *Ship*. The other *Motion* of the *Earth*, is its *Annual motion*, by which she is carried about the *Sun*, from the *West* also to the *East*, according to the Succession of the *Signs* of the *Zodiack*; by which means, the *Sun* which stands immovable in the *Center* of the *World*, doth seem to run through those *Signs*, tho' indeed it is the *Earth* only that truly doth so. And whereas the Space that is between *Mars* and *Venus*, is large enough for the *Moon* to be carried round between them, she accordingly performs there two *Motions*, the one *Monthly*, wherewith she is whirl'd about the *Center* of the *Earth*, and appears in her several *Changes*; the other *Yearly*, whereby (together with the *Earth*) she goes round the *Sun*.

Figure 17.

Wherefore, according to the *Copernican System*, the *Sun* is placed in the *Center* of the *World* immovable. Tho' this hinders not, but that it may be carried round about its own *Axis* within the space of 27 days, which that it is, appears by the turning round of its *Spots*, discovered by the *Telescope*. Next to the *Sun*, *Mercury* is whirl'd about; in the second place, *Venus*; in the third, the *Earth*, together with the *Moon* its Attendant; in the fourth, *Mars*; in the fifth, *Jupiter*; and in the last, *Saturn*. After which follows the Region of the *fix'd Stars*, so called, not because they are without all *motion*, but because they do not wander up and down like the *Planets*, but continue in their own places, and keep the same distance from one another, as will be shewed in the XX*th Chapter* of this *Part*.

IV. *The System of* Tycho Brahe.

Figure 18.

Besides these two *Systems*, a Third hath been contrived by *TYCHO BRAHE*, which partakes of both the foregoing *Systems*. For as to the Digestion of the *Parts* of the *World*, it agrees with the *Copernican*, save only in this, that it constitutes the *Earth* to be the *Center* of the *Firmament*, and accordingly makes the *Moon* and *Sun* to run round it. Thus in explaining the seeming *motion* of the *Heaven*, which seems to be performed in

in 24 Hours, he follows *Ptolomy*, and supposeth the *Earth* to stand immoved in the *Center*, and the whole *Heaven* to be carried round it, from *East* to *West*, by the Force of the *Primum Mobile*. But in explaining the Appearances of the *Planets*, he agrees with *Copernicus*; making *Mercury* and *Venus* to be carried round nearest to the *Sun*, as their *Center*; but *Mars*, *Jupiter* and *Saturn* at a farther distance; and in the middle Space placeth the *Earth*, with the *Moon* that is carried round her, in the same time that *Copernicus* assigns to it. The *Tychonick System* has this peculiar to it self, that the *Planets*, which perform their own *motions* about the *Sun*, are whirl'd about by it, so as that *Mercury* and *Venue*, in their Turnings round about the *Sun*, do never take in the *Earth*, as *Mars*, *Jupiter*, and *Saturn* do. So that as *Gassendus* observes, if instead of the *Sun*'s whirling about together with *Mercury* and *Venus*, who exclude the *Earth* from the compass they take, and with *Mars*, *Jupiter* and *Saturn* enclosing it, the *Earth* had been supposed to be whirl'd about with the *Moon*, comprehending in its compass *Venus* and *Mercury*, but comprehended within the compass of *Mars*, *Jupiter* and *Saturn*, it would come to the same thing; and *Tycho's System* would appear to be nothing else but the *Copernican* inverted.

V. *Ptolomy's System rejected.*

Having given this brief Description of these three *Systems*, we are next to examine which of them appears the *Truest*. For seeing that they all differ, and that the Structure or Disposition of the *Parts* of the *World* is but one only, we must reject two of them as *false*, and choose the third as the *truest*. And tho' we should suppose nothing of Contradiction to be found in any of these *Three*, yet ought we to pitch upon that as the *best*, which appears the most *simple*, and supposeth least *particulars*.

VI. *Many things are amiss in the Ptolomaick System, as being contrary to Experience.*

Wherefore we cannot admit of the *Ptolomaick System*, as being contrary both to *Reason* and *Experience*: To *Experience* first, with regard to the appearances of *Venus* and *Mercury*, seeing it is evident that these *Planets* are not always whirl'd about on this side of the *Sun*, as *Ptolomy* supposeth, but sometimes appear above, and sometimes beneath, yea, and sometimes also side-ways to it; so as that sometimes they are nearer to, and at other times they are further from us than the *Sun*. For this Cause *Copernicus* took occasion from the various appearance of *Mars*, to assign *motion* to the *Earth*. For he perceiving that *Mars*, whilst he is opposite to the *Sun*, appears much greater; and that he grows less, as he nearer approacheth to it, could not attribute this change to any thing better, than to the *Circumrotation* of the *Earth*: According to which, it was necessary for *Mars* to appear biggest, when the *Earth* moves neareſt to him; and least, when the *Earth* leaves him on the other side of the *Sun*.

Secondly, Pursuant to this *System*, no Reason can be given why *Mars*, *Jupiter* and *Saturn* are always in the lower part of their *Epicycles*, when they are *Retrograde*. Whence it is that the *Moon* doth always turn the same part of her Body towards us: Why *Saturn* appears in a various shape to us, sometimes *Oval*, and at others *Round*, when beheld through a *Prospective*.

Thirdy, This *Hypothesis* doth not explain the *contrary Motions*, whereby the *Stars* at the same time seem to move from *East* to *West*, and from *West* to *East*.

Fourthly, Neither can the rise of *Comets*, nor their *motions*, be solved, as long as we suppose the *Heavens* to be solid, as he doth.

Fifthly, According to this *Hypothesis* we cannot give any account, how the *Spots* about the *Sun* are generated, and afterwards dissipated; nor how they can perform their *Circuits* about the *Sun*.

VII. *This Hypothesis is likewise contrary to Reason.*

This *System* is also contrary to *Reason*, by allowing the *motions* of *Trepidation* and *Libration* to the *Crystalline Heavens*. For what is more misbecoming a *Philosopher*, than for the extricating of a lesser Change, to admit a far greater? For a *Body* that is carried towards one *Point*, tho' by an uneven *motion*, questionless doth not undergo so great a Change, as another, which is also carried towards one *Point*, and suddenly rebounds to the opposite Point. To this may be added, that it was in vain that the *Ancients* had recourse to this *motion*, for the explaining of the Equal progress of the *fix'd Stars*; since the most exact *Astronomers* frequently Experience, that what they deduce thence by their *Computations*, doth not correspond with the *Phænomena*. Besides, the *Motion* of the *Heavenly Orbs* will be swifter than can be competent to such vast *Bodies*, and more especially to the Brittle *Crystalline Spheres*; for the utmost *Sphere* of the *World* must be whirl'd about in 24 *Hours*. Moreover, what is more improbable than that the *Primum Mobile* should have the force to carry round with it all the *Inferiour Orbs*, from *East* to *West*; and yet that the *Earth*, which is included in them, should remain unmov'd? When yet, according to *Ptolomy*, the *Earth* is altogether Passive, and is encompass'd with the *subtil Matter*. These Absurdities are sufficient to make us reject this *Ptolomaick Hypothesis*.

VIII. *The Tychonick System also hath its Errors.*

Tho' the *Tychonick Hypothesis* seem more probable than the *Ptolomaick*, forasmuch as it gives an account of the Inequality and Diversity of the *Cœlestial Appearances*, yet is it not without its obscurity and defects. For it seems in a manner to disjoynt the whole *System* of the *World*, forasmuch as whilst the *Sun* (the *Center* of Five of the *Planets*) whirls about the *Earth* in its *Annual motion*, this his *Annual motion* is entangled with the proper *motions* of the several *Planets*; for the explaining whereof he is fain to make use of a *Circle*, described from the *Suns Center* with two *Epicycles*; whereas the structure of the *World*, is without doubt very far from any intricacy or confusion, and allows every *Planet* a sufficient Space to run its Course in.

IX. *And is to be rejected, as well as the Ptolomaick.*

Besides, this *System* hath several other *Defects* for which it is to be rejected, as well as the *Ptolomaick*. For tho' it admits of less *Suppositions* for explication of the *Motion* of the *Planets*, and gives a plausible account of the *Appearances* of *Venus*; yet it cannot be deny'd, but that it requireth something, which the Mind of *Man* can hardly assent to, in that it supposeth that *Motion*, whereby the Mass, consisting of the *Heavens* and *Planets*, in *Twelve Months* time, moves towards all parts of the *Firmament*. For tho' we should admit, that it had been put into such a *motion* by the Author of *Nature*, at the beginning of the *Creation*; yet withal

withal we must suppose, that according to the *Laws* of *Nature*, which GOD himself hath established, the said *Motion*, in success of *Time*, must be diminished, and at last cease altogether; since (according to the same) it must have been communicated to the *Heavenly matter*, which the foresaid *Mass*, to which *BRAHE* assigns this *Motion*, drives from those Parts to which it tends.

X. *The Copernican System is to be preferr'd before the two former.* It remains therefore, that we only admit of the *Copernican System*, as being both more plain and simple than the two foregoing, and solving the *Phænomena* of the *Heaven* the best of the three. But forasmuch as *Des Cartes* professeth himself to dissent from *COPERNICUS* and *TYCHO* as to the *Motion* of the *Earth*, which he denies with more *Truth* than *TYCHO*, and with more *curiosity* than *COPERNICUS*, we intend last of all to propound his *Scheme*, as the only true one.

CHAP. IX.

Of the true Systeme of the Universe.

I. *The Copernico-Cartesian Hypothesis explained.* *DES Cartes* supposeth that *Matter* indefinitely extended, and by *motion* impresst upon it, divided into various *Particles*, did run together into several *Vortexes* or Whirl-Pools, whirling about some certain Points with a most swift *motion*; that the more subtil matter gathered together about the *Center* of these *Vortices*, constitutes the *fixt Star*; that the *matter* which is a degree bigger, makes the *Heavens*; and that the more solid *Bodies* (such as is the *Earth* and the rest of the *Planets*) hanging poisd in this fluid *matter*, comply with the *motion* of the *Vortex* about the *fixt Star*, and may over and above this, be whirld about their own *Axis*; as we often see that *Bodies*, carried in a fluid Stream, are turn'd round by a *motion* of their own, that is, proper to themselves, and not derived from the Stream wherein they are carried.

Figure 19.

II. *The first Heaven.* Moreover *Des Cartes* divides all the *Vortexes*, that compose this *World* into two *Heavens*. In the first, he supposeth all the Matter of *Heaven* in which the *Planets* move, to run round continually in manner of a great *Vortex*, or mass of fluid Matter whirling round, in the *Center* whereof is the *Sun*, S, and that those *Parts* that are nearer to the *Sun*, move more swiftly, than those that are more remote, and that all the *Planets* (of whose number also the *Earth* T is,) have their course continually amidst the Parts of that *Cælestial* Matter.

III. *The second Heaven.* The second *Heaven* comprehends an immense number of other *Vortexes*, which surround this *Vortex* or first *Heaven* A, B, C, which in their *Centers* have the several *fixt Stars*. And because we are uncertain at how great a distance the *fixt Stars* are from us, and cannot conceive them so remote as to contradict the *Phænomena*, we will not content our selves with placing them above *Saturn*, but will take the liberty to conceive them much higher; seeing that it is apparent from the *Cælestial motions*, that they are so far distant from us, that *Saturn* compar'd to them, seems to be very near us. *Des Cartes* to illustrate the Truth the more about the motion of the *Planets*, and especially of the *Comets*, made no difficulty to assign an immense distance between *Saturn* and the *fixt Stars*.

IV. *The distance of the fixt Stars from the Sun.* Neither is this in the least contrary to Reason, forasmuch as we know that *Mercury* is above two hundred *Diameters* of the *Earth* distant from the *Sun*; *Venus* above Four hundred; *Mars* Nine hundred or a Thousand; *Jupiter* above Three thousand, and *Saturn* Five or Six thousand. And proportionably we may extend the Space between *Saturn* and the *fixt Stars*, to any distance how vast soever. For tho the *Region of the fixt Stars*, be commonly reputed the utmost Bounds of the *World*, yet its *Figure* cannot be certainly determined by us, seeing we can perceive nothing of its *Internal* nor *External Superficies*.

V. *Saturn is the First of the Planets.* The first of the *Planets* and neerest to the *fix'd Stars* is *Saturn*, who sometimes appears as if he had three *Bodies*, sometimes *Long* or *Tall*, sometimes *Sphærical*, sometimes *Oval*, with *Ears* and *Ear-rings*. For tho' *Saturn* like the other *Stars*, be of a Round *Figure*, yet is he surrounded with a broad *Circle* or *Ring*; standing at an equal distance from him; the proportion of the *Semidiameter* of the *Planet*, being to the distance of the Ring, as 3 to 5: but the entire *Diameter* of the *Ring*, to that of *Saturn* is about the proportion of 11 to 5. The *Ring* is thin, but broad, and if continued, would pass through the *Center* of *Saturn*. This *Planet* being most remote from the *Sun*, the *Center* of this our *World*, and being moved in a large *Vortex*, is almost 30 years in finishing his *Circuit* in our *Heaven* A B C.

VI. *Saturns three Satellites.* Three *Satellites* or *Guards*, are observed to move about him, the *First* whereof is distant from the *Center* of *Saturn*, one *Diameter* of the foresaid *Ring*, and performs his Circuit about *Saturn* in the Space of 4 *days*, 12 *hours and* 27 *minutes*. He is seen through a *Telescope* of 35 Foot, in his furthest digression from *Saturn*, but is imperceptible when nearer to him. The *Second* is much more illustrious, and may be descried by any moderate *Telescope*, and is distant from *Saturn* four Diameters of the said *Ring*, and whirls round him in the time of 16 *days* and 23 *hours*. The *Third* is distant from him 10 *Diameters* of the *Ring*, and performs his Circumvolution in the Space of about 80 *days*.

VII. *The Second is Jupiter.* The next to *Saturn* is *Jupiter*, who absolves his Course in almost 12 years. He hath four less *Planets*, as so many little *Moons* to be his Companions, to which *GALILÆUS* gave the name of the *Medicæan Stars*, because he first discovered them in the Dominions of the Duke of *Florence*. Their special names are, the *Jovial Saturn*, *Europa*, *Ganymedes*, *Calisto*; whereof the *First* or remotest wheels about *Jupiter* in 16 days; the *Second* in 7 *Days*; the *Third* in 85 hours, and the *Fourth* in 42 hours.

VIII. *The Third is Mars.* The Third Planet *Mars* is carried about a in greater *Vortex* than the *Earth*, and in a less than *Jupiter*; and finisheth his Revolution in near two years. In the midst of this Planet *CAMPANELLA* by the help of Prospectives discovered a Black *Mountain*, higher than the Mountains of the *Moon*: From whence, as likewise from the *Spots*, wherewith his *Face* is sprinkled, *CASSINUS* gathered, that *Mars* was whirld about his own *Center* in the Space of 24 *hours* and 49 *minutes*. There is also a round *Ring* somewhat resembling a *Rainbow*, but of a Redder Colour, which surrounds the Foot of that *Mountain*.

The

IX. *The Fourth is the Earth.* The fourth place is taken up by the *Earth*, which absolves its Course together with the *Moon*, (which she carries about in her *Vortex*) within the Space of a Natural year. All the Matter that reacheth from the *Earth* to the Moon, is called *Elementary Matter*; and because this Matter contains many parts, which are moved more swiftly than the *Rest*, it follows that they must all of them be unequally determined to recede from the *Center* of their Motion, and that those which are more swiftly moved, withdrawing themselves with greater force, do by this means thrust the other parts downwards: Which is the cause of Gravitation, as hath been said before.

X. *The Earth is not placed in the Center of the World.* Now that the *Earth* is not placed in the *Center* of the *World*, but rather is as far distant from the *Center*, as from the *Sun*, appears from hence; that all the *Planets* are sometimes nearer, and at other times farther from the *Earth*; and that with such a vast difference, that *Venus* when she is farthest from us, is at a six-fold greater distance, than when she is neareſt; and *Mars* is eight times farther distant in the one State, than in the other, which could never be, if the *Earth* were the *Center* of the *World*.

XI. *The Fifth is Venus.* The Fifth is *Venus*, who runs her course in 224 *days*. She is carried below the *Earth*, surrounding the *Sun*, which may be concluded from the changes of her *Figure* and appearance, proceeding from the Illumination thereof.

XII. *The Sixth is Mercury.* Next to *Venus* is *Mercury*, finishing his Course about the *Sun* S in the Space of 80 *days*, or as others will have it in 87. He very rarely appears, being for the most part obscur'd by the *Suns* Rayes. Hence *GALILÆUS* conceives, that *Saturn* for his slowness, and *Mercury*, for his almost continual occultation, ought to be accounted the last of the *Planets*. Now forasmuch as *Mercury* doth not appear, but in his farthest Elongation from the *Sun*; he is seldom seen *Round* through a *Telescope*; but sometimes as it were *cut in two*, as the *Moon* in her Quarters, sometimes more Gibbous, and at other times hollow; and being neareſt unto the *Horizon*, and obscur'd by Vapours, its *Figure* or *Bulk* can scarcely be discovered.

XIII. *The Sun is the Center of the whole compass of the Heavenly Matter.* In the midst of this great *Vortex* the *Sun* is placed, as in the *Center* of the *World* unmoved, and like a Prince seated in his Royal Throne, Illustrating all the *Bodies* about him, both Cherishing, and Quickning them with his *Heat*. *TRISMEGISTUS* calls him the *Visible God*, and *SOPHOCLES* gives him the Epithet of *Beholding all things*. But notwithstanding what we have said of his being unmoved, he may whirl about his own *Axis*, in the of Space of 24 *days*, which *Astronomers* conclude from the most constant Motion of its *Spots*.

XIV. *All the Planets are moved from West to East.* Tho' all the *Planets* with regard to their different Degrees of Solidity be unequally distant from the *Sun*, the *Center* of our *Vortex*, A, B, C; yet is this common to them all, that they perform their *Periodical Motions* after the same manner, *viz.* from *West* to *East*, or from A, through B, towards C, according to the succession of the *Signs* of the *Zodiack*. Save only that the *Earth* is carried with a threefold *Motion*, and as the chiefest *Star* amongst the *Planets*, hath the *Moon* for her Attendant: So that the *Vortex*, which hath the *Earth* for its *Center*, carries the *Moon* about the *Earth* in a Months Space, the *Earth* it self being whirld about every day, round its own *Axis*. Thus in the same time, that the *Earth* and *Moon* finish their Common Circle, or Great *Orb* once, the *Earth* is 665 times whirld about its own *Axis*, and the *Moon* twelve times carried about the *Earth*.

XV. *An Objection answerd.* The Common Objection against this *Hypothesis* is, that the *Horizon* in all parts of the *World*, divides all the great *Circles* into equal *Parts*, so that always one half of the *Equinoctial* is above it, and the other half under it, and consequently always 6 Signs of the *Zodiack* above the *Horizon* and as many under it; whence it must follow, that the *Earth* is in the *Center* of the *World*, and not the *Sun*.

To which I answer, that this proves indeed, that the *Earth* is in the midst of all the *great Circles* of the *Sphere*, but not that she is in the *Center* of the *World*, because it is our Imagination only, that represents these *Circles* about the *Earth*. Accordingly it would be a false consequence to say, that the *Earth* is in the *Center* of the *World*, because the *Parts* and *Degrees* of the *Earth*, do correspond proportionably to the *Parts* and *Degrees* of *Heaven*; for on the contrary it follows that these *Circles* are equally distant and proportional in their *Parts*, with regard to the *Earth*, seeing that it is our Imagination which conceives them round its *Center*.

XVI. *The Planets may more properly be said to Rest in their Vortex than to be moved.* Notwithstanding the *Earth* and all the other *Planets* be carried by the *Celestial matter* that surrounds them from *West* to *East*, yet they may more properly be said to *Rest* than to *move*. For seeing that *Local motion* is nothing else but *the Translation of one Body, from the Neighbourhood of those Bodies, which immediately touch it, and are considered as immoveable, into the Neighbourhood of other Bodies*, and that neither the *Earth*, nor any of the other *Planets*, are translated from the Neighbourhood of those parts of *Heaven* that immediately touch it, and are lookt upon as immoveable, the *Earth* and *Planets* acording to the Truth of the thing are not moved, that is, have no motion properly so called.

XVII. *Neither the Diurnal nor Annual Motion do properly belong to the Earth.* Yea, if we give head to the Definition of *motion* we shall easily discern, that that which we call the *Diurnal motion* doth not belong to the *Earth*, by it self considered, but as it is an Aggregate of *Earth*, *Seas* and *Air*, seeing it is to be lookt upon at altogether at *Rest*, whilst it is whirld about by the stream of the *Heavenly matter* wherein it swims; like as a Man who sleeps in a *Ship*, is said to *Rest*, whilst the *Ship* is carried from one place to another. We shall also perceive, that the *Annual motion* of the *Earth*, whereby it is carried about the *Sun* from *West* to *East*, through the *Signs* of the *Zodiack*, cannot be ascribed to her, but to the *Cælestial matter*, which carries this vast Mass round the *Sun*.

XVIII. *The Orbs of the Planets are not exactly Circular.* Moreover we are to mind that the *Circuits* the *Planets* make about the *Sun*, are not perfectly *Circular*: For as we see that in some parts of *Rivers*, where the *Water* whirling about, makes a *Vortex*, and carry many Straws along with it, some of them at the same time are whirld round about their own *Centers*, and are moved more swiftly as they are nearer to the *Center*; and tho' they incline to move Circularly, yet do not always describe exact *Circles*;

cles; so we may without difficulty imagine all the same things concerning the *Planets*. As is manifest from their nearer and further distances from the *Sun*, and from their Descent and Ascent in the *Zodiack*, being sometimes above the *Ecliptical Line*, and at other times under it.

CHAP. X.

That the Heavens are Fluid Bodies.

I. *It is no difficult matter to know the Nature of the Heavens.*

IT will not be difficult to have a certain knowledge of the Nature of the *Heavens*, if we consider that the *Matter* whereof they consist, is the same with that of the *Inferiour World*, nothing being to be found in it besides *Divisions*, *Figures*, *Magnitudes and Motions*. Which Modifications, wheresoever they are, still cause the same changes. And therefore we are to *Philosophize* concerning the *Heavens* no otherwise, than of our *Bodies* here below.

II. *The distinction of Hard and Fluid Bodies.*

We are therefore to suppose that *Bodies* are either *Hard* or *Fluid*. *Hard* are those whose parts are so joyned, as not to be separable from one another without difficulty. Whereas *Fluid* are such whose Parts do readily give way: But how it comes to pass, that some *Bodies* do easily give way to others, and that others are not removed from their places without Force and Difficulty, we shall easily apprehend, if we consider, that these things which are moved, do not hinder other *Bodies* from entring their places; whereas those that are at *Rest*, are not without some force pusht out of them.

III. *The Parts of Hard Bodies are at Rest, and those of Fluid, in motion.*

Whence it follows, that those *Bodies* are *Fluid* whose parts are tossed with various *Motions*; and those *Hard*, whose *Parts* being closely joyned together are at *Rest*. And tho' it may be our Sense may not perceive the parts of *Fluid Bodies* to be moved, yet are not we therefore to deny it; because we see the *Water* and *Air* do corrupt solid *Bodies*, which cannot be done without *Motion*.

IV. *The Heavens are no Solid or Hard Bodies.*

We say therefore, that the *Heavens* are no *Hard* or *Solid Bodies*, but *Fluid*. For if they were *Hard*, they could not transmit the *Light* of the *Stars*: For *Hard* and *Diaphanous Bodies*, transmit the *Light* because their Pores are rang'd in *Right Lines*, which could never be, if the vast Bulk of the *Heavens* was *Solid* like *Crystal*, or did much infringe the Light, as we see, that when many pieces of the cleerest *Glass*, are laid one upon one another, they become very opake.

V. *Supposing that the Heavens were Solid, the superior Spheres, could not carry the inferior along with them.*

If the *Heavens* were *Hard*, we could never explain how the Lower *Heaven* should be snatch'd along by the *Heaven* above it; as the *Peripatetick*s imagin. For how can the *Heavenly Orbs*, supposed polisht and even, hurry away with their *Motion* the *Spheres* that are under them? Yea when the *Sun* and the rest of the *Planets*, are whirld about round their *Center*, as hereafter shall be declared, no reason can be assign'd, why they should not as well be carried in the Liquid *Æther*. And indeed all the Antient *Philosophers*, before *ARISTOTLE*, were of Opinion that the *Stars* moved in the *Heavens* like *Fishes* in the *Sea*. And *Astronomers* are of the same Mind, who have observed that *Mercury* and *Venus* have sometimes got above *Mars*, and come down again, which could never be if the *Heavens* they move in were Solid.

The same may be evinced by the *Comets* which are found to be above the *Region* of the *Moon*, and to slide through those *Æthereal Spaces*, which could not be without those Spaces were filled with a *Fluid Body*. The *Astronomers* have also observed, that the *Medicæan Stars*, do roul about *Jupiter*, as *Venus* about the *Sun*, which likewise proves the Fluidity of the *Heavens*.

VI. *The Motion of the Comets and Stars, is a pregnant proof of the Fluidity of the Heavens.*

Neither only are those *Heavens Fluid*, which contain *Mercury*, *Venus*, *Mars*, *Jupiter*, *Saturn*, and our *Earth*, together with the *Moon* its Companion, but the *Matter* of the *Sun* it self is also Fluid, and is continually whirld about its own *Axis*, as is evidenced from the *Motion* of the *Spots* about the *Body* of the *Sun*; for they are not generated in the *Air*, as some have supposed, but in the very *Body* of the *Sun*. For at *first* they are seen in the midst of the *Suns Body*, and near to his *Ecliptick*, and never towards the *Poles* of the *Solar Body*. This is confirmed by many *Astronomers*, who at great distances of *Place*, have observed the very same *Spots*, at the same time, and in the same places. Now that the *Sun* doth not only move these *Spots*, but also the *Planets* that are about him, appears from hence, that the nearer any *Planet* is to the *Body* of the *Sun*, the swifter it is turnd about. And the same is to be conceived concerning that vast Space, which is found about every *fixt Star*.

VII. *The Fluidity of the Heaven proved by the Spots of the Sun.*

But you'l say *first*, that the *fixt Stars* observe the same distance from one another, which could not be if they wanderd in a *Fluid Heaven*, changing their places, as is evident concerning the *Planets*, who oft enter one anothers *Orbs*. I answer, that the equal distance the *Stars* keep, doth not prove the *Solidity* of the *Heavens*, but that they possess some determinate *Orbs*. For the *fixt Stars* are not placed in the Circumference of one *Sphere* as some imagin, but every one of them hath its own *Space* or *Orb*; and because they observe the same Order and Propotion amongst themselves, therefore are they called *Fixed*.

VIII. *How the fixt Stars keep the same distance from one another.*

In the *Second* place you'l say, If we suppose the *Heavens* to be *Fluid*, it cannot be conceived how *Solid Bodies* can be carried about in them, seeing that they have not so much Power, but do readily give way to *Hard Bodies*. And indeed what likelyhood is there that, that which is *Hard* and *Solid*, should be hurried along by that which is Fluid and Weak? I answer, that it must indeed be confessed, that *Fluid Bodies* are not of so great force, as those that are *Solid*, to hinder the *motions* of other *Bodies*; for seeing they having a *motion* themselves, and that *motion* is not contrary to *motion*, they do not resist them so much as *Solid Bodies*. But for all this it cannot be denied, but that the *motion of Fluids* where determin'd one way, doth carry all *Hard Bodies*, along with it. As appears in a *Stone*, which the *Water* of the *River* carries along with it, so long as it is not detained by some *External Cause*. And therefore there is good ground why the *Globe* of our *Earth*, resting in the pure *Æther*, should easily be carried about by its *Heaven*. In like manner as we see *Straws* on the surface of the *Water* carried about by the whirling round of the *Watter*, whilst some of them whirl at the same time about their own *Centers*, being all of them moved the swifter, by how much the nearer they are to the *Center* of the said *VVhirle pool*.

IX. *Fluid Bodies have the Force to carry Solid Bodies along with them.*

The

X. *A Hard Body, how great soever it is, resting in a Fluid, will be moved by the least force.*

The Reason whereof is, because a *Hard Body* encompass'd with a *Fluid*, and Resting in it, lies there as in an Equal Poise; and how great soever it may be, will be easily carried away by a little force, whether that Force come from abroad, or that the *fluid Body* it self, wherein it is contain'd, be wholly carried one way; as the Course of *Rivers* tends towards the *Sea*; or as the *Air*, when the *East-Wind* blows, is carried towards the *West*; which whenever it happens, any *hard Body* that is in that *fluid*, must of necessity be carried along with it.

XI. *The Heaven hinders the Earth from Falling.*

Hence we may infer, that seeing the *Heaven* doth on all sides surround the *Earth*, and drive all the *Bodies*, that are on the surface of it, towards its *Center*, it doth by this means keep it from Falling: So that the *Earth* cannot but be carried along by it, and being thus without any *motion* of its own, yielding only to that of the *Heavens*, it may with good reason be said, to be *at Rest*. And the same may be said of the *Sun*, who is hindred by the *Globuli* of the *Second Element*, which surround him, from flying from the *Center*; and the lower *Globuli*, by those above them; and the utmost, by those of the contiguous *Vortexes* of the *fix'd Stars*, who by a contrary pressure do keep them within their Bounds.

CHAP. XI.

How the Heavens were disposed at first, and of their divers Motions.

I. *Three things are to be suppos'd here.*

IT will not be difficult to demonstrate the first *Disposition* of the *Heavens*, or that order which the *Heavenly Orbs* now observe, and did from the Beginning, by supposing only a few things, which we have proved in the *Fourth Part*.

II. *The First.*

First, That there is no *Vacuum* in *Nature*; for seeing that *Space* is not distinct from a *Body*, it must necessarily follow, that whersoever *Space* is found, there must be a *Body* also.

III. *The Second.*

That there can be no penetration of *Dimensions*; for seeing that the Conception of a *Body* involves *Extension*, and by it excludes all other *Bodies* out of the same place with it, it is evident that many *Bodies* cannot be contain'd in the same place.

IV. *The Third.*

Whatsoever is moved, is moved in a *Circle*; for seeing all places are fill'd with *Bodies*, it is clear, that one *Body* cannot be removed out of the *Neighbourhood* of some *Bodies*, into the *Neighbourhood* of others, without being mov'd in a *Circle*. So that when any *Body* enters into a *place*, the *Body* that was there before leaves it, and enters into the *place* of the next, and so on to the last; which at the same instant of time enters into the place the *first Body* hath left.

V. *What we are to understand by the words* Vortex, Center, Ecliptick, Poles *and* Axis.

It will not be amiss for us also to explain what we intend by the Words, *Vortex*, *Center*, *Ecliptick*, *Poles* and *Axis*. By the word *VORTEX* we understand, a vast number of *parts of Matter*, which move together about the same *Center*. By the *Center* of a *Vortex* we mean, the *point* about which all the *parts of Matter* that constitute the *Vortex* do move. And because when a *Vortex* turns round, all the Points of the *Surface* describe *Crooked lines*, which resemble *Circles*, except two that turn about themselves, we call those two Points the *POLES*; and the *Circle*, which is equally distant from the two *Poles*, we call the *ECLIPTICK*; and the *Right line*, which reacheth from one *Pole* to the other, passing through the *Center* of the *Vortex*, we call the *AXIS*.

VI. *How the Vortexes came first to be.*

These things premis'd, we say that the Parts of the *Universe*, being in the Beginning of the *Creation* put into *motion*, must naturally run themselves into several *Vortexes*; for these *Particles* being of different bulk and figure, and unable to move forwards in *Right lines*, because of their various determination, they were forced to move in *Circles*, and by this means did constitute *Vortexes* of a stupendous Magnitude, according to the Quantity of the *Matter*. For it is an unquestion'd Truth amongst *Philosophers*, that a *Body* which is dash'd against another, must of necessity rebound back from it, and so be carried in a *Circle*, that it may continue its *motion*, which may be proved by many Experiments. For the *Vortexes* of the *Air*, or those of the *Water*, which we see in *Rivers*, are caused, because the *Vapours* that make the *Wind*, and the running *Waters*, being beat back by occurring *Bodies*, are hindred from moving strait forwards: and therefore being reflected on one side, must necessarily turn *round*, because the subsequent *Air*, or *Water*, is successively push'd forwards after the same manner as the first, and so must twist in and be carried Circularly.

VII. *The Divisibility of Matter being suppos'd, the Vortexes could not but be made this way.*

That this was the Original of the *Vortexes* is unquestionable, by those who admit the Matter of the *World* to have been divided into *particles* of different *Magnitude* and *Figure*; and that they had as much *motion* from the beginning, as there is now found in the whole *Universe*. Because these *Particles* dashing one against another, must needs be carried round about divers *Points*, and so run together into divers *Vortexes*. So that all the *Particles* that were whirl'd about the *Sun* S, did constitute the *Vortex*, terminated by A, Y B, M, and that others which roul'd about the *fix'd Stars* L, C, O, K, compos'd other *Vortexes*.

Figure 20.

VIII. *That there are but two visible Heavens.*

We admit only two visible *Heavens*; the *first*, that whose *Center* the *Sun* S is, in which we live, and wherein *Venus*, *Mercury*, the *Earth* and the rest of the *Planets* are contained, and in which they are roul'd about with various *motions*. And the *Second Heaven* is that which contains innumerable *Vortexes* Z L Z, M C M, Y O Y, T K T, which have *fix'd Stars* in their several *Centers*, and on every side surround the *First Heaven* S. Whatsoever reacheth beyond these *Heavens*, does not fall under our Senses, tho' we conceive it Immense, and not confin'd within any Limits, being therefore called an *Expansion* or *Firmament*, from its vast and *Indefinite Extension*.

IX. *How the Vortexes came to be divided, and what the Form of them is.*

The Disposition therefore, and ordering of the several *Bodies* of this *World* was made, when the *Planets*, and all other *Bodies* that lay confounded together in the *Chaos*, were separated by the *subtil Matter* flowing between them, and got into several places, according to the thickness and solidity of the *Matter*. Whence it is evident, that the Forms of the *Vortexes*, are the very first and most simple *Forms* that were ever introduced into the *Matter*; they are the *First*, because they are the immediate product of the *Laws* of *Motion*; and *the most Simple*, because they suppose none before them; and because all other Forms depend on them, as on their *Principles*.

There

X. *How these Vortexes can perform their Motions without hindring one another.*

There is one Difficulty seems to arise from the Disposition of these *Great Bodies*, *viz.* how these *Vortexes* could fall into such a *motion*, as that one should not hinder the other: For it is hard to conceive how *Bodies* of so great a Bulk should not interfere with one another in their Circumvolution, seeing that according to the *Laws* of *Nature*, the *motion* of one *Body* is turned aside by the meeting of another.

XI. *The Difficulty answer'd.*

This Difficulty may be answer'd by shewing, that these *Vortexes* may be so placed, that their *Motions* will rather further than hinder each other; that is, if we conceive them so ranged, that the *Ecliptick* of one, (or that part of the *Vortex*, which whirling about its *Axis* describes the largest *Circle*) do correspond to the *Poles* of the other: For by this means they will so agree together, and move so freely, as not in the least to hinder one another.

XII. *The Vortexes must be so disposed, as that the Poles of one Vortex may touch the Ecliptick of another.*

Yea, if we examin the matter, we shall find that the *Heavenly Vortexes* cannot be so, but that the *Poles* of one must touch the *Ecliptick* of another. As suppose the *first Vortex*, whose *Center* is S, be moved from A, toward Y; another *Vortex* contiguous to it, whose *Center* is O, and another whose *Center* is C, must touch it in those Parts that are most remote from both the *Poles* A and B, of the *Vortex* S. For if we should suppose the *Poles* of two *Vortexes* to touch one another, they will either by a like determination of *motion* be carried the same way, and so will run one into another; or they must by a different determination be carried *oppositly* to one another, and so clashing in their *motions*, they will never be able to continue them long; and therefore to the end their *Motions* may not interfere together, the *Vortexes* must be so ranged, that the *Pole* of one *Vortex* may not touch that of another, but the *Ecliptick*, or those parts which are most remote from them; forasmuch as by this means they support and preserve one another.

XIII. *Those Parts of a Vortex which are neareſt to the Center, are most swiftly moved.*

The *First Heaven*, in which the *Sun* S is the *Center*, and by the force of whose *motion* the other *Planets* are wheel'd about, is most swiftly turn'd round by it; for the *Sun* being with great celerity whirl'd about its own *Axis* A B, carries the neareſt parts along with it, and imparts his *motion* unto them: So as that the parts neareſt to him are more swiftly moved, than those that are more remote, and so on to the Region of *Saturn* H N Q R, where the *parts* of the *Heaven* are moved slowest of all. The Reason whereof is, because those *parts* that are nearer to the *Center* of the *Vortex*, are less than those further off, and consequently are more swiftly moved. And that the *parts* towards S, are less than those that are about H N Q R, is evident; for that if they were bigger or equal, by being so near the *Center* of the *Sun*, they must needs be more swiftly moved, and by consequence possess themselves of Higher places.

XIV. *Those parts of the Vortex which are above the Region of* Saturn, *are more strongly moved.*

According to this Proportion therefore, the *motion* of the *Celestial Matter*, grows by degrees more slow to a certain term, beyond the *Region* of *Saturn* H N Q R, where the highest or utmost *parts* of this our *Vortex* begin to be more swiftly moved, not by the *Sun*, as is apparent enough; but from the Neighbouring *Vortexes*, which surround the *First Heaven*; for they being unequal, do variously shake the *Surface* of the *First Heaven*, and thereby conduce to the swiftness of those *Parts*. This great degree of their *swiftness*, appears from the swift *motion* of the *Comets*.

XV. *The Motions of the Vortexes are Circular.*

From what hath been said, we may gather these two things: *First*, That the *Vortexes* are circularly moved; for being hindred by other *Bodies*, from proceeding in a *Right motion*, they are forc'd to change the same into a *Circular*, and therefore must continually be whir'd *round*.

XVI. *It is not necessary that the Vortexes should be exactly Round.*

Yet is it not necessary that these *Vortexes* therefore should be exactly *Round*; for tho' they counterballance one another by their equal Force, yet is not this Force equally dispers'd through all their *parts*; because those which are about the *Ecliptick* of one *Vortex*, are always more strong than those that are towards the *Poles* of another: Which makes (since the *Ecliptick* of one *Vortex* commonly meets with the *Poles* of others) the *parts* that are about that *Ecliptick*, to advance more towards the *Poles* of other *Vortexes*, than the *parts* which are about the *Poles* of other *Vortexes*, do advance towards this *Ecliptick*. We see also in the precedent *Figure*, that the Neighbouring *Vortexes* make the *Vortex* S, which is between them, irregular.

XVII. *The Heavens are moved continually.*

Secondly, We may gather from what hath been said, that the Motions of the *Vortexes* are *perpetual*, since there is nothing that can be assign'd that should change or diminish their *motions*. For a *Body* therefore only ceaseth to move, because by running against another *Body*, it imparts its *motion* unto it, which cannot happen to the *Heavens*, because they have no *Bodies* at Rest, or slowly Moved, to which they may communicate their *Motion*, and so come to lose it. For the Law of *Nature* requires, that every thing, inasmuch as it is single and undivided, should remain in the same state, nor ever be changed, but from *External Causes*; and since no such *Causes* are in the *Heavens*, but all the *Vortexes* do comply together, we are rather to conclude, that they maintain and preserve one another.

XVIII. *A small Vortex may preserve it self, amongst others that are greater.*

As to the Bigness of the *Vortexes*, we have no reason to think, that all those which were the result of the First Division of the *Matter*, were all of them *Equal*. For as the only Reason we have to believe, that the vast number of *Vortexes* are not confounded one with another, is, because their Forces are equal and opposite; we may also well imagin, that a *Vortex*, which is less than those that are about it, will for all that preserve its station amongst them, if we consider that the Defect of its Bulk may easily be made up by its greater degree of Swiftness in *motion*. This Inequality of the *Vortexes* is represented to the Eye in this *Figure*, where the *Vortex* S, tho' greater, cannot destroy that of O, nor K, tho' lesser than it.

XIX. *What Bodies are said to be Heavy.*

We may gather from what hath been said, why *gross* and *Earthly Bodies*, are *Heavy* about the *Centers* of the *Vortexes*; tho' *Light*, when they are at a distance from them. For seeing these *Bodies* derive their *motion* from the *subtil Matter* wherein they swim; which Matter is actually turn'd Round, and inclin'd to move forwards in *strait Lines*; it by this means communicates its *Circular motion* to those thicker *Bodies*, which it carries along with it; but not the Force it has in proceeding in *right Lines*, save only so far as that Force accompanies the *motion* it imparts to them.

But

But becauſe the *ſubtil Matter*, which is about the *Center* of the *Vortex*, hath much more agitation than is required to *Circular motion*, (for every of the *Particles*, beſides the *Circular* or *Common motion*, are alſo variouſly moved) it ſo happens that thoſe *Bodies* which have leſs *motion*, have alſo leſs *force* to continue their *motion* by *Right lines*, and by this their weaker *force*, are forc'd to give way to thoſe, which with greater *force* preſs on towards *Strait lines*, and therefore muſt tend towards the *Center* of the *Vortex*, that is, become ſo much the more *heavy*, as they are more *ſolid*.

XX. *What Bodies are ſaid to be light.*

But when *Earthly Bodies* are at a great diſtance from the *Center* of their *Vortex*, ſeeing the *Circular motion* of the *ſubtil Matter* is very intenſe, foraſmuch as it employs almoſt all its *motion* in its *Revolution* about the *Center* of the *Vortex*, they have the more *agitation*, as they are more *ſolid*, becauſe they follow the *motion* of the *ſubtil Matter* in which they ſwim; and therefore have more *force* to continue their *motion* according to a *Right line*: ſo that the *groſſer Bodies*, at a certain diſtance from the *Center* of the *Vortex*, are by ſo much *lighter*, as they are more *ſolid*. For by the word *Lightneſs*, we underſtand nothing elſe, but the Endeavour wherewith the *Bodies* that are moved Round, tend to withdraw from the *Center* of their *motion*; as by the word *Heavineſs* we underſtand that *ſtrift*, whereby leſs agitated *Bodies*, or leſs *ſolid*, are thruſt down towards the *Center* of their *motion*, by ſuch as have more force than they to withdraw from it.

XXI. *The Planets are not Heavy.*

From hence it is evidently deducible, that the *Earth* about its *Center* is very ſolid, but leſs towards the *Circumference*; as alſo that the *Water* and *Air* muſt continue in that ſituation wherein we ſee them, and that conſequently they are *Heavy*. For ſeeing all theſe *Bodies* are more ſolid than the *Matter* of the *Firſt* or *Second Element*, they cannot avoid being puſh'd towards the *Center* by it: Whereas the *Moon*, being at a conſiderable diſtance from the *Center* of the *Vortex* of the *Earth*, is not look'd upon as Heavy, tho' it be a *ſolid Body*; as neither *Mercury*, *Venus*, *Jupiter*, and *Saturn*, which cannot fall down towards the *Sun*.

CHAP. XII.

Concerning the Action and Motion of the Heavenly Matter.

I. *How Light was made in the Firſt Day of the Creation.*

HAving thus been inform'd how the *Heavens* were ranged, and what Order they ſtill keep, we are next to conſider how the *Heavenly Matter* is moved, and what *Action* it exerts in them. For as ſoon as the *Vortexes* began to be formed, it could not be but that ſome part of the *Matter* of the *Firſt Element*, made by the rubbing of the divided *particles* againſt one another, muſt be gather'd towards the *Center*, and from thence propel the ſurrounding *Globuli*, which was ſufficient to make *Light*. And thus we may perceive how *Moſes* is to be underſtood, when he ſaith, that *GOD divided the Light from the Darkneſs*, and that *Light* was in the Firſt Day of the *Creation*: Becauſe the *Matter* of the *Firſt Element*, which was about the *Center* of each *Vortex*, preſs'd the *Globuli* of the *Second Element*, and ſo procured the *Light*. Yea, this was in ſome meaſure effected upon the firſt Turn of the *Vortex*, before the *ſubtil Matter* run to the *Center*. For by the name of *Light* we can underſtand nothing elſe, than that preſſure of the *Globuli* in *Right lines*, which does excite in us the ſenſe thereof. And therefore, when it is ſaid, that *GOD* commanded *the Light to be*, it muſt be thus underſtood, that *GOD* put the *parts* of *Matter* into *motion*, and gave them an Inclination to continue the ſame in a *ſtrait Line*.

II. *How the Sun and fix'd Stars were made the Fourth Day.*

But after that the Matter of the *Firſt Element*, by the continual rubbing together of the ſeveral *Bodies* was increaſed, it betook it ſelf in great Quantity to the *Centers* of the *Vortexes* S L C K O, and there made the *Sun* and the *fix'd Stars* on the *Fourth Day*. For ſeeing that all Circular moved *Bodies*, continually ſtrive to recede from the *Center* of their *motion*, and that thoſe that are ſtrongeſt recede farther than ſuch as are weak; it follows, that the *Particles* of the *Second Element*, that are more ſtrong than thoſe of the *Firſt*, becauſe they are ſolid, do more recede from the *Center* of their *Motion*, and that in this their receſs they puſh down thither all thoſe *Particles* of the *Firſt Element*, that are left after the filling the *Intervals*, which are between the *Particles* of the *Second Element*. Whence it follows, that about the *Center* of each *Vortex*, there is a *Body* only compoſed of the *Matter* of the *Firſt Element*, which cannot but be of a *Round Figure* that way it turns; that is to ſay, If one ſhould cut it by a Flat parallel to the *Ecliptick*, in what part ſoever this Section ſhould be made, it would be always a *Circle*: For otherwiſe it muſt be ſuppoſed, that ſome *Particles* of the *Second Element* are not ſo far removed, as they might be, from the *Center* which they deſcribe, which is impoſſible.

Figure 20.

III. *What we underſtand by the word Star.*

Now that *Body* of the *Firſt Element* which is formed in the *Center* of a *Vortex*, is commonly called a *Star*; ſo that by this word *STAR*, we underſtand nothing elſe, but a *Body* compos'd only of the *Firſt Element*, which has been driven by that of the *Second*, towards the *Center* of each *Vortex*.

IV. *The moſt ſubtil Matter is moſt ſtrongly moved within the Bodies of the Stars.*

It is evident from what hath been ſaid, that the *Matter* of the *Firſt Element*, is not every where moved alike, but more ſtrongly in the *Bodies* of the *Lucid Stars*, than without them in the *Globuli* of the *Second Element*. For the *ſubtil Matter* gather'd together in the *Sun* or *fix'd Stars*, hath a greater *force*, by reaſon of the Conſent of its Parts to all thoſe ſwift *motions*, by which it puſheth forwards the *Æthereal Matter*, or the *Heavenly Globuli*. But without the *Stars*, and between the *Globuli*, its *force* is diminiſh'd, and by being divided, is much weaker: So that every one of its *Particles* are puſh'd this way and that way, by the *Globuli*, and thereby are forc'd to comply with their various *motions*. Hence it is, that the *Matter* of the *Firſt Element*, becauſe of the exceeding ſmalneſs of its Parts, is forc'd to change its *Figure*, and to be toſs'd with various *motions*. For as it is toſt amongſt the *Globuli*, it hath ſeveral *motions*; firſt, its own *proper Motion*, by which it continually changeth the *figure* of its little *particles*, to be fit to fill up exactly all the Corners

it passeth through. Next it hath a *Circular motion*, which is common to all *motions* that are moved together. And lastly it hath a *Straight motion*, whilst by the *Circular motion* of the *Vortex*, it is thrust in great abundance towards the Parts that are most remote from the *Poles*.

V. *A motion may be various, and yet continue one and the same.*

And tho' there can be but one *Proper motion* assign'd to a thing, yet doth not this thwart the Truth of what we have just now said, because tho' this *motion* hath several names, yet it is still but one and the same, from the *Center* to the *Circumference*, by a *right Line*, tho in its going forth it may undergo several *Figures*; even as the *motion* whereby any Liquor is transmitted through a *Channel* or *Pipe* is said to be one, tho' it run to the term to which it is directed, in one place through a square *Pipe*, in another through a *Triangular*, in one through a narrower, in another through a wider *Pipe*.

VI. *The great Globuli, are more strongly moved than the less.*

We are also to take notice of some difference there is between the *Globuli* of the second *Element*, because the Bigger, as being *more Solid*, are more suited to receive a swift *motion* from the matter of the first *Element*, than the Less, and therefore they are more swiftly moved, and withdraw further from their *Center*.

VII. *The matter of the first Element continually passeth from one Vortex to another.*

Next, we are to consider that the first *Element*, is continually carried towards the *Center* of each *Vortex*, from other Neighbouring *Vortexes* about it, by those Parts which are neareſt to the *Poles*, where there is least resistance, that so they may make up again that which is lost: But that the same matter breaks out of its own *Vortex* into others, by the *Ecliptick* or those parts which are furthest from the *Poles*. For let us suppose A B, to be the *Poles*, about which the *Vortex* in which we are, *Whirls* round, H and Q to be the *Ecliptick*, or Parts most remote from the *Poles*, where the *motion* is the *Swiftest*. Let us also suppose the *Vortex* to be A Y B M, round about which four others *Vortexes* L C K O rowle, so as to touch O and C, at their *Poles*, and the other two K and L, in those Parts that are most remote from their *Poles*; I say, this supposed we may easily guess, that the matter which strives to withdraw from the *Axis* A B, of our *Vortex*, doth with greater Force tend towards the Parts Y and M, than towards A and B. The reason is, because the most subtil matter in Y and M, meets with the the *Poles* of the *Vortexes* O and C, where there is no great Force of Resistance; whereas in A and B, it meets with those parts of the *Vortexes* K and L, which are most remote from their *Poles*, and have a greater Force of moving from L and K, towards S, than the Parts about the *Poles* of the *Vortex* S, have to tend towards L and K; and therefore it is manifest, that the most subtil matter which is in K and L, must move on towards the *Center* of our *Vortex* S, and that that which is in S, must tend towards the opposit *Vortexes* C and O. So that as much of this subtil matter, as gets out through Y and M, so much of the same matter enters, from the other *Vortexes* L and K through the *Poles* of our *Vortex*.

VIII. *But not the Matter of the second Element.*

But there is no such passage of the matter of the second *Element* from one *Vortex* to another; for being whirld round as well as the subtil matter, it endeavours to preserve its Swiftness, but would certainly lose much of the same, if it should wander out of the limits of its own *Vortex*, since the motion is so very slow in the *Polar Parts* of the other *Vortexes* M and Y, that it cannot meet with any free entrance there. Yea, tho' we should suppose, that the *Æthereal Globuli* should pass from the *Poles* of one *Vortex*, towards the *Center* of another; and that all the matter both of the first and second *Element*, contained in the *Vortex* L, at the very same moment of time, had begun to move, from the middle place between the *Centers* S and L, towards S; yet we shall easily understand, that the said subtil matter will arrive sooner at the *Center* S, than the *Globuli* of the second *Element*. Because the Agitation of the first *Element* far surpasseth that of the second, and hath always an open passage, through those little *Angles*, which cannot be fill'd up by the matter of the second *Element*. To which we may add, that the matter of the first *Element*, by passing through the narrow spaces left by the *Globuli*, meets with no impediment, nor loseth any part of its Swiftness, seeing that according to the Laws of *motion*, it always endeavours to recede from the *Center*, and hath a force to persevere in its Swiftness.

IX. *How the matter of the first Element is moved amongst the Stars.*

Having thus seen how the *Matter* of the *first Element*, which is impatient of *Rest*, breaks forth from one *Vortex* to another; we are to enquire how the said *matter* is moved amongst the *Stars*. Consider we therefore, that a part of the most subtil *matter*, in the Space *d e f g*, where we place the *Sun*, moves from A, by a *right line* to *d*, and there meeting with the *Globuli* of the second *Element*, beats them back towards B; and that contrarily another part of the said *matter* comes from B to *f*, and there drives before it the *Globuli* of the second *Element* which it meets with, towards A, and that immediately thereupon, as well the *matter* about *d*, as about *f* becomes reflected towards all the parts of the *Ecliptick e g*, and doth equally drive before it all the adjoyning *Globuli* of the second *Element*, and lastly gets away into M Y, through the materials that separate those *Globuli*, about the *Ecliptick e g*.

X. *The motion of the matter of the first Element is the cause of the Roundness of the Stars.*

Whereupon this Space must needs be *Spherical*, because the *matter* of the first *Element*, which is entred into the *Body of the Sun* by its *Poles* A B, must equally beat back all the circumjacent *Globuli* of the second *Element*, as well *those*, against which it is only obliquely reflected, as the other against which it pusheth in a direct *Line*; after the same manner as we see, that a *Glass pipe* is formed Round, because the *Air* driven through the *Iron pipe*, with an equal force spreads it self round, and equally presseth it on all sides.

XI. *The motion of the subtil matter amongst the Globuli is various.*

The matter of the first *Element* without the *Stars*, or whilst it wanders between the *Globuli* of the second *Element*, hath a various *motion*. For first it hath a *Proper motion*, whereby it runs to the filling up of the little Spaces left by the *Globuli* of the second *Element*, which the diversity of *motion* changeth every moment. And it hath also a *Circular motion* about the *Poles*, common to the whole *Heaven* A M B Y; because that which is contained between the little spaces of the *Globuli*, follows the *motion* of them. As *Water* contained in a *Barrel*, follows the *motion* of it, and accommodates its self to its *Figure*. It hath also a *Straigh motion*, from the *Poles* A B to the *Sun*; and likewise from the *Sun* to the *Ecliptick* Y M, according-

ing to the Law of *motion*, that *things which are circularly moved, always tend to recede in a right Line, from the Center of the Circle they describe.*

XII. *The matter of the first Element hath a greater force in the Stars than without them.*

VVhence it appears that the matter of the first *Element*, collected in the *Center* of the *Sun* and *fixt Stars* hath a very great Force, because the *motion* of all its *particles* do readily agree and conspire together, to push forward the *Globuli* with an equal Force: But this Force grows weaker out of the *Body* of the *Stars*, because it spends the greatest part of its Agitation, in changing the *Figures* of its little *Particles*, to the end it may exactly fill all the little Corners through which it passeth.

XIII. *Of the Figure of the Strait or Screw-like Particles.*

VVherefore whilst the matter of the first *Element*, passeth through the *Triangular* intervals 1 and 2 of the *Globuli* touching one another, it must needs assume a *Triangular Figure*, and become shaped into striate *Particles* 3 and 4 bent a contrary way. It is not easy to determin the length of those *Particles*, because this depends on the slenderness or abundance of the matter, whereof they are made: But it is sufficient to conceive them like little *Columns*, with three Notches round them *like a Screw*; so that in their whirling round, they may pass through those narrow passages 1 and 2 of a *Triangular Form*. For seeing that they are longish, and with a most swift *motion* pass between the *Globuli* of the second *Element*, which touch one another, whilst the *Globuli* in the mean time by a different *motion* are whirld round, about the *Poles* of the *Heavens*, we clearly understand, that their *Notches* must go winding about, like those of *Screws*, which winding must be more or less according as they pass through parts that are more remote from the *Axis* of the *Vortex*, or nearer to it, because they move more swiftly in those, than in these.

Figure 21.

XIV. *The Globuli of the second Element, have not the same bigness every where.*

As to the *Globuli* of the second *Element*, of which the *Vortexes* consist, they are not all of the same bigness; for those that are nearer to the *Star* and its *Center*, are less than those that are farther off, and consequently absolve their *Circle* in a less time. VVhich inequality of their Magnitude, extends it self to the Region of *Saturn* H N Q R, where the parts of *Heaven* move most slowly. Yet beyond that *Orb* it is probable, that the *Globuli* are all of an equal Magnitude, and that the Higher move more swiftly than the Lower. So as that the Higher must move more swiftly towards M and Y, than the Lower towards H and Q. The reason whereof is amongst other things, that the bordering *Vortices* being unequal, the *motion* of the subtil matter, between those unevennesses of the surface, becomes much accelerated.

Figure 20.

CHAP. XIII.

Of the Heavenly Sphere and its Circles.

I. *What the Sphere is.*

BY the word *Sphere* we understand that common instrument of a round *Figure*, consisting of several *Circles*, invented to explain and represent the *Heavenly motions*, and the Fabrick of the whole *VVorld*. This *Sphere* hath a little *Ball* in the midst or *Center* of it, with an *Axis* through it, the Extremities whereof are called *Poles*, about which the whole *Body* of the *Heavens* is supposed to turn round in the Space of 24 hours.

II. *What an Axis is.*

The *Axis* of the *World* is a *right Line*, which extending from one *Pole* to the other, passeth through the *Center* of the *World*. By this the *Earth* is said to be supported: Not that there is indeed any such visible *Axis* in the *Globe* of the *Earth*, which is terminated in the *Heavens*, and whereby the *Earth* is sustained; but only that such a *Line* is understood, which passing through the *Center* of the *Heaven* and *Earth*, reacheth to the utmost *Heaven*, and ends at two points, which are called the *Poles* of the *World*.

III. *What the Poles are.*

The *Poles* therefore are nothing else but the Extremities of the *Axis*, or two *Points* in the highest *Heaven*, *Diametrically* opposit, about which the whole bulk of the *Heavens* is conceived to be whirld about. The one of these *Poles* is always visible to us, and from its nearness to the constellation of the *Bear* is called *Artick*, the other which is always hid from us, being from its opposition to the former called *Antarctick*.

The Northern Pole is reard in sight on High,
The other hid under our Feet doth lie.

IV. *The Circles of the Sphere are either greater or less.*

There are ten *Circles* in an *Artificial Sphere*, six whereof are called *Greater*, whose *Diameter* passeth through the *Center* of the *World*, or which divide the *Sphere* into two equal Parts, and these are the *Horizon* and *Meridian* (between which standing immoveable, the other *Circles* are turnd round) the *Æquator*, the *Colure of the Solstices*, the *Colure of the Æquinoxes*, the *Zodiack* or broad *Circle*, and the middle line thereof, which is called the *Ecliptick*. The four lesser *Circles* are those whose *Diameter* doth not pass through the *Center* of the *World*, or which divide the *Sphere* into two unequal *Parts*. They are the *Tropick of Cancer*, the *Tropick of Capricorn*, the *Arctick* and *Antarctick Circle*, which also with the *Æquator* are called *Parallels*, as being at an equal distance from each other.

V. *The Equinoctial Circle.*

The *Æquator* or *Æquinoctial Circle*, which is the chiefest of all the rest, is that *Circle*, which in all its parts is equally distant from the *Poles* of the *World*, which it divides into the *Northern* and *Southern Hemisphere*. By the Greeks it is called the *Even-day Circle*, because the *Sun* twice in a year, that is about the 10 of *March*, and the 13 of *September* intersecting the same, makes two *Æquinoxes*, by rendring the *Days* and *Nights* equal, through his equal stay above and under the *Horizon*, because the *Æquotor* intersected by the *Horizon*, becomes divided into two equal parts, one Superior, and the other Inferior.

VI. *The Zodiack.*

The *Zodiack* is a greater *Circle* superinduced over the other moveable *Circles*, unequally distant from the *Poles*, and intersecting the *Æquinoctial* at two opposit *Points*; so that its middle line which is called the *Ecliptick*, hath one part of it inclining to the *North* Twenty three degrees, and Twenty eight minutes, according to the Antients, and the other part of it as many degrees reaching towards the *South*. This *Circle* is conceived Broad, because the *Planets* which move through it, do not all of them keep the same tract, but whilst the *Sun* takes it Course through the midst of this they *Circle*, along the *Ecliptick* they swerve to the *North* and *South*. The *Points* at which the *Zodiack* Intersects the *Æquator*, are called the *Æquinoctial Points*: because when the

Sun

Sun reacheth them, it makes *Day* and *Night* of equal length. And the *Points* by which the *Ecliptick*, declines furtheſt from the *Æquinoctial*, are called the *Solſtitial Points*, becauſe when the *Sun* comes to them he ſeems to ſtand ſtill. The *Zodiack* is furniſht with twelve *Signs* or *Conſtellations* of which hereafter.

VII. *The Colures of the Solſtices and Equinoxes.* The *Colures* are two greater *Circles*, which interſecting one another in right *Angles* at the *Poles*, do interſect all the other moveable *Circles*, dividing them into four equal *Parts*. For the *Colure of the Solſtices* paſſeth through the *Poles* and the *Solſtitial Points* of *Cancer* and *Capricorn*; but the *Colure of the Æquinoxes* is deſcribed through the *Poles* of the *World*, and the *Æquinoctial Points* of the *Zodiack*, at *Aries* and *Libra*. The uſe of the *Colure* is to mark out the four *Cardinal Points*, *viz.* the beginning of *Aries*, where whilſt the *Sun* is, the *Night* is equal with the *Day*, and the *Spring* begins; the beginning of *Cancer*, where the *Sun* makes the longeſt *Day*, and begins *Summer*; the beginning of *Libra*, where the *Sun* makes *Day* and *Night* equal, and begins *Autumn*; and the beginning of *Capricorn*, where the *Sun* makes the ſhorteſt day, and *Winter* begins.

By Crab and Capricorn Solſtice is made,
The Ram and Ballance equal Light with Shade.

VIII. *The Horizon.* The *Horizon* is the *utmoſt Circle* in a *Sphere*, encompaſſing all the reſt, and is that *Circle* which is equidiſtant from the *Vertical Point* of every place; and therefore is called by the Greek *Horizon*, that is to ſay, *Terminator* or *Finiſher*, becauſe it boundeth our ſight. For when ſtanding in a *Plain* we take a Proſpect round about, we ſee the *Heavens* every where, as it were touching the *Earth*; from which Commiſſure of the *Heaven* and *Earth* as the *Stars* get upwards, they are ſaid to *Riſe*, and when they ſink beneath it are ſaid to go down. Tho' the *Horizon* with regard to every particular place of the *Earth* be *immoveable*, yet conſidered in general it is mutable, foraſmuch as whilſt we Travel from one place to another, we alſo paſs from one *Horizon* to another.

IX. *The Meridian.* The *Meridian* is a greater *Circle* which paſſeth through the *Poles*, and the two *Points*, the one directly over our heads, called the *Vertical Point*, and the other oppoſit to it, under our Feet called the *Nadir*. This immoveable *Circle*, within which the other *Circles* are moved, is called the *Meridian*, becauſe when ever the *Sun* reacheth it, he makes *Noon* or *Midday*, by dividing the *Day* into two equal Parts. Whence it appears, that the *Altitude* or *Elevation* of the *Pole* in every *Country*, is nothing elſe but that *Arc* of the *Meridian*, which is intercepted betwixt the *Horizon* and the elevated *Pole*, and whoſe complement to the *Zenith* or *Quadrant* of the *Circle*, is always equal to the *Altitude* of the *Æquator*.

X. *The Tropicks of Cancer and Capricorn.* The *Tropick of Cancer* is a leſs *Circle*, Parallel to the *Equator*, paſſing through the *Northen Solſtitial Point* of the *Zodiack*. The *Tropick of Capricorn*, is a leſs *Circle*, *Parallel* to the *Æquator*, paſſing through the *Southern Solſtitial Point* of the *Zodiack*. They are called *Tropicks*, that is to ſay *Turn-agains*, for that as ſoon as the *Sun* in his withdrawing from the *Æquator* reacheth them, he begins to return again towards it. Their diſtance from the *Æquator* is 23 Degrees and an half; that being the furtheſt Elongation the *Sun* ever makes from that Line; wherefore, alſo it is called the greateſt *Declination* of the *Sun*.

XI. *The Artick and Antarctick Circles.* The *Artick* or *Northern Polar Circle*, is a leſs *Circle*, *Parallel* to the *Æquator*, paſſing through the *Pole* of the *Zodiack*, near the *Northern Pole*. The *Antarctick* or *Southern* is a *Circle* paſſing through the other *Pole* of the *Zodiack*, near to the *Southern Pole*. Theſe two *Circles* are at the ſame diſtance from the *Poles*, as the *Tropicks* from the *Æquator*, that is 23 Degrees and an half. They have alſo this common uſe with the *Tropicks*, that they ſerve to diſtinguiſh the *Zones*, the *Torrid* being comprehended within the *Tropicks*; and the *Frigid* within the *Polar Circles*; but the *Temperate Zones* lie between the *Polar Circles* and the *Tropicks*.

XII. *Whence the Latiude of a Place is taken.* All theſe *Circles*, the *Æquator*, *Ecliptick*, *Meridian*, with the *Tropicks* and *Polar Circles*, are applied to the *Terreſtrial Globe*: For the *Earth* alſo hath its *Equator*, commonly called the *Line*, correſponding to the *Cæleſtial Æquator*; and every place on the *Earth* hath its own *Meridian*. And theſe *Circles* are exceeding uſeful to diſtinguiſh the various Situation of *Places*, as well as to the Art of *Navigation*, and to the Knowledge of *Geography*. For ſince we may diſtinguiſh the *Earth* as well as the *Heaven*, in Length and Breadth; the *Latitude* of any *Place* is nothing elſe, but a Portion of the *Meridian*, intercepted between the *Æquator* and that *Place*. Wherefore, thoſe who live under the *Æquinoctial* have no *Latitude*; whereas they have the greateſt *Latitude*, who are at the greateſt diſtance from the *Æquator* under the *Poles*. The *Latitude* of a *Place*, is the ſame with the *Elevation of the Pole*, for they who live under the *Line*, ſee both the *Poles* in their *Horizon*, but as we withdraw from the *Æquator*, one of the *Poles* is Elevated above our *Horizon*, and the other depreſt beneath it.

XIII *Whence the Longitude is taken.* But the *Longitude* of a *Place* is taken in the *Æquator*, and is nothing elſe but a Part of the *Æquinoctial Circle* intercepted between the *Meridian* of any particular place (ſuppoſe *Paris*) and the firſt *Meridian* appointed by the conſent of Men, which *Meridian* is conceived to paſs through the *Iſlands*, of *Azores*.

XIV. *What a Right Sphere is.* A *Sphere* is either Right or Oblique. A *Right Sphere* is that whoſe *Horizon* paſſing through the *Poles* of the *World*, cuts the *Æquinoctial* at Right or Equal *Angles*.

XV. *What an Oblique Sphere.* An *Oblique Sphere*, is that whoſe *Horizon* cuts the *Æquator* at unequal *Angles*, and doth not paſs through the *Poles* of the *World*.

They therefore have a *Right Sphere*, who live under the *Æquator*, and they an *Oblique* who live under the *Tropicks*. Whence it appears that the *Sun* and the reſt of the *Stars* in a *Right Sphere* A B C D, to them that live under the *Æquator* B, Figure 22. ſeem to riſe and ſet in *Right Lines*, both the *Poles* lying on the *Horizon*; whereas in an *Oblique Sphere* E F G H, (where one of the *Poles* E, and Figure 23. the *Axis* of the *World*, is more or leſs obliquely inclin'd towards either ſide of the *Horizon*) they are ſeen to riſe above the *Horizon*, come to the *Meridian*, and ſet beneath the *Horizon* obliquely. For any one may eaſily apprehend, that where both the *Poles* lie on the *Horizon*, there the *Æquator* muſt be *Vertical*; and ſeeing it cuts the Hori-

zon

To the Right Honourable S.r Henry Goodrick of Ribston Park in York-Shire K.t and Baronet, Leivtenant Generall of their Majesties Ordenance, and one of the Lords of their most Honourable Privy Councell &c.a

Fortior Leone Justus

This Plate is humbly Dedicated by Richard Blome.

zon at *Right Angles*, the *Stars* must needs arise and set in *Right Lines*; and in like manner, whatsoever else is in the *Heaven*, forasmuch as all the *Circles*, which they describe *parallel* to the *Æquator*, will likewise cut the *Æquator* at *Right Angles*. And on the contrary, those that live between the *Æquator* and the *Elevated Pole*, because of the Oblique ascent and descent, have some *Stars* always in sight, and others ever out of sight.

CHAP. XIV.

Of the SUN.

I. *How the Sun was formed at first.*

FRom what hath been already said of the *Action* of the *Heavenly Matter*, we may easily understand how the *Sun* was formed at first. For whilst the *Globuli* of the *Second Element*, being more *solid* than the *Matter* of the *First*, withdrew from the *Center*, betaking themselves to the *Circumference*, the most *subtil Matter* being increased to too great a quantity (from the continual rubbing of *Bodies* against one another) to be contained in their Intervals, rush towards the *middle part*, where being tost with different *motions*, and most swiftly whirl'd about its *Center*, it constituted the *Sun*, and the other *fix'd Stars*. For seeing that our *World*, in the midst whereof the *Sun*'s Seat is, and which extends it self beyond the *Sphere* of *Saturn*, doth constitute one great *Vortex*, whose fluid and transparent *Matter* is circularly moved; it must follow that the *Globuli* of the *Second Element* will strive to recede from their common *Center*, and as far as their *Figure* and *Motion* will permit, come nearer together, and lye upon one another; which they cannot do, without driving the *Matter* of the *First Element*, whereof there is greater store than is needful, to fill their Intervals, towards that place which they have left; so that it cannot be, but that about the *Middle* of the *Vortex*, there must be a great *concourse* of the *Matter* of the *First Element*; which we take to constitute the *Body* of the *Sun*.

II. *What the Sun is.*

Accordingly we may define the *Sun* to be *a Lucid Body, consisting of the Matter of the First Element, gather'd together in the Center of a Vortex, in the room of the Globuli that recede from it.*

III. *Why the Sun is Round.*

From the Account we have here given of the *Sun*'s *Formation*, we gather *first*, that the *Sun* must be of a *Round Figure*; because the most *subtil Matter* entring the *Sun* at either of its *Poles*, continues its course in a *Right line*, until it meet with the *Globuli* of the *Second Element*, which are about the opposite *Pole*, and running against them, drives them forward by the force of its *motion*, and thereupon is *immediately* reflected, and turns round in all its parts towards the *Ecliptick*, and so drives forwards the adjacent parts of the *Second Element*, that are next to the *Center* of the *Star*, and by this means makes the *Sun* to be *Round*: So that if it should be intersected by a *Plain*, parallel to the *Ecliptick*, in whatsoever part the Section be made it will always be a *Circle*. For otherwise it would follow, that some parts of the *Second Element*, do not recede so far as they can from the *Center* of the *Circle* they describe; but this is impossible, considering the *Fluidity* of the *Heavens*.

IV. *Why the Sun is Lucid.*

In the *Second place*, we infer from hence that the *Sun* is *Lucid*; because the Matter of the *First Element*, gather'd together in the *Center* of the *Vortex*, by pressing every way upon the *Heavenly Globuli*, (besides the *motion* they have, as they are a *Liquid Body*) do communicate to them such a force or impression as is sufficient so to affect our *Eyes*, as to produce the *sense* of *Seeing*.

V. *How it comes to pass, that the Sun appears so much greater to us than any of the fix'd Stars.*

The *Sun* therefore, and the rest of the *fix'd Stars*, shine with their own *Light*, which their brisk and lively *Rays* are an evident Proof of. And the reason why the *Sun* appears *so great* to us, in comparison of the *fix'd Stars*, is, because he is nearer to us, who are in the same *Vortex*. For which reason also, the *Sun* doth not only abundantly illuminate our *Earth*, whence he is called in *Scripture, the Greater Light*; but also communicates *heat* and *warmth* to the same: Whereas the *fix'd Stars*, tho' visible to us; because of their Remoteness can do neither.

VI. *The Sun is a Fluid Body.*

The *Sun* therefore is no *solid Body*, neither a *burning Stone*, nor *Red-hot Plate*, as some of the *Ancients* apprehended, but consisting of a very fluid and movable *Matter*, which whirls all the Circumjacent parts of *Heaven* round with it. And thus much is not only confirm'd to us by *Reason*, but also by *Astronomical Observations*: For SIMON MARIUS, in *Scheinerus* his *Rosa Ursina*, tells us, That he had beheld the *Sun* thro' an *Optick Glass*, *boyling like molten Gold in a Furnace*. ATHANASIUS KIRCHERUS, in his *Book* entituled, *Ars magna Lucis & Umbræ*, writes, That he had seen the *Sun*, *like to the Sea, tost and foaming with Waves*. And RAPHAEL AVERSA assures us, That he had observ'd the *Sun* to be *a Fluid Body, contain'd in its place, as if it were in a Vessel, and agitated within it self, like a molten Metal*. Yea, there are several who have assured me, that the whole *Body* of the *Sun* boyls continually, and that they had often observ'd it through a *Prospective-Glass*, *boyling* like *Water* in a *Kettle*.

VII. *The Sun is a true Fire.*

Whence all *Modern Philosophers* that are of any Note, take it for granted, that the *Sun* is nothing else but a *Fire* or *Flame*. Since we have great reason to conclude that *Body*, which gives forth *Warmth* and *Light*, to be *Fire*; but we Experience the *Sun* to give forth *Heat* and *Light*: Therefore we must conclude the *Sun* to be a *Fire*. The *Minor* is manifest, because we are convinced that both these proceed from the *Sun* by our *Feeling* and *Sight*; neither do we find any thing in the *Fire*, which we may not with equal right attribute to the *Sun*. *Besides*, we cannot conceive any *Body* to have an *inborn* or *connatural Light*, by means of which it produceth *Heat*, except it be of the nature of *Fire*. Wherefore, seeing the *Sun* is as communicative of *Light* and *Warmth*, as *Fire* is, and that both of them have the same Properties; for the *Sun dries, melts, kindles*, and *burns*, as well as *Fire*: Therefore we must conclude that the *Sun* is *Fire*. For we can have no stronger *Argument* to prove two things to be the same, than by demonstrating, that all the *Effects* of one of them, do also proceed from the other. For as if any one by *Night* should meet with a *Body* that sent forth *flames*, heated the *Bodies* that were near it, and enlightned the *Air*, he would make no scruple to conclude it to be a *Fiery Body*: In like manner,

seeing the *Sun* performs all these things, we are not to question but that it is a *Fire* or *Flame*.

VIII. *Why the Sun's heat is greater in Summer than in Winter.*

But against this you will object, *First*, if the *Sun* were a *Flame*, and as such continually diffus'd its *heat* through the whole *World*; it would follow from hence, that the *Air* would never be *cold*; but this is contrary to Experience: For we find the *Air* much hotter in *Summer*, than in *Winter*.

Some endeavour to solve this Objection, by saying, that the Difference of *Heat* we feel at divers *Seasons*, proceeds from the various incidence of the *Sun-beams* on the *Surface* of the *Earth*, which in *Summer* come down to the *Earth* more directly, and in *Winter* more obliquely or slantingly. But this Answer will scarcely satisfie those, who consider that the *Surface* of the *Earth* is not polish'd, as a *Looking-Glass*, but rough and very uneven; and that consequently it may receive direct *Rays* in *Winter*, as well as *Summer*. The reason therefore why the *Cold* is more intense about the *Earth* in the *Winter-season*, is, because the *Air* we breath in, which is ten or twelve Miles high, hath a very smooth and even *Surface*, as having no *Winds* to ruffle it; and the *Sun-Rays* falling very slantingly in the *Winter* upon this smooth *Surface*, is the reason why fewer *Rays* are transmitted to us in *Winter*, than in other *Seasons* of the *Year*. To which may be added, that more *Vapours* and *Exhalations* at that time proceed from the *Earth* and *Sea*, which filling the *Air*, do allay the *Heat* of the *Sun*.

IX. *The Sun is fed and maintain'd as our Fires are.*

In the *Second place*, you'l object, That our *Fire* here below stands in need of *Fewel*, which is no sooner taken away, but it becomes extinct, and vanisheth: But in the *Heaven* there is no *Fewel* to feed the *Sun*'s *Flame*: Therfore it is a great mistake to suppose it a *Fire*.

X. *The Sun's Flame is not weakned by the Bodies that are about it.*

I Answer in the *first* place, That the state of the *Sun*, and our *Flames* here below, is very different: For our *Flames* stand in need of Nourishment, because they are compos'd of a *Fluid* and *Moveable Matter*, which is easily destroy'd by the *Bodies* that surround it; and therefore it is needful it should be furnish'd with *New Matter*, to supply that which is extinguish'd and vanisheth. But above the *Sun* there are no such *Agents* as are able to dissipate its *Matter*, and therefore it needs no *Fewel* to preserve it. For so vast a quantity of *Fiery Matter* is heap'd up in the *Sun*, that it can neither be exhausted or extinguish'd by it self, nor by the *Heaven* that surrounds it.

XI. *The Sun is fed and maintain'd by the Matter of the First Element.*

I answer in the *Second* place, That the *Matter* of the *First Element* is the *Fewel* of the *Sun*'s *Flame*, which is continually convey'd to the *Sun*, in the room of the like *Matter*, it loseth at any time. For the *Stars* entertain such a *Communication* among themselves, as to convey *food* to one another through their *Vortexes*, bestowing upon others what goes out by their *Ecliptick*, and receiving from others what comes in by their *Poles*. And thus *New Matter* continually enters into the *Sun*, by the *Poles*, and other *Matter* again flows out from it, in that part which is fartheſt from the *Poles*. And accordingly the *Sun* is always said to be the same, in like manner as a *River* is supposed the same, notwithstanding that *New Matter* continually makes up the defect of that which runs away.

XII. *How the Sun makes Twilight.*

The *Sun* is not only the Cause of the *Light*, which in the *day time* is diffused through the *Air*; but also of the *Twilight*, which is perceived in the *East* before its *Rising*, and in the *West* after its *Setting*; forasmuch as the *Rays* of the *Sun* falling obliquely upon the *Vapours* that are in the *Air*, are *refracted* towards the *Earth*. The Beginning of this *Twilight* happens, when the *Sun* is depresst beneath our *Horizon*, about 18 *Degrees*, perpendicularly taken from the *Vertical Circle*. Hence it is, that in those parts of the *Earth* where the *Sun* doth not in *Summer* sink below the *Horizon* 18 *Degrees*, there they have a continual *Twilight* all *Night* long.

XIII. *There are no certain Points of the Sun's Rising and Setting.*

Whatsoever part of the *Earth* the *Sun* salutes with his *Rays*, there he is said to *Rise*; and to *Set* in those *Parts* which he ceaseth to illuminate. Now forasmuch as there is no part of the *Earth* in which he may not sometimes *Rise*, and sometimes *Set* in this manner, we may assert, contrary to the Vulgar receiv'd Opinion, that there are no certain *Points* of the *Sun*'s *Rising* or *Setting*.

CHAP. XV.

Of Light.

I. *The Opinion of the Peripateticks, concerning Light, refuted.*

THe *Peripateticks* generally are of Opinion, that *Light* is a Quality really distinct from *Substance*; and propagated to the *Senses* they don't know how. But this *Opinion*, at present, hath but few Followers:

First, Because it is evident, that *Qualities* are no *Entities* really distinct from *Substances*, but only their *Modifications*, which neither can remove from the *Substances* wherein they are, nor do any thing without them.

Secondly, Because the *Beams* of *Light* are *reflected* from some *Bodies*: Now every *Reflexion* is caus'd by *Resistance*, and whatsoever meets with Resistance, must be *Corporeal*; but forasmuch as *meer Qualities*, abstracted from *Substances*, include nothing of *Corporeity*, neither can they be liable to *Resistance*. Whence we must conclude, that *Light* which is *Reflected*, is no *pure Quality*, separately existing from the *Lucid Body*.

Thirdly, The *Rays* of *Light* are *refracted*, and by the help of *Convex-Glasses* are strengthned; which could not be in case the *Light* were a meer *Quality*, for then, as being destitute of all *Quantity*, it would equally penetrate all *Bodies*. For the better understanding whereof, two things especially are to be supposed.

II. *Two things are to be supposed, in order to the understanding of the Nature of* Light.

First, That all *Bodies* consider'd in themselves, strive to move in *Right lines*. For a *Stone* thrown from you always moves strait forwards towards some part or other; nor ever turns aside, except by other *Bodies* meeting with it, it be forced to rebound or deflect. *Secondly*, That whatsoever is *Circularly* moved, as far as it is able, strives to recede from the *Center* of its *motion*; as we may experience in a *Leaden Bullet* tied to a *String*, for wee feel that the swifter the *Bullet* is whirl'd about, the stiffer the *String* is extended and stretch'd; which cannot be attributed to any other Force, but because it strives to recede from the *Center* of its *motion*.

When

III. *What is to be understood by the word* Striving.

When I say, that the *Bullet* strives to withdraw from the *Center* of its *motion*, it is not so to be understood, as if the *Bullet* or any other *Body* had a perceptive inclination to move one way rather than another; but only that it hath such an impulse to *motion*, that it would move in such a manner, in case it were not hindred of something else.

IV. *How Light is produced.*

We assert therefore, that *Light* consists only in this, that the *Matter*, which is in the *Center* of every *Vortex*, by its swift *whirling* about, doth shake the *Luminous Matter*, that is dispers'd throughout the whole *Heaven*, and all *Diaphanous Bodies*, which in *Right lines* beating against the *Nervous Fibres* of the *Tunica Retina*, produceth that perception, whence *Bodies* are denominated *Lucid*: For as a *Blind man* by the means of his *Staff*, because of its Resistance only, is able to distinguish betwixt *Bodies*; tho' no *Species* be transmitted by the *Stick* to the *Eye*: So likewise the Cause of the Perception of *Light* is nothing else, but that a certain *Matter* dashing against the *Organs* of *Sight*, stirs up the *Soul* to such an Animadversion.

V. *What Light, and the Rays of Light are.*

Light therefore is a *Quality proceeding from the Vibration of the Globuli diffus'd in Right lines, and moving the small fibres of the Optick Nerve, disperst through the Net-like Membran of the Eye.* Which is then chiefly, when the *Matter* of the *First Element*, contained in the *Center* of the *Sun*, or any other *Lucid Body*, strives to withdraw from it: For in so doing it presseth the adjacent *Globuli* of the *Second Element*, and they again those which are above them to the very last. So as that by this means the *Light* is diffused in a moment, to any distance whatsoever. Which will not be hard for us to conceive, if we consider that the *Action* of *Light* doth not so much consist in *Motion*, as in *Pression*, or a first disposition to *Motion*; and therefore that the *Rays* of *Light* are nothing else but so many *Lines*, by which that *quick* and *lively Action* is performed.

VI. *The Sun equally diffuseth its Light.*

From whence we conclude, that the *Sun* doth not more forceably drive forwards the *Matter* which is towards the *Ecliptick*, than that which is towards its *Poles*: For the *Sun* being of a *Round figure*, the *Matter* of the *First Element* entring into its *Center*, doth equally drive from it all the *Globuli* that surround it; so that no greater Force proceeds from one, than from any other *Point* of its *Superficies*, by which means infinite *Rays* are extended to every part of the *Body* it illumi nates.

VII. *What is required to the Production of Light.*

To the Production therefore of *Light*, is required, *First*, *Matter* very swiftly agitated, as is that which is in the *Center* of every *Vortex*. *Secondly*, A certain *Matter* that is shaken, as is that *Matter* which is about the *Stars*, that is, the *Globuli*. *Thirdly*, It is requisite that this *Matter* be shaken or vibrated in *Right lines*, or such as are equipollent to Right ones: For tho' in all *Diaphanous Bodies*, the *Pores* are not *Mathematically strait*; yet are they sufficiently so, for the transmission of the *Action of Light*. *Fourthly*, That this *Vibration* of the *Matter* be such, that by Moving the *Nerves* the *Soul* may be excited to that perception we call *Sense*; for it is our *Soul*, and *not the Body that is sensible*. When therefore either the *Organ* is unfit to receive this *Vibration*, or that it be affected by any stronger *Vibration*, the *Sensation* will be thereby hindred. And this is the reason, why after the *Sun* is *risen* we cannot see the *Stars*; because the stronger *Vibration* of the *Sun*, renders the weaker *Vibration* of the *Stars* imperceptible, except it be in case of some very great *Eclipse*.

VIII. *The farther the Beams of Light withdraw from the Luminous Body, the less and weaker they grow.*

Tho' the *Light* diffuse it self on every side, and equally drive before it the adjacent *Matter*; yet is its Action lessen'd according to the *Degrees* of its elongation from the *Luminous Body*. The better to comprehend this, suppose we the *Tube* A B C here decypher'd, enlarging it self by *degrees* to contain *Water* as high as D E; and let afterwards, by means of a *Spring*, so much *new Water* be spouted into it by the *Hole* A, as may be sufficient to fill the *Space* A F G, which tho' it be of some height, yet it hath but little breadth; it will hence appear, that by the accession of this *New Water*, the *Water* contained in the *Tube* will be sensibly raised a little higher towards H I, but not toward D E. By which *Example*, the Nature of *Light* is fitly illustrated: For as we cannot say, that the *Water* above D E is not raised higher at all, but only that it is raised very little; so in like manner we must say, that the farther the *Beams* of *Light* recede from the *Luminous Body*, the weaker and less their *motion* is. Figure 24.

IX. *How tho Light must be reflected upon its meeting with some Bodies.*

As a *Body* that is in *motion* upon meeting with another *Body* that resists it, doth lose its determination, and is forced to turn aside; as we experience in a *Ball*, which being struck against a *Wall*, rebounds; so we are to conceive, that the *Light* meeting with some *hard Body*, is by it reverberated. For seeing that *Light* is nothing else but a *pression* of the *Globuli* of the *Second Element*, which tho' in the *Pores* of *Water*, *Air*, *Glass*, and other such like *Bodies*, do touch one another in various *ranks* or *rows*: Suppose the *Globuli* that constitute the Row C D, to represent those Parts of the *Second Element* that constitute one *Ray*, falling upon the *hard Body* A B; it is necessary that the *Action* of this *Ray*, be continued by the *Line* D E, towards E, that so the *Angle* of *Reflexion* B D E, may be equal to the *Angle* of *Incidence* A D C; that is, this *Action* must be transmitted by the very same *Lines*, which the *Globulus* C would describe, in case it were alone, and were moved by the *Line* C D: For it is manifest, that the *Globulus* D is *disposed* to move onwards that way it would really move, if its Power were reduced to act. And because this *Globulus*, by meeting with the *Body* A B, would neither tend towards G nor H, but only towards F, it is evident that the *Globulus* F only is push'd forwards by it, and that that alone receives its *Action*. This is confirm'd by daily Experience, for we find that the *Sun-beams* falling upon the Surface of any *Compact Body* (as *Gold*, or *Steel*) are reverberated, and that the *Lights* Angle of *Reflexion*, is equal to the *Angle* of Incidence. Figure 25.

X. *Light cannot be Fire.*

I know no Body that hath better explained the nature of *Light* than our *Author*: And tho' they who maintain *Light* to be *Fire*, do support their Opinion by strong *Arguments*, yet they struggle with many difficulties, which are of no force against our *Opinion*. For according to their *Hypothesis* two *Bodies* would be in one place, if *Light* and *Fire* were one and the same thing. Again there

are

are many things that give *Light* without imparting *Heat*. Moreover, what shall we say becomes of the *Light*, when the *Sun* leaves our *Hemisphere*? shall we suppose that such a vast *Body* can perish in a moment? And lastly, how can the *Light* without interruption or disturbance reach our *Eyes*, when the *Air* is shaken by *Winds*, seeing one *Body* always resists another? And other such like difficulties that may be urged against the *Light*'s being *Fire*.

IX. *No inconveniences follow upon supposing Light to be Motion.* But by constituting the nature of *Light*, in the *Pression* of the *Subtil matter*, we are delivered from the Danger of *Penetration* of *Dimensions*: neither are we necessitated to admit that *Light*, is always in conjunction with *Heat*; forasmuch as the *matter* of the *first Element*, can withdraw from the *Center* of the *Lucid Body*, and push forwards the *Globuli* of the *second*, which compass it about without producing the effect of *Heat*, as appears in *Glow-worms* and *Rotten-wood*. Neither are we pinched by that Question which demands, what becomes of the *Light* when the *Sun* withdraws from our *Hemisphere*, seeing we maintain the *Light* to be no more than *motion*, which cannot but cease as soon as the cause vanisheth. Neither needs the objection of the *Air* tost with *Winds* to trouble us, forasmuch as the Intervals, which we conceive to be between the *Parts* of *Bodies*, are fill'd with the *Subtil matter*, and are always open for the *Globuli* of the *second Element*, so that nothing hinders the *Light* from coming to us in a *Right Line*.

XII. *How Light is transferred in a Moment.* There is one *difficulty* only which seems somewhat to affect us, *viz.* how the *Light* of the *Sun*, and *fixt Stars* can reach our *Eyes* in a moment; yet even this also will be removed, if we consider, that the nature of *Light* doth not consist in the *Duration* of *Motion*, but that it is only a *Subitaneous Action*, directed to our *Eyes*, through the *Pores* of the *Air* and other *Diaphanous Bodies*; much after the same manner, as we by night with a *Stick* can discern and distinguish between *Water*, *Clay*, *Stones* and such like: For we then experience that the same *Action*, wherewith the end of the *Stick* toucheth the *Body*, is at the same instant felt at the Head of the *Stick*: And which would be the same were the *Stick* never so long, as might be demonstrated by many Examples.

XIII. *An objection Answered.* If it be objected, that the *matter* of the second *Element* being *Fluid*, a Range of its little *Pellets* reaching from the *Sun* to our *Eyes*, cannot have the same effect in pushing fowards in a *right Line* as a *Stick* would and must have; for the more round and slippery these *Pellets* are, the more apt they are to slide away, and by this means to make the impulsion of no effect. To this I answer, that tho' the *matter* of the second *Element* be the most *Fluid* of all *matters*, yet this doth not hinder but that a Rank of them, reaching from the *Sun* to our *Eyes*, may be as effectual in pushing, as an *inflexible* stiff *Line*: For the *World* being every where full, every Ray of *Light*, hath always many others about it, which hinder it from sliding away, and consequently transmits the Action of the *Lucid Body*, in the self same manner as if it were a stiff *Stick*.

XIV. *In the Transmission of Light there is no Translation of a Body.* You'l say, that no *Motion* can be made in an instant. We grant it, for in that *Motion* wherein the Action of *Light* consists, no *Body* is transmitted, but the *Motion* only is transferred from one *Body* to another. For the *Sun*, who is the *Principle* and *Fountain* of *Light* is not transmitted to our *Eyes*, but its *motion* only is continued to our *Eyes*, by means of the *Subtil matter*, which fills the *Pores* of the *Air*, and other *Pellucid Bodies*. Nor is it any contradiction that a *motion* should be transmitted in an instant, tho' no *motion* can be made in an instant.

XV. *How the solar Light might appear though there were no Sun.* From what hath been said, it may be clearly understood, how that *Action*, wherein we conceive the nature of *Light* to consist, spreads and diffuseth it self every where from the *Body* of the *Sun* and *fixt Stars*, and how in the least moment of time it extends it self to the farthest distance; and to *Right Lines*, not only from the *Center of the Lucid Body*, but as well from any other *Points* of its *Surface*: Whence all other Properties of *Light* may be deduced. And I may add further, which will seem to some a great *Paradox*, that all these things would happen in the *Heavenly matter*, tho' there were no force at all in the *Sun* or any other *Star*, about which it was whirld: So that if the *Body* of the *Sun*, were nothing else but an empty *Space*, yet should we perceive his *Light* as well as now we do, (tho' it would not be so strong) at least in that *Circle* wherein the *Heavenly matter* is moved.

XVI. *How Des Cartes is to be understood, when he saith that Light is only a Propension to motion.* Some, it may be, will object that *Des Cartes* makes *Light* to be nothing else, but an *Aptitude* to *motion*; as when he saith *Dioptric.* Cap. 1. *that Light is nothing else, but the Action of the Cœlestial matter, or a Propension to motion.* Now if it be only a *Propension* to *motion*, it is no *motion*, and therefore the *Light*, which he saith, is received in the most *Subtil matter*, that fills the *Pores* of other *Bodies*, will never be produc'd, as long as it hath only a Propension to push forwards the same. Whence we must conclude, that if *Light* be an *Action*, and that such an one, as tends to the production of *motion*, *Light* must be before *motion*; for every *cause* is before its *effect*, and therefore *Light* cannot be *motion*.

XVII. *The distinction of Lux and Lumen, or Light in its Fountain, and Light in the Medium.* This difficulty will be easily cleared, by distinguishing betwixt *Light* in its *Fountain* or *Principle*, such as are *Lucid Bodies*; and *Light* in a *Medium*, that is, any *Transparent Bodies*. The Propension to *motion*, or pression which is in the *Lucid Body*, as the *Fountain*, is properly called *Lux*: But when considered in its progress, that is, in the *Heaven*, or the *matter* of the second *Element*, then it is called *Lumen*, tho' *Authors* commonly confound both these *words*, using them promiscuously; *Lux* therefore, or *Light* in its *Fountain*, is a Propension to *motion*; or is that *Action* in *Lucid Bodies*, which tends to produce some *motion* in *Transparent Bodies*, which is *Lumen* or *Light* in a *Medium*. Neither doth it imply any absurdity to say, that *Light* in the *Fountain*, preceeds *Light* in the *Medium*, since every cause is before its *effect*. The *motion* therefore which is in *Lucid Bodies*, produceth another *motion*, that is, *Light* in the *Air*, and other *Pellucid Bodies*.

XVIII. *The Sun is not before the Light.* It may be you'l urge, that if *Light* be that *Action* or *Motion*, whereby the *Sun* or any other *Lucid Body* pusheth forwards the *Subtil matter*, which is in *Transparent Bodies*, then the *Sun* must be conceived to be *before* that *Action*, and by consequent would be destitute of all *Light*; every *cause* being before its *effect*.

But

X. *The Answer* But I answer, that this doth not follow, because the *Light* it self, or that *motion*, whereby the *Sun* doth circularly push fowards the *Subtil matter* whereof it is composed, is natural to it, and therefore it is not necessary, that as an *Efficient cause* it should be before it. Forasmuch therefore as the *Sun* is composed of the most *Fluid matter*, which is wholly whirld about its *Center*, it is necessary according to the *Rules of motion*, that it press the *matter* of which the *Heaven* is made, that is, the *Subtil matter*, which from the *Stars*, reacheth to our *Eyes*; in which *Action*, the nature of *Light* consists.

CHAP. XVI.

How Spots come to be Generated about the Sun, and fixt Stars, and how they vanish again.

I. *What the Spots of the Sun are and who was the first discoverer of them.* BY the *Spots* of the *Sun*, we understand those close or compact *Bodies*, consisting of gross and slow *Particles*, mixt with others that are more Thin and Subtil, which since they cannot comply with the *motion* of a more *Subtil matter*, are cast out from it; and by reason of their slower *motion*, clinging together about the *Surface* of the *Sun*, continue there for some time, and follow the *Suns motion*, according to the course of the *Ecliptick*, till by the *Suns* force they be dissolved, or suckt in again by it, or wholly expell'd from it. The first Observer and Discoverer of these *Spots* was *GALILÆUS*, in the year 1610, when he was *Mathematick Professor* in the University of *Padua*; and asserted them to be contiguous to the *Body* of the *Sun*, and that they moved round it, or rather were whirld about by the *Solar Globe* in the Space of 26 or 27 Days.

II. *The Colour and Figure of the Solar Spots.* The *Spots* of the *Sun* appear for the most part of a *Black-colour*, and are commonly surrounded with a *Darkish cloud*, which in the inside is more *Bright* than it appears on the outside. They vary their *Figures*; as appears by that *Spot* which was first discovered by the Famous *CASSINUS* in 1672, and which appeared 36 or 37 Days. These *Spots* are moved more slowly from the *Eastern part* of the *Sun*, to the *West*, and pass from one brim to the other in about 13 Days time. Their *motion* is found to be more swift near the *Center*; and they seem to make as great way in that part in 4 Days, as they do in 9 or 10 Days when they are near the *Circumference*. They appear likewise bigger in the *Center*, but near the *Circumference* long and narrow. From this their swifter *motion* near the *Center*, it is concluded either that they cling to the *Sun*, or at least are very near to him.

III. *How these Spots are formed.* Now as to the manner of their *Formation* we are to note, that the *Particles* of the first *Element* are not all of them of the same *Bigness* and *Figure*; and tho' we conceive them to be very *Little*, yet withal we must conclude some of them to be cornerd, and not so fit for *motion*, if we consider the Spaces or Intervals of the *Globuli* through which they pass: For these Spaces being mostly *Triangular*, they by passing through them get the same *Figure*, not much unlike the form of a *Screw*, as hath been before observed: By which means it is, that they cannot move so swiftly as before, but do as it were rest or lye still, with respect to others that are more swiftly moved, and so more easily cling together. For tho' they retain the name of the first *Element*, as long as they continue between the *Globuli* of the second *Element*, because then being yet in their swift course, they only fill up the Spaces that are betwixt the *Globuli*, without composing any grosser *Bodies*: Yet they obtain the name of the third *Element*, when they come near to the *Body* of the *Sun*, especially the more gross and slowly moved *Particles*; for seeing they cannot comply with the *motion* of the rest of the subtil Matter of the first *Element*, they are cast out from it, and by running together into great Lumps or masses, they obscure and at last wholly hide the *Star*, from whence they came forth; for by clinging to its *Surface*, they darken and obstruct the *Light* proceeding from it, and hinder it from pushing forwards the subtil Matter in right *Lines*, wherein the force of *Light* doth consist.

IV. *Spots are of two sorts* Some *Spots* are more *Solid*, and very compact, as are those which run round the *Sun*; others are *more thin*, and therefore dissipable, such as are those which sometimes appear about the *Sun*, and then vanish again.

V. *Spots like a kind of Scum, stick to the Star whence they proceed.* For as we see that *Water* or *Oil boyling* in a *pot*, doth cast off those *Particles* that are less fit for *motion*, and raise them up to the *Surface*, reducing them into *Scum*: So the *Sun*, whose *matter* is agitated with a fervent *Heat*, doth cast off from it, those grosser and many corner'd *Particles*, which cannot accommodate themselves to the motions of others, and these afterwards running together, constitute a kind of Scum, and so obstruct the *Light*. Which then more especially happens, when the *Sun* darts his *Rays* more forceably against them, for by this means, they are driven more closely together, and become more compact.

VI. *The Sun appears sometimes more dim and obscure because of the interposition of his Spots.* By this means it may happen, that a *Spot* which at first is *Soft* and very thin, may at last grow to that hardness, as to stop the passage of the *Suns Rays*. Thus *Historians* assure us, that the *Sun* hath been seen for many days together of a *Pale colour*, not much exceeding the weak and dim *Light* of the *Moon*. Neither, in my Judgment, is there any other reason assignable, why some *Stars* appear now greater, and at other times less, but because their Aspect is varied, according to the diversity of *Spots* that surround them: Yea, they may sometimes become so totally cover'd by them, that for many years they may be hid from us. So formerly the *Constellation* of the *Pleiades* consisted of 7 *Stars*, whereas now 6 only can be seen.

VII. *How a new Star may suddenly appear.* And on the contrary it sometimes happens, that a *Star* not seen before, all on a sudden appears to the *World*: Which is when the *Vortex* wherein the *Spot* is, by pressing the Neighbouring *Vortexes* more strongly, than they press it, doth enlarge its Bounds; by which means the *Matter* of the first *Element*, rushing in more abundantly, to the obscured *Star*, diffuseth it self over the *Surface* of the *Spot*; as *Water* is seen sometimes to over-flow the *Ice*: and then the *Star Shines* forth as *Bright* as if it had no *Spot* at all to darken it. According to this *Hypothesis*, we may understand how the *New Star* came to appear in *Cassiopeia* in the year 1572, which continued for 2 years, but

appeared greatest at first, and afterwards being darkned by Degrees, at last wholly vanished.

VIII. *How these Spots are sometimes turned into Torches.* It also happens sometimes, that the *Solar Matter* flowing about the *Spots* wherewith it is coverd, doth rise above or beyond them, which *Matter* being thus pent up between them, and the *Surface* of the Neighbouring *Heaven*, is made to move more swiftly; as a *River* that is straitned in its passage doth run with more violence. And for this reason it is, that often *Torches* or *bright Flames* have been seen where formerly *Spots* appeared; and so on the contrary, the parts of *Spots* beginning to appear again, *Spots* have been seen where formerly *Torches* appeared.

IX. *Why the Spots about the Sun move so slowly.* The *Spots* about the *Sun*, take up no less time than 26 Days in running round it, notwithstanding they are so near to the *Body* of it; which *slowness* of their *motion* proceeds chiefly from hence, that a kind of *Æther* is generated, of the *Striate Matter* which the *Sun* continually casts forth, which extending it self a great way towards the *Orb* of *Mercury*, doth hinder the *motion* of the *Maculæ*.

X. *The Cause of the Darkness which happened at the Death of Christ.* It doth not appear by *Authors*, whether the whole *Earth* was darkned at the Death of *Christ*, or the *Holy Land* only: But supposing (as it is most probable) that the whole *Earth* was obscured (as the *Scripture* seems to assert, and *Dionysius* the *Areopagite* does plainly witness, who was a Spectator of this wonderful *Eclipse* at *Heliopolis* in *Egypt*) the cause of this Obscuration can't be attributed to any thing better than to these *Spots*. Seeing it is possible for one *Spot* to spread it self over the whole *Surface* of the *Sun*, and to continue there for some time, before it be dispers'd again. And forasmuch as the *Body* of the *Moon* is much less than that of the *Sun*, we must conclude, that this total *Obscuration* could not proceed from the *Moon* alone, without the assistance of these *Solar Maculæ*, or *Spots*.

XI. *The Moon assisted in the obscuration of the Sun, at our Saviour's Death.* I will not deny, but this famous *Eclipse* might be caused by the intervention of the *Moons* Body, notwithstanding that it hapned at the time of the *Full Moon*. It appeared so to St. *DENYS*, as he testifies in his *Epistle* to *Polycarpus*: *Whilst I was* (saith he) *at* Heliopolis *in* Egypt, *I beyond all expectation saw the Moon upon the Body of the Sun.* Whereupon, as being astonished at this *Prodigy*, he cried out, *Either the God of Nature suffers, or the Frame of this World is dissolving.* But then, because the *Body* of the *Moon* was not great enough to effect a total obscuration, the *Solar Spots* came to its assistance, and wholly cover'd the *Sun* for three Hours together.

XII. *How these Spots come to disappear again.* As these *Spots* are generated, so in like manner are they dissolved again and vanish. For as *Oil* and other *Liquors*, do after some time suck into themselves again the Scum that hath cover'd their *Surface*; so likewise the *Striate Particles*, that cover the *face* of the *Sun*, in process of time grow less; and as they at first came from it, so they return to the *Sun* again. Except the thickness of the Parts, into which they are resolv'd, be such, that they are not able to pass through the *Globuli*, that are near the *Sun*; and therefore are forc'd to wander about, and disperse themselves in the adjacent *Heaven*.

CHAP. XVII.

Concerning COMETS.

I. *The Nature of Comets.* COMETS are certain *Bodies* appearing amongst the *Stars*, in the utmost part of our *Heaven*, and that in various *Forms*, and in bigness resembling *Mars*, *Jupiter*, or *Saturn*, when they are cover'd with a *Mist* or little *Cloud*. They are compos'd of the Parts of the *Third Element*, and are so solid, that after they have for some time been swiftly carried in our *Heaven*, they are cast off into some of the Neighbouring *Vortexes* of the *Second Heaven*, and so disappear to us. They are sometimes called *Hairy Stars*, because of *Beams* like *Hair* proceeding from them, by which they are distinguish'd from the *Planets*, which appear exactly Round.

II. *How Comets agree with, and differ from Planets.* The *Comets* therefore agree with the *Planets*, in that both *Planets* and *Comets* are Vast, Round, Opake *Bodies*, flowing or swimming in the *Heaven*. And they differ, in that *Planets* are less solid than *Comets*, and therefore not capable of so great agitation, as whereby they may be driven out of the *Sun's Vortex*, into other Neighbouring *Vortexes*; as *Comets* which have a stronger impulse, by reason of their greater solidity, do continually pass out of one *Vortex* into another.

III. *The Peripaticks suppose Comets to consist of Earthly Exhalations.* The *Peripaticks* rank *Comets* amongst *Fiery Meteors*, and therefore attribute their *Generation* to *Exhalations* arising from the *Earth*, and kindled in the upper *Region* of the *Air*; but the *Modern Philosophers* are of a different Opinion, and that for these following Reasons.

IV. *Reasons against the foresaid Opinion.* *First*, Because *Comets* are in the *Heaven*, and not in the *Air*, as being observ'd to have either no *Parallax* at all, or a very small one, that is, less than the *Moon*, and consequently must be at a greater distance from us than she is: *For the lesser the Parallax of any Star is, the greater is the Distance.*

Secondly, *Comets* cannot consist of *Earthly Exhalations*, because they are bigger than the *Earth* it self: For their appearing *Diameter* (their Distance consider'd) is oftentimes greater than the *Diameter* of any of the *Planets*. *The appearing Diameter is different, according to the Distance of the Body, as being Smaller in a less Distance, and Greater in a greater Distance.*

Thirdly, If *Comets* were kindled *Exhalations*, no reason could be given why they should not decrease daily, as their *fewel* decreaseth; whereas we find that they all increase and decrease after one and the same manner: For they are less at the Beginning and End of their appearing, and biggest in the Midst. But because some relate, that *Sublunary Comets* have at some times appeared, we will distinguish *Comets* into *Bastard* and *True*.

V. *The distinction of Bastard and true Comets.* We call those *Bastard Comets*, which are compos'd of *Earthly Exhalations*, raised into the upper *Region* of the *Air*, and there kindled. But *True Comets* are such as are above the *Moon*, and which shine by reflecting of the *Sun's* Beams, not by being kindled into a *Flame*. Those of the first kind, if any such be, are *Meteors*; but the latter are all *wandring Stars*.

VI. *What a Comet is.* A *Comet* therefore *is a Wandring Star, compos'd of the Matter of the Third Element, which because of its solidity and great agitation passeth from*

I. The Nature of Comets.

G. Freman. Inv. I. Kip Sc.

To the Worship-full Andrew Lant
of Thorp-vnderwood in the County of
Northampton Esqr.
This Plate is humbly Dedicated by Richard Blome

from one Vortex to another. I take both *Comets* and *Planets* to be perpetual *Bodies*, made in the Beginning of the *World*, and continually toſt between the Superiour or utmoſt parts of the *Vortexes*.

VII. *The Original of Comets.* But to the end we may the better underſtand the Original of *Comets* (in caſe we ſhould ſuppoſe any of them to be produc'd anew) we are to remember, that the *Matter* of the *Firſt Element*, which from other adjacent *Vortexes*, paſſeth thro' the *Poles* into the *Center* of our *Vortex*, doth carry along with it many *ſtriate Particles*, which being unfit to comply with the ſwift agitation of the *ſubtil Matter*, are caſt forth; which afterwards, becauſe of the *inequality* of their *Figures* eaſily cling and ſtick faſt together, and by this means come to conſtitute great *Maſſes*, and being cloſe to the *Star* from whence they proceed, reſiſt the *Action*, wherein the Nature of *Light* conſiſts; and in this reſpect, are very like thoſe *Spots* about the *Sun*, which we have already ſpoken of.

VIII. *How a fix'd Star becomes changed into a Comet.* Now, whenever it happens that a *Star* is cover'd with ſo many and thick *Spots*, as that its *Vortex* becomes ſwallow'd up of other adjacent *Vortexes*: Then if it be ſo ſolid, that before it comes to that Term or Limit, where the parts of the *Vortex* are moſt ſlowly moved, it happens to acquire a *motion* equal to that of thoſe Parts amongſt which it is, in this caſe it deſcends no lower, but from this *Vortex* paſſeth into others, and becomes a *Comet*. But if it be leſs ſolid, and conſequently deſcends beneath that Bound, then it continues there at a certain diſtance from the *Star*, which is in the *Center* of that *Vortex*, and whirls round about it, and by this means becomes a *Planet*. For this is the difference betwixt a *Comet* and a *Planet*, that a *Comet* being more ſolid, is carried from one *Vortex* into another; whereas a *Planet* continues fix'd to one *Vortex*, and is obſequious to its *motion*.

IX. *The Air is not the Place of Comets.* Tho' Modern *Authors* be much of the ſame mind with one another about the *Subſtance* of *Comets*; yet are they at great Variance about the *Place* of them. *Some* will have them generated in the *Third Region* of the *Air*, as being of Opinion, that the *Exhalations*, of which they ſuppoſe *Comets* are made, cannot aſcend higher. But this Opinion, as hath already been made out, is not probable; foraſmuch as the ſame *Comet*, is at the ſame time perceived in divers very remote Parts of the *World*, eſpecially that of the Year 1618, which was ſeen in *Europe*, and in the *Eaſt-Indies*, which could not have been, had its place been in the *Air*.

X. *They run round the Earth in 24 Hours.* Beſides, *Comets* commonly compaſs the whole *Earth* in 24 Hours time, and are obſerv'd to make the ſame ſtay above, as under the *Horizon*. All which may eaſily convince us, that they muſt be above the *Air*. For the *Earth* is not far diſtant from the *Circle* of the *Air*, and compar'd with it, hath a conſiderable Magnitude; ſo that if from its *Surface* we ſhould divide the *Air* into two Halves, they would not be equal, but the Half hid from our ſight, would far exceed the other; and accordingly a *Comet* would longer continue under, than above the *Horizon*; which we find not to be ſo.

XI. *The Place of the Comets is between Saturn and the fix'd Stars.* *Comets* therefore are to be placed in that *Space*, which is between *Saturn* and the *fix'd Stars*; as appears by their Excurſions, and other of their *Appearances*. Neither can they be placed amongſt the *Planets*, foraſmuch as they are Regular in their *Motion* about the *Sun*, and never wander out of their *Spheres*. And by this means we may eaſily apprehend, how *Comets* abſolve their Revolution in 24 Hours time, and continue no longer under, than above our *Horizon*; becauſe the Bigneſs of the *Earth* being inconſiderable, with reſpect to that *Space* they move in, we may well enough divide the *Circle* of the *Air* into two equal Halves.

XII. *Why ſome Aſtronomers ſay, that Comets are only above the Moon.* And tho' *Tycho*, and other *Aſtronomers*, who have acurately obſerv'd their Appearances, have only ſaid, that they were above the *Moon*, towards the *Spheres* of *Venus* or *Mercury*, and not above *Saturn*, (tho' they might as well have concluded, that from their *Calculations*;) the Reaſon whereof was, becauſe they diſputed againſt the *Ancients*, who took the *Comets* to be *Meteors*, and therefore were content to ſhew that they were in the *Heavens*, and were loath to attribute to them all the height, which they had found out by their Calculations, leſt they ſhould be disbelieved, by advancing ſuch incredible *Paradoxes*.

XIII. *Comets that wander out of our Heaven, are no longer ſeen by us.* But foraſmuch as the Space which is between *Saturn* and the *fix'd Stars*, is *Immenſe*; we ſay that *Comets*, how great ſoever they may be, cannot be ſeen by us, if they be far diſtant from our *Heaven*; for the *Light* which they borrow from the *Sun* is very weak, neither have they force enough, at ſuch a diſtance, to affect our *Sight*. Which is the Reaſon, that when they approach to the *fix'd Stars*, they diſappear; or if their *Body* appear, yet their *Tail* is hid. But the *fix'd Stars*, which are beyond them, eaſily tranſmit their *Light* to us, becauſe they have a *Light* of their own, which makes them dart their *Rays* more ſtrongly; whereas *Comets* that ſhine only with a borrowed *Light*, muſt be in our *Heaven*, to be ſeen by us.

XIV. *How the Comets are moved.* The *Comets* do all of them ſeem to move about the *Earth* from Eaſt to Weſt, and in this their *Motion* they deſcribe *Circles* almoſt *parallel* to the *Æquator*. But beſides this apparent *Motion*, which is common with them to all the reſt of the *Stars*, they have another that is *peculiar* and *proper* to themſelves, but very irregular and indeterminate, by which ſome of them move from Eaſt to Weſt, others from Weſt to Eaſt, or to other *Coaſts* of the *Heavens*. Neither can their Courſe be ſaid to be Regular, but rather various and unequal, ſince ſome of them paſs through a greater Space of *Heaven* than others. But however Great this Space may be, there are but few of them that ever were perceived to run through above one Half of the *Heaven*.

XV. *What the Beard, Tail, and Hair of Comets is.* When a *Comet* caſts its *Rays* towards that part of the *Heaven*, whither it is carried by its own *Motion*, ſuch *Rays* are commonly called a *Beard*; but when they tend to that part from whence it tends, then are they called the *Comets Tail*; and when they are caſt forth circularly, we call them *Hair*, or a *Roſe*.

XVI. *The Cauſe of theſe Appearances.* It will not be difficult to give a Reaſon of theſe *Phænomena*, if we call to mind that the *Heavenly Globuli* of the *Vortex* wherein we live, are by ſo much leſs, as they draw nearer to the *Center*; and by degrees grow greater and greater until the

Sphere

Sphere of *Saturn*, where they are of an equal bigneſs, and are more ſwiftly moved. When therefore a *Comet*, taking its Courſe beyond the *Region* of *Saturn*, tranſmits the *Rays* it receives from the *Sun* to us, it at the ſame time puſhes forwards the *Globuli* of the *Second Element* in *Right lines* to our Eyes, which imparting their active Force to others that are under them, produce an entire and pure *Light*, which makes the *Head* or *Body* of the *Comet* to appear to us: Whereas thoſe which fall obliquely upon the little *Globuli* that are beneath, or on the ſides of them, are partly refracted, and ſo repreſent a *Beard* or *Tail* to us. But thoſe which are diſperſt round about on all ſides, exhibit *Hair*, or a *Roſe*. For the variety of all theſe Appearances proceeds only from the *Reflexion* of the *Rays* of *Light* upon the *Comet*; which having been refracted by paſſing through the *Heavenly Globuli*, are ſo received into our *Eyes*, as if they came from thoſe parts, where we think we perceive the *Beard*, *Hair*, or *Tail* of the *Comet*.

Figure 26.

Thus the *Globuli* of the *Second Element*, 3, 2, 1, 9, 7, which are extended from the *Sun* to the utmoſt Bound of the *Sphere* of *Saturn* H, C, I, are very ſmall, whereas thoſe that go beyond that *Sphere* H, F, A, 4, 5, 6, I, do exceed them in Bigneſs; ſo that each of the greater *Globuli*, that are in the utmoſt part of the *Sphere* of *Saturn*, may be ſurrounded by 7 or 8 of the ſmaller *Globuli* that are lower. And foraſmuch as the greater *Globuli*, falling perpendicularly upon the *Sphere* of *Saturn*, do puſh upon few of thoſe that are under them, they muſt neceſſarily produce only a weak *Refraction* of *Light*; whereas on the contrary, thoſe that fall obliquely upon it, ſince they have many little ones on one ſide of them, muſt needs make a greater *Refraction* of weak *Rays*. As for Example; the Greater *Globulus* C, falling perpendicularly on the little ones that are under it, hath only 2 *Globuli*, *viz.* 1 and 3 on each ſide, and therefore both ways produceth ſmall *Refractions*, deflecting from the Perpendicular C B, whereof the one is only directed from C to D, but the other from C to E: But the greater *Globuli* H and I, falling obliquely on the leſſer, do puſh forwards 6 or 7 of them, *viz.* thoſe that lye under them; and therefore the greater *Globulus* I, produceth a conſiderable *Refraction* from I unto B, deflecting from the Perpendicular I K; and ſo likewiſe the great *Globulus* H, makes a great *Refraction* from H, to B, deflecting from the Perpendicular H G.

XVII. *How Comets come to appear with Tails, Hair, and like Beams.*

Hence it appears how *Comets* come to appear with *Tails*, *Hair*, or like *Beams*. For let us ſuppoſe the *Sun* to be S, and the *Sphere* through which the *Earth* is ſuppoſed to be carried in 24 Hours time, to be 2, 3, 4, 5; the Term from whence the *Heavenly Globuli* begin to grow leſs and leſs by degrees till they reach the *Sun*, to be D, E, F, G, H, and C, to be the *Comet* plac'd in our *Heaven*; it is manifeſt that the *Rays* of the *Sun* are not only *reflected* from the *Comet* in the *Right lines* C F 3, C H 6, C G 4, C E 2, and C D 7; but that they are alſo *refracted* ſide-ways, and diſperſed; ſo that according to the various Poſition 2, 3, 4, 5, of the Spectator upon the *Globe* of the *Earth*, the *Comet* ſeems either to have a *Tail*, as in 2 and 4; for

Figure 27.

by means of the direct *Rays* C, G 4, or C, E, 2, the *Body* or the *Head* of the *Comet* appears to us, and by the help of the *refracted* and weaker *Rays*, its *Tail* or *Hair* is diſcovered by us: Or with *Hair*, as in 3; for its *Head* is ſeen by us, by means of the ſtrong and direct *Rays* C, F, 3; and by the *Refracted* and weaker on one ſide of it, C, G, 3, and on the other C, E, 3, we ſee the *Hair* of the *Comet*: Or nothing but its *Tail* is ſeen by us in the form of a *fiery Beam*, as in that part of the *Sphere* of the *Earth* 5, by means only of the weaker and *refracted Rays* C, D, 2, 5, or C, H, 4, 5; becauſe no other *Rays* can reach the Eye of the Beholder, as long as he is poſited in that part of the *Terreſtrial Orb*, marked 5.

XVIII. *A Reaſon given of the various Appearances of Comets.*

And from what hath been laid down, a Reaſon may be alſo given of all the other *Phænomena* of *Comets*. As,

Firſt, Why they appear rarely, and not at ſet *times* or *ſeaſons*.

Secondly, Why they do not move long in our *ſight*.

Thirdly, Why they ſeem to be leſs at the Beginning, greateſt in the Midſt of their Courſe, and afterwards grow leſs and leſs by degrees. Which happens, becauſe at firſt they are further from us; in the middle of their Courſe, nearer, and in a fitter condition to reflect their *Rays*; and towards the end of their Courſe, again more remote from us.

Fourthly, Why their *Motion* at the beginning is *ſlower*, in the middle *ſwifter*, and at the end *ſloweſt* of all. The Cauſe whereof is, becauſe the *Comet* at its firſt ingreſs meets with ſome Reſiſtance, becauſe of the Renitency of the *Vortex*, from whoſe Force it afterwards receives power to move more *ſwiftly*; and towards the end of its Courſe it is reſiſted by the Neighbouring *Heaven*, towards which it tends.

XX. *Why no Hair appears about* Saturn.

If any demand, why no *Hair* appears about *Jupiter* and *Saturn*, as well as about the *Comets*? I anſwer, That ſometime there is a kind of appearance of *ſhort Hair* ſeen about them, in that part which is oppoſite to the *Sun*, in places where the *Air* is very pure and clear. Wherefore, when *ARISTOTLE* ſaith, *Lib.* 10. *Meteorologic. cap.* 6. that *the fix'd Stars have ſometimes been ſeen, with Rays in the manner of Hair about them*, I ſuppoſe it ought rather to be underſtood concerning theſe *Planets*. But as to that which he relates of the *Hair*, that appeared about one of the *Stars* in the Thigh of the *Great Dog*, it muſt have proceeded either from ſome very oblique *Refraction* in the *Air*, or rather from ſome fault or defect in his *Eyes*: For he adds, That it was leſs conſpicuous when he fix'd his *Eyes* ſtrongly upon it, than when he beheld it more remiſly, and without any earneſt intention.

CHAP. XVIII.

Of the Nature, Original, and Affections of Planets.

I. *What the Planets are.*

THe *Planets are Various, Round, and Opake Bodies, hanging in the Vortex of the Sun, and by it carried about the Sun, as a kind of a common Center of their Motions, receiving its Light, and variouſly conveying the ſame to our Eyes.*

Eyes. That they are ſolid and opake *Bodies* *GALILÆUS* ſhews, who by the help of his *Tube* hath diſcover'd no leſs inequalities in the *Moon*, than we meet with in our *Earth.*

II. *Their Number.* There be *Seven* of them, which are counted in this order; *Saturn*, *Jupiter*, *Mars*, the *Earth*, the *Moon*, *Venus* and *Mercury.*

III. *Whether the Sun be to be reckon'd amongſt the Planets.* The *SUN* is commonly counted to be one of the *Planets*, but by a miſtake; for beſides that the *Sun* is not an *Opake*, but a *Lucid Body*, nor hanging in another *Vortex*, but having its own proper *Vortex*; neither hath it likewiſe a *wandering Motion*, like the *Planets*, but is continually turn'd round in its own *Vortex*; and therefore cannot be reckon'd amongſt the *Planets.*

IV. *The Planets are compounded of the Matter of the Third Element.* The *Planets* were formed of the *Particles* of the *Third Element*, from the running together whereof they became great *Bodies.* For no ſooner was *Motion* communicated to the ſeveral Parts of the *World*, but the *moſt ſubtil Parts* (made ſo by their rubbing againſt one another) conſtituted the *Sun* and *fix'd Stars*; the *Round parts* (which Roundneſs they obtain'd alſo by their running againſt each other) made the *Heavens*; and the *thicker* and *groſſer Parts*, being by reaſon of the inequality of their *Figure*, leſs fit for *motion*, formed the Seven Planets; ♄ *Saturn*, ♃ *Jupiter*, ♂ *Mars*, ☿ *the Earth*, ☽ *the Moon*, ♀ *Venus*, and ☿ *Mercury.* So that the whole Matter of this viſible *World* may aptly be divided into three General Heads of *Bodies*, *viz.* ſuch as *ſend forth Light*, as the *Sun* and *fix'd Stars*; ſuch as *tranſmit Light*, as the *Heavens*; and ſuch as *Reflect the Light*, as the *Earth*, with the reſt of the *Planets.*

V. *They have no Light of their own.* For the *Planets* being deſtitute of all *Light* of their own, ſhine only with borrowed *Rays*; and accordingly we find them only to be reſplendent on that ſide which faceth the *Sun*; whence we conclude, that they only reflect to our *Eyes* the *Rays* they receive from the *Sun.* This we experience in the *Earth*, *Mercury* and *Venus*, and all the *Secondary Planets*, which in *Eclipſes* are either wholly or in part obſcured, when they come within the Shadows of other *Planets*; and being out of the reach of them, do only ſpread a *Conical ſhadow* from their oppoſite part to the *Sun.* And we may believe the ſame of *Mars*, *Jupiter* and *Saturn*; which by how much nearer they are to the *Sun*, the greater *Light* do they caſt; and ſo much the weaker, as their diſtance is farther from it. The ſame is alſo manifeſt from hence, becauſe the *Light* of all the *Planets* is more dim, than that which is ſeen in the *Sun* and *fix'd Stars*; as likewiſe, becauſe there is not ſo vaſt a diſtance between them and the *Sun*, but that he can communicate his *Light* to them.

VI. *The Earth is to be accounted amongſt the Planets.* And we are to ſuppoſe the ſame of this *Earth* we inhabit, which being made up of *Opake Bodies*, does as ſtrongly reflect the *Sun*'s *Rays*, as the *Moon* doth. It is alſo ſurrounded with *Clouds*, which tho' they be leſs *Opake* than many other *Parts*, and therefore do not ſo ſtrongly reverberate the *Light*; yet we ſometimes ſee them cover'd with as bright a *Whiteneſs*, as the *Moon* it ſelf exhibits to us, when ſhe is illuſtrated by the *Sun.* The ſame is alſo confirm'd, for that when the *Moon* intervenes between the *Sun* and the *Earth*, we ſee that its Face doth reflect a kind of obſcure *Light*, which, as far as we can gueſs, muſt proceed from the *Earth*, which reflects the *Beams* it receives from the *Sun* to the *Moon.* Which obſcure *Light* ſenſibly decreaſeth, as the illuminated part of the *Earth* turns away from it.

VII. *The Planets are not perfectly Round.* Tho' it cannot be doubted, but that the *Planets* are *Spherical Bodies*, like the *Earth* (for if they were of a plain *figure*, they would in one and the ſame moment be totally enlightned;) yet are they not ſo perfectly Round, but that their *ſurface* is very rough and uneven. For we find by the help of *Teleſcopes*, that they abound with *Cavities* and *Eminences*, correſponding to our higheſt *Hills* and deepeſt *Valleys*, (as *GALILÆUS* tells us concerning the *Moon*, *Syſtem. Coſm. Dial. prim.*) many whereof are continued for a Tract of an hundred Miles together; others again are ſingle and compriz'd in one Heap. There appear alſo many ſteep and ſolitary *Rocks.* But the moſt frequent things to be ſeen there, are a kind of *Bulworks* (I call them ſo, becauſe no fitter word occurs) of conſiderable Height, which encompaſs Spaces of different *magnitude* and *figure*, the moſt frequent being *Circular.* Many whereof have in the midſt of them an *high Mountain*, and others ſeem to be filled with an obſcure *Matter*, like thoſe great *Spots*, which we may perceive in the *Moon.* From all which Particulars we conclude, that the *Moon* and the reſt of the *Planets*, are altogether like our *Earth*, which if a Man could behold from the *Moon*, would appear much as the *Moon* ſhews to us, who view it from the *Earth.*

VIII. *The Planets are not ſo ſolid as Comets.* We are in the next place to conſider how the *Planets* came to be, and what is the cauſe of their different Diſtance from the *Sun*, and from themſelves. This will be the more eaſily cleared, if we conſider, that the *Planets* are leſs ſolid than the *Comets*, and therefore are not toſt from one *Vortex* to another, but continue in that of the *Sun*; as ſmall *Boats* are driven about in a *Whirlpool*, or carried along with the Stream of a *River.* Whence we may apprehend, that the *Planets*, as ſoon as they were got into the *Sun*'s *Vortex*, began to ſink down towards the *Center*, till they met with thoſe *Cæleſtial Globuli*, whoſe *motion* was proportion'd with theirs. For ſeeing that the greater *Globuli* are more vehemently agitated, and withdraw themſelves farther from the *Center* of their *Vortex*, it could not be, but that by their puſhing againſt the *Planets* that are leſs ſolid, they muſt drive them towards the Midſt; and when the *Planets* were ſunk ſo low, that they met with thoſe *Globuli* that were inferiour to them in bigneſs and force of *motion*, they run back from the *Center*, till arriving to that place of the *Vortex* where they were in equal poiſe, they neither came nearer to the *Sun*, nor went farther from it; but hanging there equally poiſed between thoſe *Heavenly Globuli*, whirl'd continually about the *Sun.*

IX. *Of the firſt Production of Planets.* Wherefore we may imagin, that in that *Space* where we place the great *Vortex* of our *Heaven*, there were at the Beginning 14. or more *Vortexes*, the leſs whereof, and ſuch as were weakned by reaſon of their *Spots*, were ſwallowed up of the Greater; which at laſt, together with the Leſſer, fell into one common *Vortex*, *viz.* that of the *Sun.* So that the *Stars*, which in the *Centers* of the four ſmaller *Vortexes*, encompaſs'd *Jupiter*, betook themſelves to that *Planet*; and thoſe which were in the *Centers* of other *Vortexes* near to *Saturn*,

tended towards *Saturn*; as *Mercury*, *Venus*, the *Earth* and *Mars* tended towards the *Sun*. So that of so many *Stars*, all shining with their own light, the *Sun* only remained, whilst all the rest being covered with *Spots*, did not send forth light, but only reflect it.

X. *Why the Planets are at farther distance from, or nearer to the Sun.*

It appears from what hath been said, why the *Planets* do not equally recede from the *Center*, and at different distances are carried about the *Sun*; this being to be imputed to their different solidity. For the *Globe* of *Mercury*, by Example, is nearer to the *Sun* than that of *Venus*, and the *Globe* of the *Earth* nearer than that of *Mars*, for no other reason but because they are less solid.

XI. *What the Solidity of Bodies is.*

Now Solidity is nothing else, but the proper Quantity of a *Body* compared with its Bulk and Surface; which is not only estimated from the Closeness and Thickness of its parts, but also by its *Figure*, and especially from the less extent of its *Surface*. For *Bodies* of a less *Surface*, do more easily pierce other *Bodies*: and therefore the greater the quantity of *matter* is, under a less Bulk and *Surface*, the *more solid* that *Body* is. As appears in *Gold* and other *Metals*, which when once put in *motion*, have a greater force to continue the same, than more lax and open, or porous *Bodies* (as *Wood* and *Stone*) of the same Bigness and *Figure*; and therefore are esteemed more solid, that is, to have in them more *matter* of the Third *Element*, and less Pores filled with the First and Second *Element*. And this is the reason why *Mars*, tho' less than the *Earth*, yet is farther from the *Sun* than it, even because of its greater solidity.

XII. *The Planets differ in Solidity amongst themselves.*

The *Planets* therefore, as hath been said, according to their greater or lesser Solidity, are farther from, or nearer to the *Sun*. By reason of this greater Solidity, *Saturn* is most remote from the Sun, whose Motion, if it had been swifter, and his Solidity greater, he would have been forced out of his *Vortex*, and become a *Comet*. Next to Saturn is *Jupiter*, with his four *Secondary Planets*, which we suppose did fall down into his Neighbourhood, before that *Vortex*, whose *Center Jupiter* was, had been swallowed up by the great *Vortex* of our *Heaven*. After him follows *Mars*, who, because of the extension of his *Body*, that is, his Magnitude and *Figure*, is more solid than the *Earth*. Next to him is the *Earth*, surrounded with its own *Vortex*, about which the *Moon* is whirl'd in a Months time. For the *Moon* tending towards the *Earth* (as the *Jovial Planets* towards that *Planet*) was swallowed up of its *Vortex*. *Venus* is nearer the Sun than either the *Earth* or the *Moon*, but the neareſt of all is *Mercury*, as being the most solid of them all.

XIII. *The Planets are either Primary or Secondary.*

The *Planets* are divided into *Primary* and *Secondary*. *Primary Planets* are those that perform their *Periodical motion* only about the *Sun*, and not about any other *Planet*. *Secondary*, are such as are joined with another *Planet*, and together with it, are carried about the *Sun*. Thus the *Moon* is a *Secondary Planet* with regard to the *Earth*, the *Jovial Stars* with regard to *Jupiter*; and so are those other Stars that attend upon *Saturn*. By the *Astronomers* they are commonly called *Satellites*, or *Guards* of those *Planets* to which they belong.

CHAP. XIX.

Concerning the Principle of the Planets Motion, and of their Direction, Station and Retrogradation.

I. *Why the Planets are called Wandring Stars.*

SEeing that the *Heavens* are Fluid, and that the *Planets* do, as it were, swim in their Orbs, as in so many *Rivers*, it may be enquir'd what is the *Principle* of their *Motions*; as likewise what the cause is of those *wandering excursions*, whence the name of *Wandering Stars* hath been given them. Which name, we may believe, was therefore attributed to them; for that being carried about in the *Sun's Vortex*, they seem sometimes to approach nearer to, and sometimes to remove farther from one another; sometimes to ascend, and at other times to descend; sometimes to come nearer to the *Sun*, and at other times to withdraw at a greater distance from him. Whence arise the *Conjunctions* and *Oppositions* of the *Planets*, as likewise their *Aberrations* in *Longitude* and *Latitude*, so often inculcated by *Astronomers*. For tho' the *Planets* turn round about the *Sun*, yet do not they keep on their Course in the same direct *Line*, but do sometimes *ascend*, and at other times *descend*, as we see *wooden Bowls* do that *swim* in a *River*. And this their *Deflexion* is called *Aberration* in *Latitude*. Or else they are sometimes nearer the *Sun*, and sometimes farther from him; which are called *Aberrations* in *Longitude*. And this is the Reason, I say, why the *Planets* are call'd *Wandering Stars*, because they seem to roam at random, without keeping a steady course.

II. *The First Cause of the wandering motion of the Planets.*

This *wandering motion* of *Planets* may be attributed to several *Causes*. As *First*, to the *Figure* of those *Spaces* wherein they move; for these, not being perfectly Round, but spreading more in Length than Breadth, it must needs be that the *Heavenly Matter*, that carries them, must move more swiftly, where it is narrowly pent up, than where it hath a broader space to move in. As we see that the *Wind* blows with less force in an open *Field*, than where it is straitned in a narrow *Passage*; and as a *River* runs more swiftly where it is straitned in its course, than where the *Channel* is wider.

III. *The Second Cause.*

In the *second place*, for as much as these *Spaces* do touch one another, the *matter* of the First *Element*, passing from one space to another, doth according to the different *degree* of its *motion*, variously push forwards, and determine the *Globuli* of the Second *Element*, to drive the *Planets* more towards one part of *Heaven* than another. For the *matter* of the First *Element* being more swiftly moved, than the *Globuli* of the Second, it cannot but by pushing them forwards, move the *Planets* that are *poised* in the midst of them.

IV. *The Third Cause.*

Thirdly, This difference in the *motion* of *Planets*, sometimes ariseth from *themselves*, as when their *pores* are more fit to receive the *particles* of the *First Element*, proceeding from some Neighbouring *Body*, than others. Which sometimes also happens, when the *Pores* of *Planets* are more adapted to admit the *striate Particles*, which come driving from some certain part of the *Heaven*: For these *particles* being entred into the *Cavity* of the *Planets*, do variously agitate them, directing them towards those *places* to which they did tend. As the *Wind* turns a *Ship* to this or that part,

part, according as it penetrates the *pores* of the *Sails*, or other open passages of the *Vessel*.

V. *The Fourth Cause.*

Fourthly, The same *Motion* which in the beginning of the *World* was impress't upon the *Planets*, may be preserved to this instant, seeing that every *Body* continues in the same state, and is never changed but by *External Causes*. Thus a *Top* that is made to turn round by a Boy, hath a force to continue the same *motion* for some moments, notwithstanding the resistance it meets from the *Air* and the *Earth*. And accordingly we may believe that a *Planet* likewise hath a *power* to pursue the *motion* impress't upon it at the beginning, without any considerable loss of its swiftness; because the space of 5 or 6000 *years*, is a less time, compared with the vast *bulk* of a *Planet*, than one *minute*, compared with the littleness of a *Top*.

VI. *The Fifth Cause.*

In the last place we may add, That the *power* of continuing in its *motion* is more firm and steady in the *Planet*, than in the *Heavenly matter* that surrounds it; and in a greater *Planet* more than in a less. Because the *Globuli*, which are the parts of a *Fluid Body*, cannot so well conspire in the same *motion*, as the *Particles* of the *Third Element* do, which constitute the *Compact Body* of a *Planet*. Wherefore also it must be less obnoxious to those changes that happen to the *motion* of the *Celestial Globuli*, by how much the greater and compact it is.

VII. *The Periodical and Daily Motion of the Planets.*

Every *Planet* hath a twofold *Motion*; the first *Periodical*, whereby every one of the *Primary Planets*, together with its *Attendants*, is carried about the *Sun*: For that they are whirl'd about in their *Orbs* by the force of the *Solar matter*, appears from hence, because the nearer they are to the *Sun*, the sooner they absolve their *Circuit*: Not to mention now the *motion* of the *Spots* in the *Sun*, which, without doubt, proceeds from the *whirling* about of the *Solar matter*.

The other is the *Diurnal motion*, whereby a *Planet* seems in the space of 24 *hours* to move about the Earth from *East* to *West*. But this *Motion* doth not properly belong to the *Planets*, but is common to them with the *Comets* and *Fixt Stars*, by reason of the *Diurnal motion* of the *Earth*, as will appear hereafter.

VIII. *How the Planets are carried about by their Annual Motion.*

A *Planet* therefore is whirl'd about its *Center*, much after the same manner, as we see that a *Trencher* swimming in a large *Vessel* full of *Water*, that is swiftly whirl'd about, doth not only follow the circular *motion* of the *water*, but besides turns about its own *Center*. The Famous *CASSINUS* observed this in 1672. in the *Body* of *Jupiter*: for he having observed a *Spot* at $7\frac{1}{2}$. a *clock* in the evening in the midst of the *Belt*, he found at 5 a *clock* 26 *minutes* in the *morning*, that it was return'd precisely to the same place. And therefore from this and many other *observations*, he determined not only the Revolution of the *Spot*, but also of the *Body* of *Jupiter*, which he found to be performed in 9 *hours* 55 *minutes*, and 58 seconds; and the same was perceived by him not only in *Jupiter*, but also in *Mars*, *Venus* and *Mercury*.

IX. *The Cause of these two Motions.*

This twofold *motion* of the *Planets* ariseth from hence, because the *Cœlestial Globuli* that surround them, do not only carry them along their *Orbs*; but also because of the Propension they have, to pursue their *motion* in *Right lines*, they do more strongly exert their force upon their *External parts*, that are more remote from the *Sun*, than upon their *Inward parts* that are nearer to it: by which force they impress that *motion* upon it, which makes it whirl about its own *Center*.

X. *The Planets that are nearest to the Sun are most swiftly moved.*

The Consequence whereof is, that the *Inferior Planets*, or those that are nearer the *Sun*, must move more swiftly than the Higher. Because the *matter* of the *First Element*, which constitutes the *Sun*, by being swiftly whirl'd about, doth with a greater force drive along with it, the nearest parts of *Heaven*, than those which are more remote.

XI. *How it comes to pass that* Mercury *and* Venus *seem to turn about from* East *to* West *in* 24 *hours.*

These things presupposed, it will be an easie matter to explain the *motions* of the several *Planets*, and how it comes to pass that they seem to be carried from the *East* to the *West*. For supposing that the *Heavenly matter* that surrounds the *Sun*, is moved round it from *West* to *East*, and, without any interruption of its own Revolution, carries along with it the *Earth* about its *Center* in 24 hours; we shall easily conceive, that *Mercury* and *Venus* must appear to us to move from *East* to *West*, and every day to describe a *Circle Parallel* to the *Æquator*. And that they must likewise describe a *Circle* about the *Sun* from *West* to *East*, as being contained in the same matter, that carries the *Earth* round.

XII. *They must describe a great Circle.*

We shall also apprehend that these two *Planets*, as well as the *Earth*, must be found under the *Zodiack*, because it is the greatest *Circle*, which the *Celestial matter*, by which they are carried about, describes. For as much as according to the *Law* of *Nature*, every Body that is circularly moved, endeavours to recede from the *Center* of the *Circle* it describes.

XIII. *How it comes to pass that the Axis of the Earth observes its Parallelism*

It will also appear how the *Axis* of the *Earth*, which by its *Annual motion* is carried about the *Sun*, continues always *Parallel* to it self, or which is the same, how its *Poles* always respect the same *points* of the *Firmament*, *viz.* If we observe that the *Diurnal motion* of the *Globe* of the *Earth*, *Water* and *Air* doth determinate the subtil matter, which is in continual *motion* in the *Bowels* of the *Earth*, to go forth to the Plains *parallel* to the *Æquator*; and that at the same time, a like *quantity* of *matter*, proceeding from the parts of other *Vortexes* remote from the *Poles*, must enter into it by the *Poles*. For this supposed, it will easily be believed, that after the *Earth* hath once admitted the *Subtil matter*, coming to it from one part of the *Heaven*, its *pores* will thereby be the more fit to receive the like *matter* again, than any other proceding from other parts, as being more accommodate to it. And therefore it is no wonder, if those *Pores* which we apprehend to be *Parallel* to the *Axis* of the *Diurnal motion*, are so hollowed as to answer one another, and thereby give free admittance to the *subtil matter*. Which being granted, it is necessary that the *Poles* of the *Earth*, must always answer the same *points* in the *Firmament*, and its *Axis* observe a perpetual *Parallelism* to it self.

XIV. Mars, Jupiter *and* Saturn *are moved like the other Planets.*

And the same is to be said of *Mars*, *Jupiter* and *Saturn*: For seeing that these three *Planets* do seem so to run round the *Sun*, as that the *Circles* which they describe, do include the *Circle* of the *Earth*, we must admit that they are pois'd in the *Cœlestial matter* as well as the *Earth*, and are at a far greater distance from the *Sun*, than it is. In like manner we must confess that *Mars*, *Jupiter* and *Saturn*

Saturn must seem to run round the *Earth* from *East* to *West* in 24 *hours*, and to be carried away by the *Heavenly matter*, in the same manner as *Mercury*, *Venus* and the *Earth* are. Only with this Difference, that seeing their *Circles* are much greater than that of the *Earth*, so they employ a greater space of time in running through them. For whereas *Mercury* is whirl'd about the *Sun* in 3 Months, *Venus* in 8 Months, the *Earth* in a years time, *Mars* spends 2 years in his Revolution, *Jupiter* 12, and *Saturn* almost 30. For the distance between these three latter, and the *Sun* being greater, the *matter* which carries them, requires more time to run over those vastly greater *Spaces*.

XV. *How Planets come to be Direct, Stationary and Retrograde.*

From these various Courses of the *Earth* and *Planets* in their Revolutions about the *Sun*, it comes to pass that they appear to us on the *Earth* *Direct*, *Stationary* and *Retrograde*. For tho' their *motion* be continual, without any stop or *Retrogradation*, yet doth the *motion* of the *Earth* produce these various appearances, as oft as in its Revolution it intervenes betwixt the *Planets* and the *Sun*. Because when the *Earth* is whirl'd about the same way, swifter than the *Planets*, we must see them answering to divers parts of the *Heaven* of fixt *Stars*, and to be carried opposite to that part, whither we, together with the *Earth*, are carried.

XVI. *What Planets are said to be Direct, Stationary and Retrograde*

Those *Planets* therefore are called *Direct*, which pursue their Course according to the procession of the *Cœlestial Signs*; as from ♈ to ♉, from ♉ to ♊. *Planets* are said to be *Retrograde* when they proceed contrary to the Succession of the *Signs*; or which having first been moved towards the *East*, seem now to turn back towards the *West*: and those are called *Stationary*, which keep the same place under the *fixt Stars* for several days together. These *Stations* of the *Planets*, are observed before and after their *Retrogradations*, because the Determination of the *motion* of the *Earth*, doth deflect a little with respect to the Determination of the *motion* of the *Planets*, by which means the swiftness wherewith we are then snatcht away, doth only serve to advance us, as much as is needful, to behold that *Planet* which is Stationary, for several days together, under one and the same part of the *Firmament*.

XVII. *How Planets appear direct to us.*

The thing will be better apprehended by the *Figure*. Suppose we then the Sun placed in the midst of a *Circle*, about whom let us place the *Circle a d g k*, described by the *Annual motion* of the *Earth*. The other Higher *Circle* intersected by numeral *figures*, we suppose to be the *Orb* of some one *Planet*, viz. of *Mars*, *Jupiter* or *Saturn*, and the Circle N G A, to represent the *Heaven* of *Fixt Stars*. These things thus laid, let us suppose that the *Earth*, by its *Annual motion* is about the *Point a*, and that *Jupiter* is in that part of his *Circle* marked only by 1; then *Jupiter* will appear to those that dwell upon the *Earth*, in the part of the *Heaven* of *fixt Stars*, noted A, by the right *line*, *a* 1 A. Conceive we afterwards, the *Earth* to be advanced from *a* to *b*, and *Jupiter* from 1 to 2, at the same time; and *Jupiter* will appear to us to have moved on directly in the *Heaven*, according to the Order of the *Signs* from A to B; and when the *Earth* afterwards is advanced to *c*; and *Jupiter* to the part of his *Orb* 3, *Jupiter* will be seen advanced from B to C, alway keeping a Direct *motion*. And when afterwards the *Earth* is come to *d*, and *Jupiter* to 4, *Jupiter* will appear to have advanced by a direct *motion* from C to D. And when the *Earth* hath reached the *Point e*, and *Jupiter* 5, then *Jupiter* will appear to have moved from D to E, according to the order of the *Signs*.

Figure 28.

XVIII. *How they come to appear Stationary and Retrograde*

But when the *Earth* begins to be more directly interposed between *Jupiter* and the *Sun*, by that time the *Earth* comes to *f*, and *Jupiter* to 6, then will *Jupiter* appear to have gon back from E to F; and because this interval is very small, therefore he is said to be *Stationary*, because he appears unmoved and standing still. The *Earth* afterwards being advanced to the point *g*, and *Jupiter* to 7, *Jupiter* will appear to have moved *Retrograde* from F to G. Again when the *Earth* is come to *h*, and *Jupiter* to 8, he will appear to have past *Retrograde* from G to H. And lastly, when the *Earth* is come to *i*, and *Jupiter* to 9, he will seem to have moved *Retrograde* from H to I, which space being very small, *Jupiter* will again appear *Stationary*.

XIX. *How they come to appear direct again.*

Afterwards, when the *Earth* is advanced to *k*, and *Jupiter* to 10, he will seem to have proceeded directly, according to the Order of the *Signs*, from I to K. The *Earth* being come to *l*, and *Jupiter* to 11, he will seem to have pursued his Course directly from K to L. And lastly, when the *Earth* hath reached the Point *m*, and *Jupiter* 12, *Jupiter* will appear to have advanced directly from L to M.

XX. *The same may be shewed in like manner concerning* Saturn, Mars, Mercury *and* Venus, *but not of the* Moon.

The same may be demonstrated, not only concerning *Saturn* and *Mars*, but also concerning *Venus* and *Mercury*; which always appear *Stationary*, as oft as we remove from the opposite *Region* to the same; or from the same to the opposite *Region*; because the *Earth* is then so turned about, as to make them to be seen under the same *fixt Stars*, for some time together. These *Planets* appear *Retrograde*, when they are in opposition to the *Sun*, *Direct* when in *Conjunction*, and never so in any other *places*. But we are to observe, that *Retrogradations* are more frequently seen in *Saturn* than in *Jupiter*, and in him more frequent than in *Mars*, because of the slowness of *Saturn's motion*, which makes that the *Earth* in a shorter time doth overtake him. But on the other hand they are more rare in *Mars*, his *motion* being swifter than that of *Jupiter*, and consequently must spend more time to overtake him. But these *Affections* are not incident to the *Moon*, because she, in whatsoever part of the *Earth* we are, runs about us, as about her Center, her *Orb* being comprehended within the *Orb* which the *Earth* moves in.

CHAP. XX.

Of the Motion of the Moon, and its various Appearances, or Phases.

I. *The* Moon *is carried about in the same* Vortex *with the* Earth.

FOrasmuch as it is manifest from what hath been already said, that the *Moon* is not only carried about the *Sun*, but also about the *Earth*, and that there is only a small space between us and her; we may easily guess her to be contain'd in the same *Vortex* with the *Earth*. And consequently since the *matter* of this *Vortex*, doth whirl the *Earth* about its *Center* from *West* to *East*, we may

may conclude that it also carries the *Moon* along with it. But since the *Circle* which the *Moon* runs through, is almost 60 times bigger than the Compass of the *Earth*, we may gather, that if the *Earth*, by its diurnal *motion* is whirld about its *Center* in the space of 24 *Hours*, the *Moon* will not be able to finish her Revolution in less than about a *Months* space.

II. *The Moon may appear to move from West to East, or contrarily, within the space of one Month.*

This long time the *Moon* spends in her *Revolution*, is the Cause that she seems to run round the *Earth* every Day from *East* to *West*, whilst in the mean time the *Earth* turns round from *West* to *East*. Tho' this doth not hinder the *Moon* from appearing to run through all the *Signs* of our *Zodiack* from *West* to *East*.

III. *What the* Perigæum *and* Apogæum *of the Moon is.*

The *Moon* is sometimes nearer to the *Earth*, and that is her *Perigæum*; and at other times further from it, which is her *Apogæum*. This comes to pass, either because the Peculiar *Vortex* of the the *Earth* A B C D, is sometimes *bigger*, by reason of the *Matter* of the *First Heaven* more abundantly crowding into it; and at other times becomes *less*, because of the Expulsion of it again. Or else, because the *Moon* is more or less push'd on towards the *Earth*, by the various agitation of the *First Heaven*.

Figure 29.

IV. *The Moon advanceth swifter when she is New, than in her Quarters.*

The *Moon* seems to move swifter when *New* and *Full*, than at the *Quarters*. The Reason whereof is, for that her *Vortex* A B C D, by being press'd upon by the *Orbs* of *Venus* and *Mars*, between which it is placed, is thereby reduc'd to an *Elliptical* or *Oval Figure*. Hence it is that the *Cœlestial Matter* moves more swiftly in the narrow Parts B and D, of this *Elliptical Heaven*, and more slowly in the broader Spaces A and C; and therefore the *Moon*, in her *Conjunction* and *Opposition*, or at the *New* and *Full*, must be more swiftly carried about the *Earth* towards the *East*; because the Spaces it then runs through are more narrow, and do not suffer it to wander.

V. *Why the Moon is not exactly moved under the Æquator.*

If the whirling about of the small *Vortex* A B C D, which carries the *Moon* along with it, did only accord with the *Motion* of the *Earth*, then the *Moon* would appear to move under the *Æquator* from *West* to *East*; and on the contrary, if the *motion* of the said *Matter* should only agree with the *motion* of that great *Vortex*, which has the *Sun* for its *Center*, then it would only be seen under the *Ecliptick*. But seeing it is to agree with the *motion* of them both, it follows, that its *motion* must neither be under the *Æquator*, nor under the *Ecliptick*, but under another *Third Circle*, which comes nearer to the *Æquator*, than the *Ecliptick*; because the *Moon* is nearer to the *Matter* of the *Sun*'s *Vortex*, than to that of the *Earth*.

VI. *Above one half of the Moon is always illustrated by the Sun.*

The *Moon* being a *Round Body*, and receiving its Light from the *Sun*, it follows, that always one half of it, yea, somewhat more, must be enlightned by him. For seeing that the *Sun* exceeds the *Moon* in Bigness, and that the bigger *Sphere* always enlightens above half of a less, it does follow, that above one half of the *Body* of the *Moon* must always be illuminated. But seeing that the *Moon* alters her Position, and in running about the *Earth* doth variously face the *Sun*; it must needs be, that according to its various Access to, or Recess of the *Sun*, less or more of the illuminated Half will appear to us; which Variations of her *Appearance*, are commonly called her *Phases*.

VII. *The Conjunction of the Moon with the Sun is not to be accounted amongst her Phases.*

The *Philosophers* commonly reckon up four *Phases* of the *Moon*, according to the Fourfold respect which the *Moon* hath to the *Sun*, in different parts of the *Zodiack*. Whence it receives different Names; for the *Moon*'s meeting with the *Sun* in the same Degree of the *Zodiack*, is called the *Conjunction* or *New Moon*. Tho' it seems that the *Moons Conjunction* with the *Sun*, ought not to be accounted amongst her *Phases*; because the *Moon* at that time doth not appear to us at all, its enlightned part being wholly turn'd away from us, and its dark part turn'd towards us.

VIII. *The first Phasis of the Moon.*

The first *Phasis* therefore of the *Moon* is, when she being newly come from her *Conjunction* with the *Sun*, by moving in her *Orb* A B C D E F G H, reacheth B, whence she appears to us on the *Earth* I, *Horned* (or *Crescent-wise*) because of the *Hollowness* which is seen in her Illuminated part. Figure 30.

IX. *The second Phasis of the Moon.*

The second *Phasis* is, when the *Moon* about the *Seventh* or *Eighth day*, being 90 *Degrees* distant from the *Sun*, doth represent the full Half of her Enlightned part C, whose *Horns* or *Points* are directed to that part of *Heaven* which is opposite to the *Sun*, as from whence it receives its *Light*. and here she appears *Bisected*, or divided into two *Halves*.

X. *The third Phasis of the Moon.*

The third *Phasis* is, when the *Moon* D, advancing towards an *Opposition* with the *Sun*, exhibits to us more than one half of her Illuminated part, and therefore appears *Gibbous* or *Bunching out* on both sides.

XI. *The fourth Phasis.*

The fourth *Phasis* happens, when the *Moon* E being 180 *Degrees* distant from the *Sun*, and in *Opposition* to him, turns her whole Enlightned side towards us, who are placed betwixt the *Sun* and her.

XII. *The same Phasis happen to the Moon, when she is in the Wane.*

The same *Phasis* also belong to the *Moon* in Decrease, according to her various Aspects to the *Sun*. For when by going back she hath reach'd F, she appears *Gibbous*; when to G, *Half*; and at *H. Crescent-wise* again; till returning to A, her Enlightned part be wholly turn'd away from us towards the *Sun*.

XIII. *The Moon is more illuminated at the New, than at the Full Moon.*

The *Moon* is never less Enlightned than when she is at the *Full*, or in *Opposition* with the *Sun*; and never more than at the *New*, or when she is in *Conjunction* with the *Sun*; because when she is *Full*, only that part towards us is Enlightned: Whereas when *New*, she is wholly *illuminated*, that part which is then *towards us* being Enlightned by the *Earth*, and the other part that is turn'd *from us*, by the *Sun*. For the *Moon* doth not only borrow her *Light* from the *Sun*, but receives also some weak *illustration* from the *Earth*: Because the *Earth* being an *Opake Body*, must of necessity reflect part of her received *Light*; and forasmuch as the *Earth* is bigger than the *Moon*, consequently more *Light* must be deriv'd from the *Earth* to the *Moon*, than from the *Moon* to the *Earth*. This is confirm'd by Experience, because this *Secundary Light*, as *GALILÆUS* calls it, after the first *Quarter* quite vanisheth, by reason of the *Moon* being too far distant, and without those Bounds to which the reflected *Beams* from the *Earth* reach.

XIV. *The Moon is sometimes Enlightned from the Earth.*

We know likewise by Experience, that this *Light* is more perceptible when the *Moon* is *Eastward* from us, than when she is *West*. The Reason whereof is, because in the former situation, the *Light* is reflected to her from all the *Continent* of *Asia*, and part of *Africa*, which are more proper to reflect the *Sun-beams*, than those Seas which are towards the *West*. So that as the *Moon* doth at some times Enlighten the *Earth*; so at other times again, the *Earth* Enlightens the *Moon*.

XV. *What a Periodical and Synodical Lunar Month is.*

The *Moon* performs her *Revolution* in 27 *Days* and about 8 *Hours*; and this time is called the *Periodical Lunar Month*: And the time that intervenes betwixt the *Conjunction* of this *Planet* with the *Sun*, till the next *Conjunction*, is called the *Synodical Month*; which consists of 29 *Days*, and about 12 *Hours*. Wherefore, when on a certain *Day* there is a *Conjunction* between the *Moon* and the *Sun*, the *Moon* indeed will return to the same *Degree* of the *Zodiack*, at the end of 27 *Days* and near 8 *Hours*; but she will not meet with the *Sun* there, who by this time will be advanced 27 *Degrees* further to the *East*; so that the *Moon* will be fain to proceed two *Days* longer before she can overtake him.

CHAP. XXI.

Of the Eclipses of the Sun and Moon.

I. *What an Eclipse of the Sun is.*

FOrasmuch as the *Earth* by its *Annual Motion*, turns round about the *Sun*; and the *Moon* by her *Monthly Revolution*, is whirl'd about the *Earth*, it cannot be but that the *Earth*, *Sun* and *Moon* must sometimes meet, and be oppos'd to one another. Whence, if it so happens, that by the *Moons* intervening betwixt the *Sun* and the *Earth*, the *Sun* becomes obscured by her *shadow*, this we call an *Eclipse* of the *Sun*, because its *Light* is hindred from being diffused on the *Earth*. So that the *Eclipse* of the *Sun*, is nothing else, but *a Failing of Light in some Region of the World, caused by the Diametrical Interposition of the Moon betwixt the Sun and that Country*. Wherefore this *Eclipse* always happens at the Time of the *Moons Conjunction* with the *Sun*.

II. *What an Eclipse of the Moon is.*

But if the *Moon* come within the verge of the *Earths shadow*, and by this means be deprived of the *Light* it borrows of the *Sun*, this we call an *Eclipse* of the *Moon*. And accordingly, *an Eclipse of the Moon is a Failure of Light in the Moon, because of the Diametrical Interposition of the Earth between the Sun and the Moon*. For then is the *Moon* obscured by the *shadow* of the *Earth*, and it happens always at the *Full Moon*, or *Opposition*: Tho' this Observation be not perceiv'd by all the *Inhabitants* of the *Earth*; but by those only that are in that part of the *Earth*, which is Diametrically interpos'd between the *Sun* and *Moon*.

III. *An Eclipse of the Moon is either Total or Partial.*

An *Eclipse* of the *Moon* is either Total, or Partial. A *Total Eclipse* is, when the whole Round of the *Moon* is cover'd with the *Shadow* of the *Earth*: Whereas in a *Partial*, a part of it only is obscured.

IV. *A Solar Eclipse may more properly be called an Eclipse of the Earth.*

Betwixt these two *Eclipses* we are to observe this considerable difference, that the *Failure* of *Light* in the *Moon*, is caused by the Interposition of the *Earth*, which really keeps off the *Sun's Rays* from it, hindring it from receiving its wonted splendour. But no such *Defect* of *Light* ever happens to the *Body* of the *Sun*, whose *Light* cannot be the least impair'd, because of the *Moons* Interposition between him and the *Earth*. And therefore an *Eclipse* of the *Sun*, may with more propriety of Speech be called an *Eclipse* of the *Earth*, the Defect of *Light* being only in Appearance in the *Sun*, but really and indeed in the *Earth*, which is then deprived in a greater or less degree of his *Light*.

V. *What the Head and Tail of the Dragon is.*

We are to observe that, as the way of the *Sun*, or the *Ecliptick*, doth obliquely intersect the *Æquator* in the two opposite *Æquinoctial Points*; so likewise the *Orb* of the *Moon* is not directly under the *Ecliptick*, but cuts the same in two opposite Points at *Oblique Angles*; and these *Points* are called the *Nodes*, or the *Dragons Head* and *Tail*. For the clearer conceiving whereof we are to note, that the *Ecliptick* divides the *World* into two Parts, whereof that which contains the *Northern Pole*, is called the *Northern part*; as that which contains the opposite *Pole*, the *South part*. This supposed, we say that the *Dragons Head* is one of the Common Sections of the *Ecliptick*, as well as of the *Circle* which the *Moon* describes, when she passeth from the *South part* of the *World* to the *North*; and the other Section, by which the *Moon* passeth from the *North* to the *South part* of the *World*, is the *Tail* of the *Dragon*. The *Orb* of the *Moon* therefore, A B C D, doth not concur with the *Sun's Ecliptick* A E C F, but intersects the same in two places, at A and C. In or very near which Intersections the *Sun* and *Moon* must be, or else no *Eclipse* can happen. For beyond the *Ecliptical Terms* G H I K, there are no *Eclipses*; because every where else the *Moon* is either too high towards the *North* B, or too much depress'd towards the *South* D; so that where there is not a *Conjunction*, or an *Opposition* of these *three Bodies*, the *Sun*, *Moon*, and the *Earth*, at the *New* or *Full* of the *Moon*, neither *Solar* nor *Lunar Eclipse* can ever happen. Figure 31.

VI. *The Eclipse of the Sun ever happens at the New of the Moon.*

Wherefore we see, that the *Eclipse* of the *Sun* can only happen at the *New Moon*, when the *Sun* and *Moon* are in *Conjunction*. For since the *Orb* of the *Moon* only intersects the *Ecliptick* at two *Points* or *Nodes*, she must of necessity be found in one of these before she can cause an *Eclipse*. And forasmuch as the *Sun* meets twice only in a Year with the *Moon*, in or at those *Nodes*, the *Sun* cannot suffer an *Eclipse* more frequently, than about every sixth Month. The *Moons motion* also from *West* to *East*, being not always exactly under the *Ecliptick*, but deviating something from it towards the North or South, and consequently not moving directly between the *Sun* and us, it is apparent that no *Eclipse* can be, but when the *Sun* and *Moon* are together in the *Dragons Head* or *Tail*, which, as I said, happens but every *sixth Month*.

VII. *The Eclipse of the Moon happens only at the Full, tho' not at every Full Moon.*

Accordingly the *Eclipse* of the *Moon* happens, when the *Earth a*, being directly interpos'd between the *Moon b* or *d*, and the *Sun c*, doth by its *Conical shadow 1 h i*, hinder the direct *Rays* of the *Sun* from reaching any part of the *Body* of the *Moon*, as in *b* and *d*, or only from illuminating some part

Figure 32. part of it, as in *e* and *f*. The *Eclipses* of the *Moon* are only at the *Full Moon*, that is, whilst the *Sun* and the *Moon* are diametrically oppos'd in the *Dragons Head* and *Tail*; because then the *Earth* comes between them, and by its *Shadow* does obscure the *Moon*. Yet it doth not follow from hence, that there must be *Lunar Eclipses* every *Full Moon*; because the *Moon* having some *Latitude*, she is often at the time of her Opposition to the *Sun*, at a considerable distance from the *Nodes*, whence it happens that the *Shadow* of the *Earth* does not touch her; there being no possibility of an *Eclipse*, except the *Sun* and *Moon* be in the *Head* and *Tail* of the *Dragon*. And forasmuch as the *Sun* cannot be there above twice in a Year, it is evident, that we cannot have a *Lunar Eclipse* every *Full Moon*.

VIII. *The Cause of a Total and Partial Eclipse.* A *Total*, or *Partial Eclipse* is caused, when the *Luminaries* are in *Opposition*, as in the *Lunar*; or in *Conjunction*, as in the *Solar Eclipse*, in or near the *Nodes*, or else at a little distance from them: For seeing that the *Axis* of the *Earths Shadow* is always in the Plain of the *Ecliptick*, it cannot be otherwise, but that when this *Axis* coincides with the *Nodes*, the *Moon* passing that way, or near to it, must be wholly dipp'd in the *Shadow* of the *Earth*; but when more remote, then the *Moon* must be only in part obscured, as entring only into the verge or brim of the *Shadow*. And so likewise in the same manner, because the *Axis* of the *Lunar Shadow*, the *Sun* being behind it, doth then appear, when the *Moon* is in the *Ecliptick* or *Node*: Therefore it is necessary, that at that time when it doth not appear less than the *Sun*, it must cover the whole *Sun*, which otherwise covers only some part of it; *viz.* when the *Axis* of that *Shadow* being somewhat turn'd aside from our Sight, a part of the *Moon* only comes between us and the *Sun*.

IX. *A Total Eclipse of the Sun happens very rarely, and when it does, lasts only for a Moment.* A *Total Eclipse* of the *Sun* is a thing seldom seen; for the *Moon* being much less than the *Earth*, cannot but rarely be so conjoyn'd with the *Sun*, as to cover its whole Round, and hinder the *Light* proceeding from it to reach the *Earth*; but only so, as to cover some part of it with its *Shadow*. Besides, forasmuch as the *motion* of the *Sun* from *West* to *East* is very swift, she makes haste away from under the *Sun*, and therefore can only obscure it for a very short time. So that tho' we should suppose the *Moon* to be so conjoyn'd with the *Sun*, that his *Light* might appear to be totally intercepted; yet could not the Failure of *Light* last above a Moment, seeing that in the next following Moment, some of its *Light* would be diffused from that part of the *Sun*'s *Body*, which by that time would be got out of the *Shadow*.

X. *Eclipses appear various in various Parts of the Earth.* Thus it often happens, that tho' a *Total Eclipse* be perceived in some part of the *Earth*, yet in other parts the same is only *Partial*, and in other again *none at all*. This will clearly appear in the *Scheme* or *Figure*, where the *Moon a*, being interpos'd between the *Sun b*, and the *Earth c*; it is manifest that the *Inhabitants* at the Point *d* will be deprived of the whole aspect of the *Sun*, because of the interposition of the *Moon*; they who dwell at the Point *e*, will be depriv'd of the one half of it; whereas no part of the *Sun* will be obscur'd to them who live at *f*; and the same is to be understood of all other the Inhabitants of the *Earth*, from whom the *Moon* turns away the *Sun-beams* more or less, according to their several situations.

Figure 33.

This acquaints us with the Reason, why a *Lunar Eclipse* is perceiv'd in one and the same manner, by all those that are in the same *Hemisphere*, and have the *Moon* above their *Horizon*; but not the *Eclipse* of the *Sun*, which appears to some *Total*, to others *Partial*, and to others again *None at all*.

XI. *Why the Eclipse of the Sun never appears Total to all the Inhabitants of the Earth.* For the *Moon* being destitute of all *Light* of her own, must needs be perceiv'd alike obscur'd by all: Whereas the *Sun*, being *Lucid* of it self, cannot appear destitute of all *Light*, but only so far as it is cover'd by the *Globe* of the *Moon*, which intervenes between the *Sun* and the *Earth*; and forasmuch as the *Lunar Globe* is less than the *Sun*, or the *Earth*, it can no otherwise happen, but that some part of the *Earth*, to which the *Moon* appears equal to the *Sun*, or greater, must be depriv'd of the whole *Light* of it; whereas others, to whom it appears otherwise, are but deprived of the Half, or of more or less of its *Light*, and others again enjoy the whole *Light* of it.

XII. *Eclipses of the Sun are less frequent, than those of the Moon.* The *Solar Eclipses* are not so frequent as the *Lunar*; for the *Body* of the *Moon*, which deprives us of the *Sun-beams*, being much less than the *Earth*, which deprives the *Moon* of *Light*, it cannot be otherwise, but that the *Moon* must more frequently meet with the *shadow* of the *Earth*, than our *Sight* meets with the *shadow* of the *Moon*. But this is not to be understood of the whole Round of the *Earth*, but only with respect to some determinate *Part* of it, as by *Example*, that place where we live: For otherwise there is no question, that every six Months *Solar Eclipses* happen in this or the other part of the *Earth*, and no less frequent than the *Lunar Eclipses*.

XIII. *How long the greatest Eclipse of the Sun lasteth.* The Duration of *Eclipses* is not always the same. If it be enquir'd, what the greatest Duration of a *Solar Eclipse* is; *GASSENDUS* in his *Astronomical Institution*, determines it to be the Space of about 2 *Hours*. For seeing that the *Moon* spends a whole *Hour* from the time that she hath made a beginning of the *Eclipse*, by touching the Western brim of the *Sun*, with her Eastern, until the time that the same brim come to the Eastern part of the *Sun*, and thereby make the midst of the *Eclipse*; and because then only the Western brim of the *Moon*, is advanced to the Western brim of the *Sun*, which soon after it quits wholly: So that as soon as the Incidence ceaseth, the Emersion begins; it necessarily follows, that she must spend another *Hour*, before the same brim can reach the Oriental part of the *Sun* again, and wholly quitting it, put an end to the *Eclipse*.

XIV. *Why the Superiour Planets are not subject to be Eclipsed.* The *Superiour Planets* suffer no *Eclipses*, when the *Earth* comes between them and the *Sun*; because the *Conical shadow* of the *Earth* cannot reach them. Yet those *Planets* that have any Assistant *Stars*, are subject to *Eclipses* by their Interposition, as is evident from Observations about *Jupiter* and *Saturn*.

CHAP.

CHAP. XXII.
Of the Fixed Stars.

I. *What the Fixt Stars are.*

THE *Fixed Stars* are ſo called, not becauſe they reſt without any *motion* at all, or becauſe they are faſtned to the *Heaven*, as ſo many *Nails*, but becauſe, being ſeated in the *Center* of their ſeveral *Vortexes*, they always keep the ſame *ſituation* and diſtance from one another. So that the *Fixt Stars are Lucid Bodies, conſiſting of the matter of the Firſt Element flowing to the Center of the Vortex, and ſucceeding in the room of the Globuli that recede from thence, giving forth light from themſelves, and much differing in Magnitude from each other.*

II. *The Fixt Stars are higher than the Planets.*

Tho' there ſeem to be an immenſe diſtance between us and the *Planets*, yet is the ſpace that reacheth from the *Earth* to the *Fixt Stars*, much greater, becauſe the *Planets* do ſometimes hide the *Fixt Stars*, which they could not do, if they were not interpos'd between us and them, and conſequently lower than the *Fixt Stars*. Moreover, foraſmuch as the *Aſtronomers* have not as yet found out any thing, whereby to meaſure this vaſt diſtance, we may ſuppoſe it to be as great as we pleaſe.

III. *How the Aſtronomers find out that the Fixt Stars are higher than the Planets.*

That the *Fixt Stars* are higher than the *Planets*, the *Aſtronomers* prove from the *Parallax* or Commutation of our Sight. They conceive two *lines*, the one drawn from the *Center* of the *Earth*, the other from its *Surface*, or from the *Eye* of the *Spectator*, through the *Center* of a *Planet*, and reaching to the *Firmament* beyond it. That which is drawn from the *Center* of the *Earth*, will be higheſt; whereas that which is drawn from the Eye of the *Beholder* is lower and more depreſt, unleſs when they both end in the ſame Vertical Point. And foraſmuch as the *Point*, in which the Firſt *Line* is terminated, is accounted to be the true *place of the Planet*, and the Point in which the other line ends, the Apparent or *ſeen place* of the *Planet*, it is eaſily apprehended, what the *Parallax* is, *viz.* the difference or diſtance that is found betwixt both theſe *places*. Foraſmuch therefore as there is no *Planet* that hath not ſome *Parallax*, the *Aſtronomers* infer, that the *Region* of the *Fixt Stars* is at a greater diſtance from the *Earth* than any of the *Planets*. For there would be no *Parallax* or change of the Sight, in caſe any *Planet* were as far from the *Earth*, as the *Fixt Stars*.

IV. *The Sun is the greateſt of all the Fixt Stars as to our ſight.*

The *Sun* is the greateſt of all the *Fixt Stars* as to us, for that by reaſon of his nearneſs to us, he doth more ſtrongly move the *Luminous matter*; for there is no queſtion, but that if the *Sun* were beheld from the *Fixt Stars*, it would not appear any greater than they do. Yea, *GALILÆUS* gathers that the *Fixt Stars* themſelves, have greater appearing *Diameters*, their immenſe diſtance conſidered, than agrees with the common *Aſtronomical Calculations*, becauſe if we take away their *Beams*, the *Diameters* of the *Fixt Stars* by this means become much leſs.

V. *Some Fixt Stars are higher than others.*

All the *Fixt Stars* are not placed in the Circumference of one *Sphere*, as ſome have imagined, by giving too much credit to their *Senſes*; but as the *Sun* hath a ſpace about it, in which no *Fixt Star* is contained; ſo likewiſe every *Fixt Star* muſt be ſuppoſed to be at a vaſt diſtance from any other, and ſome of them at far greater diſtance from *us* and the *Sun*, than others of them. So that the inequality which is diſcerned to be betwixt the *Fixt Stars*, will be as much from their greater or leſs *diſtance*, as from the greater or leſs *Bulk* of their *Bodies*. And tho' the *Region* wherein the *Fixt Stars* are, appear *Spherical* to our Eye, yet would it be irrational to undertake to determine any thing concerning the *figure* of any *Body*, whoſe outward and inward Surface cannot be diſcovered by us.

VI. *Why the Fixt Stars appear to be in the ſame plain.*

For it is notorious, that *Bodies* of equal bigneſs, by reaſon of their unequal diſtances, appear to be unequal. Now to ſuppoſe all the *Fixt Stars* to be in one Plane, is not ſo much as probable, neither is there any reaſon to prove it: for tho' they be at vaſt diſtances from one another (which we boldly do aſſert) yet will they ſeem to be in one and the ſame Plain, after the ſame manner as *Planets*, *Fixt Stars* and *Clouds* ſeem to be in the ſame Plain, yea, and to touch the very *Horizon*, becauſe there is nothing interpoſed between them, and our ſight, whereby we may judge of their *diſtance*: And I durſt lay it down for a general *Rule*, that *all diſtance vaniſheth, where we have no* Senſe *nor Judgment of the intervening Bodies.*

VII. *The Fixt Stars ſhine with a Light of their own.*

The *Fixt Stars* have a light of their own, as we have ſhewed in the foregoing part of this *Diſcourſe*, that the *Sun* hath, whom we take to be one of the *Fixt Stars*; there being no other *Lucid Body* whence he might borrow his *Light*, in caſe he had it not in himſelf. And the ſame is evident alſo concerning the reſt of the *Fixt Stars*, from the briskneſs of their *Beams*, and their vaſt diſtance both from us, and from the *Body* of the *Sun*, ſo that they cannot borrow any part of his *Light*. For we frequently perceive the *Body* of the *Sun*, covered with *Spots*, which like ſo many *Clouds* cover his Face, and by reſting the Preſſure of the *Light*, ſuffer only ſome languid *Beams* to proceed from him to us; and this, as *Hiſtorians* tell us, hath ſometimes continued for a whole year together, and hath made the *Sun* all that while to appear with a pale whitiſh Light, like that of the *Moon*: And yet the *Fixt Stars*, during this time, were never found to have loſt any thing of their *Light*; which muſt have followed in caſe they had received their *Light* from the *Sun*.

VIII. *The Fixt Stars are at too great a diſtance from the Sun to receive any Light from him.*

Again, that the *Fixt Stars* are of a *fiery Nature*, and like the *Sun*, ſhine with their own *Light*, may be thus proved; becauſe if the *Sun* ſhould be viewed from the *Fixt Stars*, it would appear no greater than one of the leaſt of them; and therefore if the *Sun* were removed from us, as far as they are, its bulk would appear ſo much leſſened, as ſcarcely to be conſpicuous. And again, if we ſhould ſuppoſe the *Dog-Star*, to be placed where the *Sun* now is, it would appear as great and glorious as the *Sun* now appears to us. Now this vaſt diſtance of the *Sun* from the *Fixt Stars*, ſufficiently proves that it is impoſſible they ſhould borrow their *Light* from him. Wherefore we muſt conclude, that the *Light* of the *Fixt Stars*, doth not at all differ in nature from that of the *Sun*, as conſiſting only, on their part, in the ſwift agitation of the matter of the *Firſt Element*; and with reſpect to the *Medium*, in the *motion* they communicate to the *Globuli* of the *Second Element*, intervening between thoſe *Stars* and us.

All

IX. *Why the Fixt Stars twinckle.* All the *Fixt Stars* do seem to *Twinckle*, the reason whereof is the strength and briskness of their Rays, whereby they strike upon our Eyes. Which appears from hence, that when we look upon them through a *Telescope*, their *Twinckling* is much diminished, the strength of their *Rays* being much weakned, by passing through the small holes thereof. Another cause of their Twinckling is, because their *Vortexes*, which on every side encompass our *Heaven*, are not perfectly round, but have irregular Surfaces, as may be seen in *Figure* 20: whereby it happens, that whirling about their *Centers*, and acting upon our *Heaven*, the *Rays* of the *Stars* come to fall obliquely upon it, and by that means are refracted; from which *Refraction* their Scintillation or Twinckling follows. The said Scintillation may also be caused by the agitation of *Vapours* and *Exhalations* in the *Air*; as we see little *Pebbles* that lie without any *motion* at the bottom of a *River*, do seem to shake, by reason of the continual *flowing* of the *Water*.

X. *How it comes to pass that the Stars do not appear in their own places.* For the same reason also it is that the *Fixt Stars*, are not seen by us in the same places, wherein they are indeed, but as if they were placed in the surface of our *Great Vortex*, which hath the *Sun* for its *Center*. And here they cannot appear in their own places, because the Surfaces are in a manner, never so disposed, that the *Rays* which pass through them, from these *Stars* to the *Earth*, do meet with them at *Right Angles*; for when they meet with them *obliquely*, it is necessary, according to the *Rules of Refraction*, that they must bend a little, because they pass more easily, by one of the sides of these *surfaces*, than by the other.

XI. *The Fixt Stars seem to move.* Tho' the *fixt Stars* are contained in their *Vortexes*, and always keep the same distance from one another, yet they seem to move, not only by a *Diurnal motion*, by reason of the *Earths Revolution* about its own *Center*; but also by another *motion*, according to which every *Star* seems to encrease its *Longitude*; ever since that time, when *HIPPARCHUS* 130 years before *Christ*, observed that the *Fixt Stars* had a *motion* like the *Planets*, from *West* to *East*; having taken occasion for making this Discovery from some observation of *TIMOCHARIS* and *ARISTILLUS*. For when *TIMOCHARIS*, amongst other *Stars*, had observed, that the *Spica Virginis*, was almost 8 *degrees* antecedently distant from the point of the *Autumnal Æquinox*, He found the same *Star* to be only removed six degrees from the said point. From which observation he concluded, that they move by this *motion* about one degree, in the time of 100 years; and consequently that the *Fixt Stars* also had a *motion* of their own.

XII. *What the cause is of this appearing motion.* In order to the Explication of this appearing *motion* of the *Fixt Stars*, we are to suppose, that the *Axis* of the *Diurnal motion* of the *Earth*, doth not accurately keep the same *Parallelism* in its *Annual Revolution* which it had before, but somewhat turns aside from the same, after the running out of a great many *years*; and tho' this *Deflexion* from the *Axis* of the *Ecliptick* be insensible; yet the *Earth*, by this *Reeling motion*, in the space of many thousand *years*, is the cause that its *Poles* describe a *small Circle* from the *East* to the *West*. And since that according to this *Hypothesis* we conceive the *Æquator of the Earth* to answer to different parts of the *Heaven*, it follows that the *Cœlestial Æquator* must also change its place, and cut the *Ecliptick* at divers *Points*, from *East* to *West*. And because the *Longitude* of the *Fixt Stars* is computed from that time, in which these two *Circles* are intersected, it cannot be, but that the said *Longitude* must seem to be encreased every hundred years.

XIII. *Why the Poles of the Earth are by little and little obliquely turned the contrary way to its Annual motion.* This will appear more manifestly, if we suppose that the *Declination* of the *Axis of the Earth* from the *Perpendicular* to the Plain of the *Ecliptick*, proceeds from the *Striate* Matter of the First *Element* (as shall be explained more at large in the sixth Part) which coming from that part of the Second *Heaven*, which is 23 degrees distant from the *Poles* of the First *Heaven*, and passing through its *Poles*, doth incline it to so many *degrees*. But because that part of the Second *Heaven*, which is fit and dispos'd, to drive the *Striate Matter* into the *Poles* of the *Earth*, and by this means to sway them obliquely, is insensibly turned round from 1 to 2, and from 5 to 6, and so on, according to the trace of the *Polar Circles* 1, 2, 3, 4, and 5, 6, 7, 8, which in this our age, are 23 *degrees* distant from the *Poles* of our First *Heaven* A C; whilst, in the mean time, the *Earth*, together with the rest of the *Planets* is moved in its *Annual motion*, according to the Succession of the *Signs* of the *Zodiack* from *Aries* ♈ to *Taurus* ♉, and from *Taurus* to *Gemini* ♊, and so on, by a contrary *Motion* to that of the Second *Heaven*, that communicates the *Striate Matter* to the *Earth*; by this means it comes to pass that the *Poles* of the *Earth* are by little and little turn'd about, respecting those *Polar Circles* at this time, with an inclination of 23 *degrees*, contrary to the course of their *Annual Motion*: So that the *Poles* of the *Earth*, which were directed to the parts of the *Polar Circles* marked N O, are now directed, to those parts of them that are marked L M. Figure 34.

Neither only is that part of the Second *Heaven*, which sends the *Striate Matter* to the *Poles* of the *Earth*, and directs or inclines them according to the trace of the *Polar Circles* 1, 2, 3, 4, and 5, 6, 7, 8, swayed about, but it is also lifted up to the *Poles* A C, of our *Heaven*, and is again by them, in that wresting about, softly depressed. And this is the Cause, why the *Axis* of the *Poles* of the *Earth* I, doth now decline 23 *degrees* and 30 *minutes*, according to the magnitude, for Example, of the *Line* L M, or N O, from the *Poles* A C, of our *Heaven*, whereas formerly this *Declination* was of whole 24 *degrees*.

XIV. *The Longitude of the Fixt Stars may be unequal.* Wherefore altho' the *change* which happens to the *Longitude* of one *Star*, cannot but be like to that which happens to another; yet it is not necessary, that all the *Fixt Stars* together, should throughout all *Ages* obtain the same *Longitude*, since it is possible that this *Reeling* of the *Earth*, may be more sensible in this Age than in another. And therefore the Irregularity of the Apparent *motion* of the *Fixt Stars*, may be easily explained, by supposing, that the *Reeling* or Titubation of the *Earth* is not *Regular*; and that in some *Ages* it deflects somewhat more, and in others less.

XV. *How the Change of the Declination of the Ecliptick is made.* We may likewise easily comprehend, that the apparent *Ecliptick*, must somewhat alter its *declination*, provided we conceive, that during this *Titubation*

tubation of the *Earth*, its *Axis* inclines towards the plain of the *Ecliptick*, somewhat more at one time than another; for thus the *Æquator* of the *Earth*, determines that of the *Heaven*, in parts that are at such different Distances from the *Ecliptick*. Now this *Reeling motion* of the *Earth*, follows necessarily from its being placed in the *Vortex* of the *Sun*: For it would be a great wonder, if being plac'd in the midst of a *Liquid matter*, as it is, it should continue there many Ages, without admitting any change in its situation.

XVI. *Why the Fix'd Stars are not seen in the Day time.*

The *Fix'd Stars* are not seen by us in the day time, because the impression of the *Sun*'s *Brightness* is so strong on our *Eyes*, that the *Light* of the *fix'd Stars* cannot make it self perceptible. The case is the same, as when our *Ear* being stun'd with some great Noise, cannot perceive any low or weak sound: Or, as a *hot Hand* cannot distinguish the less sensible warmth that is in another *Subject*. Yet doth not this hinder, but that a *Man* plac'd at the bottom of a *Well*, may perceive the Light of the *fix'd Stars*; because there his *Eye* is not so strongly affected by the splendour of the *Sun*; neither doth any thing hinder a *Star* that is above the *Horizon*, from freely transmitting his *Rays*.

CHAP. XXIII.

Of the Asterisms and Constellations.

I. *The Number of the fix'd Stars.*

THo' the *Fix'd Stars* be dispers'd throughout the immense Space of *Heaven*, and can no more be numbred than the *Sand* on the *Sea-shoar*; yet the *Astronomers* have been pleased to determine a certain Number of them, which they have discover'd by the help of their *Telescopes*, as being nearer to us, and more in view. Of these they count 1022; which they have divided into 6 *Classes* or *Ranks*.

II. *The difference of the Magnitude of the Stars.*

The greatest *Stars* of all are called, *Stars of the First Magnitude*; and of these there are 15.

The next to these are called, *Stars of the Second Magnitude*, of which there are 45.

After these follow those that are of the *Third Magnitude*, being 208 in number.

Of the *Fourth Magnitude*, there are 474.

The fifth *Classis* of *Stars*, are those of the *Fifth Magnitude*; and of these there are 217.

The sixth *Rank* or *Order* of *Stars* contains 49, and are the least of all. To which, for the making up of the Number, 9 *Stars* called *Obscure*, are added, and 5 called *Misty* or *Cloudy*, because they can hardly be perceived.

III. *All the Stars that belong to one of these Orders, are not equal.*

It is to be observ'd, that all the *Stars* that are of one *Classis*, do not appear to us of the same Bigness and Brightness; but in every one of these *Divisions*, there are some that are Greater, some Less, and some of a Midling-size, between both. For the *Dog-Star* is the biggest of them all; and tho' the *Lyre* or *Harp* be of a very conspicuous Magnitude, yet can it not be compared with it; and the same may be said of the other *Orders* or *Divisions*. For the *Eye of the Bull* doth far exceed the *Lions-Heart*, and the *Virgins Ear of Corn*.

IV. *How the Stars came by their several Names.*

To the end these *Stars* might be the better distinguish'd and remembred, the *Astronomers* have reduc'd them to certain *Constellations*, and affixed some *Signs* or *Figures* to them, according as they imagin'd them to have some resemblance or agreement with such and such *Animals* or *things*.

V. *The Number and Character of the Constellations in the Zodiack.*

The *Astronomers* reckon up 48 of these *Figures* or *Constellations*, whereof some are in the *Zodiack*, others without it in the Northern and Southern *Hemisphere*.

In the *Zodiack* are 12 *Constellations*: *Aries*, or the *Ram*, expres'd by this Character ♈, as representing the *Head* and *Horns* of a *Ram*: *Taurus*, ♉, the *Bull*, the *Head* and *Horns* of an *Ox*: *Gemini*, or *Twins*, ♊, two *Bodies*, with their *Arms* and *Legs* twisted together: *Cancer*, the *Crab*, ♋, the *Claws* of a *Crab*, with their Retrograde going: *Leo*, the *Lion*, ♌, representing a *Lion*'s *Tail*: *Virgo*, the *Virgin*, ♍, resembling a *Wing*, or the *folded Gown* of a *Damsel*: *Libra*, the *Balance*, ♎, the *Beam* of a pair of *Scales*: *Scorpius*, the *Scorpion*, ♏, the *Body* and *Tail* of a *Scorpion*: *Sagittarius*, the *Archer*, ♐, an *Arrow*, apply'd to a *Bow*: *Capricornus*, ♑, the *Head* and *Horns* of a *Goat*, with the *Tail* of a *Fish*: *Aquarius*, the *Waterman*, ♒, the pouring of *Water* out of a *Pitcher*: *Pisces*, the *Fishes*, ♓, two *Fishes* tied together with a String.

VI. *Each Sign contains 30 Degrees.*

The *Astronomers* attribute to each *Sign* of the *Zodiack* 30 *Degrees*, tho' the *Asterisms* themselves be unequal, some of them being shorter, and others longer: For if 360 be divided by 12, the result will be 30.

VII. *What are the most conspicuous Stars in every Sign, and first in* Aries.

In ARIES 3 *Stars* are most conspicuous, 2 in the *left Horn* of the *fourth Magnitude*, and 1 of the *third*, between the *Horns*; which *Tycho* calls the *Bright Star* in the top of the *Rams Head*.

VIII. *What in* Taurus.

The most considerable *Star* in the Sign TAURUS is placed in his *left Eye*, being a *Star* of the *first Magnitude*, and is therefore called the *Bulls Eye*. Near to it are other 5 *Stars*, which are called *Hyades*: And those 6, formerly 7 *Stars*, that appear on the *Back* of the *Bull*, are called *Pleiades* and *Vergiliæ*, in the midst of which is a *Star* of the *third Magnitude*, commonly called *the Bright Star of the Pleiades*.

IX. *What Stars are in* Gemini.

There are 2 Principal *Stars* in GEMINI of the *second Magnitude*, whereof that in the *North Head* of the *Twins*, is called *Castor*; as that in the South, *Pollux*. There is also another *Star* of the same *Magnitude* in the *right Foot* of *Pollux*, towards *Orion*. There is also one of the *fourth Magnitude*, called *Propus*, because it is placed near the *left Foot* of *Castor*.

X. *What in* Cancer.

In CANCER, scarce any *Stars* appear, besides one of the *third Magnitude*, near to the *right Claw*, and 3 others of the *fourth*, 2 whereof are most noted, whereof 1 stands towards the North, the other towards the South.

XI. *What in* Leo.

The LION is adorned with divers *bright Stars*, 2 whereof are of the *first Magnitude*. That which is seen in his *Breast*, is called the *Lions Heart*, or *Regulus*; and that in his *Tail*, the *Lions Tail*. Besides these there are 2 other, the one in his *Neck*, the other in the utmost part of his *Back*; to which, if the next *Stars* in his *Loyns* be added, they, together with those of the *Heart* and the *Neck*, will represent the Figure of a long *Square*.

XII. *What in* Virgo.

In the VIRGINS *left Hand* is an *Ear of Corn*, in which there is a *Star* of the *first Magnitude*, commonly called, the *Virgins Ear of Corn*. There are also other *Stars* of the *third Magnitude*, dispers't all along the *Virgins Body*.

SCOR-

XIII. *What Stars are in the* Scorpion. SCORPIUS, beſides 2 *Stars* of the *ſecond Magnitude* plac'd in the further part of his *Claws*, and 2 more of the *third Magnitude* in his *Tail*, hath another in the midſt of his *Body*, called *the Scorpion's Heart*, plac'd between 2 *Stars* of the *fourth Magnitude.*

XIV. *What in* Libra. LIBRA conſiſts of 2 very *bright Stars*, which are called *the Scales.*

XV. *What in* Sagittarius. In SAGITTARIUS are 4 *Stars* more conſiderable, which being plac'd on his *Right ſhoulder*, conſtitute a *Trapezium* or *Table*; beſides 3 or 4 that do ſomewhat reſemble a *Bow*: Beyond the midſt of which, there is another of the *third Magnitude*, which repreſents the form of an *Arrow.*

XVI. *What in* Capricorn. The *Chief Stars* in CAPRICORN are 4 of the *third Magnitude.* There are 2 in his *Tail* that have a greater luſtre than the reſt; and two other in his *Horns*, the uppermoſt whereof hath a ſmall *Star* joyned to it.

XVII. *What in* Aquarius. In AQUARIUS, the moſt conſpicuous *Stars* are ſome of the *third Magnitude* about his *ſhoulders*, with 4 others about his *right Hand*; the one whereof is, as it were, plac'd in the midſt of a *Triangle*, conſtituted by the other 3. And there is another in his *right Hand* of the *third Magnitude*; beſides which there are many other of the *fourth Magnitude*, and more eſpecially one at the end of the pouring forth of the *Water*, which is of the *firſt Magnitude.*

XVIII. *What in* Piſces. The Conſtellation PISCES conſiſts of many ſmall *Stars*; there being but few amongſt them that are as big as thoſe of the *fourth Magnitude*: And tho' theſe *Fiſhes* are at ſome diſtance from each other, the one in the Neighbourhood of *Aquarius*, under the Neck of *Pegaſus*, and the other near to the *Ram* or *Aries*, under the Breaſt of *Andromeda*; yet they are tied together with a kind of looſe *Riband*, which is alſo adorn'd with ſeveral *Stars* of the *firſt Magnitude.*

XIX. *The Northern Conſtellations, without the Zodiack* The *Conſtellations* without the *Zodiack*, are either Northern or Southern. The Northern, which appear in our *Hemiſphere*, are 21; the particular account whereof here follows, beginning with that *Conſtellation* which is next of all to the *Pole.*

1 *The* Little Bear. And this is URSA MINOR, the *Leſſer Bear*; which conſiſts of 7 *Stars*, 4 whereof repreſent a *ſquare Figure*; whereof the uppermoſt in the Neck of the *Bear*, is of the *ſecond Magnitude*; another lower than it, of the *third*; a third on the Back, of the *fourth*; and the laſt in the Back alſo, of the *fifth.* The hindermoſt and brighteſt of the other 3, is called the *Pole-Star*, becauſe it is nearer to the *Pole* of any other.

2 *The* Great Bear. URSA MAJOR, the *Greater Bear*, conſiſts likewiſe of 7 *Stars*, whereof the 4 that repreſent a *ſquare*, exhibit ſo many *Wheels*, and the other 3, the *Beam* of the *Wain*, and the *Oxen* or *Horſes* that draw it; and therefore was called by the Ancients, *Plauſtrum majus*, or the *Greater Wain.*

3 Bootes. BOOTES, the *Herdſman*, or rather the *Driver of the Oxen*, called alſo *Arctophylax*, the *Bearward*, conſiſts of many *Stars* of the *third Magnitude*, plac'd in the *ſhoulder*, *back* and *knees* of this Figure. But one of them is more famous than any of the reſt, placed between his *Thighs*, on the rim or edging of his *Coat*, being of the *firſt Magnitude*, and is called *Arcturus.*

4 *The* Dragon. The DRAGON conſiſts of many *Stars*, but none of them greater than thoſe of the *third Magnitude*; only there are 2 in the *Head* of it, that are *brighter* than the reſt.

5 *The* Crown *of* Ariadne. The CROWN of ARIADNE, plac'd at the *Right ſhoulder* of *Bootes*, repreſents a *half Circle*, compos'd of 5 *Stars*; whereof 3 are of the *fourth Magnitude*, one of the *fifth*, and another of the *ſecond*, which is called *the Bright Star of the Crown.*

6 Engonaſi. ENGONASI, the *Man*, according to ſome *Hercules*, *Kneeling*, comprizeth ſeveral *Stars* all of the ſame *Magnitude*; of which one eſpecially is more conſpicuous in the *Head* of this Figure, for its being of an equal ſize, with another *Star* like it, found in the *Head* of *Ophiuchus.*

7 Lyra, *or* the Harp. LYRA, the *Harp*, which by ſome is called *the Falling Vultur*, hath the moſt eminent *Star* of the *firſt Magnitude*, next to the *Dog-Star*; beſides which it contains ſome few other *Stars*, 2 whereof are of the *ſecond Magnitude.*

8 *The* Swan. The SWAN is an illuſtrious *Conſtellation* within the *Milky-Way*, reſembling the Form of a *Croſs*; and hath a very notable *Star* of the *ſecond Magnitude.*

9 Cepheus. CEPHEUS hath his *Head* pointing to the *Swan*, and his *right Foot* ſtanding on the *Tail* of the *Little Bear.* It contains but few bright *Stars*, beſides 3 of the *third Magnitude*, one in the *Right ſhoulder*, another in his *Girdle*, and a third in his *Right knee.*

10 Caſſiopeia CASSIOPEIA hath 5 *Stars* of the *third Magnitude*, over againſt the *Great Bear*, the leaſt being in the midſt of them; 3 of theſe are on the outſide, one of them being called *the Bright Star of the Chair*; another upon her *Breaſt*, called *Schedir*; the third near her *Flank*; all which repreſent the Figure of a *Triangle.*

11 Perſeus. PERSEUS is plac'd between the *Feet* of *Caſſiopeia* and the *Bull*, the moſt bright *Star* of which *Aſteriſm*, that on the *Back*, is of the *ſecond Magnitude.* It hath alſo another famous one of the *third Magnitude*, which being placed in the *Head* of *Meduſa* in the *Left hand* of *Perſeus*, is therefore called *the Head* of *Meduſa*, and the other 4 are call'd *Gorgons.*

12 Andromeda. ANDROMEDA is an *Aſteriſm* under *Caſſiopeia*, on the *Left-ſide* of *Perſeus*; very remarkable, becauſe of 3 *Stars* it hath of the *ſecond Magnitude*; one whereof is on the *Left Foot*, above the *Triangle*, the other in the *Girdle*, above the *Fiſhes*; the laſt in the *Head*, which is common to her and *Pegaſus.*

13 Deltoton, *or* the Triangle. DELTOTON, or the *Triangle*, conſiſts of 3 *Bright Stars* of the *fourth Magnitude*, one whereof is at the top, and the other 2 at the Baſis of it, with another *Star* of the *fifth Magnitude*, near to it.

14 Auriga. AURIGA, the *Wagoner* or *Wain-Driver*, hath a *Star* of the *ſecond Magnitude* in the *Left Foot*, where there is alſo another of the *fourth Magnitude.* But the moſt noted of them all is a *Star* of the *firſt Magnitude* very illuſtrious, on the *Left ſhoulder*, called *Capra*, the *Goat.*

15 Pegaſus. PEGASUS, or the *Flying-Horſe*, is a notable *Conſtellation*, by reaſon of a large *ſquare* compoſed by 4 of its *Stars* of the *ſecond Magnitude.* Beſides which it contains other 3 of the *third Magnitude*, the one in the *Knee*, the other in the *Neck*,

Neck, and the third in the *Opening of the Mouth*, which is therefore call'd *the Mouth of* Pegasus.

16 *The* Dolphin. The DOLPHIN, seen between the *Constellation* of the *Colt* and the *Eagle*, has 10 *Stars*, whereof 5 are of the *fifth Magnitude*: The other, except that which is in the *Tail*, do constitute the Figure of a *Lozenge*.

17 *The* Arrow. The ARROW hath 5 *Stars*, of which, that at the *Point* is of the *fourth Magnitude*.

18 *Equuleus, or* the Colt. The COLT is nothing else, but as it were the *shadow* of the *Head of Pegasus*, in which are seen 4 *Stars*, all of them of the *fourth Magnitude*.

19 *The* Eagle. The EAGLE is considerable for 3 *Stars*, representing the situation or position of *Orions Girdle*. The 2 that are at each end, are only of the *third Magnitude*; as likewise 2 others at the end of his *Tail*: The *Star* which is in the middle is of the *second Magnitude*, and out-shines the rest, being therefore call'd, *the Bright Star of the Eagle*.

20 Serpentarius. SERPENTARIUS OPHIUCHUS, or *the Serpent-Bearer*, is a great *Asterism*; for its *Head* is near to the *Head* of *Hercules*; its *Feet* rest upon the *Scorpion*; the *Head* of the *Serpent* reacheth to the *Northern Crown*, and its *Tail* to the *Eagle*. Its greatest *Star* is only of the *third Magnitude*. Yet there is one of these that is very considerable by the *right Ham*, between the *Scorpion* and *Sagittary*, which in the Fourth year of this *Century* was accounted amongst the *Great Stars*.

21 *The* Serpent *of* Ophiuchus. The SERPENT of *Ophiuchus*, is famous for several *Stars* of the *third* and *fourth Magnitude*, in the middle Joynt of the *Neck*, next to that Hand in which *Hercules* holds his *Club*.

XX. *The Southern* Constellations, *without the Zodiack.* The Southern *Signs* are 15 in Number, without the *Zodiack*.

1 *The* Whale. The first is the WHALE, situate under the *Fishes* and the *Ram*, having a vast wide Mouth, in the midst whereof is a *Star* of the *first Magnitude*, *the Bright Star of the Jaw-bone of the Whale*; and hath another of the same *Magnitude* answering to it, in the midst of the Point of his *Tail*; besides other *Stars* over his whole *Body*, of the *third* and *fourth Magnitude*.

2 *The River* Eridanus. ERIDANUS is a long and winding *Asterism* betwixt *Orion* and the *Whale*. The end of which, towards the South, is invisible to us.

3 *The* Hare. The HARE, besides other of the *Stars* whereof it is composed, hath 4 of the *first Magnitude*, and other 4 smaller ones in his *Ears*.

4 Orion. ORION is a *Constellation*, adorned with many *bright Stars*. Of these, 2 principal ones are in his *Shoulders*, 3 in his *Girdle*, which are called *Three Kings*; 1 in his *right Knee*, and another in his *left Foot*, called *Rigel*.

5 *The* Great Dog. The GREAT DOG hath not his equal for Brightness, and is commonly call'd *Sirius*, as being supposed to Dry all things. About his *right Feet* he hath some *Stars* of the *third Magnitude*.

6 *The* Little Dog. The LITTLE DOG riseth before the Greater, and is, as it were, the Harbinger of his Rising. Besides the *Star* which is in his *Neck*, of the *third Magnitude*, he hath another Bright one in his *Thigh* of the *second Magnitude*, called *Procyon*.

7 *The* Ship Argo. The *Ship* ARGO hath but a few *Stars* that are conspicuous, except it be about the *Mast*. In its *Helm* is a very noted *Star*, called *Canopus*.

8 Hydra. HYDRA, the *Hydre*, a *Water-Serpent*, is a long extended *Asterism*; for with its *Head* it toucheth the *Claws* of the *Crab*, and its *Tail* is near to *Libra*, or the *Ballance*. It hath a very *bright Star* in its *Breast* of the *first Magnitude*, called the *Heart of the Water-Snake*.

9 Crater, *the Bowl.* The BOWL, or *Cup*, is placed upon the Middle part of the *Hydra*, having some *Stars* of the *fourth Magnitude*, representing an half Round.

10 *The* Crow. The CROW is very remarkable, by reason of the Table in it, consisting of 4 *Stars*, whereof 3 are of the *third Magnitude*, and another of the *fourth*.

11 *The* Centaur. The CENTAUR, besides 14 visible *Stars*, hath others that are not conspicuous to us; whereof 1 is of the *first Magnitude*, at the *right Fore-foot* of the *Horse*. In his *hind Legs* are 4 *Stars*, which represent a very remarkable *Cross*. The Uppermost and Lowermost are of the *second Magnitude*; but the Right and Left of the *third*.

12 *The* Wolf. The WOLF, or *Wild-Beast*, doth with his *Head* reach the middle part of the *Scorpion*; it hath no *Stars* bigger than of the *fourth Magnitude*.

13 *The* Altar. The ALTAR, or *Censer*, is for the most part hid from us under the bending of the *Scorpions-Tail*. It hath no greater *Stars*, than of the *third Magnitude*.

14 *The* Southern-Crown. The SOUTH-CROWN hath one very notable amongst the rest, of the *third Magnitude*; and is the same which is called by some *Uraniscus*, or the *Petty-Heaven*.

15 *The* South-Fish. The SOUTH-FISH contains many *Stars*, and those of the *fourth Magnitude*, under the *left Leg* of *Aquarius*. In its *Mouth* it hath a Principal one of the *first Magnitude*, called *Fomahant*.

XXI. *What those Stars are that are* Unformed. Tho' the *Constellations* of the *Zodiack*, together with the North and South, are reduced to the Number of 48; yet we are to know that the *Astronomers* could not comprize them all into *Figures*, but were fain to leave some in the Intervals of them, which they called *Unformed*, as being comprehended in no *Figure* or *Image*.

XXII. *What the* Galaxy, *or* Milky-way, *is.* The *Astronomers* also make mention of the *Galaxy*, or *Milky-way*, which is nothing else but a vast multitude of thick-set *Stars*, that by their weak *Light* represent the appearance of *Milk* in a clear *Sky*, as the *Telescope* hath informed us. Whereby *ARISTOTLE* is convinc'd of a manifest Error, who suppos'd the *Milky-Way* to be a *Meteor*; who yet therein is to be pardoned, because he wanted the Helps that we have to discern it better.

XXIII. *How the* Sun, *or any* Planet, *is said to be in a Sign.* We are to observe, that when that the *Sun*, or any *Planet*, is said to be in a *Sign*: As for Example, in the *Ram*, or in the *Bull*; the meaning thereof is, that it is plac'd under it, or that it intervenes, or is intercepted between our *Eye* and that *Sign*. For it is certain, that the *Zodiack*, and its *Signs*, are at a vast distance from the *Planets*. But this way of speaking hath obtain'd, because the *Planets* appear to us, as if they were in the Region of the *fix'd Stars*. For our unassisted Sight cannot discern which of the *Stars* are farther from, or nearer to us. Hence it is, that because we know that the *Planets* are nearer to us than the *Stars*, we understand them

to

to be so placed, as to be between us and the *Signs*. But the *Stars* that are without the *Zodiack* are said to be in that *Constellation*, or rather to belong to it, between which and the next *Pole* of the *Zodiack* they are placed.

CHAP. XXVI.

Of the Influence of the Stars, and of Judicial Astrology.

I. *The sense of the Question stated.*

IT is a Question frequently handled by the graveſt *Authors*, Whether the *Stars* act upon theſe *Inferiour Bodies*; and whether the Things that happen here on *Earth* do depend on their *Influences*. Or to ſpeak more plainly, Whether the *Stars* be the *Cauſe* of thoſe *Effects* we ſee in this *Sublunary World*; or at leaſt, contribute ſomething to their *Production*. For the better underſtanding of this *Queſtion*, it will be neceſſary to examine the *Virtue* and *Power* of the *Stars*, and thence gather their manner and way of acting.

II. *The Sun influenceth this ſublunary World.*

There is no doubt, but that the *Sun* concurs by a real *influx* to the *Production* of *Terreſtrial Bodies*; yea, if we give heed to his *Virtue*, we ſhall find him to be the *only*, or at leaſt the *Principal Cauſe* of all things that are generated in the *Earth*; for the *Growing* of *Plants*, the *Nouriſhment* of *Trees*, the *Ripening* of *Fruit*, and the *Springing* of *Corn*, are all to be referr'd to the *Sun*, by whoſe *Heat* they are cheriſhed, grow, and are brought to perfection.

III. *An Objection against the Virtue of the Sun.*

If you ſay, That many things happen in the *Earth* which cannot be imputed to the *Sun*; as *Cold* and *Moiſture*, which require a Cauſe diſtinct from that of *Heat*. For how can *Heat* be conceiv'd to be the Original of *Cold*? Or, how can the *Sun*, who is of a *fiery Nature*, produce *Moiſture*, ſince the Natural effect of *Fire* is to dry, and deprive a Body of all *Moiſture*? And therefore the *Sun* can only be ſaid to be the *Cauſe* of ſome particular Effects.

IV. *Answer.*

I Anſwer, It is true that *Cold* and *Moiſture* do not proceed from the *Sun*, as their productive Cauſe; yet doth not this contradict their proceeding from the *Sun accidentally*. For as his *preſence* drives away the *Cold*, and ſuffers it not to prevail on the *Earth*; ſo his *abſence* ſuffers it to prevail, and expoſeth *Terreſtrial Bodies* to its conſtriction. In like manner, tho' *Moiſture* doth not deſcend from the *Sun*; yet becauſe the ſame abounds in the *Earth*, and that the *Sun* doth not always elevate the ſame into *Vapours*, therefore he may be ſaid to be an *Accidental Cauſe* of it.

V. *The Sun is the General Cauſe of all Effects produced in the Earth.*

The *Sun* therefore is to be conſidered by us as a *General* or *Univerſal Cauſe*, which every where diffuſeth its *Beams*; yet it happens by Accident, that he illuminates one part of the *Earth* more than another: As it is accidental to *Fire*, that this or the other thing comes near to it, to be *heated* and *cheriſhed* by it, or not. And hence it is, that all that variety, which we ſee in Nature, doth not ſo much proceed from the *Sun*, as from the various *ſituation* and *diſpoſition* of *Bodies*. For the reaſon why in one part of the *Earth* it is *Spring*, in another *Autumn*, in a third *Summer*, doth not proceed from the *Sun* as a *Special Cauſe*, but only as a *General*, the *Sun* being always the ſame, and equally diffuſing his *Heat*. For that it is now, ſuppoſe, *Summer* with us, by the *Sun-beams* falling more directly upon us; this is owing to that *Part of the Earth* wherein we live, whoſe *ſituation* is ſo directed towards the *Sun*, as to receive his *Beams* more directly, at the very ſame time that it is *Winter* with our *Antipodes*, to whom the *Suns-beams* are obliquely directed.

VI. *The Planets contribute nothing to any ſublunary Effects.*

I know that ſome *Philoſophers* refer the Cauſe of this diverſity to the *Planets*, as ſuppoſing *Saturn* to be Cold; *Mars*, Hot; *Venus*, moderately Warming; *Mercury*, Various; the *Moon*, Cold and Moiſt. But theſe I take to be no more than meer Fictions, ſince we perceive no *Cold* from *Saturn*, nor *Heat* from *Mars*; and ſo from the other *Planets*: Becauſe it cannot be, that we ſhould feel or perceive any of theſe *Qualities*, but that at the ſame time all the other *Inhabitants* of the *Earth* muſt perceive the ſame, ſeeing that they are ſenſible of theſe Viciſſitudes of *Seaſons*, as well as of the *Sun's Heat*; and therefore theſe Changes depend on the various poſition of the *Parts of the Earth*. As we ſee, that the *South-Winds*, which produce Warm Weather in the midſt of *Winter*; and *North-Winds*, which cauſe Cold in *Summer*, do not ariſe from the *Aſpects of the Planets*, ſince the ſame *Aſpects* are over the whole *Earth*, and yet we do not find the ſame *Winds* every where; ſo that they proceed only from the various diſpoſition of the *Regions of the Earth*.

VII. *The Fix'd Stars ſend down no Influences upon theſe Inferiour things.*

Neither do the *Fix'd Stars* ſeem to diſpenſe any *Influences* to us here below, becauſe their vaſt diſtance hinder them from producing any *Effects* here: For tho' by their *Light* they may put the *ſubtil Matter* contain'd in the *Pores* of the *Air* into *motion*, and by means thereof agitate other groſſer Matter, which thereby may produce a ſenſible Effect; yet becauſe we know of no other Virtue that is in them, whereby they might act upon theſe Inferiours, ſave only their *Light*, we cannot attribute to them any *Effects*, beſides thoſe that proceed from *Light*: And foraſmuch as the *Light of the Sun* is incomparably greater than that of the *Fix'd Stars*, we are to attribute all *Natural Effects* to the *Light of the Sun*, as the General and Primary Cauſe of them.

VIII. *The Fix'd Stars do not always Riſe and Set at the ſame time; and yet we find that the General Changes of Seaſons in the World keep the ſame time.*

This *Opinion* may be further confirmed, if we conſider that the *Fix'd Stars* do not Riſe and Set now at the ſame time as formerly; but becauſe of their turning round from *Eaſt* to *Weſt*, they Riſe now almoſt a whole Month later than of Old: And yet the *Seaſons* and *General Changes* that are in the *World* ſtill obſerve the ſame Tenour, and correſpond with the *Suns* Courſe through the *Zodiack*. For the *Dog-Days*, by Example, or that great *Heat*, which in old Times was perceived about the midſt of *July*, ſtill continues about the ſame term, neither is changed to the midſt of *Auguſt*, at which time the *Dog-ſtar*, which they make the Cauſe of its *Heat*, doth now Riſe. Neither can we ſuppoſe, that 6000 years hence, this *Heat* will be removed to the midſt of *November*, at which time the *Dog-ſtar* will then Riſe. Beſides, if the *Heat* we perceive in *Summer* be to be aſcribed to the *Dog-ſtar*, how comes it to paſs that at the ſame time the ſaid *Star* is almoſt 40 *Degrees* diſtant from the *Sun*? Since it might be rather expected it ſhould diſplay its *Heat* in the *Winter*, when it is conjoyn'd with the *Sun*, *viz.* about the 29*th* of *October*.

IX. *The Cause of the great Heat in Summer.* The Cause therefore of these great *Heats* is, because the *Sun* at that time sends down his *Beams* more perpendicularly upon us, and continues longer above our *Horizon*; and forasmuch as this perseveres for some Days after the *Solstice*, during which time new degrees of *Heat* are still added, it cannot be otherwise, but that the *Heat* during that time must be increased.

X. *The Moon produceth no Effects upon the Earth.* Neither doth the *Moon*, tho' she be so near unto us, produce any Effects here below. I know that several *Effects* are attributed to her by some; as the Breaking or Splitting of *Stones*, and the increasing of *Oisters*, and other *shell-Fish*, at the *Increase of the Moon*, and their decreasing at the *Wane of the Moon*; as likewise that the *Bones* of *Animals*, at the *Full-Moon*, are full of *Marrow*, whereas at the *New* they are almost empty.

XI. *What is the Cause why Stones are broken.* But all these *Effects* may be with more Truth attributed to other *Causes*, than to the *Moon*. For as to the breaking of *Stones*, the same may with more Reason be attributed to the *Sun*, than to the *Moon*; seeing it is certain, that some *Stones*, after many years lying expos'd to the *Sun*, have been calcined. And therefore seeing that the *Sun*'s *beams* reach the *Stones*, as well as those of the *Moon*, it seems very reasonable that this *Effect* should rather be imputed to the *stronger*, than the *weaker Agent*.

XII. *The increase or decrease of Oysters, doth not proceed from the increase or decrease of the Moon.* So likewise it is a Popular Error to imagin, that *Oysters* and other *shell-Fish*, are bigger and fuller at some times of the *Moon*, than at others: For tho' they are sometimes bigger than at other times, yet is not this to be ascribed to the *Moon*, but rather to *Chance*, because they have not had sufficient *Food*, or because the tossing of the *Sea* hath forced them to some Evacuations. This is apparent in those *Fishes* which are taken in the same place, and in the same day: For those which are caught in a *Net*, and immediately taken out thence, are fuller Bodied and better Fed, than those which having been long kept up, have lost much of their *flesh* by striving to get out. The original therefore of this Error hath been, for that some have taken that to be caused by the *Moon*, which was meerly fortuitous. And accordingly we find, that indifferently at any time some *Oysters* are found to be fat and full, and others lean and poor.

XIII. *The Cause why more or less Marrow is found in the Bones of Living Creatures.* And the same may be said of the *Marrow* that is found in the *Bones* of *Animals*: For several who have examin'd the matter, have found that there is no more *Marrow* in the said *Bones*, at any one precise time, than at another; but that the want or defect thereof sometimes is caused, by want of *Food*, or for that the *Beasts* have been tired by long Journeys before they were kill'd.

XIV. *What Judicial Astrology is, and of how many sorts.* *Astrology is an Art, which foretells future things from the motion of the Heavenly Bodies, and their Aspects to one another.* And is therefore called *Judicial*, because from these it judgeth of the *Events* of things. *Astrology* is twofold; the one is that *Art*, which from the position of the *Stars* at the time of *Birth*, judgeth of the *Inclinations* and *Tempers* of Men, whether they will be *Passionate*, *Melancholy*, *Wise*, *Venereal*, *&c.* because the Hour of their *Nativity* was accompanied with such or such *Aspects of the Stars*, which have a Virtue of causing the *Gall*, *Melancholy*, or *Spirits* to abound. The second kind of *Judicial Astrology* is that *Art*, which from observing of the *Horoscope*, judges of *Future Events*, *Children*, *Manner of Life*, *Marriage*, *Honours*, *Misfortunes*, *Losses*, *&c.*

XV. *Who were the first Professors of it.* This *Judicial Astrology* was first cultivated by the *Chaldæan* and *Babylonian Philosophers*, who not only affirmed that they could Foretel *Future Events* from the *Aspects* of the *Stars*; but also boasted that by them they could discover the particular *Actions of Men*, and the *special Events* of their *Lives*. But that both the one and the other of these are vain and false we prove as follows:

XVI. *Reasons against Judicial Astrology.* *First*, Because the *Astrologers* had no exact knowledge of the *Virtues* of the *Stars*, no not of such as were most Notorious. *Secondly*, Because they were ignorant of the Nature of most *Stars*, which might variously alter or hinder the operations of those *Stars* they knew. *Thirdly*, Because no sufficient Reason can be given, why *Schemes* for *Nativities* are erected from the point of *Birth*, rather than from that of *Conception*. *Fourthly*, Because the *Astrologers* themselves own, that they have no *Principles* whereby they might be informed, that the *Stars* have such *Virtues* as they assign to them, and that consequently their *Predictions* are not any deductions from *Premisses*, but the Dreams of Idle men.

XVII. *Astrologers can have no certain Experience.* Besides, how can they be assur'd of the certainty of the *Events* they pretend to guess at? Not by *Experience*: For who will conclude that it will lighten, for Example, upon the *Kings* entring into St. *James*'s *Park*, because once it hapned so? Or that some *King* will dye at the Appearance of a *Comet*; because it hath been found, that upon the Appearing of a *Comet* some *Prince* hath died? And much the same Evidence the *Astrologers* have for their *Predictions*, since it is but once in many thousand years, that the *Stars* are found in the same position.

XVIII. *What happens to one part of the World, cannot be brought as an Argument to prove that the same will happen in another part.* But let us grant the *Astrologers*, that some Changes have been observ'd to come to pass in certain places of the *Earth*, under such *Constellations*; yet can these only be of use to those *Countries* where they hapned: Seeing it is most certain, that the same *Fair weather*, or *Tempests*, do not happen to all parts of the *Earth* at the same time: For we see it *Rain* in one part, whilst it is *Fair weather* in another. And thus the *Dog-star*, which most suppose to be *Hot* by Nature, and to be the Cause of the greatest *Heat* when it Riseth in *July*, is notwithstanding a sign of *Cold* to our *Antipodes*, and to those that live in the South-part of the *Earth*; because they at the same time that this *Constellation* Riseth, together with the *Sun*, and we feel the greatest *Heat*, experience the greatest *Cold*: Notwithstanding that it is then directly over their *Heads*, and sends down its direct Rays upon their *Country*.

XIX. *The Conclusion.* Conclude we therefore, according as we have said at the Beginning, that the *Sun* is the General Cause of all the *Effects* that happen in this *Sublunary World*, forasmuch as by his presence he is the Cause of *Heat*, and by his absence of *Cold*; and that all the rest of the *Stars* or *Planets*, cannot be the Cause of any Alterations in these *Sublunary things*.

The

XV. Who were the first Professors of it.

XVI. Reasons against Judicial Astrology.

XVII. Astrologers can hardly maintain Experience.

XVIII. What happens to one part of the World cannot be brought as an Argument to prove that the same will happen in another part.

XIX. The Conclusion.

To the Right Noble Henry Duke of Beaufort Marques and Earle of Worceſter, Baron Herbert of Chepſtow, Raglon & Gower, Lord Leivtentant of Wales and the Marſhes, and of the Countyes of Gloceſter, Hereford and Monmouth, and of the Citty and County of Briſtol, Lord Warden of his Ma.tys Foreſt of Deane, and Conſtable of the Caſtle of S.t Briavels, Knight of the moſt noble Order of ye Garter, Gentleman of his Ma.tys Bedchamber, and one of the Lords of his Ma.tys moſt Honourable privy Councell & c. to King Charles and King Iames the Second.

This Plate is humbly Dedicated by Richard Blome.

METALS, and METEORS.

CHAP. I.
Concerning the Original of the Earth, its Parts and Figure.

I. *What the Earth is.*

THE EARTH *is a congested Mass of the greater Particles of the Third Element, having Irregular Figures, and by Rest clinging together.*

II. *The Formation of the Habitable Earth.*

But, forasmuch as by the Name of EARTH, we commonly understand the whole *Globe* which we *Inhabit*, it will be a fit place here to speak of its *Original*, and to describe how at first it might have been form'd, had it so pleas'd GOD: Let us imagine therefore, that it was made at first only of the *Matter* of the *First Element*, being like unto the *Sun*, tho' much less than it; and that it had a vast and peculiar *Vortex* in the *Center* whereof it was seated. But that by the clinging together of the less *Subtil Parts* of the *First Element*, they were changed into the *Matter* of the *Third Element*, which gathering together produced *dark Spots* about its *Surface*, like to those that are continually generated about the *Sun*, and again dissolved. Upon the continual Dissolution whereof, the remaining *Particles* of the *Third Element*, being scatter'd through the Neighbouring *Heaven*, made there a vast *Mass* of *Æther*, which being afterwards greatly increased, caused the *generation* of more *compact Spots*, which at last wholly cover'd the whole *Earth*. Which *Spots* being no longer in a condition to be dissolved, and many of them lying heaped together, and the Force of the *Vortex*, which contain'd the *Earth* being thereby diminish'd,

gave

gave occaſion to the *Sun*'s *Vortex* to ſwallow up the *Earth*, together with the *Spots*, *Air*, and all, which ſtop'd in that place where it now is.

III. *There are three Regions to be diſtinguiſht in the Earth.* Suppoſing the *Earth* in this *ſtate*, we are to take notice of Three *Regions* in it: Whereof the *Firſt* and Inmoſt I ſeems to contain nothing but the *Matter* of the *Firſt Element*, which is there moved like the *Sun*, and much of the ſame Nature; ſave only, that probably it is not ſo pure, becauſe it cannot rid it ſelf of that *Matter*, which the *Sun* continually caſts forth, and of which *Spots* are generated. The *Middle Region* M, conſiſts of a very dark and compact *Body*: For ſeeing that this *Body* was at firſt made up of very minute *Particles* (as at firſt appertaining to the firſt *Element*) joyn'd together, it ſeems probable that there could be no *Pores* in it, but ſuch only as were ſo ſmall, that they could only tranſmit thoſe *ſtriate Particles* with the other *Matter* of the *Firſt Element*. And Experience witneſſeth as much in the *Spots* of the *Sun*, which being of the ſame nature as this *Body* M; ſave only that they are much more thin and looſe, do notwithſtanding obſtruct the paſſage of *Light*, which could not be in caſe their *Pores* were large enough to admit the *Globuli* of the *Second Element*. For ſeeing that theſe *Pores* were at firſt formed in fluid and ſoft *Matter*, they would alſo without doubt be ſtrait and ſmooth enough, not to hinder the Action of *Light*. But theſe two *Regions* of the *Earth* do not much concern us, as being conceal'd from us. The *Third Region*, is that out of which all *Earthly Bodies* are formed, as we ſhall ſhew hereafter: At preſent we ſuppoſe nothing to be in it, beſides a *vaſt Maſs* or gathering together of the *Particles* of the *Third Element*, encompaſs'd with much *Heavenly matter*, whoſe nature we may eaſily underſtand from the manner of their *Primordial Generation*.

Figure 35.

IV. *The Formation of the various Earthly Bodies.* From what hath been ſaid, we eaſily apprehend, that no great Change could happen in the innermoſt or middle *Region* of the *Earth*; but the *External part* of it, was capable of being formed into various *Bodies*. For at the firſt 2, then 3, and afterwards 4, with many other different *Bodies*, were to be made out of it.

V. *The Uppermoſt Region of the Earth diſtinguiſht into two Bodies.* And here, in the firſt place let us conſider, that the groſſer *Particles* of this *Third Region* being thruſt down below the reſt, by the force of the *Heavenly Globuli*, this Supream part of the *Earth*, here marked with the Letter A, is thereby diſtinguiſh'd into two different *Bodies*, repreſented by B and C; whereof the uppermoſt B, is of a *looſe* contexture, *fluid* and *pellucid*; whereas the undermoſt is ſomewhat *cloſe*, *hard* and *opake*.

Fig. 36.

VI. *The Formation of the Third Body, between the two former.* Again, becauſe we find that the *Body* C was diſtinguiſh'd from the *Body* B, only by this means; becauſe its Parts being preſt downwards by the *Heavenly Globuli*, did cling together, we ſhall eaſily apprehend, that it was neceſſary that another *Body*, ſuch as is that marked D, muſt have been generated between them. For the *Figures* of the *Particles* of the *Third Element*, of which the *Bodies* B and C conſiſt, are very *different*, and may be here diſtinguiſh'd by us into 3 Chief General *Heads*; for ſome of them are variouſly divided and extended like the *Branches* of *Trees*, and theſe chiefly were thoſe, which being driven down by the *Celeſtial matter* cling together, and compoſe the *Body* C. Again, there are others that are *more ſolid*, and as to their *Figure*, are not all of them *Round* or *Cubical*, but of ſeveral *Figures*, like the ſmall parts of *Rubbiſh*; and theſe, if they be ſomewhat great, ſink down below the reſt by the force of Gravity; but in caſe they be ſomewhat leſs, they continue mix'd with the former, and fill up the Spaces that are left by them. Laſtly, there are ſome of a *longiſh Figure*, and without any Jettings-out like *Boughs*, but like long and even *Sticks*, which alſo mingle themſelves with the former, where they find *Pores* or *Intervals* wide enough for them to enter, but do not readily cling or ſtick to them. Which being thus ſuppoſed, it will be obvious to believe, that when firſt the *Branchy Particles* of the *Body* C began to be entangled together, many of the *Longiſh* were intermix'd with them; and that they afterwards, whilſt thoſe being ſtill more and more preſt down, became more cloſely joyn'd together, got up above them towards D, and there conſtituted a *Body*, very different from the two other B and C. After the ſame manner as we ſee, that by Treading the *Earth*, in *Mooriſh places*, *Water* is ſqueez'd out of it, which afterwards comes to cover the *Surface* of it.

VII. *The Formation of the Fourth Body.* Now when ſome other *Particles* leſs ſolid than thoſe of the *Body* D, fell down from B, they ſtuck to the *ſurface* of the *Body* D; and becauſe moſt of them were *Branchy*, they by degrees clung together, and conſtituted the *hard* *Body* E, very different from B and D, which are *fluid*. Which *Body* E, at the firſt was very thin, like a *Cruſt* or *Shell* covering the *Body* D; but grew thicker in proceſs of time, new *Particles* from the *Body* B, as likewiſe from D, joyning themſelves to them.

VIII. *How a Space was left between the Third and Fourth Body.* We are likewiſe to conſider, that it could ſo happen in proceſs of Time, that a great part of the *Body* D, might be waſted, by which means a conſiderable Space F, might be left between D and E, which could not be fill'd up with any other *matter*, beſides that out of which the *Body* B did conſiſt, the thinneſt *Particles* whereof, eaſily found a paſſage through the *Pores* of the *Body* E, into thoſe places which were quitted by other thicker *parts*, which came forth from D.

Figure 37.

IX. *How Cracks or Slits came to be in the Fourth Body. And how it broke into ſeveral pieces.* Laſtly, We may grant, that many Cracks might be made in the *Body* E, by the *heat* of the *Sun*; as we find that there are many *Cracks* in the *Ground* in *Summer time*, when it is parched by the *Sun*; and that theſe *Cracks* grow greater and greater, the longer that the *Drought* laſts: By which means its *parts* at laſt did ſo looſly hang together, that it was no longer able to hold up as an *Arch* between F, and B; but being broke to pieces, by reaſon of its *Heavineſs* fell down upon the *Surface* of the *Body* C; and foraſmuch as that *Surface* was not *broad* enough, for to receive all the *Fragments* lying together, ſo as to keep the ſame ſituation they had before, ſome of the ſaid *Fragments* were forced to lye ſhelving one upon another. As for Example, If we ſuppoſe that in that part of the *Body* E, which this *Figure* repreſents, the chief *Crack* or *Slits* were ſo diſpoſed in the places 1, 2, 3, 4, 5, 6, 7. that the two *Fragments* 2, 3, and 6, 7, ſhould fall a little before the reſt, and the ends of the four other *Fragments* 2, 3, 5, and 6, before the oppoſite 1, 4, and V; as alſo the End 5, of the *Fragment* 4 5, before the End V of the *Fragment* V, 6, there is no queſtion but

Figure 38.

but they would be rang'd upon the *Surface* of the *Body* C, in the ſame manner as they are delineated, *viz.* ſo as that the *Fragments* 2, 3, and 6, 7, would be joyned next to the *Body* C, and the other four lye ſhelving on their ſides, the one leaning upon the other,&c. Figure 38.

X. *That hence was the Original of Mountains, Plains, Seas,&c.*

Further, if we conſider that by the *Body* B, and F, here, the *Air* is to be underſtood; and by C, an inward very thick Cruſt of the *Earth*, from whence *Metals* are generated; by D, the *Water*; and laſtly by E, the outward part of the *Earth*, which conſiſts of *Stones*, *Clay*, *Sand* and *Mud*; we ſhall eaſily underſtand by the *Water* ariſing above the *Fragments* 2 3, and 6 7, the *Sea*; by other *Fragments* that are but a little leaning, and not cover'd with any *Waters*, as 8, 9, and V X, great *Plains*; and by others that ſtand more upright, as 1 2, and 9 4 V, *Mountains*. We ſhall alſo take notice, that when theſe *Fragments* by their own weight thus fell down, their extremities or ends forceably daſh'd againſt each other, which made them fly into many leſs *Fragments*; which made *great Stones* on ſome *Sea-ſhoars*, as at 1; and ſeveral *tops* of *Mountains*, partly very High, as at 4; partly Riſing only, as at 9 and V; as alſo *Rocks* in the *Sea*, as at 3 and 6.

XI. *The Earth is a Round Body.*

As to what belongs to the *Figure* of the *Earth*, it may be *Mathematically* demonſtrated that it is *Spherical*; but foraſmuch as *Mathematical Demonſtrations* ſeem obſcure to thoſe who are ignorant in the *Doctrin* of *Dimenſions*, it will here be ſufficient to prove it to be ſo: *Firſt*, Becauſe its *Particles* are equally preſt on all ſides by the *Heavenly Matter* that ſurrounds it. *Secondly*, Becauſe the *Sun*, who is at a great height above us, doth not *enlighten* all the *Parts* of the *World* at once, but firſt vouchſafes his *Light* to the *Eaſtern Inhabitants*, and afterwards to the *Weſtern*; in which communication of his *Light* he obſerves this proportion, that thoſe who live 15 *Degrees* nearer to the *Eaſt*, perceive his *Light* one *hour* ſooner; and thoſe who live 30 *Degrees* nearer, two *hours*, and ſo for the reſt, obſerving the Proportion of 15 *Degrees* for each *hour*. Which could not be ſo, if the *Earth* were not of a *Round figure*.

XII. *The ſame proved from the poſition of the Stars.*

The ſituation of the *Stars* alſo confirms this. For thoſe *Stars* which are about the *North Pole* are always in ſight; whereas thoſe that are about the *South Pole* do not appear, except we move ſo far towards the *South*, as to be in the midſt between both *Poles*: In like manner the *Sun* doth ſooner Riſe and Set to thoſe that live more *Eaſtward*, than to thoſe that live *Weſtward*, as appears by an *Eclipſe*, which was ſeen by us at *Midnight*; and by thoſe that liv'd *Eaſtward*, not till after 3 a *Clock*.

XIII. *The Mountains are no Argument againſt the Round Figure of the Earth.*

Neither is the Inequality of the *Surface* of the *Earth*, by reaſon of *High Mountains* and *Deep Valleys*, any Proof againſt its *Roundneſs*: For the *Earth* is not *Mathematically Round*, as an exact poliſh'd *Globe*, but *Geometrically*; inaſmuch as all theſe Inequalities, compar'd with the *Compaſs* of the *Earth*, are no more an obſtacle to its *Roundneſs*, than the unevenneſs of the *Rind* of an *Orange* ſpoils the Roundneſs of its *figure*.

XIV. *What we are to underſtand by the Globe of the Earth.*

By the *Globe* of the *Earth*, we do not only underſtand the *Earth* it ſelf, but the *Water* alſo which covers a great part of it; ſeeing that the Parts of both of them tend to the ſame common *Center*; and becauſe the *Surface* of the *Sea* is continuous with that of the *Earth*; ſo that to thoſe who Sail *North* or *South*, or Inhabit *Eaſtward* or *Weſtward*, the ſame Quarters of *Heaven* appear, or diſappear. Which is an evident Proof, that the *Surface* of the *Earth* is not a *level* or *plain*, ſince thoſe that ſet *Sail* do find, that the ſwelling Roundneſs of the *Sea* hides the *Earth* from them, and at laſt makes it altogether diſappear.

XV. *There can be no exact Parallels upon the ſurface of the Earth.*

Accordingly GASSENDUS well infers, that no two *Plumb Lines*, or *Perpendiculars*, are exactly *Parallel*; and conſequently, that no two *Walls* built by a *Plumb-Line*, are ſuch; tho' they appear ſo to the *Eye*: For ſeeing that all *Perpendiculars* fall upon the *Convex ſurface* of the *Earth*, they muſt needs meet in the *Center*, in caſe we ſhould ſuppoſe them to be drawn on at length, and conſequently cannot be *parallel*.

XVI. *The Bigneſs of the Earth.*

Foraſmuch as the *Semidiameter* of the *Earth* is a *Meaſure*, whereby we diſcover the *magnitude* and *diſtance* of the *Stars*; we are to take notice that one *Degree* of a great *Circle* doth contain 60 *Miles* on the *ſurface* of the *Earth*: By which Number, if we multiply the 360 *Degrees* that are in a whole *Circle*, we ſhall find that the Compaſs of the *Earth* conſiſts of 21600 *Miles*. Beſides, we are to obſerve, that when a *Circle* is divided into 22 *parts*, its *Diameter* contains 7 of them, and its *Semidiameter* 3 and an half: So that the whole Compaſs hath the ſame proportion to the *Diameter*, as 22 to 7. Wherefore the *Diameter of the Earth* conſiſts of 7200 *Miles*, and the *Semidiameter* 3600 *Miles*.

XVII. *Other Properties of the Earth.*

From the Deſcription we have already given of the *Earth*, it follows alſo that it muſt be *Hard* and *Dry*: For the *Dryneſs* and *Hardneſs* of any *Body* proceeds from the Reſting of its *Parts*. As alſo, that it muſt be *Cold*: For ſeeing that its *Parts* have either but a very weak, or elſe no *motion* at all, neither can they be conceived to have any *heat* to ſpeak of. It is neceſſary alſo that it ſhould be *Heavy*: For ſeeing its *parts* have leſs Force than others, to recede from the *Center* of the *Vortex* wherein it is contain'd, they muſt needs be driven down towards it. So likewiſe it is *Opake*, and reflects the *Light* it receives; by reaſon of the Interruption and manifold Windings of its *Pores*, not exactly anſwering to one another.

XVIII. *There are four kind of Pores in the inward parts of the Earth.*

There are 4 kind of *Pores*, that are found within the *Earth*. The *Firſt* whereof are ſuch as are extended in length, but with wavings and turnings this way and that way. The *ſecond* are ſtrait *Pores*, whereof ſome have a hollow *Surface*, but rough and rugged, and others ſmooth and even. The *third* kind are thoſe, that run into one another, and whereof one has often communication with many other *Pores*, upon which account we may compare them to the *Branches* of *Trees*. And laſtly, the *fourth* kind of *Pores* are ſuch, as are ſomewhat like *Screws*.

XIX. *All the Pores that are of the ſame kind, are not altogether alike.*

But tho' we have here deduced all the *Pores* of the *Earth* to *four* kinds; yet we allow that there may be infinite variety in one and the ſame kind, ſo that it may be there are not two *Pores* of one and the ſame kind, that are altogether like one another.

CHAP. II.

The Earth is moved by the fluid Heaven, that encompaſſeth it round.

I. *The Common People ſuppoſe the Earth to remain immoveable in the midſt of the World.*

THe *Common People* are not more obſtinate in any Perſuaſion, than they are in that of the *Earths Immobility*; for they cannot imagine, that that which is the foundation and ſupport of all things, ſhould be moved; or that a *Body* of ſuch prodigious Weight and Bulk ſhould be carried about by another. Hence it is they believe, that the *Sun* and *fix'd Stars* are whirl'd round about us, and that the *Earth* reſts immovable in the midſt of the *Heaven*. Indeed our *Eyes* are not wanting to confirm this Perſuaſion; for we ſee that the *Stars* turn towards us from the *Eaſt* to the *Weſt*, and that the *Sun* after the ſame manner inſenſibly approacheth to us.

II. *We muſt not be too apt to truſt our Senſes.*

But we ought to remember, that we muſt not too much rely upon the report of our *Senſes*. For in this caſe it is with us, as with thoſe that are in a *Ship*, who think that the *Shoar* departs from them, when indeed they themſelves do depart from the *Shoar*. For to make a thing appear as if it were moved, it is all one, as *ARISTOTLE* ſaith, *Whether the Motion be in the Spectator, or in the thing that is moved.* Wherefore neither muſt it ſeem ſtrange to us, who are carried about with the *Earth*, from whence we ſee nothing but the Roof of *Heaven*, and the *Stars* in a manner reſting in their ſeveral *Stations*, that they do ſeem to draw near, paſs by, and depart from us, the *motion* of the *Earth* being moſt ſteady and even. This is the *Reaſon*, that whilſt Men look upon the *Earth*, they cannot conceive it to be moved; but when they turn their *Eyes* to any other *Object*, with regard to which the *Interval* is either increaſed or diminiſhed, then indeed it ſeems to be moved: But our *Sight*, or rather our *Mind*, is more apt to aſcribe it to the thing *ſeen*, tho' it be at reſt, than to the *thing* that is *moved*, which it finds to be at no diſtance from it ſelf. But that we may not ſeem to aſſert this without any grounds, we will enquire, Whether the *Earth* in it ſelf have any *Repugnance to motion*; and if we find it hath not, Why ſhould not we conclude that it is *moved?*

III. *The Objections that are made againſt the Motion of the Earth.*

Two things are only alledg'd againſt *the Motion of the Earth, viz.* its *Bulk*, and its *Weight*. For they Object, that all the *parts* of the *Earth* tend to the *Center*, where they are kept by the force of their *Gravity*. As we ſee that *Stones* and *Metals* reſt in their ſeveral *places*, whence they cannot be removed without *force*, by reaſon of the propenſion they have to the *Center*. But that this Reaſon is not concluſive, appears from hence, that round *Bowls* or *Bullets*, made of *Iron* or *Steel*, are by a ſmall Force made to trundle along a Plain or Level. *Stones* therefore and *Metals* continue in their *places*, not becauſe they ſtrive to tend towards the *Center*, but becauſe they are firmly joyned to the *Bodies* whereon they lye; which Impediment is not to be found in the *Earth*, as being ſurrounded with the *Fluid Heaven.*

IV. *There is no inward*

Beſides, we know that there is no *Inward Gravity* in the *Earth*, ſeeing that all *Gravitation* is cauſed by the *Heavenly Globuli*, which drive *Terreſtrial Bodies* towards the *Center*; ſo that if we ſhould ſuppoſe all the Space about the *Earth* to be fill'd with ſuch *Bodies*, as did neither promote nor hinder the *motion* of other *Bodies*, and the *Earth* to be turn'd about its *Axis* in 24 *Hours*, all its *Parts*, which did not very cloſely ſtick together, would fly away on every ſide; as we find that *Sand*, which is caſt into a *Whirlpool*, is every way diſſipated. And accordingly we may rather account the Parts of the *Earth* to be Light, than Heavy. *Heavineſs in the Earth.*

V. *The Heavineſs of the Earth cannot hinder its Motion.*

Neither do I ſee what elſe can be underſtood by the *Heavineſs* of the *Earth*, than a Quality whereby *Bodies* tending towards the *Center* of the *Earth*, have a tendency alſo to lye cloſer and cling together. Now ſuch a *Heavineſs* cannot hinder the *Earth* from being whirl'd about with the *motion* of the *Heaven* that ſurrounds it; no more than a Company of *Men*, being in a *Boat* that is whirl'd round, could hinder their turning round, by their mutual embracing and holding faſt to one another.

VI. *Its Bulk is no obſtacle to its Motion.*

Neither can the Bulk or Magnitude of the *Earth* hinder its *motion*: For the *Bigneſs* of a *Body* doth not deprive it of *Mobility*, which is a Property of all *Bodies*, and cannot be removed from them, except we ſhould own all *motion* to be violent.

VII. *The Earth is turn'd round by a yearly and daily Revolution.*

We muſt conclude therefore, that the *Earth* can be carried round by the *Cæleſtial matter* that ſurrounds it. For ſeeing that according to our *Suppoſition*, the *Vortex* of the *Earth* hath been ſwallow'd up by that of the *Sun*; and that by this means the *Earth* hath been thruſt down to that place where it now is, where it is ſurrounded with the *Fluid Heavenly matter*, always turning round, it cannot be otherwiſe but that the *Earth* muſt be carried about with it. This is clear of it ſelf. *Secondly*, from the *Nature* of the *Earth*, which being a *Planet*, muſt not only be carried round by an *Annual motion*, in the ſurrounding *Cæleſtial matter*; but alſo by a daily *Circumvolution*: For the *Earth* having formerly been a *Star*, may eaſily be conceived to have retain'd the *motion* it had before; and ſeeing that the *ſubtil Matter* in its *Center* doth turn round, it communicates that *motion* to the other Parts of the *Earth*, and makes the whole to turn round likewiſe.

VIII. *An Objection againſt the Earths being a Planet.*

But youl'l ſay, What reſemblance is there between the *Earth* and the *Planets*, ſeeing that it is the meaneſt of all other *Bodies?*

IX. *The Properties of a Planet do belong to the Earth.*

Yet for all this, if we conſider the *Form* and *Nature* of the *Earth*, we ſhall meet with ſeveral *Arguments* to perſuade us, that it is a *Planet*. For it is very like to the *Planets* in its *bulk* and *bigneſs*. Its *figure* alſo and *ſituation* prove the ſame; for it is as round as they are, and hangs pois'd in the midſt of the *Air*. So alſo like them, it wants *Light* of its own, and ſhines only with a borrowed Refulgency from the *Sun*: And laſtly, It is ſubject to the ſame *Appearances, Aſpects, Directions, Stations, Retrogradations, &c.* For to paſs by its various Reciprocations with the *Moon*, whatſoever *Mercury* and *Venus* do appear to the *Earth*, the ſame doth the *Earth* appear to *Mars*, *Jupiter*, and *Saturn*: And as *Mars*, *Jupiter*, and *Saturn* appear to her, ſo doth ſhe appear to *Venus* and *Mercury*. Wherefore ſince the *Planets* are moved, why may not we conclude that the *Earth*, foraſmuch as it

is like them, must likewise move about its own *Axis*, and about the *Center* of the *Universe*. How does it appear then, that the *Earth* is the meanest and most ignoble of all *Bodies*; but only from that mistaken Opinion, that the *Matter* of *Heaven* is something that is *Divine*, and that the *Earth* is nothing else but the very Sink of the *World*? What can hinder the *Earth* from being as Noble a *Body* as *Venus*, *Mercury*, or any other *Planet*?

X. *According to* Tycho's *Hypothesis, the Earth is moved most of all.*

This Opinion will not seem strange to those that follow *TYCHO BRAHE*; for upon examining of his *Hypothesis* they will find, that he attributes more *Motion* to the *Earth* than we do. For supposing the *Earth* to be immovable, the *Heaven* and *Stars* must whirl round it in 24 *hours*; but this cannot be done, except that the Parts of the *Earth* be translated out of the Neighbourhood of those Parts of the *Heaven* which they touch; and forasmuch as *Motion* is nothing else than such a *Translation*, we may well conclude, that according to his *Hypothesis*, a *motion* must be attributed to the *Earth*. Yea, if we consider rightly of the Matter, we must conclude that the *Earth* is more moved than the *Heaven* it self; forasmuch as the *Earth*, according to its whole *Surface*, doth recede from the *Body* that surrounds it; whereas the *Heaven* only removes according to its hollow *Surface*, which is very little if compar'd with its *Convex Surface*. And thus according to *TYCHO*'s *Hypothesis*, there is an evident Reason for attributing a *motion* to the *Earth*; whereas the Reason whereby he attributes *Motion* to the *Heaven*, and *Rest* to the *Earth*, is altogether uncertain, and forged by his own Imagination.

XI. *The Motion of the Earth produceth no diversity of Aspect in the fix'd Stars, because of their vast distance.*

You'l say, If the *Sun* has its position amongst the *fix'd Stars*, and the *Earth* be moved round it, it is necessary that the *Earth* must at some times be nearer to them, by the whole Space of its *Orb*, than at other times; but the *Appearances* make out no such thing to us.

To which I Answer, That this Difficulty will vanish, if we consider the vast Distance that is between us and the *fix'd Stars*, which is so very great, that the whole *Orb*, which is describ'd by the *Earth* about the *Sun*, is but a *Point* compared with it. Which tho' it may seem to be incredible to those, who are not used to consider the *wonderful Works* of *GOD*, and who look upon the *Earth* as the chiefest part of the *World*, and the *Habitation* of *Man*, for whose sake all other things were made: Yet can it not seem so to *Astronomers*, who are well acquainted with these things.

XII. *The Globe of the Earth is of an imperceptible Magnitude, when compared with the vast Compass of the Starry Heaven.*

From hence also we may easily answer the Objection of some *Astronomers*, alledging, That if the *Earth* were not in the midst of the *World*, the whole *Hemisphere* could not appear to us, or the one half of the *Heaven*, and especially of the *Zodiack*, which always contains 6 *Signs*. For these Men do not consider, that the whole *Earth*, compar'd to the *Heaven*, is of an *insensible Bulk*. Which thing *PYTHAGORAS* and *COPERNICUS* do not only affirm concerning the *Earth*, but also of the *Annual Orb*, compar'd with the *Heaven* of the *fix'd Stars*: For they assert, That 2 *Plains*, whereof the one being drawn through the *Sun*, the other through the *Surface* of the *Orb*, as *Horizontal*, would appear to meet together, because of the vast *Distance*: So that by that time they reach the *Heaven*, notwithstanding that they are terminated at *Circles* so greatly distant from each other, as is the *Sun* from the *Earth*, they will seem to end at the same indivisible *Point*; neither doth the amplitude of the great *Orb*, hinder us from seeing the whole *Hemisphere*, and whole 6 *Signs* of the *Zodiack*.

In the *second* place you'l Object, That it hath been asserted in the *General Physicks*, that a *Body* which is turn'd round, doth endeavour, as much as in it lies, to recede it from the *Center*: How then comes it to pass, that *Castles* and *Steeples* are not cast off into the *Air* by this Circular motion of the *Earth*?

XIII. *How it comes to pass, that this Motion of the Earth, doth not overturn Houses and Buildings.*

It is Answered, That all the Parts of the *Earth* are on all sides prest down towards the *Center*, and hindred from flying loose and being scatter'd abroad: For the *Heavenly Globuli* moving by right *Lines*, or such as little deviate from them, drive with great force against the *Earth*; and thus thrusting all its Parts towards the *Center*, hinder it from flying out towards the *Heaven*: For seeing that the *Heaven*, which lies between the *Earth* and the *Moon*, is much more swiftly carried about the *Earth*, than the *Earth* is carried about its *Axis*: And since the *Particles* whereof the *Heaven* consists, are most fluid and variously agitated in *Right Lines*, or approaching thereto, they with great force strike against the *Earth*, by which means all the *parts* of the *Earth* are compress and thrust towards the *Center*.

XIV. *The Answer.*

CHAP. III.

The Earths Motion established by other Arguments.

FOrasmuch as it is evident from what hath been said already, that the *Earth* of it self hath no repugnance to *Motion*; and that neither its *Bulk*, or *Heaviness*, can hinder it from being carried about by the *fluid Heaven*: It remains now that we superadd some *Reasons*, which have not only induced our Modern *Mathematicians*, but also the *Ancients*, to favour this Opinion.

I. *The Earth hath no Repugnance to Motion.*

But before I enter upon these *Arguments*, I would desire such as are free from Prejudice, to contemplate the vast extension of the *Heavens*, and compare the same with the small *Bulk* of the the *Earth*, which is so many Thousand times less: (For even the Common Opinion admits the *Circumference* of the *Firmament* to exceed that of the *Earth* 50000 times.) Next, let them consider the *swiftness* of that *Motion*, which we must necessarily allow to those high *Bodies*, if we suppose them to be whirl'd about the *Earth* in the space of 24 *Hours*. Which being attentively consider'd, I question not but they will be more inclin'd to think the *Heavens* immovable, and that the *Earth* by its *Diurnal motion* is turn'd round the *Sun*, than that the whole *Universe* is snatch'd round about it, with a *swiftness* that is altogether unconceivable.

II. *The vast Extension of the Heaven, and the Littleness of the Earth, are to be well consider'd.*

For the *Mathematicians* do allow, that the *fix'd Stars* are distant from us 14000 *Semidiameters* of the *Earth*. And since, according to *ARCHIMEDES* his Computation, the *Semidiameter* of the *Earth* consists of 859 *German Miles*, every one of which contains 4000 *Geometrical Paces*, or 20000 *Foot*, the *Circumference* of the *Sphere* of

III. *The Motion of the Stars is incredible.*

of the *fix'd Stars* will be of 75592984 *German Miles*. And seeing all this Space must be run over in 24 *hours*, in 1 *hour* the 24*th* part of it must be dispatch'd, that is, 3149066 *German Miles*; in the 60*th* part of an *hour*, or a *first Minute*, 52494 *German Miles*; in a *second minute*, that is, the 3600*th* part of an *hour*, 874 *German Miles*, that is, 3496 *Italian Miles*, or 3496000 *Geometrical Paces*, or 174900000 *Foot*, which is inconceivable in so short a Space.

IV. *The Earths Motion, proved by an Argument drawn from the* Ptolomaick *Hypothesis.*

A strong Argument for the *Earths Motion*, may likewise be drawn from the *PTOLOMAICK Hypothesis*. For according to it, the *Heavenly Bodies* are moved more slowly or swiftly, according to their *Bulk*; they that are less in *Bulk* performing their Revolution in less time, than those that are of a greater *Bulk*. Thus *Saturn*, the highest and biggest of all the *Planets*, takes up almost 30 *years* in running through his *Orb*; *Jupiter* 12, *Mars* 2; and so of the rest, according as the *Orbs* they are to run over, are nearer or further from the *Earth*: But if we suppose the Immobility of the *Earth*, all this Order must be overthrown, since not only *Saturn*, but all the *Intermediate Planets* between him and the *Earth*, must be hurl'd about in 24 *hours*: All which things are contrary to the *Phænomena*.

V. *The Motion of the Earth, makes for the Beauty and Order of the World.*

But supposing the *Earth* to be moved, all these things are salv'd, and the comely Order of the *Universe* preserv'd and establish'd. Seeing that we may proceed from the *Earth*, to those *Bodies* that are more slowly moved, without any confusion, till we come to the *Heaven* of *fix'd Stars*. Or if any one should assert the *fix'd Stars* also to be moved, thence will follow another Absurdity, *viz.* that their *Motions* will be *unequal*. For some of them that are in the Greatest *Circles* will be most swiftly moved, and others in the least *Circles*, with a very slow *motion*, according as the said *Circles* shall be further from the *Ecliptick*, and nearer to the *Poles*. Now what can be more absurd, than to suppose *Bodies* to be moved at the remotest distances from the *Center*, and yet to assign the least Spaces to their *motions*?

VI. *If the Earth be unmovable, there must be two contrary Motions in the Heavens.*

Moreover, all those who are of the contrary Opinion, hold, that the *Determination* of a *motion* towards one part, and its meeting of another *Body*, *resting*, or otherwise *moved*, are contrary to one another: Now supposing that the *Heaven* is moved, we shall find divers *motions* in it, one from *East* to *West*, and another from *West* to *East*. For the *Heaven*, according to them, is most swiftly whirl'd towards the *West*; and the *Planets* from *West* to *East*; which two *motions* are *Diametrically* opposite. Now, it is impossible for one and the same *Body* to be carried divers ways *by contrary Motions*: For if a *Body* be carried from *East* to *West*, it cannot at the same time be carried from *West* to *East*.

VII. *These Difficulties are removed by the Motion of the Earth.*

But what still more surpasseth our Apprehension is, How it is possible that whilst the *Heaven* is with such incredible swiftness hurl'd about, the *Planets* should in spight of it perform their Courses in a quite contrary *motion* to it; especially seeing that their *motion*, compared with that of the *Heaven*, is very slow, and therefore may be easily overpowr'd by a stronger *motion*. But by attributing a *Motion* to the *Earth*, all this contrariety of *motions* ceaseth, and we have no more than one *motion*, *viz.* from *West* to *East*, which way the *Earth* and all the *Planets* are carried.

VIII. *'Tis incredible that all the Heavens should be moved about the Earth, and that it should be unmoveable.*

The great Force also of the *Motion* of the *Heavens*, asserted by the Followers of *PTOLOMÆUS* his *Opinion*, is a strong Argument to prove the *Diurnal Circumvolution* of the *Earth*; for they must allow it to be so powerful, as to whirl about with it not only the *Planets*, but also the *fix'd Stars*. Now if it be so that all *Inferiour Bodies* are forc'd to follow the *motion* of the *Highest Heaven*; and that the *Element* of *Fire*, and a great part of the *Air*, cannot resist its *motion*, how is it possible that the *Earth* that hangs in the midst of the *Air*, and is indifferent to *Motion*, or *Rest*, and surrounded with *fluid* Matter, should for all that alone remain *immovable*, and resist so vast a Force? This, according to my sense, seems utterly inconceivable; for by what *Ropes* or other *Holdfasts*, is it kept immovable in this *Æthereal Ocean*? For altho' the *Heavenly* Matter be liquid, and doth not push against other *Bodies*, with as much force as *hard Bodies* do; yet neither can it be denied, but that the *motion* of *fluid Bodies*, when determin'd to some one part, doth carry along with them whatsoever Matter is contained in them, how *solid* or *compact* soever it may be, except it be detained by some outward Force. As we see that great *Stones*, by the strong Current of *Rivers*, are carried along to a vast distance, except they be stopt by the *unevenness* of the *Bottom*, or some other *Obstacle*. Now all these Difficulties vanish by ascribing to the *Earth*, which is a very little *Body*, yea, imperceptible, if compar'd with the *Universe*, and unable to cause any Change in the *World*, a *motion* round its own *Center*.

IX. *It is also contradictory to the Order of Nature.*

Moreover, what shall we assign to be the Cause, that keeps the *Earth* immovable? Is it by some Force? But where shall we look for this *Force*? or what is it? Is it a *Natural Force*, depending on the Divine Order and Constitution, setled in the first *Creation*, and consequently the ordinary *Providence of GOD*? Or is it an immediate *Hand of GOD*? It cannot be the ordinary *Power of GOD*: For the *Order of Nature* is this, that where *Bodies* that are near and far off, are hurried away by another *Body*, there also that which intervenes between those that are near and far off, must be carried about also, except something hinder it. Let us suppose *Lines* to be drawn from the *Sun* through the *Earth* and *Planets*; by which *Lines* we are to conceive the *Sun-beams* to be diffused, according to *TYCHO*, that by them he may carry about with him the Upper and Lower *Planets*; if therefore he snatcheth the superiour *Planets* along with him, must not he of necessity do the same for the *Earth*, which is in the midst between them? Neither can this be said to be done by the immediate *Power of GOD*, since *TYCHO* himself never thought fit to have recourse to any such *Power*, for the making out of his *Hypothesis*.

X. *The Sun being the great Lamp of the World, it would be absurd to conceive it plac'd in a Corner.*

The *Light of Nature* also seconds our Opinion; for those *Bodies* are supposed to be of different *Natures*, which are endued with different *Affections*: Thus *Lucid* and *Opake Bodies* are distinguish'd in their Composition, because they have distinct *Properties*. Wherefore seeing that the *Planets*, of whose number the *Earth* is, are solid and

and deſtitute of all *Light*; it is neceſſary that the *Sun* and *fix'd Stars* ſhould continue unmoved, and that the *Earth* and the reſt of the *Planets*, ſhould move round him, to partake of his *Light*. For as it would be abſurd to place a *Light*, that is to enlighten a *Church*, in ſome *Corner* of it, and not in the midſt: So the *Sun* being deſign'd to be the Great *Light* of the *Univerſe*, by which other *Bodies* were to be illuminated, it was to be placed in the *Center*, and not in one of the *Sides* of it. And accordingly we muſt conclude, that the *Sun* ſtands ſtill, and that the *Earth*, with the reſt of the *Planets*, are carried round him.

XI. *The ſame Effects follow, whether the Earth be ſuppoſed to move or ſtand ſtill.*

Beſides, I cannot conceive what Reaſon ſome *Philoſophers* could have, to maintain the *Earths* Immobility, ſeeing that the ſame Effects follow, whether its *motion* be allow'd or deny'd. For the *Sun* ſeems to us to run through the *Zodiack* after the ſame manner, notwithſtanding that he reſts in the *Center* of our *Vortex*: For whereſoever the *Earth* is, the *Sun* being look'd upon from it, will always hide that *Sign*, in oppoſition to which the *Earth* is placed. Thus when the *Earth* is in *Libra*, the *Sun* is ſeen in *Aries*; and when the *Earth* paſſeth from *Cancer* to *Leo*, the *Sun* is ſeen to paſs out of *Capricorn* into *Aquarius*.

XII. *Some Body muſt reſt, or ſtand ſtill, for to be able to judge of the motion of another Body.*

For ſeeing that no relation can be fixt between *Bodies* that are in *motion*, and it is neceſſary that ſome be *moved*, and others *ſtand ſtill*, that we may be able to form ſome reſpect between them: The ſame Appearances happen to us, whether we ſuppoſe the *Earth* only to be moved, or the *Heaven* with the Circumambient *Bodies*; foraſmuch as by this means the Relation only of a *Body* moving and at reſt, is varied, the ſame effect being indifferently produc'd by either of them, as to us. Now this being ſuppoſed, it will not be eaſie for any one to believe, that *Nature*, which always proceeds the moſt ſhort and compendious way, ſhould have choſen to perform that by the unconceivable *motion* of ſo many vaſt *Bodies*, which ſhe might, without all that ado, have brought about by the alone *motion* of the *Earth*.

XIII. *The Air and Water are whirl'd about with the Earth.*

Theſe and other like *Arguments*, which I might alledge, are ſufficient, as I ſuppoſe, to prove that the *Earth* moves, at leaſt to thoſe who liſten to Reaſon, rather than Authority; eſpecially if they conſider, that the *Globe* of the *Earth* is turned round together, with the Neighbouring *Bodies* of *Water* and *Air*. For as the *Water*, as hath been ſaid already; ſo likewiſe the *Air* makes a part of the *Terreſtrial Globe*, and may be conceived to have the ſame reſpect to the *Earth*, as the *ſoft Down* that grows upon a *Body* hath to it.

CHAP. IV.

The Objections anſwer'd, which by ARISTOTLE and others, are framed againſt the Motion of the Earth.

I. *Objections afford a greater Evidence, to diſcern the truth of the matter in queſtion.*

AS *Lucid Bodies*, compar'd with ſuch as are *Opake*, do thereby appear the clearer; and as the *Sun* ſhines brighter, when newly got from under a *Cloud*: So I queſtion not, but that this Opinion concerning the *Earths motion*, will appear more plauſible by a Refutation of the Objections that Adverſaries make againſt it. Amongſt thoſe who oppoſe this Opinion, *ARISTOTLE* is the Chief; a Man of a great *Wit*, and fit for the Contemplation, not only of *Earthly*, but *Sublime things*: Who 'tis like, had he liv'd in theſe our days, would either have been of our *Opinion*, or at leaſt have better refuted the *Arguments*, which are brought to overthrow the ſtability of the *Earth*.

II. *Ariſtotle's Objection, drawn from the Nature of Natural and Violent Motion.*

The Firſt *Argument* he brings againſt us is, That this *Circumvolution* of the *Earth* is not a *Natural*, but a *Violent motion*; becauſe it is repugnant for that to agree Naturally to any thing, that doth not agree to all its parts likewiſe. Now it is evident that the Parts of the *Earth* do not move ſo, for they are carried in a ſtrait *Line* to the *Center*, wherefore *Circular motion* cannot be ſaid to be Natural to the *Earth*, and therefore much leſs to be everlaſting.

III. *The word* Violent *doth not belong to Natural things.*

This Objection is eaſily anſwer'd, by ſaying, That the word *Violent* doth not at all belong to *Natural things*, foraſmuch as they are indifferent to *Motion* or *Reſt*; and it is no leſs Natural for *Bodies* to be moved, when they are puſh'd forwards by an External Agent; than it is for them to *reſt*, when they are not puſh'd out of their places. It belongs only to our Will to *ſuffer Violence*, when any thing is done that is contrary and adverſe to it. But let us grant that *Violence* may be attributed to *Bodies*, and that there are certain Inclinations in things, by which they proſecute the Ends they are deſign'd for; yet cannot we conclude thence, that the *Earth* is moved againſt *Nature*, becauſe its *parts* are moved downwards by a *ſtrait*, and not by a *Circular motion*: For this is to be underſtood of the *parts* of the *Earth*, ſeparated from the reſt of the *Globe*; and thus conſider'd, it is not neceſſary that they ſhould be in all things like unto the whole: No more than it is neceſſary, that all the *Particles* of the *Earth* ſhould be *round*; or every part of a *Circle*, make a *Circle*, becauſe the whole is Round, and the *motion* of the whole conſtitutes a *Circle*: But only that the *parts* of the whole be moved together with it; and like as the *Globe* of the *Earth* is whirld about in 24 *hours*, ſo all the *parts* that compound it, be in the ſame Space carried about its *Center*.

IV. *Nothing hinders, but that the Motion of the Earth may be Everlaſting.*

Which *Motion* may be no leſs Everlaſting to the *Earth*, than any other *motion*; yea, and more too, if we attend to the Nature of *Strait motion*. For it is certain, that the *Earth* cannot move for ever upwards or downwards: But what can hinder that a *Body* may move Round continually, ſuppoſing the ſame cauſe that produceth it at firſt, to perſevere? Wherefore, according to our *Principle* we are to aſſert, that no *force* or *violence* is to be found in its *Nature*; and that it is no leſs *natural* for *Bodies* to move *Round*, than to move in a *ſtrait Line*, upwards or downwards, or any other way whatſoever.

V. *The ſecond Objection, from the Heavineſs of Bodies.*

The *Heavineſs* of *Bodies* ſeems of all other things to be moſt contrary to the Circumvolution of the *Earth*. For *Heavy Bodies* do from on high, fall to the *Earth* by a *ſtrait Line*: Now ſuppoſing this *Circular motion* of the *Earth*; how can it be, that a *Stone* let fall from the Top of a *Tower*, ſhould fall down plumb to the Bottom of it, when in the mean time that the *Stone* is falling down, the *Earth* that bears the *Tower* moves many Cubits; and therefore the *Stone*, in caſe the *Earth*

were moved, would not light at the foot of the *Tower*, but a good diſtance from it, which is contrary to daily experience.

VI. *A Stone falling down from the top of a Tower, is carried by a twofold motion.*

This *Objection*, tho' accounted of great weight by our *Adverſaries*, is nevertheleſs eaſie enough to be anſwered, if we conſider, that in every *Heavy Body*, beſides its *motion downwards*, there is another impreſt upon it, from the *Earth*, whirling round about its own *Axis*, whereby not only it ſelf, but the *Bodies* that are about it, are carried along. There is therefore a twofold *motion* in a a *Stone* that falls from a *Tower*, the one a *ſtraight motion*, whereby it falls down to the *Ground*, the other a *circular*, whereby the *Earth* is carried along with the *Cæleſtial matter* that ſurrounds it; and therefore it is not neceſſary that a *Stone* fallen down from a *Tower*, ſhould fall at a diſtance from it, ſince both of them are carried about with the ſame ſwiftneſs, and the *Stone* cannot but fall plumb down at the foot of the *Tower*. For it is no contradiction in *Philoſophy* for one *motion* to be compounded of a ſtraight and circular. *ARISTOTLE* himſelf owns as much, when he attributes to the *Fire* a *ſtraight motion*, by which it is carried upwards; and a *circular*, in which it is carried about the *Earth* by the *ſupream Heaven*. A *Stone* therefore falls *plumb* down to the *Earth*, becauſe with reſpect to the *Stone* it is all one, as if it were not mov'd at all, ſeeing that the *Air* and all the *Bodies* contain'd in it, are preſt down by the *ſubtil matter*, and are whirl'd about together with the *Terreſtrial Globe*. This is proved by a *Stone* falling from the *Maſt* of a *Ship*, which whether it move, or ſtand ſtill, the *Stone* ever falls down in the ſame place. The reaſon whereof is plainly this, becauſe the *Stones motion downwards*, which it derives from the *Cæleſtial matter*, is accompanied with a *Lateral motion*, communicated to it by the *Ship*, which is ſwiftly driven along. And conſequently it is not ſtrange at all, that it falls down *perpendicularly*, becauſe the *Stone* moves as much forwards as the *Earth*, and conſequently one and the ſame point of the *Earth* ever anſwers to the *Stone*, and therefore upon it the *Stone* muſt needs fall.

VII. *The motion of a Stone falling down is not ſtraight, but according to a Parabolical Line.*

Tho' indeed to ſpeak exactly concerning theſe things, we muſt own, that *heavy Bodies* do not fall downwards by a Right, or Perpendicular *Line* to the ſurface of the *Earth*, but by a kind of *Tranſverſe* or Crooked, called a *Parabolical Line*: and the Reaſon why the *motion* of a *Stone* appears to be Right and Perpendicular, is, becauſe the *Eye* doth not perceive that *motion* whereby it ſelf is moved, and which is common to it with the *Stone*, but only that *motion* which proceeds from the *Action* of *Gravitation*, or which is impreſt upon the *Stone*, by him that caſts it.

VIII. *A Third Objection from the Shot of a Gun.*

Againſt this Solution it may be, will be urged an *Argument* taken from the Shot diſcharged out of *Great Guns*, *viz.* how it comes to paſs, the *Earth* being moved about its own *Center*, that a *Bullet* diſcharged from the *Eaſt*, ſhould not move more ſlowly than another that is diſcharged from a like *Gun*, and an equal quantity of *Powder* from the *Weſt*? For if the *Earth* be carried from *Weſt* to *Eaſt*, it muſt neceſſarily follow that the *Bullet* diſcharged from the *Weſt*, muſt much exceed the ſwiftneſs of the other, as being aſſiſted and promoted by the Circumvolution of the *Earth* the ſame way; whereas the other is as much obſtructed by the ſame, becauſe it moves a quite contrary way.

IX. *The Anſwer.*

I Anſwer in the *Firſt Place*, that when a *Bullet* is diſcharged towards the *Weſt*, as much as the *Earth* moves towards the *Eaſt*, ſo much is the *Bullet* alſo driven back that way, by the common motion of the *Vortex*: and on the contrary, when a *Bullet* is diſcharged towards the *Eaſt*, as much as the *Earth* haſts the ſame way, ſo much is the *Bullet* retarded by the *Vortex* of the *Earth*.

X. *A common or general motion is no obſtacle to particular motions.*

I Anſwer in the *Second Place*, that the *motion* of the *Earth* which is common to it with the *Air*, and other *Bodies* contained in it, doth neither hinder nor promote the *motions* of particular *Bodies*; and conſequently, that all things happen in the ſame manner, as if the *motion* of the *Earth* were not determined to any certain part. As is manifeſt from this *Example*. Suppoſe we, a *Boat* to be driven with great ſwiftneſs to ſome particular *Region*, and one part thereof to be full of *Water*, in which two *Fiſhes* are *ſwiming*, the one from the *Eaſt* to the *Weſt*, and the other from *Weſt* to *Eaſt*; no body will imagine, that that *Fiſh* whoſe motion conſpires with that of the *Boat*, will therefore move faſter than the other. For it is certain, that which way ſoever they move, it will be with equal ſwiftneſs, as if the *Boat* were not moved at all. Thus the *motion* of the *Earth* from *Weſt* to *Eaſt*, is no hinderance at all to thoſe *Bodies* that move the contrary way. Yea the motion being common, its the very ſame, as if there were none at all.

XI. *The motion of a Bullet diſcharged from a Gun, compared with the motion of Fiſhes in a Boat.*

For as theſe *Fiſhes*, beſides the motion they have from their *Animal Spirits*, whereby they are carried which way they pleaſe, have alſo a motion impreſt upon them from the *Boat*: In like manner a *Bullet*, beſides that *motion* communicated to it by the *Gunpowder*, which carries it ſtraight forward, hath another *motion* impreſt upon it by the *Earth*, whereby it is whirl'd about in the ſame ſwiftneſs with it from *Weſt* to *Eaſt*, and therefore runs through the ſame ſpaces as if there were no motion at all in the *Earth*.

XII. *A fourth Objection from the Nature of the Winds.*

Others again raiſe this Objection againſt the *motion* of the *Earth*: Suppoſing the *circumvolution* of the *Earth*, ſay they, there would always be a ſenſible Breez of *Wind* upon the *Surface* of it, as we perceive when we ride on *Horſeback*, we are ſenſible of a kind of a *Breez* of *Wind* coming againſt our *Faces*, becauſe the *motion* of the *Horſe* exceeds the *motion* that is in the *Air*. Accordingly what a ſtrong *Breez* of *Wind* ought we to feel, if with ſo ſwift a whirling about, as that of the *Earth* is ſuppoſed to be, we ſhould run againſt the oppoſing *Air*? Wherefore ſeeing we find nothing of this, we have reaſon to conclude, that there is no ſuch motion at all.

XIII. *Foraſmuch as all the Bodies up to the Moon are moved together with the Earth, it cannot ſeem ſtrange that we feel no wind from the motion of the Earth.*

But this Objection is not ſo much the effect of *Reaſon*, as of an inverate Prejudice about the ſtability of the *Earth*, which makes it a difficult thing for ſome men to conceive, that the *Air*, with all other ambient *Bodies* to the *Moon*, are carried about together with the *Earth*. Whereas, to ſpeak exactly, the *Heavenly matter* that carries the *Earth* along with it, is more ſwiftly moved about the *Earth* than the Earth it ſelf is about its *Axis*. Wherefore, in this Caſe, no wonder if we feel no *Wind* at all, no more than it is ſtrange that a man that

the Earth.

that purſues us with a *Sword* doth never reach us, in caſe we move faſter than he.

XIV. *A Fifth Objection from Holy Scripture.*

The Authorities taken from *Scripture* ſeem to be of more force againſt this Opinion: For the *Scripture* in may places *attributes ſtability* to the *Earth*, and to the *Sun* a *motion* from *Eaſt* to *Weſt*, as in the 1*ſt* Chapter of *Eccleſiaſtes*, where it is ſaid, *The Sun ariſeth, and goeth down, and haſteth to his place where he aroſe.* And in the Book of *Joſhua* it is reported for a *Miracle*, that the *Sun* ſtood ſtill at the Prayer of *Joſhua*, when he ſaid, Chap. 10. 12. *Sun, ſtand thou ſtill upon Gibeon.* Now this would not have been a *Prodigy*, if the *Sun* had always ſtood ſtill in the midſt of the *World*, and the *Earth* had whirl'd about it; for if ſo, it had been more proper for *Joſhua* to have ſaid, *Earth, be not thou moved.*

XV. *The Scripture in may places accommodates it ſelf to our manner of conceiving of things.*

To which I Anſwer, That it is generally owned, that the *Scripture* ſpeaks of things according to the manner of *men*, that is, our way of conceiving them. As when the *Scripture* ſpeaks of the *Ends* and *Foundations* of the *Earth*, neither of which do properly belong to it. In like manner, when it attributes to the *Sea*, an *Abyſs* of an unmeaſurable depth, with other various *Affections* and *Motions*, which it hath not. Thus likewiſe it is ſaid in the 1*ſt*. Chapter of *Geneſis*, that *God made two Great Lights, the Greater to rule the Day, and the Leſſer to rule the Night.* Which can only be underſtood as to outward appearance, and not according to exact *Truth*. Becauſe the *Sun* and *Moon* are not the greateſt *Lights*, eſpeally not the *Moon*, for *Saturn* and any of the *Fixt Stars* are greater than it. Neither can the *Moon* be called abſolutely the leaſt *Light*, ſeeing that *Mercury* is much leſs. And therefore we muſt conclude, that the *Scripture* calls them ſo, only becauſe they appear ſo to us, and are accounted ſo according to *vulgar* opinion. And upon the ſame account it is, that the *Earth* in *Scripture* is ſaid to *ſtand ſtill*, and the *Heaven* to move about it; becauſe, as to our ſight, the *Earth* ſeems rather to ſtand ſtill, and the *Sun* to be whirl'd about it, than the contrary. The ſame thing happening to us in this caſe, as to thoſe that *Sail*, to whom the *Shoars* ſeem to withdraw, tho' indeed they withdraw or depart from the *Shoar*. When therefore *Joſhua* ſaid, *Sun, ſtand thou ſtill*, this is not to be underſtood, as if the *Sun* then had been ſtopt in his *motion*, and made to ſtand ſtill; but only that the *Light* of the *Sun*, at *Joſhua*'s Prayer, continued without change, by which means the *Body* of the *Sun* ſeem'd to ſtand.

XVI. *The Objection farther urged from Scripture.*

If it be urged, that this Explication cannot be admitted, foraſmuch as in many other places of *Holy Scripture* the *ſtability* of the *Earth* is plainly aſſerted: As in the 92 *d*. Pſalm, *The Earth is eſtabliſhed, that it cannot be moved*, and the 1 *ſt*. of *Eccleſiaſtes*, *One Generation paſſeth away, and another cometh, but the Earth ſtandeth for ever.* For how can the *Earth* be ſaid to ſtand faſt for ever, when indeed it is continually in *motion*?

XVII. *The Objection anſwered.*

I Anſwer, that theſe places are not ſo to be underſtood, as if the *Earth* were immoveable, and did not turn about its own *Axis*, but only that there is ſuch a firm and indiſſoluble union of its parts, that it continues the ſame, notwithſtanding the perpetual generation and corruption of *Animals*, *Plants*, and other things that are upon it. So as that paſſage of the *Poet* may be attributed to the *Earth*.

The ſame that our Progenitors did ſee,
The ſame is now, and ſtill ſhall be.

And that this is the *genuine ſenſe* of this place, plainly appears from the foregoing words, *one Generation paſſeth away, and another cometh.* As if it had been ſaid; tho' the *Earth*, according to ſome of his *parts*, be changed by means of *Generation* and *Corruption*, yet it ſtandeth for ever, that is, it always continues in the ſame ſtate: Much after the ſame manner as a *Ship* is ſaid to continue the ſame, though it hath been often repaired, and ſeveral new *Parts* put inſtead of the old and decayed.

CHAP. V.

Concerning Day and Night, and the Viciſſitudes of Seaſons.

I. *What a Natural and Artificial Day is.*

A *Day* is commonly taken by *Philoſophers* for the *ſtay* of the *Sun* above the *Horizon*: In which ſenſe it is oppoſed to *Night*, which is the abode of the *Sun* under the *Horizon*. Or elſe a *Day* is taken for that *Duration* in which the *Sun* is conceived to run round the whole *Earth*. The *Aſtronomers* call the former of theſe an *Artificial*, and the later a *Natural Day*, as containing both the *Artificial Day* and *Night*.

II. *A Natural Day is either Aſtronomical or Civil.*

A *Natural Day*, is either *Aſtronomical* or *Civil*. An *Aſtronomical Day* is that ſpace of time, wherein the whole Revolution of the *Æquator* is abſolved, together with that portion of the *Æquator*, which anſwers to that part of the *Ecliptick*, which the *Sun* in the ſame time is underſtood to run through. The *Civil Day*, is that which is determined as to its *Beginning* and *Ending*, according to the cuſtom of particular *Cities* or *Nations*. Thus the *Italians* begin their *Day* from *Sun* ſet; the *Babylonians* from the *Riſing* of the *Sun*; the *Umbrians* from *Noon*; the *Romans* from *Midnight*, &c.

III. *What a Year is.*

A *Year*, which conſiſts of *Days* and *Nights*, is that *time*, wherein the *Sun* runs through the whole *Ecliptick*, or all the Signs of the *Zodiack*; which it doth in 365 days, 5 hours and 49 minutes; Which form of the *Year*, that it might be obſerved throughout the whole *Roman Empire*, *Julius Cæſar* appointed that the 5 hours, with the 49 minutes, which the *Year* contained over and above the 365 days, ſhould every fourth *Year* make one *Day*, which ſhould then conſiſt of 366 *Days*.

IV. *Why a Year is not the ſame every where, and why the Engliſh differ in their computation from ſome other Nations.*

But foraſmuch as theſe 20 *hours* with their *minutes* could not make up a whole Day, it was ſo ordered that thoſe *minutes* which were added to every *Year*, over and above the due length of it, by proceſs of time were ſo increaſed, as by exact computation to amount to 10 days. And conſequently alſo the *Vernal Æquinox* had changed its place, ſo as that the *Sun*, which entred *Aries* at the beginning of *Chriſtianity*, on the 21*ſt* day of *March*, did about 1500 years after, enter the ſame about the 11*th*. day. To remedy which error, Pope *Gregory* XIII. reſtored the *Æquinox* to its former Seat, and by taking away 10 days, made it to return to the 21*ſt* of *March* again. Which is the Reaſon

Reaſon why we here in *England*, not receiving this Reformation of the *Kalender*, differ 10 days from the account of others; ſo that when in *France* it is the 11*th.* day of *March*, it is no more than the 1*ſt.* day with us, and ſo on.

V. *A threefold Revolution of the Earth.* Foraſmuch as the Diverſity of the *Days*, *Nights* and *Seaſons* of the *Year*, are conſequent upon the *motion* of the *Earth*; we are to take notice of a threefold *motion* in the *Earth*, *viz.* A *Diurnal*, *Annual*, and *Motion* of *Inclinations*.

VI. *The Diurnal motion of the Earth.* The *Diurnal motion*, is that whereby the *Earth* is whirl'd about from *Weſt* to *Eaſt*, in the ſpace of 24 *hours*. This *motion*, according to our *Hypotheſis*, doth not properly belong to the *Earth*, but to the *fluid matter*, in the midſt whereof the *Earth* being poiſed, is together with the *Atmoſphere*, carried about, not by a motion of its own, but of the *Fluid Heaven* that ſurrounds it: ſo that according to *DES CARTES* his Opinion, *motion* doth not properly belong to the *Earth*, but to the little *Vortex* which carries the *Earth* round with it ſelf.

VII. *The Annual.* The *Annual motion*, is that whereby the *Earth* runs through the *Ecliptick* in a years time; which *motion* is alſo imparted to it by the *Fluid matter*, whereby it is pois'd, which being whirl'd round by the force of the *Solar matter*, doth neceſſarily carry about with it all the *Bodies* that *Swim*, or are poiſed in it. The *Earth* therefore being carried about the *Sun*, between the *Orbs* of *Venus* and *Mars*, runs through the 12 *Signs* of the *Zodiack* in a *years* time. Now how the *Earth* can, beſides its turning round, about its own *Axis*, perform a circuit about the *Sun*, we may learn by the Example of a *Top*, which turning round upon your *Hand*, may by you in the mean time be carried round a *Tree*, without hindring the *motion* of it about its own *Center*.

VIII. *The Earths motion of Inclination.* The *motion of Inclination* or *Declination* of the *Earth*, is the *Deflexion* of its *Axis*, from a *Paralleliſm* with the *Axis* of the *Ecliptick*, and ever keeping it ſo in every *Situation*, that it may always continue *Parallel* to the *Axis* of the *World*. So that indeed this *motion*, is not ſo much a diſtinct *motion* from the foregoing *motions*, as a certain modification of them; for whilſt the *Earth* abſolves its *Diurnal* and *Annual motion*, it always hath its *Poles* directed to the ſame parts of *Heaven*.

IX. *This threefold Motion of the Earth explained.* Theſe three *motions* of the *Earth* will be apprehended without difficulty, by comparing the two former to a *Bowl* delivered out of ones *Hand*, and rowling along the ground: and the *third* to a Flag fixt to the Maſt of a *Ship*, but ſo, as to be able to turn round, in which Flag we ſuppoſe the *Globe* of the *Earth* to be painted, with its *Axis*, not placed right upwards, but ſomewhat leaning on one ſide, *parallel* with the *Axis* of the *Terreſtrial Globe*. Now ſuppoſe a *Ship*, in which a *Maſt* and *Flag* is, were to *ſail* round ſome *Caſtle* or *Fort*, a ſtrong *South Wind* blowing, it is manifeſt that this moveable *Flag* on the top of the *Maſt*, would not turn about with the *Ship*, but by the force of the *Wind*, would be always directed towards the *North*, together with the *Axis* painted in it. So that by that time the *Ship*, purſuing its *courſe*, had performed one round, about the *Fort*, the *Flag* alſo would have perform'd one round, about the *Iron Pin* to which its faſtned, contrary to the *motion* of the *Ship*; the *Axis* of the *painted Globe* of the *Earth* being ſtill directed towards the ſame part of *Heaven*.

X. *The Great Orb, is but a Point in compariſon with the fix'd Stars.* The *Orb*, whoſe middle Line the *Earth*, by its *Annual motion* deſcribes, is called the *Great Orb*, which with regard to the *fix'd Stars* is but like a *Point*, according to our *Hypotheſis*, ſo great is the *diſtance* between the *fix'd Stars* and the *Earth*; and therefore 'tis all one, whether the *Stars* be viewed from the *Center* of this *Great Orb*, or from the *Circumference*. And thus much will be readily admitted by thoſe who conſider how raſh a thing it is, to define the *Works* of *GOD* to be leſs Auguſt and Ample, than indeed they are; and eſpecially if we conſider, that the *Appearances* can no other way be explained; neither doth Reaſon oppoſe it, ſeeing that the whole *Earth* is but a *Point*, compar'd with the *Sun*: Which is prov'd by this Inſtance, becauſe the *Sun* ſeems to move about a *Round Sun-Dial* placed upon the *Surface* of the *Earth*, after the ſame manner as it Rolls about the *Earth*; which ſhews, that the *Diameter* of the *Earth* is of no account in this caſe.

XI. *The Pole of the Earth declines 23 Degrees from the Pole of the Ecliptick.* It is to be noted alſo, that the *Axis* about which the *Earth*, in a *Days* time, turns round, is not perpendicularly raiſed above the Plain of the *Ecliptick*, in the which, in a *years* time, it is whirl'd about the *Sun*; but declines above 23 *Degrees* from a *Perpendicular*. The reaſon whereof is, becauſe the *ſtriate Matter* of the *firſt Element*, which enters into the *Poles* of the *Earth*, near to the *Poles* of its *Axis*, coming from that part of the *Vortexes* which conſtitute the *ſecond Heaven*, doth in this manner inflect or turn it aſide: The other Parts of the *Earth* having not their *Pores* ſo diſpos'd, that other *ſubtil Matter*, coming from other parts of *Heaven*, ſhould enter into them, and turn it another way.

XII. *Without the Motion of Inclination, there could be no difference of Seaſons.* The Neceſſity of the *Motion* of the *Axis* of the *Earth* appears from hence, that without it there would be no *inequality* of *Days* and *Nights*, but the *Inhabitants* of the ſame place would always have the ſame length of *Days* and *Nights*, and the ſame conſtitution of the *four Seaſons* of the Year; that is, ſome would have all the year, *Winter*, others *Summer*, others *Autumn*, and others *Spring*. Wherefore it is of abſolute neceſſity to admit the *motion* of *Inclination*, to ſalve the *Appearances*, and to make all things agree in Harmony.

XIII. *How Days and Nights come to be.* Foraſmuch therefore as the *Earth* is a great *Spherical Body*, and at a great diſtance from the *Sun*, its whole extenſion cannot be enlightned at once, but only *one half* of it; and therefore when the *Earth* is once carried about its *Axis* A B in the ſpace of 24 *Hours*, it makes the ſame part of the *Earth*, when turn'd toward the *Sun*, to enjoy *Day-light*; and when turn'd away from him, to have *Night*. For *Day* is ſaid to be in that Part of the *Earth*, which being turn'd to the *Sun*, receives its *Rays*; and *Night* in that Part, which being turn'd from the *Sun*, cannot immediately receive them. And therefore it is no wonder, if the *Parts* of *Heaven* ſeem to ariſe and go down; becauſe by the *Revolution* of the *Earth* they are gradually diſcovered, and ſeem in order to approach towards us; and on the oppoſite ſide to ſet and vaniſh. Figure 39.

And

XIV. *Whence the diversity of Seasons of the Year ariseth.*

And because the *Axis* of the *Earth* A B, (as hath been said already) about which its *Diurnal Revolution* is performed, doth at present decline almost 23 *Degrees* from the Perpendicular 1, 6 of the *Ecliptick*, in which the *Earth* in a *Years* time performs his *Course* round the *Sun*; it so is, that the *Earth*, in various parts of its *Orb*, by objecting these two *Poles* of the inclined *Axis*, more or less, turned to or from the *Sun*, and exposing its several *parts*, sometimes for a longer, at other times for a shorter Space to the *Sun*, doth by this means produce the different *Seasons* of the *Year*, and the *Inequality* of *Days* and *Nights*. So that that part of the *Earth* which hath its *Axis* more inclin'd towards the *Sun*, enjoys *Summer*, as admitting the more direct *Rays* of the *Sun*, and consequently stronger and hotter: Whereas in that part which hath its *Axis* more turn'd away from the *Sun*, it is *Winter*, because it receives the *Rays* of the *Sun* more obliquely, and consequently more scatter'd and less agitated. And that *part* which continues longer turn'd toward the *Sun*, enjoys *longer Days*; as that which is for a less time illustrated by the *Sun*, has *shorter Days*.

XV. *There are four Signs, to which when the Earth approacheth, she produceth the different Seasons of the Year.*

This will appear more manifest, by shewing how the *Seasons* come to be, and how it happens that with some *Inhabitants* of the *Earth* it is *Spring*, with others *Summer*, with others *Autumn*, and with others *Winter*. Let us place therefore 4 Points, *Libra* ♎, *Capricorn* ♑, *Aries* ♈, and *Cancer* ♋, as *Centers*, or 4 Equal *Circles*, that may represent the *Earth* to us, placed there at divers *Seasons*; the *Earth* with its *Center* running through the whole Circumference of *Libra*, *Capricorn*, *Aries* and *Cancer* in a years time, from *West* to *East*, according to the *Order* of the *Signs*.

XVI. *How Spring comes to be.*

For it is manifest, that the *Earth* being placed in the *Point* of *Libra* ♎, at the same time that the *Sun* is in the opposit *Sign* of ♈, *Spring* time begins with us, who inhabitate the North parts of the *Earth*; because the *North Pole* of the *Earth* A, being constituted between its past greatest *Declination* from the *Sun*, and its future greatest *Inclination* to it, makes, that the *Sun-beams* falling upon our *Temperate Zone* 1, 2, reach it only obliquely; and therefore make the *Air*, yet thick and sluggish by reason of the *Winters Cold*, more temperate about this time of the *Year*. And forasmuch as both the *Poles* A B, about which the *Earth* is carried by its *Annual Revolution*, are constituted in the Extream parts of the *Hemisphere* of the *Earth*, that is illuminated by the *Sun*; by this means it comes to pass that we, and all other *Inhabitants* of the *Earth* have equal *Days* and *Night*.

XVII. *How we come to have Summer, and those who live in the South parts Winter at the same time.*

But when the *Earth*, in its *Annual Revolution*, comes nearer to *Capricorn* ♑, the *North Pole* A, doth further enter into the *Hemisphere*, illuminated by the *Sun*; whereas the *Southern Pole* B, is more withdrawn from it. By which means it comes to pass, that to those who live towards the *North Pole* A, the *Days* begin to increase, and the *Heat* to prevail; whereas those who live about the *South Pole* B, experience the contrary. But when the *Earth* is come quite to *Capricorn* ♑, *viz.* at the same time that the *Sun* appears in *Cancer* ♋, we enjoy *Summer*; because the *North Pole* A being at that time most inclined towards the *Sun*, it makes the *Sun-beams* to fall directly, and almost perpendicularly upon our *Temperate Region* 1, 2, and the *Cold Region* 1, A; and therefore produceth the greatest *Heat*. But to them who live beyond the *Æquator* 3, towards the *South Pole* B, *Winter* happens at the same time; because the *Antartick Pole* being at that time in his furthest *declination* from the *Sun*, the *Beams* thereof reach it very obliquely and consequently impart but very weak *Light* to them. At the same time the *Longest Days* are with us, and the *Heat* increaseth; because the *North Pole* A continuing for a long time in that *Hemisphere* of the *Earth* which is illustrated by the *Sun*, makes us to enjoy the *longest Days* and *shortest Nights*. The contrary to which happens to the *Southern Inhabitants*, because the *Antartick Pole* B, is then entred into the *Darkned Hemisphere*; and therefore makes, that those who inhabit the *temperate Zone* 4, 5, and the *Cold* 5 B, are for many *Hours* overwhelm'd with *Darkness*, and enjoy the *Light* but a very little Space.

XVIII. *How it comes to be Spring with us, and Autumn with those who live towards the South Pole.*

Afterwards, when the *Earth* having left *Capricorn* proceeds to *Aries* ♈, the *North Pole* A, doth more and more decline from the *Sun*, towards the *Hemisphere* of the *Earth* that is cover'd with *Darkness*; but the *Antartick* B, towards the *illuminated Hemisphere*, which causeth the *Days* to be shortned to us, that live North; whereas those that live *South*, begin to have their *Days* and *Heat* increased: 'Till at last the *Earth* being arriv'd at *Aries* ♈, both the *Poles* being in the Extremes of both the *Hemispheres*, *viz.* of that which is enlightned, and that which is *Darkned*, produce Equal *Days* and *Nights* to all the *Inhabitants* of the *Earth*.

XIX. *How it comes to be Winter with us, and with the Inhabitants of the South Summer.*

Last of all, As the *Earth* continues his Course from the Point of *Aries* ♈, towards *Cancer* ♋, the *Artick Pole* A by degrees begins to enter the *darkned Hemisphere*, and the *Antartick* or *Southern Pole*, the *illuminated Hemisphere*: By which means it comes to pass, that they who live beyond the *Æquator* 3, begin to have longer *Days*; and they shorter, who live towards the North: Till the *Earth* being arriv'd at *Cancer* ♋, the *North Pole* becomes dipt 23 *Degrees* in the *darkned Hemisphere*, and thus makes *Winter* and the *shortest Day* to the Northern *Inhabitants*; whereas to those that dwell in the South, it makes *Summer* and the *longest Day*. Lastly, the *Earth* proceeds from the Point of *Cancer* ♋, to *Leo* ♌, and *Virgo* ♍; till that being arriv'd again at *Libra* ♎, it restores *Spring* to those of the North, and *Autumn* to those of the South.

XX. *Why the Seasons are every year alike.*

All the foresaid *Seasons* of the *Year*, as to the *length* and *shortness* of the *Days* and *Nights*, in the continual process of *Years*, are much alike; because the *Diurnal* and *Annual Revolution* of the *Earth*, whence the Vicissitudes of *Days* and *Nights* do arise, are in all years much alike.

XXI. *How the Poles of the Æquator and Ecliptick come to approach to one another.*

However, because the two Conversions of the *Earth*, *viz.* the *Annual* and *Diurnal*, would be more commodiously performed, if they were done about *Parallel Axes*, the Causes that hinder this are by degrees changed; whereby it comes to pass, that in process of time this *declination* of the *Ecliptick* from the *Æquator* will grows less and less.

CHAP. VI.

Of the Zones and their Inhabitants, and of the Climats.

I. *There are five Zones in the Earth; and what we are to understand by the word* Zone.

THE *Ancients*, to distinguish the Degrees of *Heat* and *Cold* on the *Surface* of the *Earth*, did divide it into 5 *Zones*, *viz.* into the *Torrid Zone*, 2 *Temperate*, and 2 *Cold Zones*. By the Name *Zone* they understood a space of the *Earth*, lying between the two *Tropicks*; or one of the *Tropicks*, and the next *Polar Circle*; or between either of the *Polar Circles*, and the Neighbouring *Pole*. So that the *Zones* are nothing else, but *different Regions of the Earth differing in Temperature, according to the Suns Nearness, or Distance.*

II. *The Torrid Zone.*

The *Torrid Zone*, is that Space which is comprehended between the *Tropicks*; the Northern part whereof reacheth 23 *Degrees and an half* from the *Æquator*; and the other part, as far towards the South: So as that the whole Space contains 47 *Degrees* in *Latitude*; and is therefore called the *Torrid Zone*, because it is scorched by the perpendicular *Beams* of the *Sun*.

III. *The Temperate Zones.*

The *Zones* that are placed between the *Tropicks* and the *Polar Circles*, are called *Temperate*; the one of them being between the *Tropick* of *Cancer* and the *Artick Circle*, which is 43 *Degrees* broad. And this is called the *Temperate Zone* towards the *North*. The other is call'd, the *Temperate Zone* towards the *South*, between the *Tropick* of *Capricorn* and the *Antartick Circle*, and hath as many *Degrees* in *Latitude* as the former.

IV. *The Frigid Zones.*

The other two which are comprehended within the *Polar Circles*, are called *Frigid* or *Cold*: Whereof one is the *Northern Frigid Zone*, between the *Artick Circle* and the *North Pole*; from which *Circle* to the *Pole*, are accounted 23 *Degrees and an half*. The *Southern Frigid* lies between the *Antartick Circle* and the *South Pole*, and is just as many *Degrees* in *Latitude*.

V. *The Torrid Zone is not inhabitable, as was believ'd by the Ancients.*

The *Ancients* believ'd the *Torrid Zone* to be Inhabitable; according to that of *Ovid*,

——*of these, the Middle* Zone,
Is scorch'd with Heat, *inhabited by none.*

But Experience hath now better inform'd us; for the *Spaniards*, *Portuguese*, *Hollandors*, and also the *English*, who have *Sailed round the World*, as they call it, have found the *Torrid Zone* not to be scorch'd with intolerable *Heat*, but *Temperate* enough, and water'd with plentiful *Showers*, and with frequent *Rivers* and *Springs*, abounding also with all manner of *Fruit* and *Corn*, and affording a pleasant and delightful Abode to *Animals* and *Men*, so as that *People* of several *Nations* come to inhabit there. This appears also consonant to Reason; because the Length of the *Nights*, which are equal to the *Days*, in those Regions, doth greatly allay the *heat* of the *Air*. Neither are there wanting in this Space many *Lakes*, *Pools*, and other moist places, whence copious Vapours are raised, which afterwards coming down in *Rain*, do allay and temper the *heat* of the *Sun*. For tho' the *Rains* that fall there be but *small*, yet they are so frequent, as sometimes to continue for some *Months* together, greatly favouring the growth of *Plants*, and conducing to the refreshment of *Men*, and other *Living Creatures*. Which inclines me to be of *Polybius* his Opinion, who asserts that part of the *Earth* under the *Æquator* to be more *Temperate*, than that which is under the *Tropicks*; because when the *Sun* is about the *Æquator*, he presently runs over the *Vertical Point*; but when at the *Tropicks*, he continues *Vertical* for several *Days*.

VI. *The Inhabitants of the Torrid Zone, are in a threefold difference.*

There is a difference amongst the *Inhabitants of the Torrid Zone*: For some of them live under the *Æquator*, others under the *Tropicks*, and others again between the *Æquator* and the *Tropicks*. The *Sun* toucheth the *Zenith* or *Vertical Point* of all these, once or twice every *Year*. They who live under the *Æquator*, in the *first* place, have a *Right Sphere*: *Secondly*, They alone enjoy a *Perpetual Æquinox*: *Thirdly*, They alone have the view of both *Poles*: *Fourthly*, To them alone all the *fix'd Stars* Rise and Set: *Fifthly*, They have two *Summers* and two *Winters*: *Sixthly*, The *Sun* passeth their *Zenith* twice in a *Year*. Those who live under the *Tropicks* do *first* experience two *Meridional Shadows*, in a *Years* time: *Secondly*, They have but one *Summer*, and one *Winter*: And *lastly*, The *Sun* reacheth their *Zenith* once in a *Year*. They who live betwixt the *Æquator* and the *Tropicks*, have 3 *South shadows* in a *Year*; in the next place they have 2 *Summers* and 2 *Winters*, especially if they be more remote from the *Tropicks*: *Thirdly*, The *Sun* passeth their *Zenith* twice in a *Year*.

VII. *The Inhabitants of the Temperate Zones.*

The *Inhabitants* of the *Temperate Zones*, in the *first* place, have one *South shadow* in a whole *year*: *Secondly*, They have two *Solstices*: *Thirdly*, They have one *Summer* and one *Winter* in a *year*: *Fourthly*, The *Sun* never reacheth their *Vertical Point*: *Fifthly*, They have 2 *Æquinoxes* every *year*, as all those have that have an oblique *Sphere*, or that dwell betwixt the *Æquator* and the *Poles*.

VIII. *The Inhabitants of the Frigid Zones.*

The *Inhabitants* of the *Frigid* or *Cold Zones*, are of 3 sorts: For they either live under the *Polar Circles*, or under the *Poles* themselves; or betwixt the *Circles* and the *Poles*. They who live under the *Polar Circles*, do alone enjoy a *Day* of 24 *Hours* long; and all other things which happen to the *Inhabitants* of the *Temperate Zones*, happen also to them. They who live under the *Poles*, have a *Day* of 6 *Months*, to which succeeds a *Night* of the same length. They have never any *Æquinox*, and to them alone no *fix'd Stars* ever Rise or Set. But they who live betwixt the *Poles* and the *Polar Circles*, their longest *Day* in the *Summer* is above 24 *Hours*. They do not see the *Sun*, whilst he is in the *Tropick* of *Capricorn*. Other things they have common with those that live under the *Polar Circles*.

IX. *The difference of the Inhabitants of the Earth, with respect to their situation.*

Another Distinction of the *Inhabitants* of the *Earth* is taken from the opposite situation of their *Habitation*; and this Difference is Threefold, being distinguish'd into *Periœci*, *Antœci*, and *Antipodes*.

X. Periœci.

They are call'd *Periœci*, who live under the same *Parallel*, and the same *Meridian*, but yet under the opposite Points thereof. Such are those who live in the places marked 7 and 8, and 3 and 6. Now all these have the same *Summer* and *Winter*, and much the same Temperature of the *Air*, and the same Length and Shortness of *Days* and

Fig. 40.

and *Nights*; but have their *Day* and *Night* at a contrary time to one another: Except they be placed within the *Frigid Zone*, because then it may so happen, that they have the same *Day* and *Night*.

XI. Antœci. *Antœci* are those that live under *Parallels*, that are equally distant from the *Æquator*, and under the same *Meridian*, in the same *Longitude*. Such are those who dwell in the *Points* 9 and 7, and in 6 and 8. They have the same *Noon* and *Midnight*; but have their *Summer* and *Winter* at opposite times: So as that the longest *Day* of one of them, is the shortest *Day* of the other. The *Antœci* between the *Tropicks* may have the same *Winter*, but never *Summer* at the same time.

XII. Antipodes. *Antipodes*, or *Antichthones*, are those who live under *Parallels* or *Points* distant the same *Latitude* on either side of the *Æquator*; or under the *Æquator* it self, but yet in opposite Points of the same *Meridian*: Or more briefly, as *Cicero* has it, *Antipodes are those whose steps are opposite to each other.* And such are they who live in 1 and 2, 5 and 4, 6 and 7. The *Antipodes* without the *Æquator*, 5 and 4, have all things opposite. Those at 5 and 4, have *Night* and *Day* quite contrary: And all the rest have also their *Summer* and *Winter* at contrary times. There is no Point assignable on the *Surface* of the *Earth*, to which an *Antipodal Point* doth not answer; and this is nothing else, but the other Extremity of the *Diameter* from the foresaid Point, passing through the *Center* of the *Earth*. Whence it is, that these great Varieties must needs happen.

XIII. *The Opinion of the Ancients concerning the Antipodes.* Those who are our *Antipodes*, live towards the *South Pole*, and are yet undiscover'd what kind of *People* they are; but the *Antipodes* of other *Nations* are known. For though some Great Men of Old did deny *Antipodes*, as supposing that if any such were, they must hang in the *Air*, and have their *Heels* higher than their *Heads*; yet these are worthily derided by *Lactantius*, *Lib.* 4. *cap.* 14. *de Falsa Sapientia*; forasmuch as the *Inhabitants* of the *Earth*, in what part soever they live, tread upon the *Earth* with their *Feet*, which every one may easily understand that considers the *Earth* to be *Round*.

XIV. *Why the Surface of the Earth was divided into Climats.* But because the Distinction of *Zones* did not seem sufficient to the *Ancients*, to specifie all the diversity of the Situations of *Regions* about the *Æquator*, they thought convenient to add many *Parallels*, by which, as by so many lesser *Zones* they divided the *Earth*, and called them *Climats*, as being so many Inclinations or Deflexions from a *Right Sphere*. Yet there is this difference betwixt the *Parallels* and *Climats*; that the *Parallels* are only of one Quarter of an Hour, but the *Climats* of Half an Hour. So that in whatsoever place of the *Earth* the *Solstitial Day* is one Quarter of an Hour longer than 12 *Hours*, that place is under the *first Parallel*. But if the Excess reach to Half an *hour*, that place is situate under the *second Parallel*; or, which is the same, under the *first Climat*. For by *Climats* the *Ancients* understood nothing else, but large Spaces of the *Earth*, or *Zones*, between two *Circles Parallel* to the *Æquator*, equal in *Latitude*, and passing through every 10*th Degree* of the *Meridian*. These are 18 in all, 9 whereof are called *Northern*, and 9 *Southern*.

XV. *The first Northern Clime, is that which is call'd* Æthiopicum. The *first Climat*, from the *Æquator* towards the North, hath its beginning where the Longest Day is of 12 *Hours*, and its *Latitude* or distance from the *Æquator* is 10 *Degrees*; towards the further part of which, the Longest Day is 12 *Hours*, 35 *Minutes*. It is commonly called *Æthiopicum*, from the Country of *Æthiopia*, as passing over the City *Meroe*. For the Custom of the *Ancients* was, to put the Name of some Famous place contained in it upon the several *Climats*.

XVI. *The second*, Arabicum. The *second Climat* is that, where the *Latitude* is of 20 *Degrees*, and the Longest day of 13 *hours* and 12 *minutes*, and is called *Arabicum*, from *Arabia Fœlix*, through which it passeth.

XVII. *The third*, Ægyptiacum. The *third* is that where the *Latitude* is of 30 *Degrees*, and the Longest day of 13 *hours* and 56 *minutes*: And took the Name *Ægyptiacum* from *Alexandria*, the Metropolis of *Ægypt*, through which it passeth.

XVIII. *The fourth*, Syriacum. The *fourth Clime* is that, where the *Latitude* is of 40 *Degrees*, and the Longest day of 14 *hours* and 51 *minutes*. It is called *Syriacum*, because it passeth through *Rhodes* in *Syria*.

XIX. *The fifth*, Italicum. The *fifth* is, where the *Latitude* is of 50 *Degrees*, and the Longest day of 16 *hours* and 9 *minutes*; and it was call'd *Italicum*, or *Gallicum*; because it passeth through *Rome* and *Paris*, where the Longest day is of 16 *Hours*.

XX. *The sixth*, Britannicum. The *sixth* is where the *Latitude* is of 60 *Degrees*, and the Longest day of 18 *hours* and 30 *minutes*; and this is called *Britannicum*, or *Germanicum*.

XXI. *The seventh* Suecicum. The *seventh* is, where the *Latitude* is of 70 *Degrees*, and the Longest day of 65 *Days*; and is commonly call'd *Suecicum*.

XXII. *The eighth*, Glaciale Boreum. The *eighth* is, where the *Latitude* is of 80 *Degrees*, and the Longest day of an 134 *Days*; and is called *Glaciale Boreum*.

XXIII. *The ninth*, Polare Boreum. *Lastly*, The *ninth* is that Space which is extended to the *Northern Pole*, where the Longest day is of *Half a year*, or of 188 *Days*, and is called *Polare Boreum*.

XXIV. *The first of the Southern Climats, is called* Brasilianum. The *first* of the *Southern Climats* begins at the *Æquator*, and ends in the 10*th Degree*, where the Longest day is of 12 *hours*, 35 *minutes*. It takes its name of *Brasilianum*, from the Country of *Brazile*.

XXV. *The second*, Peruanum. The *second* is, where the *Latitude* is of 20 *Degrees*, and the Longest day of 13 *hours* and 12 *minutes*: And is called *Peruanum*, from the Country of *Peru*.

XXVI. *The third*, Paraguaticum. The *third* is, where the *Latitude* is of 30 *Degrees*, and the Longest day of 13 *hours* and 56 *minutes*; and is called *Paraguaticum*.

XXVII. *The fourth*, Chiliacum. The *fourth* is called *Chiliacum*, from the Country of *Chili*, which is extended 40 *Degrees* towards the South; where the Longest day is of 14 *hours* and 51 *minutes*.

XXVIII. *The fifth*, Sylvestre. The *fifth* is, where the *Latitude* extends to 50 *Degrees*, and the Longest day is of 16 *hours* 9 *minutes*. It is called *Sylvestre*, because it is inhabited by *Savages* and *Wild People*.

XXIX. *The sixth*, Magellanicum. The *sixth* is call'd *Magellanicum*, where the Longest day is of 18 *hours* and 30 *minutes*, and reacheth to 60 *Degrees*.

XXX. *The seventh* Incognitum. The *seventh* is of 70 *Degrees*, and is call'd *Incognitum*, *Unknown*; where the Longest day is of 65 *Days*.

The

XXXI. *The eighth, Glaciale Auſtrinum.* The *eighth* is that, where the *Latitude* is of 80 *Degrees* and the Longeſt day makes 134 of our *Days*; and is called *Auſtrinum Glaciale.*

XXXII. *The ninth, Polare Auſtrinum.* The *ninth* and *laſt* is extended to 90 *Degrees*, where the Longeſt day is of 6 *Months*, and is called *Polare Auſtrinum.*

XXXIII. *Of Old there were only ſeven Climats, whereas now there are eighteen.* Formerly there were only 7 *Climes*, becauſe they contained all the Countries that were then known: But the *Earth* being more known and diſcover'd, is now diſtinguiſh'd into 18 *Climats*, which *Aſtronomers* call by another name, *Elevations of the Pole*; and *Geographers*, the *Latitudes of Places*, or their *Diſtances* from the *Æquator.*

CHAP. VII.

Of thoſe things which are generated in the Earth; and firſt of Fountains.

I. *Fountains and Rivers have their Riſe from the Sea.* FOraſmuch as *Fountains* break forth on the *Surface* of the *Earth*, and proceed from its *Bowels*, we muſt enquire in the *firſt* place, what is the Original of *Fountains*, and from what *Principle* they are derived. And this we find can be nothing elſe but the *Sea*: For ſeeing that many *Fountains* flow continually, and that the *Rivers* which are made by them, do without ceaſing continue their *Courſe* towards the *Sea*, without ever increaſing the ſame, according to that of the Wiſe *King* in the 1*ſt* of *Eccleſiaſtes*: *All the Rivers run into the Sea, yet the Sea is not full; unto the place from whence the Rivers come, thither they return to flow again.* And accordingly we may eaſily gather, that the Original of *Fountains* is from this, That the *Sea-Water* being driven into the *Bowels* of the *Earth*, is led up to the *Surface* thereof; where breaking forth, it at laſt, after various Turnings and windings, returns to the *Sea.*

II. *They return to the Sea, from whence they came.* And indeed, foraſmuch as the *Earth* contains many *Clefts*, by which, as by ſo many *Channels*, the *Water* may be carried from one place to another; there is no reaſon to oppoſe, but that *Water* may come from the *Sea*, to the bottoms of *Mountains*; and that the ſame which break forth in *Springs* from thoſe *Mountains*, may after various windings run again into the *Sea.* Much after the ſame manner, as we find that in *Living Creatures* the *Blood* is carried from the *Left Ventricle* of the *Heart*, through the *Aorta* into the *Arteries* and *Veins*, and after having finiſh'd its *Circulation*, returns to the *Vena Cava*, and from thence to the *Heart*, from whence it came forth at firſt.

III. *How the Water riſeth from the Sea to the Tops of Mountains.* But foraſmuch as the *Surface* of the *Earth* is not even, ſome part of it being ſtretch'd out into *Plains* and *Levels*, and others riſing into *Mountains*, which do far exceed in height the *Surface* of the *Ocean*; we are to enquire, by what means the *Water* becomes raiſed from the *Depths* of the *Earth*, to the *Tops* of the higheſt *Mountains*; as alſo how the *Sea-Water* becomes deprived of all its Saltneſs, when it breaks forth into *Springs* and *Fountains* whoſe *Waters* are freſh.

IV. *Not by the Suction or Attraction of the Earth.* As to the firſt of theſe, ſome are of Opinion that this is performed by the *Earth*, to which they attribute a Virtue of ſucking and attracting the *Water* to the tops of the *Mountains*: After the ſame manner as *Bread* being dip'd in *Wine*, doth ſuck and draw up the *Wine* into it ſelf; or as a *Sponge*, ſucks-up *Water.* But this way of explaining this Difficulty is not Rational, ſince *Sucking* preſuppoſeth a ſenſible Motion in the *Body* that *ſucks*; for I cannot *ſuck* without ſome dilatation and ſwelling of my *Body*: Neither can it be ſuppos'd that the *Earth* can perform any ſuch action. And as to the Inſtance of *Bread*, or a *Sponge* dip'd in *Water*, nothing can be inferr'd thence to prove, that the *Earth* ſucks up the *Water* to the tops of the *Mountains*; ſeeing that it is but a ſmall quantity of *Water* that is ſuck'd-in by the *Spongious Body*; and that that which is attracted by it, doth never run out from it. And ſo likewiſe may that part of the *Earth*, which lies next to the *Spring*, be moiſtned and ſoak'd through with the *Water* of it; but this will never make the *Water* ſpring or break forth from thence.

V. *Nor by the preſſure of the Sea-Water.* Others ſuppoſe, that the *Sea-Water* is raiſed to the higheſt parts of the *Earth*, by means of that preſſure whereby the *ſurface* and upper-part of the *Sea-Water* preſſeth that which is at the Bottom, and forceth it up the paſſages of the *Earth*, till having at laſt found an Out-let, it breaks forth on the *Surface* thereof. But neither can this *Opinion* be admitted; for tho' the *Water* at the bottom of the *Sea*, be driven into the *Cavities* and open Paſſages of the *Earth*, by the weight of the *Water* that lies upon it; yet can it not by this means be raiſed higher than the *Surface* of the *Sea.* Beſides, if the *Water* by ſome *Channels*, or wide and open *Paſſages*, ſhould be conveyed by one continued *Channel*, from the *Sea* to the *Surface* of the *Earth*, then it would not be *freſh*, but *ſalt*; becauſe the *Salt* eaſily gets through thoſe places, where the *Water* in any quantity can paſs; and ſo all *Springs* would be as *ſalt*, as the *Sea* it ſelf.

VI. *The Sea-Water being turned into Vapours, mounts upwards.* We ſuppoſe therefore, that the *Water* in thoſe *Holes* and *Caves*, whither it is driven by its weight, is reſolved into *Vapours* by the *Subterranean heat*; and that this *Heat*, by thoſe Paſſages which it every where meets with, mounts it upwards, and raiſes it to the *tops* of the *Mountains.* To which may be added, that the *Pores* through which the *Vapours* tend upwards, are continued open towards the very tops of the *Mountains*, and that they more eaſily mount up through the ſaid *Pores*, becauſe they are ſupported by the *Particles* of *Earth*, than through the *Air*, whoſe *fluid* and ſoft *particles*, cannot ſo uphold them and aſſiſt their Elevation. Now that there are ſuch *Subterraneous Fires*, that turn the *Water* into *Vapours*, is evident from thoſe *Fire-Vomiting-Mountains*, *Hecla*, *Veſuvius*, *Ætna*, and others of the ſame nature. And tho' ſuch *Fires* do not break forth from all parts of the *Earth*; yet it is probable that they communicate their *Heat* far and near, by means of *hollow Paſſages* in the *Earth*, in the ſame manner as the inborn *Heat* is diſperſed through the *Guts* and other parts of the *Body.*

VII *Condenſed Vapours furniſh the Fountains with Water.* But when the *Vapours* are thus mounted up, and are come near the *ſurface* of the *Earth*, they then become condenſed by meeting with the *Cold parts* of the *Earth*; and by this means being unable to mount higher, they cling together, and are turn'd to drops of *Water*: And ſince in this ſtate they are not able to return back by the ſame *Paſſages*, or *Pores*, becauſe of their Narrowneſs, they are carried downwards by their own *weight*; where

where many of them being united together make a *Subterraneous Rivulet*; and many of these *Rivulets* gather'd together make a greater, which breaking forth out of the *Earth*, constitutes a Living *Fountain* or *Spring*. An Example whereof we have in *Chymical Distillations*; where, by the means of *Fire*, many *Vapours* are driven up the *Alembick* from moist *Bodies*, which are condensed in the cool Head of the *Still*, and being united into Drops, run down the *Neb* thereof.

VIII. *What Springs or Fountains are.* So that *Springs* are nothing else, but *Sea-Water*, which being by its own weight driven to the bottom of *Mountains*, is there changed into *Vapours* by the inward *heat* of the *Earth*, and again condensed into *VVater* by the Coldness of the *Air*, or that of the tops of *Mountains*; whence these run down, according to the declining of the *Passages* that convey them, to the open place they have made for themselves on the side, or at the foot of the *Mountains*.

IX. *Why some Springs are dried up in Summer.* Some, it may be, will object: If it be true that *Springs* have their Rise from the *Sea*, whose *VVaters* being resolv'd into *Vapours*, by means of *heat* are again changed into *VVater*; how comes it to pass that some *Springs* are altogether dried up in *Summer* time, and do quite vanish by extream *heat*, since it cannot be question'd, but at that time many *Vapours* mount up from *Subterraneous places*, and that likewise there is *Cold* enough about the *surface* of the *Earth* to condense them.

X. *Answer.* I Answer, That these *Springs* which are subject to dry up in *Summer*, do for the most part owe their Original to *Rain* and *Snow*, which running through the *Clefts* of *Rocks*, do afterwards insinuate themselves through the *Pores* of the *Earth*, and drop down into some *hollow places*, and being there resolv'd into *Vapours*, by the *Heat* lodg'd in the *Bowels* of the *Earth*, meet with some proper place, by the *Coldness* whereof they become condensed, and so discharge themselves through some open passages on the *surface* of the *Earth*. Hence it is, that after long continued *Rains* we see many *New Springs* arise, which afterwards by degrees vanish, except more *Showers* succeed and fill those hollow places of the *Earth* from whence they proceeded, and supply Matter for a new breaking forth of *VVater*.

XI. *Of the various kinds of Fountains.* Whence we may distinguish *Fountains* into several kinds, according to their different ways of *Flowing*, *Failing*, or *Duration*; and so *Springs* or *Fountains*, are either Temporal or Perpetual: *Temporal*, are those that do not run continually: *Perpetual* are such as *spring* without ceasing. Which are again divided into *clear* and *pure Fountains*, falling down by drops, or gushing out with a *stream*; or *mixed*, being such as are impregnated with *Salt*, *Sulphur*, *Bitumen*, or *Jews Lime*, and the like.

XII. *How Wells come to be generated in the Bowels of the Earth.* *VVells* are furnish'd with *VVater* much after the same manner as *Springs* are: For after that the *Vapours* of *VVater* have been raised to the *surface* of the *Earth*, they are by the *Coldness* thereof changed into *VVater*; which afterwards wandring under *Plains* and *Mountains*, without being able to mount up to the *surface* of the *Earth*, are there turn'd into *VVells*. Now the reason why *VVell-water* doth not ascend higher, is, because *VVater* cannot mount up above the place of its first Rise, for being come up to that pitch, it is equally pois'd, and so can rise no higher. Another Reason also may be, because *VVells*, for the most part borrow their *VVaters* from *Rivers*, *Lakes*, and *Pools*, not far off: Or if they receive their *VVaters* from the *Sea*, the said *VVaters* being drained through the *Earth*, run together into one and the same place.

XIII. *Why Spring and Well-water is fresh.* Hence it is that *Springs* and *Wells*, tho' they proceed from the *Sea*, yet their *Waters* are fresh, whereas the *Sea-water* is *salt*. The Reason whereof is this, because the *Sea-water*, consisting of *fresh* and *salt Particles*, whereof the fresh only are turned into *Vapours*, and carried upwards, leaving the *salt particles* behind, it is plain that their *Water* must be *fresh*. For the *salt Particles*, being stiff and inflexible, can neither be changed into *Vapours*, nor pass through the winding and bending *pores* of the *Earth*. The *Water* therefore of *Wells* and *Fountains* is *fresh*, because the *Sea water* being drain'd through much *Sand* or *Earth*, is depriv'd of its stiff *saline Particles*, and so becomes *fresh*.

XIV. *How it comes to pass, that Salt water is found in some Wells.* If any Man enquire how it comes to pass, since only *fresh Water* is drained through the *Earth*, that notwithstanding much *Salt* should be found in some *Wells*, at a great distance from the *Sea*.

XV. *The Answer.* I Answer, That this may happen, because the *Passages* of the *Earth* in some places are more wide and open, through which the *Sea-water* passing freely, may reach those *Wells*, without leaving its *Saline particles* behind it: Or, because the *surface* of the *Sea* may lye level with the bottom of those *Wells*; or likewise, because where the ways are wide and open, the *particles* of *Salt* are carried upwards by the *particles* of *Fresh water*. Of which this is a confirmation, because in some *Mountains* are found vast lumps of *Salt* grown together like great *Stones*: For the *Sea-water* being got up thither, whilst the *particles* of *Fresh-water* mount still higher, the *Salt* is left alone in those *Cavities* it meets with there, and fills them up.

XVI. *Of Fountains that Ebb and Flow.* Some *Fountains* are famous for their *ebbing* and *flowing*, like the *Sea*; yet not all in the same manner. For there is one at *Cadiz*, and another at *Bourdeaux*, that imitate the *motion* of the *Sea*, and *ebb* and *flow* at the same time with it. There is another in *Spain* which *ebbs* when it is *flood* at *Sea*, and *flows* when there is an *Ebb-tide* at *Sea*.

XVII. *The Cause of these ebbing and flowing Fountains, is the Sea.* The Cause of this *ebbing* and *flowing* in *Fountains* cannot be attributed to any thing, but to the *Sea-tide*; by means whereof the *Sea* entring into some *Subterranean passages*, drives up the *Water* as high as it self riseth. But the Reason why these *Springs* variously imitate the *Sea-tide*, is to be deduc'd from the difference of the *passages* through which the *Water* is convey'd: For if these *Channels* be strait without windings, or if the distance from the *Sea* be small, the *Fountain flows* at the same time with the *Sea*, and falls again when the *Sea ebbs*. But if the *Water* be convey'd to the *Cavities* of *Fountains*, through many crooked and winding *passages*, it may so happen that the *Fountain* may not *swell* when the *Sea flows*, nor fall when it *ebbs*; but quite contrary may *swell* when it *ebbs*, and sink when the *Sea flows*; because the *Water* having so many winding *passages* to go through, much time is thereby lost, so that by that time the *water* of the *Fountains* begins to *swell*, the *Sea* begins to *ebb*.

CHAP. VIII.

Of Metals and Minerals.

I. *What Metals are.* METals *are Bodies dug out of the Earth, Heavy, Hard, and Fusible by Fire, hid in the Inward part of the Earth, and there generated by the heat of the Sun, and subterraneous Fires.* Such as are *Gold, Silver, Copper, Iron, Tin,* and *Lead.*

II. *Of what Parts the Metals are compounded.* The *Particles* which compose *Metals*, are *Salt, Oil,* and *Earth*; which being mingled together, and meeting in the long and branch-like *Pores* of the inward parts of the *Earth*, are in the same so straitly link'd together, that *Art* hath not as yet found out any means whereby to separate them.

III. *Which be the pure Metals.* Some of these are called *Pure Metals*, others *Impure: Pure Metals* are those, *which compar'd with others, have been excocted or digested to a greater degree of fineness and perfection*, by means of the *Solar* and *subterraneous Heat*; such as are *Gold* and *Silver*. *Gold is the most heavy and most perfect of all Metals, very ductil, consisting of parts of equal Fineness and Heaviness, and being more heavy than the particles of Fire, cannot be carried away by them:* Which is the Reason why *Gold*, when it is *melted*, loseth nothing of its *weight*, as having no *Dross*, which by the Action of the *Fire* might be separated from it. *Silver is a Metal in Fineness and Perfection inferiour to Gold, heavy and solid, less ductil than Gold, and which being melted in the Fire, loseth something of its weight*; more especially that which by the agitation of the *Fire* is turned to *Dross*.

IV. *Which the Impure.* *Impure Metals*, are those *whose Principles are not so mature and refin'd, nor so fix'd and pure. Some of these, because of their impure Earthy substance, are made Red-hot before they can be melted*; as *Copper* and *Iron*: Whereas others of them, because of their abounding Moisture, are *melted* before they become *Red-hot*; as *Tin* and *Lead.*

V. *The Principles of the Chymists examined.* To the end that the *Nature*, not only of *Metals*, but of *Minerals* also, may be the more clearly and distinctly known, it will be fitting that we know before-hand, what we are to understand by the *Active Principles* of the *Chymists*; and what the *Philosophers* mean by *Salt, Sulphur,* and *Mercury.*

VI. *What we are to understand by the word* Salt. By the Name of SALT, we understand a *sharp Juice*, consisting of slender and stiff *particles*, which being intercepted in the *Pores* of the *inward* part of the *Earth*, are beaten or forged into *little Swords*: For as a *round Rod* of *Red-hot Iron*, is by the frequent stroaks of *Hammers* beaten into a longish *thin Plate*; so those *particles*, by being dash'd and rubbing against the hard Sides of the *Pores* of the *Earth*, are form'd into such *Figures.* Wherefore *Salt* is nothing else, but a *sharp Juice, consisting of slender, stiff and sharp Particles.* Which, if it be *volatil* and very bitter, is called *Salt Armoniack*; if it be more fat and inflammable, growing to *Walls* and *Rocks*, 'tis called *Nitre* and *Saltpeter*; if it be found in *Mines* and *Mineral-waters*, *Allom*; if it be joyn'd with a *Metallick matter*, and a most sharp and subtil *Mercurial Juice*, 'tis called *Vitriol.*

VII. *What Sulphur is.* By SULPHUR we understand, the very soft amd minute *Branchy particles* of *Fat* and *Oily matter.* And that such *particles* abound in *Brimstone*, we can demonstrate by this that it is very *inflammable*; for it is evident, that *soft* and *thin particles*, are the first of all others put in *motion*, and snatch'd away by the *Fire.* *Sulphur* therefore *is a Mineral Juice, consisting of the most soft and minute Branch-like particles of Fat and Oleaginous Matter, easily inflammable, and generated in the Caverns of the Earth.*

VIII. *What Mercury is.* By the Name of MERCURY we understand *Quicksilver*, or an *opake* and ponderous *Liquor*, consisting of thick, slippery and smooth *particles*; whose Nature shall be explained hereafter.

IX. *The number of Metals.* *Metals* are commonly reduced to six *species*, as was before mention'd, *viz. Gold, Silver, Copper, Iron, Tin* and *Lead.* To which some joyn *Mercury* or *Quicksilver*, which tho' it be *liquid* in its Natural state, and *Proteus*-like changeth it self into all *forms*; yet may it be made solid, and that several ways; as when it is held over the Fumes of *Molten-Lead, &c.* The *Astrologers* seem to favour this Opinion, *viz.* That *Quicksilver* is a *Metal*, who, as they appropriate *Gold* to the *Sun*; *Silver* to the *Moon*; *Iron* to *Mars*; *Copper* to *Venus*; *Tin* to *Jupiter*; and *Lead* to *Saturn*; so they attribute *Quicksilver* to *Mercury*, and do own its Virtue to be derived from the Influences of that *Planet.*

X. *The various Juices that are in the Bowels of the Earth.* To the end we may more clearly discover the Original of *Metals*, it will be of use to suppose, that in the Inward part of the *Earth* there are certain *fluid Bodies*, whose *particles* do not stick so close together, but that they may be easily dissolved: Such as are some *Earthy Juices*, which being generated in the deepest *Bowels* of the *Earth*, and consisting of the thickest *particles* of the upper part thereof, do fall down thicker by the force of the *Globuli* of the *second Element*, which by pressing them makes them heavy, and by passing through the *Pores*, wherewith they abound, somewhat agitates and makes them less, and so reduceth them to two kinds of *Figures.* For the *Particles* whose Matter is more solid, as those of *Salt* are, being intercepted, and, as it were, hammer'd in those *Pores*, of *round* and *stiff*, are made *plain* and *flexible*: Much after the same manner, as we have said, that a *Rod* of *Red-hot Iron* is hammer'd into a thin *longish plate.* And forasmuch as these *particles*, being agitated by the force of *Heat*, do this way and that way creep through these *pores*, by dashing and rubbing against their *hard Sides*, they become sharp like so many *little Swords*, which then constitute *sharp, sourish*, and *corroding Juices.* But the more *soft particles*, as are those of *Fresh-water*, and the like, being in the said *pores* wholly crush'd and bruised, are reduced to so great a thinness, that by the Motion of the *first Element*, they are divided into many very small and extreamly flexible little *Boughs*, which lying upon one another, are moved by a slow and creeping *motion.*

XI. *Metals are formed in the inward parts of the Earth.* Forasmuch therefore as *Metals* are solid and heavy *Bodies*, it is evident that they cannot consist of the outward *Crust* of the *Earth*, which is *softer* than the other parts. For tho' the uppermost part of the *Earth* consists of *Ramous* or *Branchy parts*, which

which are firmly joyn'd together; yet becauſe there are many Intervals between them, which may be taken up by the *Air*, or other *Bodies*, and by their agitation are an obſtacle to Solidity, which is the Property of *Metalline Particles*, it is neceſſary that they ſhould be generated in the more *inward parts* of the *Earth*, which are more cloſe, hard and compact. So that it ſeems probable that theſe *Metals* are hid, and cannot be reached or come to, by reaſon of the Depth of the *Earth*, and the ſtore of *Water* that is about them, which thoſe that go to ſearch for them cannot fail to meet with.

XII. *How the Particles of Metals are conveyed to the outward part of the Earth.*

But ſeeing, that beſides the *Vapours* which exhale from the *Waters* that lye hid under the *Earth*, there are alſo many *ſharp Spirits*, and *oily Exhalations*; and likewiſe *Vapours* of *Quickſilver*, which can carry along with them, from the inward part of the *Earth*, the *particles* of other *Metals*, and with them aſcend to the outſide of the *Earth*; by this means theſe *Metalline Particles* being brought to the *ſurface* of the *Earth*, do there ſtop between the *Sand*, and conſtitute *Veins* of ſeveral *Metals*. For it is probable, that the Reaſon why any *Metals* come within our reach is, becauſe the foreſaid *ſharp Juices* flowing through the paſſages of the *inward parts* of the *Earth*, do ſeparate ſome of its *particles* from their fellows, which being wrapt up in ſome oily Matter, are afterwards eaſily carried upwards by *Quickſilver* rarified by *Heat*, where they conſtitute ſeveral *Metals*, according to the diverſity of their *magnitudes* and *figures*.

XIII. *The diſtinction and diverſity of Metals, depends on the difference of their Parts.*

For nothing elſe is required to the Diſtinction of *Metals*, than the changing of their *parts*, or a different ranging of them: Becauſe *Bodily things*, whoſe *parts* are of the ſame bigneſs, and alike *ranged*, are to be accounted the very ſame things; their diſtinction only proceeding from the various *contexture* of their Parts, as when by the acceſſion of new Parts others are thruſt out of their places, or they become otherwiſe ranged. And thus thoſe *particles* that have *long* and *round*, as alſo *ſmooth* and *ſlippery Figures*, which becauſe of their *weight* lye one above another, and are moved only by the Matter of the *Firſt Element*, that fills up the Spaces between them, do conſtitute *Quickſilver*. For this is nothing elſe, but *a very heavy and opake Liquor, conſiſting of ſuch thick Particles as are long, and round like a Pillar, and very ſmooth, which tho' by reaſon of their weight they lye one upon the top of another, yet are eaſily moved by the Æthereal Matter that fills their Pores.* And ſo likewiſe thoſe Parts which are ſo firm and fix'd, as that they cannot be changed by any *Fire*, or conſum'd by any *acid Spirits*, conſtitute *Gold*. Thick and Branchy *Particles*, whoſe *ſurfaces* lye cloſe together, and whoſe *Pores* are only penetrated with the *ſtriate Matter*, make *Iron*. And ſo for the reſt of the *Metals*, which derive their diſtinction from the different *magnitude* and *figure* of their *Parts*.

XIV. *Tranſmutation of ſome Metals is poſſible.*

For this Reaſon ſome have believed the *Tranſmutation* of *Metals* to be poſſible, ſince it is notorious that *Iron* may eaſily be changed into *Copper*: For if *Iron* be caſt into *Copperas* or *Vitriolick Water*, its outſide is thereby turned Red, which *Red powder* being frequently ſcrap'd from it, and melted down, becomes true *Copper*. The ſame *Tranſmutation* is alſo effected by ſome *Fountains*; as by that which AGRICOLA mentions, near *Smolnitz*, the *Water* whereof being derived into three *Channels* rang'd in order, in which pieces of *Iron* are laid, they are thereby changed into *Copper*; and the ſmall *ſcales* of *Iron* are ſo corroded by this *Water*, as to become like *Clay* or *Dirt*: All which afterwards being melted down, becomes pure and good *Copper*. It is manifeſt alſo that *Quickſilver* may be chang'd into another *Metal*. For if after you have reduc'd *Lead*, or *Litharge*, to *Aſhes*, you pour the *Flegm* of *Vinegar* upon it, and afterwards pour ſome drops of this *Vinegar* upon *Quickſilver* diſſolv'd in *ſtrong Water*, it will preſently be precipitated to the bottom of the *Veſſel* in the form of a *Powder*, which being melted down becomes *Lead*.

XV. *It is morally impoſſible to make Gold.*

But the Queſtion is, Whether Imperfect *Metal*, by Example *Quickſilver*, can be turn'd into *Gold*? This the *Chymiſts* confidently aſſert, and take for their Vouchers, RAYMUND LULLY and ARNOLDUS *de Villa Nova*; who, they tell us could do as much. But I take all this to be no more than *Lies* and *Stories*: Or if ever they did make *Gold*, that this Effect was not to be attributed to their *Art*, but to meer Chance. And indeed it is a thing as unlikely, as if a *Man* having broke his *Hour-Glaſs*, ſhould ſo dexterouſly throw the *Sands* of it upon a *Table*, that the grains of it ſhould be ranged into the *figures* of ſuch Letters as ſhould make up ſome *Verſes* of *Ovid's Faſtorum*. For ſince we are ignorant of the preciſe *bigneſs* and *figure* of thoſe *Particles* that enter the Compoſition of *Gold*; as well as of the way of knitting them together, ſo as to make one *Body* of them; we may well conclude, that to make *Gold* is a thing morally impoſſible.

XVI. *Ductility is a Property of Metals.*

It is a Property of *Metals* to be *Ductil*, and more eſpecially of *Gold*, a ſmall quantity whereof may be beaten or drawn out into a vaſt extent. For out of one Broad piece of *Gold*, a vaſt number of *Leaves* may be beaten, 5 or 6 whereof are ſufficient to cover a piece of *Silver*, of a *Cylindrical Figure*; which being drawn into a fine Thred, the *Gold* is coextended with it, there being no part of the *Silver-thred* to be ſeen which is not gilt. The reaſon of this Ductility in *Metals* is, becauſe the *particles* of *Metals* are of a *Longiſh figure*, and are ſo diſpoſed, that they lye upon one another according to their whole *ſurface*; which makes, that when they are preſt under the *Hammer*, or in *Drawing*, they fall down ſideling, and joyn ſide to ſide without any ſeparation. Thus it comes to paſs, that *Metals* under the *Hammer*, may be extended into length and breadth, ſtill retaining the firm cohæſion of their *parts*; and the ſame is the Cauſe of their ductility into *Threds*.

XVII. *Metals are ſubject to Ruſt.*

Metals are ſubject to Corruption by *Ruſt*, and more eſpecially *Iron*. Which is an Argument, that its *particles* are not more ſolid than thoſe of other *Metals*, tho' they be Thicker; but that it abounds with *Pores*. And becauſe theſe *Pores* after Infuſion grow leſs, therefore it is that *Steel* is not ſo eaſily penetrated by other *Bodies*, as *Iron*, and conſequently, leſs ſubject to *Ruſt*. Now *Ruſt* is nothing elſe, but a perturbation of the Parts of *Metals*, cauſed by the Exhalations of a greatly agitated *Sulphureous Liquor*, the *particles* whereof thruſt themſelves into the *Pores* of *Metals*, and ſtop the *Orifices* of them.

The

XVIII. *The Sun is the Efficient Cauſe of Metals.* The Efficient Cauſe of all *Metals* is the *Sun*, whoſe *heat* pierceth through all the *Paſſages* and *Pores* of the *Earth*. For tho' the *Action* of *Light* be nothing elſe, but a kind of *Preſſion*, whereby the *Sun* puſheth the *ſubtil Matter* to *Right Lines*, that reach from his *Body* to the *Earth*; yet the *Terreſtrial particles* being agitated by his *heat*, do continue in their *motion*, except ſome intervening Cauſe do chance to hinder them. Hence it is we perceive, that the Heat which the *Light* hath left upon the *ſurface* of the *Earth*, doth continue for ſome time; ſo that it is no wonder, if from thence by degrees it proceeds to the *Bowels* of the *Earth*, becauſe the *Terreſtrial parts* that are ſtruck by the *Sun-beams*, do move thoſe that lye next to them, and they again their *Neighbours*, till the *Heat* at laſt be derived to the moſt Inmoſt parts of the *Earth*. After the ſame manner as a mans *Head* cover'd with a *Hat*, tho' it be not enlightned by the *Sun*, yet is ſenſible of its *heat*, even after that the *Sun-beams* do no more beat upon it. And thus much ſhall be ſufficient to have ſpoken of the *Nature* of *Metals*, their *Original* and *Affections*; we proceed now to the *Minerals*.

XIX. *What Minerals are.* MINERALS, are *Bodies made up of Salt, Sulphur and Mercury, mingled in a certain proportion with Aqueous and Terreſtrial particles, and excocted or brought to perfection by means of Subterraneous fires, or the Sun's heat, and digg'd out of the Mines of the Earth.* Wherefore alſo they are called *Foſſils*.

XX. *How many ſorts of Minerals there are.* There are Three kinds of *Minerals*: 1. *Mineral*, or *Coagulated Juices*: 2. *Mineral Earths*: 3. *Stones*.

XXI. *Mineral Juices.* *Coagulated Juices are Mineral Bodies, compounded of ſharp and oleaginous Juices, mingled with a more groſs Earthly Matter, endued with a ſtrong taſte or ſmell, and eaſily ſoluble in Water or Oil.* The chiefeſt of this kind are *Salt* and *Sulphur*.

XXII. *Mineral Earth.* *Mineral Earth, is a Body dug out of the Earth, conſiſting of Terreſtrial Particles, joyned with a tough and viſcous Humidity, reducible to Powder, and ſoluble in Water, ſo as thereby to be turn'd into a kind of Clay.* Wherein it differs from *Mineral Coagulated Juices*, which are wholly diſſolv'd in *Water*, and are not turn'd into *Clay* by admixtion of the *Aqueous particles*.

XXIII. *The various kinds of Mineral Earths.* Theſe *Mineral Earths* are *various*, according to the diverſity of the *Particles* whereof they conſiſt; or of the *Juice*, whereby their Parts are joyned together; as alſo of the *Country* where they are found. For if the *Matter* be very tough, ropy and unctuous, it makes *Potters-Clay*; if it be tough, white and dug up in the *Iſle* of *Crete*, it is *Chalk*; if in the *Iſle* of *Samos*, *Samian Earth*; if a yellow Colour, *Oker*; if Red, and found in the *Iſle* of *Lemnos*, *Lemnian Earth*, and *Sealed Earth*, becauſe it was uſed to be ſealed with the Seal of *Diana*'s *Prieſt*; if it be of a pale Red, and digg'd in *Armenia*, 'tis call'd *Armenian Earth*, or *Bole*. What *Stones* are, ſhall be delivered in the next *Chapter*.

XXIV. *In what part of the Earth Minerals are produced.* *Minerals* are not generated, like *Metals*, in the Inward parts of the *Earth*, where they have the whole weight of the *Earth* lying upon them; but about the *ſurface* of it, where its Parts are ſeparated by infinite *Chinks* and *Creviſſes*, by which they give a free paſſage to *Vapours* and *Exhalations*, and to other *particles* of that *Matter*, which the *Heat* contain'd in its *Bowels* hath put into *motion*. And foraſmuch as it is peculiar to *Exhalations*, to mingle themſelves with the ſmalleſt *particles* of the *Earth* they ſnatch along with them, they by this means come to form certain little *Lumps* or *Maſſes*, which after various agitation acquire alſo the ſame *motion*; but that ceaſing, they are all at laſt brought to a ſtate of *Reſt*, being cloathed with a roundiſh *Figure*. And after this manner 'tis probable that the *Grains* of *Sand* are formed; which are *Heavy*, becauſe they are compacted of *Terreſtrial Matter*; *Hard*, becauſe they are without *motion*; and *Tranſparent*, becauſe they have *Pores* that tranſmit the *Globuli* of the *ſecond Element* to right *Lines*, in the very ſame manner as they were moved, before that the *Particles* of *Sand* were yet *Coagulated*.

XXV. *The Pellucid Grains of Sand being heaped together, make an Opake Body.* Tho' every ſingle *grain* of *Sand* be tranſparent, nevertheleſs where many of them meet together, ſo as to make a *Heap*, they conſtitute an *opake Body*; becauſe in this ſtate they cannot give a free paſſage to the *Light*, ſeeing that each *ſurface* reflects ſome Rays of it. Thus the Powder of *Glaſs* is not Tranſparent, becauſe the various *particles* of *Glaſs* cannot have their *pores* ſo correſponding with one another, as freely to tranſmit the *Light*. Thus the *Grains* of *Sand*, eſpecially thoſe of the *Indies*, when beheld through a *Microſcope*, be tranſparent, and reſemble *Diamonds*; yet when they lye in heaps, they can no longer give free paſſage to the *Light*, and therefore conſtitute an *opake Body*.

XXVI. *How Potters Clay differs from Sand.* *Potters Clay*, notwithſtanding that it is *tough* and *fat*, yet is produc'd much after the ſame manner as *Sand*; only with this difference, that the *Grains* of *Clay* are much leſs, which make their *Intervals* not to let in *water* ſo readily, nor indeed without ſome force.

XXVII. *The reaſon of the difference of Clay in ſeveral parts.* If the *Particles* of *Salt* and *Oil*, which continually aſcend from the Inward parts of the *Earth*, were always like one another, we ſhould every where meet with the ſame kind of *Sand* and *Clay*: But it being very probable, that the ſaid *Particles* of *Salt* and *Oil*, are not in all places the ſame; it is to be of no matter of Wonder to us, that the *Clay* and *Sand* likewiſe is not always the ſame, but differing in Colour and the Magnitude of their Parts.

CHAP. IX.

Of the Generation of Stones, Common and Precious, and of their difference and diſtinction.

I. *What Common Stones are.* STONES are *Mineral Bodies*, hard, and compounded of a *petrifying Juice*, and *Terreſtrial Particles*, not ſubject to *Fuſion*, but *Calcination* by *Fire*; nor malleable, but breaking to pieces under the ſtroak of the *Hammer*. Theſe, according to the Purity or Impurity of the *Matter* whereof they conſiſt, are divided into *Common* and *Precious*, which are either generated in the *Bowels* of *Animals*, or without them.

Some

II. *New Stones are daily generated in the Earth.*

Some are of Opinion, that there are no *New Stones* produced, but that all of them were created at the Beginning. But *Miners* assure us to the contrary, who often find *Stones* in those places, where before was nothing but *Sand* or *Clay*. Whence it is obvious to conclude, that both these are the *matter* of *Stones*, and that of the *particles* thereof variously joyned and mingled together, they are compounded. For tho' things made of *Sand* be hard, and cannot be softned; yet this nothing hinders, but that by the help of some *Terrestrial matter*, filling their *Pores* and *Intervals*, they may so hang together, as to constitute *Stones*. Thus it frequently happens, that *Waters* running through the *Earth*, do carry away with them some small *particles* of the *Stones* through which they run; which *water* coming afterwards to places where its Current is very slow, may give occasion to those *particles* to unite together, and constitute a *Stone*.

III. *A twofold Rise of Stones.*

Stones may be made of *Sand* these two ways; first, out of *dissolved Sand*, as when *Sand* dissolved in any quantity, is afterwards hardned. And the *Stones* thus formed are transparent, as the single *grains* of *Sand* are, and are of various *figures*, according to the Compression of the *Bodies* that are lying about them. The other way is, when *Stones* are made of *solid Sand*; as when a great heap of *grains* of *Sand*, by the intervening of some *Exhalation*, do grow together: This way all *opake* and *rough Stones* are made, which are proper for the grinding of *Iron*, and polishing of other *Stones*.

IV. *That there is such a Matter wherewith the parts of Stones are knit together.*

It is not to be doubted, but that much of this Matter is sublimed towards the *surface* of the *Earth*, in the form of such *Exhalations* as accompany the rising *Vapours*. This is evident in many *Fountains*, which notwithstanding that the *water* of them being very clear to the *Eye*, yet contains great store of them, which meeting and joyning together in some Parts, become sensible. Thus there is a *River* in *Avergne* in *France*, which doth so abound with these *Exhalations*, that the Channel of it is become *Stony*, swelling by degrees higher and higher. In like manner there are found some *Springs* which cover the *Channels* and Conveyances by which they pass, with a Crust of *Sand-stone*. And there is one at *Rome*, which stopt the *Pipe*, through which its *water* passed, with *Alabaster*.

V. *How Marble is formed.*

The *production* of *Marble* doth not at all differ from the *production* of other *Common Stones*; save only that the *Clay* whereof it is made consists of lesser *particles*, and hath straiter *Pores*, which for that Reason are more easily fill'd with those *Exhalations* that stick to the Sides of them. And this makes the Composition of *Marble* more acurate, and the Texture of its *parts* more close and compact, than the common *mixture* of *Stones* is. Which may be easily gather'd from the smoothness of its *surface*, seeing that the Roughness of *Sand-stones* and *Pumice-stones*, and other such like, proceeds only from their *Cavities*. Now *Marble* is polish'd with *Sand*, by the rubbing whereof its prominent *particles* are worn away. In this Polishing, *Water* also is made use of; which being mix'd with the *Sand*, doth by this means more easily insinuate it self into the *pores* of these *Particles*, that are to be rubb'd off. There are several sorts of *Marble*, some being *White*, others *Black*, some *Transparent*, and some *Opake*; all which diversity proceeds from the various Contexture of their *Parts*.

VI. *Some Stones are Diaphanous, others Opake.*

For *Transparent Stones* are generated, when the *Exhalations* and *Vapours* being first changed into *Juices*, in the Chinks or Cavities of the *Earth*; afterwards by the departure of those *fluid Particles*, do come nearer together, and by degrees so cleave together, that the *Globuli* of the second *Element* have free passage through their *pores*, in order to the Transmission of the *Action* of *Light*. And on the contrary *Stones* become *Opake*, when the *Vapours* that are shut up in the narrow Chinks and Clefts of the *Earth*, are there stopt, and become so mingled with the *Earthy particles*, that the *pores*, in many places, are not wide and open enough to transmit the *Light*.

VII. *Several kinds of Common Stones.*

There are many kinds of *Common Stones*, viz. *Marble*, *Flint*, *Touch-stone*, *Whet-stone*, *Pumice*, and *Sand-stone*; *Stones* in the *Bladder* or *Reins*; *Talck*, *Load-stone*, *&c.* Of *Marble* we have treated already.

VIII. *Flint.*

Flint is almost the hardest of all *Stones*, and is commonly Round, and somewhat Flat, like *Lentiles*, and being dash'd against another, divides it self in two little *Hemispheres*. Because of its extream *hardness* it is apt to leap back or rebound, since it neither yields, nor can be easily reduc'd to Powder. Its *production* is much like that of *Marble*, being found buried in *Clay*, as in its *Matrix*, whose *pores* being fill'd with the said *Exhalations*, procure it the great Hardness it hath.

IX. *Touch-stone.*

Touch-stone belongs either to *Marble* or *Flint*. It admits of the most perfect Polishing, and is sometimes found very exquisitely smooth'd by *Nature*. For which Reason also it is very *hard*, and doth not admit any Division without difficulty.

X. *Whet-stone.*

A *Whet-stone* has a Roughness, which conduceth to the Smoothing and Grinding of *Glass* and *Metal*; in which Operation *Water* is sprinckled upon it: For the *Water* being pour'd over it, smooths and makes even the more sensible Asperities of the *Whet-stone*, and hinders it from acting too boisterously upon the *Body* that is to be Ground.

XI. *Pumice-stone.*

Pumice-stone is a *Stone* of an *Ash colour*, full of great Cavities like a *Sponge*, into which it admits Moisture, but soon lets it go again. It is made use of for the Polishing of *Marble*; for by its Roughness it reduceth the prominent parts of *Marble* to smoothness.

XII. *Sand, or Gravel-stone.*

The *Sand-stone* is formed in *Holes*, from whence the intercepted Matter derives its *smoothness*. Its Colour is *white*; because its *particles* are so dispos'd, as to reflect or send back the *Rays* of *Light*, in the same manner as it hath received them. Wherefore also it appears in the likeness of *Froth*. Tho' it be very Light, yet doth it not swim upon the *Water*; but the *moisture* entring into its *pores*, it sinks immediately.

XIII. *Talck.*

Talck is a *Stone* that is *Transparent*, except it be too thick; for then it is *opake*, by reason of the multiplicity of *Surfaces* heap'd one upon the top of another, and whose *pores* do not correspond exactly enough for the *Transmission* of *Light*.

XIV. *Stones form'd in the Body of Man.*

A *Stone in the Body of Man*, is formed in like manner as other *Stones* are, *viz.* by the *Coalition* of *Sand*, by means of some *slimy Matter* in the *Reins* or *Bladder*. It commonly inclines to a *reddish Colour*, and according to the different disposition of the *Sand*, is either *smooth* or *rough*; as we see that *Stones* that lye at the bottom of *Rivers*, are some of them *smooth*, and others very *rough* and *uneven*.

XV. *What precious Stones are.*

Precious Stones, are Bodies small in bulk, of a hard and strong substance; which either are Transparent, or of a lustrous Colour.

XVI. *How precious Stones are generated in the Earth; and first of such as are transparent.*

Gems are generated, not of a company of *Sands* grown together, as the *Common Stones* are; but of a certain *fluid Matter*, which only constitutes one *grain*; provided there be but so much of it, as to make some sensible Bulk, and such as is sufficient for a *pellucid Body*. Because that when the *Exhalations* that in the Clefts and Cavities of the *Earth* are gather'd into a *Drop*, by the loss of their slippery and fluid *Particles*, begin by little and little to cleave to one another, the *Globuli* of the *second Element* can on all sides freely and strongly enough pass through their *pores*; which could not be, in case they did consist of many *grains*: For how soft soever they might afterwards come to be, yet they could never be so joyned, but that there would be some *Interruption*, which would spoil their *Transparence*. And therefore these kind of *Exhalations*, according to the different degrees of their *Hardness*, and the various disposition of their Parts, are turned into *Stones*; as into *Crystal*, *Diamonds*, and the like. There is no difference betwixt a *Crystal* and a *Diamond*, save only that the *particles* of a *Diamond* are more closely knit together.

XVII. *Of Colour'd Gems.*

But if it so happen, that any *Metalline particles* be mix'd with this *matter*, that is common to all *precious Stones*; this causeth some modification of the *Light* that passeth through them, so that it produceth in us the *sense* of divers *Colours*; and thus instead of a *Diamond* or *Crystal*, we shall have several kinds of *precious Stones*, as *Saphirs*, *Chrysolits*, *Jaspars*, *Agats*, and the like.

XVIII. *The several kinds of Precious Stones.*

Precious Stones therefore are divided into *Transparent* and *Colour'd*. The *transparent* are *Crystal*, the *Diamond*, and the *Beryl*, which have their Parts so ranged, as to leave Intervals, through which the *Globuli* may transmit their *Action* to *Right Lines*. The most *precious* of these is the *Adamant*, being of an exceeding Hardness, because of the close coherence of its Parts. Yet is not its Hardness such, as to be of proof against the *stroaks* of a *Hammer*, as some relate, seeing that it may be grinded into Powder. So likewise the Common Story of its becoming soft in the *Blood* of a *Goat*, is no better than a *Fable*; and that it cannot be hurt by the *Fire*: All which Experience hath condemn'd of *falsity*.

XIX. *Crystal.*

Crystal is of an *Hexagonal figure*; for every *particle* of *Crystal* being surrounded and kept in by six others, it must necessarily admit of a six Corner'd *figure*. There are some that affirm, That *Crystal* by the strength of the *Fire* can be melted; whereas others assert the contrary, and that after utter Diligence used, they could never bring it to *Liquefaction*. Some of the *Ancients* believ'd, that *Crystal* was the effect of extream *Cold*; but this is a vain Imagination, for all confessing *Crystal* to be a *Stone*, we cannot attribute its *Coagulation* to *Cold*. *DIODORUS* was better advis'd, who *Lib.* II. tells us, that *Crystal is a Stone coagulated out of pure Water, not by Cold, but by the virtue of a Divine Fire.*

XX. *The Beryl.*

The *Beryl* hath a great resemblance with *Crystal*; it is chiefly found in the *East Indies*, according to *PLINY*, at least the best and most lustrous are found there. For those we have from *Babylon* are of a kind of *greasy Colour*; yea, it is said, that there are *Beryls* found in *Germany* of the Colour of *Oil*.

XXI. *The Carbuncle.*

The most Noble of all the *Colour'd precious Stones* is the *Carbuncle*, of a *Red colour*, and resembling the *flame* of *Fire*.

XXII. *The Chrysolite.*

The *Chrysolite* is a *Gem* of a *Golden colour*, whence it took its Name; transparent and very hard.

XXIII. *The Hyacinth.*

The *Hyacinth* is of a *Yellow colour*, resembling the *lustre* of *Gold*.

XXIV. *The Emerald.*

The *Emerald* is the most *precious* of all *Gems*, and well nigh the most *Brittle* too, for it is easily broken. It is of a *Green colour*, like *Grass*.

XXV. *The Topaz.*

The *Topaz* approacheth to the Colour of an *Hyacinth*; tho' some do say it is of a *Green colour*. It is said, that when it is laid under the *Sun-beams* it represents a *Star*; which is rather the effect of its *form* and *colour*, than of any *peculiar Nature*.

XXVI. *The Turcois.*

The *Turcois* is a *precious Stone*, of a *Sky colour* mixt with *Green*.

XXVII. *The Amethyst.*

The *Amethyst* is much of the same *softness* as *Crystal*, and is found in the same place. It is of a *Violet Purple colour*, very grateful to the sight.

XXVIII. *Morion.*

The Gem *Morion*, is of a very *Black colour*.

XXIX. *The Agate.*

The *Agate* admits of all *Colours*, as having *white*, *black*, and other variegated *stroaks* in the midst of it. And by this diversity of its *colours*, it is represented of divers *kinds*, by those who have a mind to deceive the *Buyers*.

XXX. *The Jasper.*

The *Jasper* is a *Green stone*, with the mixture of *Bloody spots*. The best are those that come from the *East*.

XXXI. *The Ruby.*

The *Ruby* takes its names from the glorious *Red colour* wherewith it sparkles.

XXXII. *The Granat.*

The *Granat* is also of a *Red colour*, but with some mixture of a *Yellow*; so called, because of its likeness to the grain of a *Pomgranate*.

XXXIII. *The Onyx.*

The *Onyx* is the *Alabaster* of the Ancients, but much more *precious* than that which we commonly call so; it resembles the *colour* of the *Nail* of a a *Mans Hand*, with some Veins running through it, which imitate the colour of a *Jasper*.

XXXIV. *The Saphire*

The *Saphire* exceeds the other *Gems* in Beauty, and is of a *Sky Blew colour*, resembling the lively colour of the *Sky*, by its wonderful lustre, and extraordinary perspicuity. It is the hardest of all *precious Stones*, next to the *Diamond*.

XXXV. *Of other Stones that are counted amongst the Precious, but are not so.*

There are also other *Stones* which are reckoned amongst the *Precious*, as the *Pezar*, or *Bezoar*, *Pearls*, *Chelidonius* or the *Swallow-Stone*, *&c.* But these do not seem to deserve the name of *Gems*; because the *Pezar*, which is found in the *Stomach* of a Beast called *Pezain*, is too soft to deserve that name. *Pearls* which are found in the *shells* of *Oysters* and *Muscles* are of too dark and faint a *colour*, and without *transparence*. And the *Swallow-stone*, which is found in the *Stomach* of *Swallows*, hath nothing in the least in it that resembles a *Gem*.

CHAP.

CHAP. X.

Of the Load-Stone, and Electrical Bodies.

I. *Of the Original and Compoſition of the Load-ſtone, and what its Nature is.*

THo' the *Load-ſtone* be reckon'd amongſt *Common Stones*, yet doth not the *Earth* produce any thing more wonderful than it, the effects whereof, as they were matter of Aſtoniſhment to the *Ancients*, ſo do they ſtill puzzle the *Brains* of the *Greateſt Philoſophers*. This wonderful *Stone* is compounded of thick and branchy *Particles* of the *Earth*, approaching to the Nature of *Iron*; ſince there is no *Iron* Oar, which hath not much *Earthy matter* joyn'd with it; nor any *Load-ſtone*, which doth not encloſe more or leſs of *Iron*. Yea, ſo great is the affinity between the *Load-ſtone* and *Iron*, that they are both digged out of the ſame *Mines*; and if we will take the word of *GILBERTUS*, the beſt *Iron* is got out of the *Load-ſtone*.

II. *The Definition of the Load-ſtone and Iron.*

The *Load ſtone* therefore *is a Stone, reſembling the Matter that conſtitutes the Middle part of the Earth, which having Pores from one of its Poles to the other, fitted for the free paſſage of the ſtriate Matter, can turn it ſelf towards one of the Poles of the Earth.* It is ſaid to *reſemble the Middle part of the Earth*; becauſe the *Load-ſtone*, of all other *Stones*, ſeems to be of the ſame make and compoſition with the Middle part of the *Earth*. By the *ſtriate Matter* mention'd in the Definition, we are to underſtand the *Matter* of the *firſt Element*, twiſted in the manner of the *Tendrils* of a *Vine* or *Ivy-Buſh*. It is ſaid, that it *can turn it ſelf to one of the Poles of the Earth*; becauſe a *Load-ſtone* being left without impediment, always turns it ſelf to the *Poles*. *Iron is a Metal of Affinity with the Load ſtone, endued with Pores, accommodated for the free paſſage of the ſtriate Matter, by which means it is able to turn it ſelf to the Poles of the Earth.*

III. *The Virtues of the Magnet may be referr'd to three Heads.*

The *Virtues* of the *Load-ſtone* may be referr'd to three Heads; whereof the *Firſt* is, that being in a free *poſition* without any thing to hinder it, it ſpontaneouſly directs it ſelf to the *Poles* of the *World*. *Secondly*, That it draws *Iron* or another *Magnet* to it ſelf, and ſometimes alſo repels the ſame. *Thirdly*, That by a *Touch* it communicates to the *Iron*, as well the *virtue* it hath of pointing to the *Poles* of the *World*, as that whereby it draws *Iron*.

IV. *The Celeſtial matter is the Cauſe of all the Motion in the World.*

For the better underſtanding of theſe *Virtues* of the *Load-ſtone*, we are to ſuppoſe in the *Firſt* place, that the *Heavenly matter* is the *Principle* of all the *motions* of the *World*; which, as it conſiſts of moſt ſubtil and thin *parts*; ſo it eaſily penetrates the *Pores* of all *Bodies*, and according to the different degree of its agitation, doth put them into *motion*, and puſh them forward; and being *fluid*, doth accommodate it ſelf to the narrow Spaces through which it paſſeth, and puts on various *Figures*, according to the diverſity of their ſituation; ſo that its *particles* which paſs through the *Triangular Spaces*, which are left in the midſt of three *Globuli* of the *ſecond Element* touching one another, muſt take upon them a Three-corner'd *figure*, which we may conceive as ſo many little *Pillars*, with three hollow'd *Channels*, winding like a *Screw*. And this more or leſs, as they paſs nearer to, or further from the *Axis* of the *Vortex*, becauſe the *Globuli* of the *ſecond Element* move more ſlowly in the former part of the *Vortex*, than in the latter; as it hath been declared more at large in the *Fifth Part* of this *Inſtitution*.

V. *The Striate Particles are variouſly crook'd and turn'd.*

We are likewiſe to Note; that becauſe the *Striate particles* come towards the Middle of *Heaven* from contrary *Quarters*; that is, ſome of them from the *South*, and others from the *North Pole*, whilſt in the mean time the whole *Vortex* is moved one and the ſame way; therefore thoſe *Particles* which come from the *Southern Pole*, cannot have their Screw turn'd the ſame way, as thoſe which come from the *Northern Pole*, but the quite contrary.

VI. *How the Striate Particles, that proceed from the Earth, do affect the Load-ſtones that come in their way.*

Again, we are to ſuppoſe that in the Region of the *Earth* C A D B, there are many *Pores* parallel to its *Axis*, through which the *Striate*, or *Screw-like Particles*, coming from the *parts* about one *Pole*, may paſs freely to the other oppoſite to it; but foraſmuch as they are *writh'd* a contrary way, and that the one go one way, and the other quite oppoſite, the *Pores* which admit the *Striate particles* that come from the *South Pole* A, will never be able to receive thoſe that proceed from the *North Pole* B. Whence it comes to paſs, that thoſe *Particles* that proceeded from one *Quarter*, can never return by the *oppoſite* part, becauſe of the different writhing of the *Pores*, and becauſe of ſeveral moſt minute *fibres* ariſing in them, which obſtruct their return. So that after the *Striate Particles* have run through that Great *Load-ſtone*, the *Earth* C A D B, in *Right Lines*, or equivalent to ſuch, from one *Hemiſphere* to the othe other; or from the *North* B to the *South* A, or elſe quite contrary from A to B, they are forced to return to the ſame *Hemiſphere* through which they at firſt entred the *Earth*.

Figure 41.

VII. *About every Magnet a Vortex is formed, as about the Earth.*

So that about every *Magnet*, as well as about the *Earth*, C, A, D, B, a perpetual *Voxtex* of the *Striate Matter*, which is manifeſt from this Expe-riment, that if you caſt the *filings* of *Iron* or *Steel* round about a *Load-ſtone* laid upon *Paper*, the ſaid *filings* will diſpoſe themſelves a-round the *Load-ſtone* in manner of a *Vortex*. Wherefore if you ſhall direct the *North Pole* of a *Load-ſtone* you hold in your hand, to the *North Pole* of another *Load-ſtone* plac'd upon a piece of Cork in a *Baſon* of *Water*, the *North Pole* of the later *Magnet* will turn away from that you have in your hand. But when the *Load-ſtone* placed on the *Water*, being turned about, directs his *South Pole* to the *North Pole* of the *Magnet* in your hand, then it will approach to it, becauſe the interjacent *Air* being driven away by the *Striate Matter*, the *Loadſtone* is alſo puſht forwards by the *Air* that ſurrounds it. Whence it is that the *Poles* of a *Loadſtone* are ſaid to be of a contrary virtue.

And if by chance the *Striate Particles*, in paſſing from one *Hemiſphere* to another, do there meet with the *Load-ſtone* I, K, L, M, N, foraſmuch as they find in the ſame, *Pores* ranged in the ſame manner, as the *Pores* of the inward part of the *Earth*, they eaſily and freely paſs through them; eſpecially if the *Load-ſtone* be ſo poſited, as to have the arangement of his *Pores* turn'd towards that quarter, from whence the *Sriate Particles* proceed.

More-

VIII. *The Striate Particles do not so easily pass through the Air or Water, as through the Earth.*

Moreover we are to observe that the *Striate Particles* cannot pass so freely through the *Air* or *Water*, as through *Iron*; for they being *fluid Bodies*, their parts cannot always keep the same situation, and therefore if at any time such *pores* come to be formed in them, they are presently again spoil'd and confounded by the continual agitation of their *Parts*. Those *Bodies* only are disposed to admit the *Striate Particles*, that consist of *Thick* and *Branchy Parts*, such as rationally we may believe *Iron* and *Steel* to have. For of all *Metals*, none is either with more difficulty *melted* in the *Fire*, or extended under the *Hammer* than *Iron* is, or made *harder* without the addition of any other *Body*: which three instances abundantly shew, that the *Particles* whereof it consists must be Angular and *Branchy*, which is the reason they are so closely knit together, this being the most necessary condition in order to the free transmission of the *Striate Particles*. For we find that *Iron* temper'd and hardned, doth more freely afford them passage, than other *Iron*; and so likewise 'tis observed, that when the *Iron* is smooth and burnisht, the *Striate Particles*, that proceed from one *Pole* do more orderly return to the other.

IX. *In every Magnet are two Poles, an Axis, and Parallel Lines.*

For the better understanding of this *Magnetick virtue*, we are to take notice, that in every *Load-stone* there be 2 *Poles*, *South* and *North*. *The* South Pole *is the Point* A. *being the middle of that part wherein are the Orifices of the Pores, by which that striate matter enters, which comes from the* South *part of Heaven: and the* North *Pole is the middle of the other part, by which these Striate Particles go forth, and others coming from the* North F, *do enter.* Besides the *Poles*, considered in a *Load-stone*, there is also its *Axis*, or the *Diameter* from the *North* point F, to the *South* A, drawn through the *Center* of the *Load-stone*. And lastly, its *Parallel Lines*, which being drawn from the *North* to the *South*, are at an equal distance from the *Axis* of the *Load stone*.

Figure 42.

X. *Why the Magnet points to the Poles of the Earth.*

These things being premised, it will not be difficult to explain, why a *Load stone* turns its *Poles* to the *Poles* of the *Earth*; because the *Magnetical Particles* coming from the *North Pole* F, and *South* B of the *Earth*, rushing obliquely against the *Poles* of the *Magnet*, do push it this way and that way, till that they can freely, that is in right *lines*, pass through its *Pores*.

XI. *How one Load-stone turns to another.*

And it is for the same reason that one *Load-stone* turns to another. But it is to be observed, that the *South pole* of the *Magnet* always turns to the *North pole* of the *Earth*, or of another *Load-stone*; because the *particles* that come forth from the *South pole*, are writhed another way than those that enter. Whence it is that the *Poles* of the same *denomination* do always flee from one another. As for instance, suppose we that the *Poles* of 2 *Magnets* be turned to the *North Pole* of the *Earth*; these 2 *Poles* are of the same Denomination, because the *Particles* that flow from the *North Pole* of the *Earth*, do act upon them after the same manner; but it is apparent that these *Poles* flee one another, and therefore would flee from the *Pole* of the *Earth* also, in case they were of the same Denomination with it.

XII. *A Load-stone flees from another, if it be apply'd to the same Pole.*

For the same Reason it is that a *Load-stone* being set on one end on its *North Pole*, and swiming on a piece of *Cork* in the *Water*, if to the *South Pole* of this *Load-stone*, the same *Pole* of another *Load-stone* be applied, the *Cork* flees away from it; for seeing that the *Particles* cannot enter those *Pores*, they require some space, in the which turning themselves, as in a *Vortex*, they may return to their *North Pole*.

XIII. *Whereas it draws near to it, when apply'd to the oppesite Pole.*

When the *North Pole* of one *Load-stone* is turned to the *South Pole* of another, and that the *Spheres* of both of them become one, then they approach to each other; because in this case they act with their joynt forces upon the *Air*, and therefore make it withdraw; which, by its Circulating, pusheth on both the *Magnets* till they come to touch one another.

XIV. *Why the Poles of a Load-stone, that are of the same denomination, do not unite or come together.*

But some, it may be, will demand, Why for the same Reason the *Poles* of the same denomination do not as well come together; or, why the *Magnet* doth not approach to their *Bodies*, seeing that the *Air* in both cases is alike prest upon?

The Answer to this is obvious, for the *Magnetical particles*, because of their different way of wreathing, finding no fit passages for themselves in the *Pole* of the same denomination, do greatly hinder this Conjunction. And the same is the reason, why it doth not draw near to other *Bodies*, since the *Magnetical matter* doth not find any corresponding *Pores* in them.

XV. *How a Load-stone attracts Iron.*

From what hath been said, it will not be difficult to explain, how a *Load-stone* draws *Iron* or *Steel*; or rather how a *Load-stone*, *Iron* and *Steel* draw near to each other: by saying that the *Load-stone* B. attracts the *Iron* C. because both their *pores* are so disposed, that the *striate matter* A, which comes from about the *Poles* of the *Heaven*, and continues its course through the *pores* of the *Earth*, that are *parallel* to the *Axis* thereof, passing more easily through the *pores* of the *Load-stone* B. and of the *Iron* C. than of other *Bodies*, drives away the intermediate *Air*. Now because the *Air* finds no place (for there is no *Vacuum*) to which it might pass, but that which is left by one of these two *Bodies*; it cannot be otherwise, but that the *Load-stone* B, must be push'd towards the *Iron* C, or the *Iron* C towards the *Load-stone* B. For this is a General Rule, That the Virtue of the *Load-stone* is increased or diminished, according to the approaching or withdrawing of the *Iron*. It is *increased*, when the *Load-stone* and *Iron* are so disposed, as that the one sends its *Striate particles* into the other; but *diminished*, when the *Iron* is withdrawn from the *Magnet*, or the *Magnet* from the *Iron*. For the Communication of the *Striate matter* being by this means removed, their force must needs be weakned and lessened.

XVI. *How the Air thrusts forwards a Body.*

This will not be hard to conceive, if we take notice, that the Parts of the *Air*, as of all other *fluid Bodies*, are in continual *motion*, and that therefore of necessity they must push continually towards the *Load-stone* B, which they surround on every side: And because they equally push it forwards on all sides, they do not push it more one way than another. But when the *Air* is driven out of its place by the *Striate matter*, proceeding from the *Magnetical Body* at *A*, it so happens that the *Magnet* is less push'd forwards on that side, than on the other, and so approacheth to the *Iron* C, or on the contrary.

Where-

XVII. *The Sphere of the Magnetical Activity.*

Wherefore the *Sphere of Magnetical Actions* is conceived to be about the *Circuit* D E, within which the *Striate particles*, composing the *Vortex* from F to G, can affect *Bodies* that have their *Pores* dispos'd alike. And this *Sphere* is by so much the greater, as the *Load-stone* is bigger, or at least the longer it is; because the *Magnetick matter*, passing through the longer *Pores* of it, thereby acquires the force of passing farther in a *strait Line* in the *Air*; which makes, that the Virtue of great *Load-stones* doth reach farther than that of small ones.

XVIII. *The Magnet doth not properly draw Iron.*

Hence it appears, that the *Load-stone* B, cannot properly be said to draw the *Iron* C; because in this Action there is no *Attraction* at all, but as soon as the *Iron* C, is placed within the *Sphere* of the Activity of the *Load-stone* B, it gets strength, and is carried towards the *Magnet*; which Action doth not so much deserve the Name of *Attraction*, as that of *Circumpulsion*, or of being push'd forwards on all sides.

XIX. *Why an Armed Load-stone bears much more Iron, than a bare one.*

There still remains one Difficulty behind, which is this: If there be so great a Correspondence betwixt the *Pores* of a *Load-stone* and *Iron*, how comes it to pass, that the *Load-stone* A B, *armed* with *Iron*; that is, to which the *Iron Plates* C D, and E F, are fastned, should carry much more *Iron*, than one that is bare. To which I return this Answer, That this greater Force or Virtue, doth not proceed from the *Iron* that is fastned to it, but from the *contact* of it; because the *pores* of the *Iron Plates* C D, and E F, do exactly answer to the *Pores* of another *Iron*, and their Parts are so joyned, as to appear immediately to touch one another. Whence it is that the *Striate matter* passing through these *Pores*, from the *Iron* fastned to the *Load-stone*, to another *Iron b a*, doth with more ease drive away the intermediate *Air*, and make them more closely cleave together. Now the *Pores* of the *Magnet*, cannot so immediately agree with the *Pores* of the *Iron*, by reason of its *Impurity* and *Stony Nature*. Which makes, that there is always some Interval between the *Load-stone* and the *Iron*, by which the *Striate matter* doth remove from the *Pores* of the one, to those of the other.

Figure 43.

XX. *The Contrariety of the Poles of the Load-stone, do not hinder their concurrence to bear up the Iron.*

Neither doth the Contrariety of the *particles* of the *Striate Matter*, whereby those that enter at one *Pole*, cannot enter in by the other, hinder them from agreeing to bear up the *Iron*; because those that come from A, the *South* Pole of the *Load-stone*, being reflected by the *Steel-plate*, enter in at one part of the *Iron b*, in which they make its *North* Pole, and flowing from thence to the *South* Pole *a*, they meet with others of the *Steel-plate* F E, by which they mount up to B, the *North-pole* of the *Load-stone*; and on the contrary, those that go out from B, through the *Plates* F E, the *Iron* that hangs at it H G, and the other *Plate* D C, return to A.

XXI. *Why a Load-stone, be it never so strong, cannot draw an Iron that is not contiguous to it from another.*

Neither can any other Reason be given in my Judgment, why a *Load-stone*, tho' never so strong, cannot withdraw an *Iron* that is distant from it, from the *contact* of another, tho' much weaker *Magnet*; because tho' the *Striate particles* pass through both those *Magnets*, and the intermediate *Iron*, so that one only *Load-stone* is made of them all three; yet by reason of the *Contact*, and a greater agreement of the *parts*, the *Iron* cannot be withdrawn from a weaker *Magnet*, to which it is joyn'd, by a stronger. Forasmuch as the *Load-stone*, not only joyns the *Iron* to it self, but over and above communicates its virtue to it.

XXII. *The Load-stone communicates its Virtue to the Iron.*

It remains still to be explained, how the *Load-stone* communicates its *virtue* to the *Iron*, without any loss of its own strength and virtue. The *Iron* acquires this New virtue, when it hath *pores* fit for the receiving of the *Striate Particles*, and so situate, that they can freely pass through them, as hath already been said. For nothing is wanting to it towards the acquiring of this Virtue, save only that some small *ends* of the *Branchy particles*, which stick out here and there in those *pores*, must all of them be turned away in those *pores*, through which the *Striate Particles* that come from the *South* are to pass; whereas in the other *pores* they must be turned the quite contrary way. Now as soon as the *Load-stone* toucheth the *Iron*, the *Magnetical particles* rush with great force and in crowds into the *pores* of the *Iron*, and by this means bow these Extremities of the *Branchy particles*; and consequently contribute all that which was requir'd to the *Magnetical virtue*.

XXIII. *How Red-hot Iron comes to acquire a Magnetical Virtue.*

Hence it is, that when a *Gad* of *Steel* or *Iron* being Red-hot, is set to cool, with its Extremities turn'd directly *North* and *South*, it is, by reason of its *contexture* and *pores*, which the action of the *Fire* hath clear'd and opened, immediately penetrated by the *Magnetical Effluvia's* of the *Earth*; which continually do course it through the *Air* from one *Pole* to another, and so becomes endued with a *Magnetical property*: Which doth not so happen in an *Ingot* of *Silver* turn'd South and *North*, and that because of the difference of its Contexture, and disposition of its *Pores*.

XXIV. *How it comes to pass that an Iron, according as it is variously apply'd to a Load-stone, doth also differently receive its Virtue.*

An *Iron* differently receives the *Magnetical virtue*, according to its different way of application to the *Load-stone*. For the part *R*, of the *Iron* R S T, if it be apply'd to the *North*-Pole of the *Magnet* P, will become the *South* Pole of the *Iron*; because the *Striate particles* coming from the South, will enter in by it, and the Northern will enter in by the part T, being reflected or beat back from the *Pole* A, through the *Air*. And the same part R, if it lye upon the *Æquator* of the *Load-stone*, and look towards its *North* Pole, as in C, it will again become the *South* Pole of the *Iron*. But if it be turn'd about, and look towards the *South Pole*, as in D, then it will lose the Virtue of the *South Pole*, and become the *North Pole*. Lastly, If the Middle part of this *Iron* S, touch the *Pole* of the *Magnet* A, the Northern *Striate particles* which have entred into it by S, will go out again by R and T; and by this means the *Iron* will receive at both ends the Virtue of the *South Pole*, and in the midst that of the *North*.

Figure 44.

XXV. *Why a long piece of Iron doth not receive this Virtue, but in its length.*

It may be Queried, why those *Striate particles*, that from the *Pole* A of the *Magnet*, do enter the part of *Iron* marked S, do not directly pass on to E; but are reflected this way and that way towards R and T; so as the *Iron* receives the *Magnetick virtue*, rather according to its *Longitude*, than to its *Latitude*? The Answer to which is obvious, *viz.* because they meet much more free and open passages in the *Iron*, than in the *Air*; for which Reason they rebound from the *Air* towards the *Iron*.

XXVI. *A Plate of Iron hinders the attractive Virtue of the Load-stone.* There is also another Difficulty remains to be explained. *viz.* how the *Iron Plate* D C D, being apply'd to the *Pole* of the *Magnet* A B, which, we said before, did much help the carrying or bearing force of the *Load-stone*, should notwithstanding hinder its force of attracting and turning *Iron* to it; so as to make the Point E of the *Magnetick Needle* E F, not to be directed to the *Pole* of the *Magnet* B, but towards the end of the *Iron Plate* D. To which we Answer, That the *Striate particles*, which, if this *Plate* had been out of the way, would have past from B, toward E F, are diverted by it from C, towards the Extremities thereof D D, because they find a more ready and free passage for themselves through the whole length of the *Plate* from C to D, than through the small interval of its thickness C. To this may be added also, that the *Striate particles* do pass more freely through the *Plate*, than through the *Air*, so that scarcely any of them reach the *Needle* E F.

Figure 45.

XXVII. *Iron is more apt to receive the Magnetick Virtue according to its length, than breadth.* Wherefore, tho' *Iron* be made partaker of the *Magnetick virtue*, yet doth it more readily admit it according to its length, than according to its breadth, even then when the Middle part of it is applied to either of the *Poles*: The Reason whereof is, because the *Striate particles* proceeding from the *Load-stone*, do find fitter *Pores* for them in the *Iron*, than in the *Air*, which is the reason why they go towards it. This likewise is the Cause why *Needles* endued with the *Magnetick virtue*, have the *Poles* of their *virtue* at their Ends or Extremities.

XXVIII. *And this in a moment.* This Virtue is communicated, as it were, in a moment, the course of the *Magnetick particles* through the *Iron* being very swift; because they meet with, in the *Iron* and *Magnet*, Pores exactly fitted to their *figure*. Now this Virtue is afterwards confirmed by long stay; for the longer that the ends of the *Branchy particles* have continued turn'd one way, it is with the more difficulty that they are turn'd the contrary way. This Virtue is longer retain'd in the *Load-stone*, than in the *Iron*; because the parts of the *Magnet* are more stiff and inflexible, by reason of the *Stony matter* that is mixed with them.

XXIX. *Steel better keeps the Magnetical Virtue, than common Iron.* Hence it is that *Steel* receives a greater *Magnetick virtue* than common *Iron*, forasmuch as it hath more and more open *Pores*, and doth more surely keep, and preserve the same; because its *Branchy particles* are more stiff and rigid.

XXX. *The Reason why a Load-stone loseth nothing of its Virtue.* The Reason why the *Magnet*, tho' it communicates its *virtue* to the *Iron*, yet loseth nothing of it, is, because nothing of its Substance or Constitution is destroy'd by this *Contact*, seeing this whole operation is performed by the *Striate matter*; which tho' it be hurried forceably and abundantly through the *Pores* of the *Load stone*, yet by its passage takes nothing from the *Magnet*, nay, rather its *virtue* by this free communication thereof, is much increased.

XXXI. *By what Efficiency Glass and Amber draw to them bits of Straw and Stubble.* And here, seeing that besides the *Load-Stone* there be some other things that draw to them outward *Bodies*, such as *Glass*, *Amber*, *Jet*, *Diamonds*, which attract bits of *Straw* and *Stubble*; it will not be amiss to say something of them. And first concerning *Glass*; it seems probable that besides those Intervals, which in other *Bodies* give a free passage to the Matter of the *first Element*, there be some *Long pores* like unto *slits*, and so *narrow*, that they are only fit to admit the Matter of the *first Element*, without being capacious enough to receive the *Globuli* of the *second Element*. And forasmuch as the Matter of the *first Element*, accommodates it self, as hath been said, to the *Pores* through which it passeth, and assumes their *figures*, as it is wandring through those *little Slits* or *Chinks*, it becomes turned into certain *Wreaths* or *Twists*; which because of the various disposition of the parts of *Air*, being not able to penetrate its *Pores*, do remain in their own lodging, and there move from one *Chink* to another by a *Circular motion*. So that when a piece of *Glass* is rubb'd hard and swiftly against some other *Body* till it grow hot, the *particles* lodged in the *Glass* are by this agitation first thrust out of their places, and so being driven from the *Glass*, and flying through the *Air*, penetrate the *Pores* of other *Bodies*: But because they cannot so freely course it between their *parts*, they soon return to the *Glass* again, and carry along with them those *small Bodies*, out of whose *Cavities* they cannot extricate themselves. And the same may be said of *Diamonds*, *Amber*, *Jet*, *Rosin*, *Sealing-Wax*, and the like, since we suppose the same *Intervals* or *Pores* in them, *viz.* such as only can admit the Matter of the *first Element*, and that their *Particles* have the same *force* to enter the *Pores* of *Bodies*, and of carrying them along with them.

CHAP. XI.

Of Water.

I. *What Water is.* WATER *is a congested Mass of Particles of the Third Element, which are very thin, longish, smooth, and therefore very flexible, resembling small plying Cords, disposed to bend and yield every way.*

II. *The Particles of Water are smooth.* That the *Particles* of *Water* are smooth, may easily appear by *Bodies* that are wetted therewith; which with the least degree of *Heat*, or with the *motion* of the *Air* only are dried. For the *Particles* of *Water* are by this means separated, and by force of the Motion of *Heat*, or the Agitation of the *Air*, driven out from the *Bodies* to which they were joyned. Hence it is, that *Water* is not frozen without some difficulty; for its *Particles* being smooth, are readily separated from one another, by the Agitation of the *Æthereal matter*.

III. *That the Particles of the Water are in continual motion.* Now that these *Watry particles* are in continual *motion*, besides what we have *already cleared in our General Physiology*, may be proved by these *Instances*, *viz.* that *Liquors pour'd together* do readily mingle; that *Oil* and *Water*, by strong shaking, become incorporated together; that *Colours* and *Tastes* are, as it were, in an instant diffus'd through all the parts of them, and other such like, which occur to our daily Experience.

IV. *Whence Water hath its Liquidity.* Forasmuch as the *Subtil matter* is in perpetual *motion*, and never ceaseth to agitate the *Bodies*, through which it passeth; it needs not seem strange to us, that it should make the *Water* Liquid, seeing it moves all its *Particles* one by one, and bends them one upon another. And on the contrary, when

The Honourable Haddock Knight their Majesties

S.r Richard Comptroller of Navy Royall &c.

This Plate is humbly

Dedicated by Richard Blome.

when this its Force is hindred (which chiefly happens in *Winter* time, becauſe of the *Suns* diſtance) the *parts* of the *Water* being promiſcuouſly hudled together, and without order heap'd upon one another, remain immovable, and conſtitute that which we call *Ice*. Which Conſiſtence of the Parts, is the Reaſon why *Frozen Liquors* are ſo cold, for that their Parts being deprived of the agitation of the *Subtil matter* are cloſely joyned, and therefore cannot admit any greater *particles* of the ſaid *matter* or *heat*.

V. *How Water becomes turn'd to Ice.* *Water* is never *frozen*, but when the *Heavenly matter* which runs betwixt the *Watry Particles*, becomes more *ſubtil* than is cuſtomary; by which means it comes to paſs, that the *Pores* of the *Ice* being reduced to the meaſure of theſe leſſer *particles* of that *matter*, do ſhut out thoſe that are never ſo little bigger. For which Reaſon it is that *Ice* is extream *cold*, and always keeps its Hardneſs, tho' it be kept till the midſt of *Summer*. Neither doth it grow ſoft by little and little, as *Wax* doth, foraſmuch as by reaſon of the narrowneſs of its *pores*, the *heat* cannot enter into the Inner parts of it, but as the Outward parts of it begin to melt.

VI. *Some parts of the Water are flexible, and others inflexible.* There are two ſorts of *particles* in the *Water*, *Flexible* and *Inflexible:* The *Flexible particles* are thoſe, which are agitated by the *Heavenly matter* that ſurrounds them; and of theſe, *Freſh-water* is compoſed. Theſe *Flexible particles* have no *Elaſtick force*, and apply'd to the *Nerves* that are diſperſt through the *Tongue*, they produce no *Taſte*; for wherever they meet with the leaſt reſiſtance they ſlip away. The *Inflexible parts* of the *Water* are ſtiff and ſharp, like ſo many *Swords*, and theſe conſtitute *Salt*. As appears from what hath been ſaid before.

VII. *Why Salt watr pricks the Tongue.* Hence we may ſee the Reaſon, why *Salt-water* as it were pricks the *Tongue*; for ſince the *Saline particles* cannot be made to ply or bend, by the *ſubtil Matter* which ſurrounds them, they continue *ſtiff*, and as ſo many ſharp-pointed *Needles* enter the *pores* of the *Tongue*, and entring, prick them with their Points: Whereas the *parts* of *Freſh-water* lye ſmooth upon the *Tongue*, and touch it not with their Points, but with their Sides.

VIII. *Salt-water is more heavy than Freſh-water, and lighter than Earth.* It alſo appears from what hath been ſaid, why *Salt-water* is more heavy than *Freſh*, *viz.* becauſe it abounds with thicker and more ſolid Parts, which therefore cannot be reſolved into *Vapours:* For the *Saline particles* being long and ſtrait, they cannot long continue ſuſpended in the *Air*, but that one end of them muſt hang downwards, which is an obſtacle to their mounting upwards. But *Water*, whether *Salt* or *Freſh*, is lighter than the *Earth*; becauſe quantity for quantity, it hath leſs Force to withdraw it ſelf from the *Center* of its *motion*, than the *Earth*.

IX. *Why Water is tranſparent.* *Water* is made *Tranſparent* by the *Globuli* of the *ſecond Element*, which continually paſſing through the *pores* of it, and being of ſufficient force to remove ſome of its *particles*, by this means eaſily form therein paſſages fitted for the tranſmiſſion of *Light*. And as for thoſe *Liquors* which are dark and troubled, the Reaſon thereof is, becauſe their *parts* are too thick to admit the *Globuli* of the *ſecond Element*. As is apparent in *Blood* and *Quickſilver*.

X. *Why the Surface of the Water is ſmooth and even.* The *Surface* of the *Water* is kept ſmooth and even, by the *motion* of the *Air*, which continually preſſeth down its *Outward parts*; whence it is that ſmall *Needles* being laid ſoftly upon the *Surface* of it do not ſink, but make a kind of hollow under them; but when once the *ſurface* of the *Water* is divided, they immediately ſink to the bottom.

XI. *Why the Water is not ſo fit to receive Sounds, as the Air.* Tho' the *Water* do admit the *Light*, as well as the *Air*, as being capable of the Rectilineal preſſure of the *Matter* of the *ſecond Element*, continually paſſing through its *Pores*; yet is it not ſo ſuſceptive of *Sounds* as the *Air*, becauſe its parts are thicker and more ſlowly moved. Hence it is that *Veſſels* fill'd with *Air* being ſtruck upon yield a Sound; but not thoſe that are full of any *Liquor*. And for the ſame Reaſon, *dry Wood* is more ſuſceptive of *Sound*, than *Green-wood*; becauſe the *pores* of *Dry-wood* have the ſame reſpect to thoſe of *Green-wood*, as an Empty Veſſel hath to one that is full; the *pores* of the *Dry-wood* being open and empty, whereas the other are ſtopt up.

XII. *Whence the ſaltneſs of the Sea proceeds.* It is a Queſtion much canvas'd, whence the *Saltneſs of the Sea* proceeds? Which may be thus anſwer'd, That the ſame is cauſed by the *Salt* which is mingled with its *Waters:* For *Sea-water* abounds with *Salt*, as appears by its *diſtillation*; for the *Water* diſtill'd from it is *ſweet*, and the *Salt* remains in the bottom. What ſome ſay, that the *Sea* borrows its *ſaltneſs* from ſome *Veins* of *Salt*, doth not ſeem probable; becauſe if theſe *Veins* be near the *Water*, they muſt needs have been all diſſolved long before this; for *Salt* immediately diſſolves in *moiſture*. And if the *waters* do not touch them, how ſhall they communicate their *ſaltneſs* to them? We conclude therefore, that the *Sea* is *ſalt*, and continues ſo, becauſe it abounds with many inflexible and ſtiff Parts; which tho' they may get up into the *Air* for ſome time, yet by reaſon of their Thickneſs, ſoon fall down thither again. Which is the Reaſon alſo, why they cannot, together with the flexible *particles*, paſs through the *Sand*, but are left behind.

XIII. *The Sea being ſalt, how comes it to paſs, that Freſh-water is found in it?* But tho' the *Sea* be *ſalt*, yet *Freſh-water* hath been ſometimes found in the midſt of it, and that by reaſon of the many *ſubterraneous Channels* of *Freſh-water*, which are found at the bottom of it. Thus we ſee, that the *Sea* about the *ſhoars*, which are near to the Mouths of great *Rivers*, is leſs *ſalt*; becauſe the *Freſh-water* of the *Rivers* overpowering the *Salt-water*, continue to be *freſh* for ſome diſtance in the *Sea*. As may be ſeen at the Mouth of the River *Rhôſne* in *France*, where the *Salt-water* doth not mingle with its *Freſh-water*, till at ſome diſtance.

XIV. *Water is not Naturally cold.* We are not to think with ſome *Modern Philoſophers*, that *Water* is *cold* in its own Nature: For tho' it feels *cold*, when *frozen*, this only happens to it from the *Reſt* of its *parts*, wherein the Nature of *Cold* conſiſts. But when it is in its Liquid form, it is indifferent to *Heat* or *Cold*, as being naturally ſuſceptive of a greater or leſs degree of *Agitation*, according to which it appears *hot* or *cold*. So that when *heated Water*, by degrees is reduc'd to its former *coldneſs*; this proceeds not from its Natural propenſion to *Coldneſs*, but becauſe it communicates ſome part of its Agitation (wherein its *heat* doth conſiſt) to ſome Neighbouring

bouring *Bodies*. And therefore when *Hot-water* is ſo cloſe ſhut up in any *Veſſel*, as to have no Communication with any ambient *Bodies*, it preſerves its *heat* for a long while. *Running-water* therefore ſeems to be of ſuch a Temperature, as to be a kind of Mean betwixt the Exceſs of *Heat* and *Cold*; ſeeing that by great *heat* it would all vaniſh into *Vapours*, and by exceſs of *cold* be lock'd up into *Ice*.

XV. *Hot Fountains do not receive their Heat from ſubterraneous Fires.*

Suppoſing, according to what hath been deliver'd before, that the *Earth* contains great ſtore of *Brimſtone*, *Jews-Lime*, and other inflammable *Bodies*, it will not ſeem ſtrange to us, that *Hot-waters* or *Bathes* break forth in ſeveral places of the *Earth*. Nor is it neceſſary that theſe *Bodies* ſhould be actually ſet on *fire*, in order to *heat* the *water* flowing by them: For it doth not ſeem probable, that any ſuch *matter* ſhould be able to flame in the *Earth*; becauſe the Smoak of it would ſoon choak it for want of vent, or the *ſurface* of the *Earth* muſt burſt to give it *Air*. Wherefore it ſeems more likely, that as of *Saltpeter*, *Brimſtone*, *Jews-Lime*, and *Quick-Lime* Mixtures are made, which by ſprinkling *water* upon them, do grow hot (which happens alſo to *Aqua Fortis* and *Oil of Tartar*, and to *Butter of Antimony*, and *Spirit of Nitre*, when put together;) ſo the like *Mixtures* may be under the *Earth*, and the ſame *Heat* may happen when any Moiſture comes to them.

XVI. *But from a Mixture of Heterogeneous Bodies.*

For it is not always neceſſary that *Hot Fountains* ſhould proceed from *ſubterraneous Fires*, ſeeing that a mixture of *Heterogeneous Bodies* is ſufficient for this purpoſe, as being able by Fermentation to produce the ſame effect. *Heat* therefore is communicated to *Hot Bathes*, whilſt their *water* paſſeth through Channels heated by the *fumes* from *Jews-Lime*, *Brimſtone*, or the like. For the *water*, by paſſing through theſe *Hot places*, becomes *heated* thereby, after the ſame manner as when *water* is heated in a *Stove*.

XVII. *The Qualities of Water.*

Accordingly, if the *water* of *Fountains*, before it breaks forth on the *ſurface* of the *Earth*, happen to paſs through *Juices* and *Minerals*, it acquires from them their *Taſte* and *Smell*, and ſeveral other *qualities*. For the ſtrong Scents of ſome *waters* are from *Brimſtone* and *Jews-Lime*, their Bitterneſs, from *Nitre*; their Acidity from *Copperas*; their Harſhneſs and Adſtringency, from *Alom*; their Saltneſs, from *Common Salt*; their ſharp Taſte, from *Marchaſite* or *Fire-ſtone*; their Iron taſte, from *Iron*.

XVIII. *Waters receive their Medicinal virtue from the Mineral Juices, through which they flow.*

And foraſmuch as thoſe *Juices* through which theſe *waters* flow, abound with a *Medicinal virtue*, 'tis from them that they derive it, and by means thereof are profitable for the Cure of many *Diſeaſes*. The *Purgative virtue* that ſome have being chiefly owing to *Brimſtone*, *Salt*, or *Nitre*; the *Adſtringing faculty* of others to *Alom*, which is made uſe of by *Phyſicians* againſt *Ulcers*, *Bloody-fluxes*, and *Relaxations* of the *Nerves*. Thoſe *Waters* that have a power of mollifying the *Earth*, receive it moſtly from *Brimſtone* and *Jews-Lime*. Which is the Cauſe why *Bituminous Bathes* are accounted profitable to thoſe who are troubled with the *Gout* or *Ach* in their *Hips*. In like manner *Waters* are made hurtful, by being imbued from ſome *Metallick Bodies*; ſuch are thoſe which have received a taint from *Lead*, or *Quickſilver*, or are infected with a *petrifying Juice*, or of ſome middle *Mineral*, as that of *Antimony*; and therefore cauſing *Vomitings*, and *Scourings*. And, in a word, whatſoever *Waters* exert any ſpecial Operation on the *Body* of *Man*, have it derived from *Subterraneous matters*.

CHAP. XII.

Of the Ebbing and Flowing of the Sea.

I. *The Ebbing and Flowing of the Sea is proportion'd in time, according to the Motion of the Moon.*

BY the *Sea-Tide* we underſtand the *Ebbing* and *Flowing* of the *Sea*, which twice happens in the time of 24 *hours*, and about 50 *minutes*. The *Sea-Tide* is *Regular*; tho' it do not happen at the ſame time, nor after the ſame manner in all places. For the *Sea* ſwells as oft as the *Moon* paſſeth our *Meridian*, whether above or under our *Horizon*; and it falls again, when the *Moon* is on the *Horizon*, whether it riſeth or ſets: For we find, that the *Sea* in its *motion* keeps a proportion of Time with the *Moon*; for as the *Moon* riſeth every day 3 *Quarters* of an *Hour* and 5 *Minutes* later, ſo at the ſame Interval doth the *Sea* riſe.

II. *What the Sea-Tide is.*

For *the Flowing of the Sea is nothing elſe, but the motion of the Sea-water towards the Shoars, in about Six Hours time: And the Ebbing, is the motion of the ſaid Waters from the Shoars, Seaward, in other Six Hours time.*

III. *The Tide is not the ſame in all Seas.*

The *Tide* is not the ſame in all *Seas*; but in ſome the ſame is greater, and in others leſs, yea, in ſome the *Tide* is verry inconſiderable, or none at all. In ſome places the *Flowing* of the *Sea*, is equal to its *Ebbing*, in others greater and in others leſs. The greateſt variety of *Tides* is at the *Æquinoxes* and *Solſtices*, as alſo at the different Aſpects of the *Moon*: Thus at the *Full* and *New Moon* the *Tide* runs higheſt, as it is leaſt at the *Quarters*. This is obſerv'd in almoſt all the Shoars of *Europe*, which the *Ocean* beats upon. But the *Flood* is always ſo much the greater, and comes the ſlower, by how much the Shoars againſt which they beat, lye more towards the *North*; and on the contrary is ſcarcely ſenſible between the *Tropicks*.

IV. *The Opinion of the Ancients, and ſome of the Peripatticks, concerning the Cauſe of the Sea-Tide.*

The *Ancients*, to give a Reaſon of all theſe *Appearances*, feigned the World to be a great *Animal*, which by breathing through its *Noſtrils*, placed by them at the bottom of the *Sea*, did cauſe the *Sea* to riſe and fall. But this *Monſter* is long ſince vaniſh'd into a *Chymæra*. Some of the later *Philoſophers*, *Peripateticks*, and others ſay, that this *Reciprocation* of the *Sea* proceeds from an *Occult quality*. But what is this elſe, but a Profeſſion of their Ignorance, and that in plain terms they do not know the Thing they pretend to Explicate? At this rate, it is an eaſie matter to explain all the Myſteries of *Nature*. For that which is hid is not known; and indeed we know no Effects, but ſuch as we can demonſtrate by their proper *Cauſes*.

V. *The Opinion of* Galilæus, *and of ſome others.*

Some attribute this Effect to the *Agitation* of the *Saline particles* of the *Sea-water*, by the moderate *heat* of the *Moon*. GALILÆUS, to the multifarious and unequal *motion* of the *Earth*. But theſe their *Opinions* are overthrown by this Obſervation, that neither of them gives the leaſt probable Reaſon of theſe *motions* in the upper

Hemi-

Hemisphere, when the *Moon* is in the lower; and on the contrary. The latter *Opinion* is indeed the better of the two, but somewhat obscure, and not altogether consonant to *Reason*; because it attributes less to the *Moon* than her due, who certainly hath a great stroak in this *matter*.

VI. *Some things supposed for the better understanding of the Sea-Tide.*

For the understanding of the true Cause of the *Sea-Tide*, some things are to be presupposed.

First, That the *Course* of the *Moon*, and of the rest of the *Planets* is *Elliptical*, not perfectly Round. And this is granted by all who suppose the *Heavens* to be *fluid*.

Secondly, That whilst the *Earth* is whirl'd about from *West* to *East*, in the *Center* of her *Vortex* A B C D, the *Moon* is carried in the outward Surface or Cirumference of the said *Vortex*, and in a *Months* Space absolves her Course.

Figure 46.

Thirdly, That when the *Moon* is plac'd at B, the *Heavenly matter* will be more strong between B, and 6, than between 8 and D; because it there *flows* through a narrower Space, by reason of the *Moons* presence; and therefore the place of the *Earth*, which is determin'd by the force of the *Circumfluent matter*, will also be changed, that is, the *Earth* will withdraw towards D, till the force be equal on both Sides.

VII. *The true Cause of the Sea-Tide.*

These things presuppos'd, let us consider the *Figure* where the *Elliptick* A B C D represents the *Vortex* of the *Earth*, in the midst whereof the *Earth* E F G H is placed. The *Circle* B ☾, the *Globe* of the *Moon*; 1 2 3 4, the *surface* of the *Sea*; and 5 6 7 8, the *Air*, which surrounds the *Sea*. This suppos'd, we may easily understand that the *Rising* and *Falling* of the *Sea* must proceed from the presence of the *Moon*. For seeing that all places are fill'd with *Bodies*, and that the same portion of *Matter* is preserv'd every where; it follows that *New Bodies* cannot be admitted into them, except thereby other *Bodies* be compressed, so that they that come in must thrust the others out of their places, and force them to betake themselves elsewhere. Which happens here by reason of the *Lunar Globe* B ☾; for the *Moon* being a great *Body*, and requiring a large Space to dilate it self in, she cannot ascend upon our *Horizon*, without lessening the *Interval* that is betwixt her and the *surface* of the *Earth*, and by this means forcing the *Cœlestial matter* to flow more swiftly; and consequently pressing as well the *surface* of the *Air* 5 6 7 8, as that of the *Water* 1 2 3 4 the more, which being *fluid Bodies*, do readily yield to the said pressure.

VIII. *An Objection answer'd.*

It is of no weight, to say that the *Air* and *Heavenly matter* move more slowly in the great *Diameter*, even then when the *Moon* takes up a part of it, than they move in the little *Diameter*, when the *Moon* is without the same: For it is enough, if the passage only of the *Air* and *Cœlestial matter* be more straitned in the great *Diameter*, when the *Moon* is in it, than it is when she is not, to cause the *Waters* that are in this *Diameter* to be driven towards the *Poles*, and so by this means to cause an *Ebbing* and *Flowing*.

IX. *The presence of the Moon presseth the Water and the Air in* Forasmuch therefore as it is manifest, that the *Earth* E F G H is kept in, and determin'd to the same place, by the equal *pressure* of the *subtil Matter* that surrounds it; it cannot be conceived, how that part of the *surface* of the *Earth*, which is opposite to the *Moon*, existing in the Point B, should be more pressed, without conceiving at the same time, that the *Matter* of the *Heaven* must push the *Earth* out of its place, thrusting it forwards to the opposite part D, until the *Earth*, about the Point 8, be pressed after the same manner, as about 6. Wherefore there are two *streights*, B and 6, and D and 8, made in this *Vortex* or *Heaven*, which are diametrically opposite to each other, *viz.* the one betwixt the *Moon* ☾, and the *Earth* T; and the other between the *Earth* T, and D. *two several parts.*

X. *How the Flowing of the Sea is caused.*

Whilst therefore the *Cœlestial matter*, which moves round about the *Earth*, moves more swiftly in these *Streights*, one whereof is betwixt the *Earth* T, and the *Moon* B; and the other betwixt the same *Earth* T, and the opposite part D. It presses the *Sea* 2 and 4, and drives it from thence towards those places that are free from this *Pression*, that is, towards G and E; where *swelling* by the force of its own *Heaviness*, it is driven towards the *Shoars*.

XI. *The Sea-Tide must happen twice in a day.*

And because the *Circumvolution* of the *Earth* about its own *Center*, is performed in 24 *Hours*, if we divide its *surface* into Four parts E F G H, that part of it which is at F, where the *Sea* is lowest, because of the presence of the *Moons Body*, 6 *Hours* hence will be in G, over against the Point C. where it is highest; and after 6 *Hours* more at H, and so on. Whence it follows, that the *Sea-water* must of necessity *flow* and *ebb* every 12 *Hours*, in one and the same place. And because the *Moon* every Day runs 12 *Degrees* towards the *East*, the *Tide* must be retarded, that is, come later by almost an *Hour*: For tho' the *Earth* be carried about in 4 *Hours*, and must at a certain time bring back the same part of the *Ocean*; yet because it must also run over those 12 *Degrees*, which the *Moon* hath run through before it can bring back that part of the *Ocean*, and oppose the same to the *Body* of the *Moon*, so it is that the *Tide* happens every *day* about 50 *minutes* later; and consequently between the two *Tides* that happen every *day*, there is the difference of 25 *minutes*.

XII. *Why the Waters return to the Parallel, above which the Moon moves.*

It is easie to apprehend, that if the *Earth* and *Moon* were immovable, the *Waters* that have been prest towards the *Poles*, would not return from thence; forasmuch as they would be held there by the same *Cause* that hath push'd them thither: But seeing that the *Earth* and the *Moon* are in a perpetual *motion*, it will follow of necessity, that the *Waters* which have been thrust from the *Parallel* which is under the *Moon* towards the *Poles*, must return afterwards by their own weight, from the *Poles* towards the *Parallel*, above which the *Moon* is, at that time when the *parts*, from whence they have been driven, are no longer opposite to the *Moon*.

XIII. *Why the Tide is longer in coming to the Northern parts, and therefore is greater there.*

It is apparent also, why the *Tide* must come later to the *Northern Shoars*, than to those that are further from the *North*; for seeing that the moved *Waters* are driven from the *South* part to the *North*, they must of necessity reach the nearer *Shoars* before those that are further off: And because the *Waters* that beat the *Shoars* near to the *Torrid Zone*, may pass further and flow toward the *Poles*, except they be hindred by the *Northern Coasts*, it comes to pass by this means, that the *Tide* is greater and more sensible in that part which is at a greater distance from the *Æquinoctial Line*; because the *Waters* about the *Æ-*

quator, by reaſon of the largeneſs of the *Circle*, are diffuſed towards the *Poles*, that they may be gather'd together in a narrower *Region*.

XIV. *An Objection anſwer'd.* But if any one Object here, That the *Waters*, in the ſpace of 6 *Hours*, which is the time of the Duration of the *flood*, cannot *flow* from the *Tropick* to the *Poles*; and thence conclude, that the ſwelling of the Sea towards the *Northern parts*, cannot be an effect of the preſſing of the *Moon* betwixt the *Tropicks*. I anſwer, That in order to make the Sea ſwell towards the *North*, it is not neceſſary that the *Waters*, betwixt the *Tropicks*, ſhould go to the *Poles*; but that it is ſufficient, if they only drive away thoſe that are neareſt; and that theſe again drive others before them, and ſo on to the laſt; which may be done in leſs than 6 *Hours* time, becauſe the Sea is a continuous *Body*.

XV. *Why the greateſt Tides are about the Æquinoxes.* Now the *Body* of the *Moon* continuing of the ſame *Thickneſs*, takes up more of the narrow Space, when ſhe is in the *leſs Diameter*, than ſhe does of the larger Space, when ſhe is in the *greater Diameter*; and therefore it matters not whether ſhe be in her *fartheſt* diſtance from the *Earth*, or in her *neareſt*; becauſe at either time ſhe makes the Space of the *Vortex* wherein ſhe is ſtreighter or more narrow; and it is only her preſence over againſt the *Earth* that is the Cauſe of the *Tide*, and not her nearneſs to it. And this furniſheth us with the true *Reaſon*, why the higheſt *Tides* are at the *Æquinoxes*; becauſe at the Beginnings of *Aries* and *Libra*, the *Moon* more directly acts upon the *Earth*, and preſſeth it accordingly, foraſmuch as its Plain at both thoſe times doth not decline from the Plain of the *Æquator* of the *Earth*, above 5 *Degrees*. For then the middlemoſt part of the *Earth*, or the *Æquator*, is in the *Ecliptick*, near to which the *Moon* always continues; and conſequently the Space being there narrower, the preſſure muſt be ſo much the greater. But at the time of the *Solſtices*, ſhe declines 23 *Degrees* and 30 *Minutes* from the Plain of the *Earths Æquator*. Seeing therefore that from the former direct *Oppoſition*, doth follow a great Preſſure of the *Air* and *Water*, it is no wonder if about that time the greateſt *Tides* do happen.

XVI. *Why the Tides are greater at New and Full Moon, than at the Quarters.* So likewiſe it is manifeſt, why the *Tides* at *New* and *Full Moon* are greater, than at the *Quarters*. For the *Vortex* A B C D, wherein the *Moon* is, is not exactly round, but ſomewhat *Elliptical*, and leaves a greater Space betwixt the *Earth* and its *Circumference*, about A, and C, than about B, and D. And therefore ſeeing the *Diameter*, wherein the *Moon* is when ſhe is *New* or *Full*, is narrower than that which interſects it at *right Angles*, it muſt follow, that when the *Moon* is in thoſe narrower *ſtreights* of *Heaven*, ſhe muſt with more force preſs the interfluent *Matter*, and conſequently produce greater *Tides*. But in the *Quarter* of the *Moon* about A and C, the *Tides* are leſs; becauſe the *Moon* is then in thoſe more ample Spaces, and conſequently there muſt be a leſs preſſure of the *Waters*.

XVII. *An Objection anſwer'd.* It ſignifies nothing therefore to ſay, that the *Moon* is not always nearer to the *Earth*, when ſhe is in *Conjunction* or *Oppoſition*, than when ſhe is in her *Quarters*; and that conſequently the *Tides* ought not to be greater at the *Conjunctions* or *Oppoſitions*, than at the *Quarters*: Becauſe, as I have before obſerved, the higheſt *Tides* do not preciſely depend upon the *Moons* being nearer to the *Earth*; but becauſe at the *Conjunctions* and *Oppoſitions* the *Moon* is always in the leaſt *Diameter* of the *Ellipſis*; where, whenſoever ſhe is, be ſhe nearer to, or further from the *Earth*, ſhe always more ſtreightens the paſſage of the *Air* and *Heavenly matter*, than ſhe doth when ſhe is in the greateſt *Diameter* of the *Ellipſis*.

XVIII. *Why the greateſt Tides are three days after the New and Full Moon.* The greateſt *Floods* commonly happen 3 *days* after the *New* and *Full Moons*, becauſe of the Diſpoſition the *Sea-water* is in at that time, to be moved more than ordinary: For having been ſtrongly moved the two foregoing *days*, it is no wonder to find the *Tides* ſtill to increaſe for 2 *days* after that the *Sea* hath received its greateſt Impulſion from the *Moon*.

XIX. *The Cauſe of the various Tides in the Sea, proceeds from the different ſituation of the ſeveral places,* It remains ſtill to be explained, how it comes to paſs, that ſeeing the *Moon* is the common Cauſe of all *Tides*, there is a great variety of them to be obſerved in the *Ocean*. To clear this Difficulty, I ſay, that this variety of *Tides* is often to be attributed to the *Sea-ſhoars*, which according as they are nearer or more remote, ſo the *Waters* reach them ſooner or later. Wherefore, if the *Sea* about the *Aquitain ſhoar* flows 7 *Hours*, and *ebbs* but 5; and on the contrary, if near *Canada*, it flows 5 *Hours*, and ebbs 7; if on the *ſhoars* of *Guinea* in *Africa*, it flows 4 *Hours*, and ebbs 8. If at *Venice* the *Tide* riſes many Foot high, and at *Ancona* nothing at all, or very little, this depends on the diverſity of the *ſituation* of thoſe *Coaſts*. Of this we have an Inſtance in the *Banks* of *Rivers*, between which, according to the difference of their *ſituation*, the *Water* runs either headlong, or glides away ſmoothly; runs winding and turning, or takes a ſtrait courſe. The *Aquitain Sea* therefore is longer a *flowing*, than it is *ebbing*; whereas on the *Belgick ſhoar*, the *Flood* and *Ebb* is equal, becauſe of the different degrees of their Steepneſs and Declining. So likewiſe at *Venice*, and on the *Coaſt* of *Syria*, the *Tide* riſeth much higher than with us; becauſe the former places are *ſituate*, as it were, at the end of the *Channel*; whereas the latter are in the midſt of it: For it is manifeſt, that the *riſing* or *falling* of the Water ſhaken in a *Veſſel*, is only perceived at the Extream parts of the *Veſſel*; whereas in the Middle there is nothing to be perceived, but an equal and ſimple *flowing* of the *Water*.

XX. *And from the various preſſion of the the Moon.* But to determine ſomething more particularly about this *Diverſity* of *Tides*, we are to take notice, that the *motion* of the *Waters* chiefly depends on this, That in that vaſt *Tract* of the *Sea*, there be ſome peculiar places where the *Waters* are very much preſſed, becauſe of the *Moons* preſence; and others again, where no force at all ſeems to be put upon them: Which makes that the *Waters* are driven to thoſe *places* where there is no preſſure, and ſo ariſe there againſt the *Shoars*, and make a *Flood*. Wherefore, if there be any *Waters* in the *Sea*, which becauſe of the inconſiderableneſs of their *Extenſion*, are all over cover'd by the *Body* of the *Moon*, they muſt needs be ſo equally preſt in all their parts, as that no *Riſing* or *Falling* can be perceived in them. Thus thoſe *Lakes*, *Pools*, and *Rivers* that are between the *Tropicks*, have no *Tides*, ſeeing that becauſe of the ſmalneſs of their *ſurface*, compar'd with the Bulk of the *Moon*, they cannot be ſenſibly preſt one way more than another. Wherefore

in the County of Buckingham Gent.

This Plate is humbly Dedicated by Ric: Blome

XXI. *Why some Seas suffer no Tides.* Wherefore it is no wonder, if in the *Baltick Sea*, the *Dead Sea*, and the *Euxine Sea*, no *Tides* at all are perceived; becauſe thoſe *Seas* have no enter-courſe with the *Ocean*; or if any of them have any communication with it, it is by ſuch narrow paſſages, that the agitation of the *Sea* can have no great *force* upon them.

XXII. *The meeting of Waters, a Cauſe of the diff'erence of of Tides.* To this Diverſity of *Tides*, the various Meetings of *Waters*, and difference of *Winds*, which differently agitate them, and drive them one againſt another, do much contribute. For the *Sea* flows continually from *Eaſt* to *Weſt*, which thoſe who ſail from *Spain* to the *Weſt Indies* have Experience of; for they frequently perform this *Voyage* in 30 *Day*,; whereas in their Return, they ſpend no leſs than 3 *Months*, becauſe the *Courſe* of the *Sea* is againſt them, and runs *Weſtward*. And the ſame is obſerv'd by thoſe who *ſail* from *Lisbon* to *Brazile*.

XXIII. *Why the Gulf of Venice flows towards the Weſt.* If you Object, That the quite contrary to this is found in the *Gulf* of *Venice*; for the *Sailers* tell us, that when they are over againſt *Epirus* and *Dalmatia*, they perceive that the *Waters* are carried with a ſtrong Stream *Weſtward*, towards *Venice*; and that when they are near the Coaſt of *Italy*, they are carried *Eaſtward*, towards the *Morea*. I Anſwer, That theſe *motions* of the *Waters* are cauſed by *Rivers*, which from *ſubterraneous Cavities* flow into the *Sea*; which in their coming forth, do with great Violence puſh forwards the *water* of the *Sea* that meets them, and divert it from its Courſe. Or elſe thoſe *Rivers*, being beaten back by the *Water* of the *Sea*, are forc'd to turn their *motion*, and to run another way.

XXIV. *An Objection againſt the foreſaid Explication, of the Ebbing and Flowing of the Sea.* But againſt this Explication of the *Ebbing* and *Flowing* of the *Sea*, it is Objected, *Firſt*, That if the *Moon* did drive the *Waters* from between the *Tropicks* towards the *Poles*, it would follow, that when the *Moon* is in the *Meridian*, it would be *Low-water* in that part which was oppoſite to it, and *High-water* towards the *Poles*; whereas Experience ſhews the contrary, *viz.* that the *Tide* comes in when the *Moon* approacheth to the *Meridian*, and that the *water* falls, as ſhe withdraws from it.

XXV. *Anſwer'd.* I Anſwer, That when the *Moon* is in the *Meridian*, the *Sea* muſt be low preciſely in that place which is over againſt it; but it doth not follow therefore, that it muſt be *High-water* under the *Poles*, but only that it muſt be *High-water* between the *Tropicks* and the *Poles*, and ſo it is. For we find by Experience, that the *Sea* increaſeth from about the *Tropicks*, to the moſt Northern part of *England*; and that from thence, towards the *Poles*, it increaſeth no more. Whence it is, that in the *Northern Ocean*, from about the *Latitude* of about 65 *Degrees*, to the *Poles*, there is no *Flood* nor *Ebb* at all.

XXVI. *A ſecond Objection againſt this Explication of the Tide.* In the Second place it is Objected, That the *Cœleſtial matter* which follows the *Moon*, and which moves ſomewhat ſwifter than ſhe doth, from *Weſt* to *Eaſt*, doth not only run under the *Moon*, but alſo above it, and on the ſides of it; ſo that that part of the *Sea*, over againſt which the *Moon* is, will be no more preſſed than the reſt.

XXVII. *Anſwer'd.* For Anſwer: It is certain that the *Heavealy matter* which follows the *Moon*, and is in a tendency to go ſomewhat ſwifter than ſhe doth, from *Weſt* to *Eaſt*, doth not all of it flow under the *Moon*, but that a part of it paſſeth above it, and on the ſides of it; yet doth not this hinder, but that the Way of the ſaid *matter* under the *Moon* is more *ſtreightned*, which is ſufficient to make the *Sea* to be more preſſed in that part, than in all the reſt.

XXVIII. *There is a threefold Tide.* From what hath been ſaid, we may gather, that there is a Threefold *Tide*, according to the difference of Times, *viz.* a *Daily*, *Monthly*, and *Yearly Tide*.

The *Daily Tide* is that, whereby the *Sea* in 24 *Hours* time doth twice approach to the ſame *Shoar*, and as many times retires again in this order, That the *Tide* of the *Day* following falls about 50 *minutes* later, than that of the *Day* foregoing.

The *Monthly Tide* conſiſts in this, that the *Daily Tide* increaſeth twice in a *Month*, *viz.* about the *New* and *Full Moon*, and twice decreaſeth, *viz.* in the *Quadrate Aſpects* of the *Moon*.

The *Yearly Tide* conſiſts in this, that the *Monthly Tide* twice in a *Year* riſeth higher than ordinary, *viz.* at both the *Æquinoxes*, and as often decreaſeth, *viz.* at the *Solſtices*. Wherefore if theſe 3 *Periods* be compared with the *Daily* and *Yearly motion* of the *Earth*, it will ſeem impoſſible, they are the words of GALILÆUS, in the *4th Dialog. Syſtem. Mundani*, *That Naturally there ſhould be any Tide, ſuppoſing the Earth to ſtand immovable, without betaking ones ſelf to the abſolute Power of* GOD, *and conclude, that the Sea-Tide is a ſupernatural Effect.*

CHAP. XIII.

Of the Air.

I. *Of the Atmoſphere.* THE AIR, according to the Order of *Nature*, follows the *Earth* and *Water*, to the *Surfaces* whereof it adheres and is joyned. The *Aſtronomers* call that part of *Heaven*, *Air*, into which the *Vapours* and *Exhalations* aſcend. And becauſe all thoſe *Exhalations*, which are continually breath'd forth from the *Earth* and *Sea*, are by the preſſing of the *Subtil matter*, diſpos'd into a Round *ſurface* (at leaſt as far as the agitation of thoſe *Bodies* will permit) they gave the Name of *Atmoſphere* to thoſe *Vapours*. It is various, according to the diverſity of *Heat* and *Cold*, and of the *Vapours* themſelves; and from thence proceeds a *various Refraction* and *Reflexion* of the *Rays* of the *Sun* and *Moon*, and the other *Stars* in the *Air*.

II. *There is a twofold Subſtance in the Air.* Accordingly we are to diſtinguiſh a twofold *Subſtance* in the *Air*, *viz.* one *Native* and *Primitive*, which hath been from the Beginning of the *World*, and which is the moſt pure and thin part of it: And the other *Adventitious* or *Foreign*, which conſiſts of the *Effluvia's* or *Steams* of other *Bodies*, according to the difference of *Place* and *Time*. Hence the *Air* is accounted, *Firſt*, abſolutely Pure, when theſe Steams are not ſo thick, that they can eaſily cling together, and thereby loſe the form of *Air*. *Secondly*, With reſpect to us, whilſt thoſe *ſteams* are not ſo hurtful to our Bodies; ſuch as they are at the time of *Epidemical* and *Contagious Diſeaſes*.

The

III. *What the Air is.* *The Air is a loose Body; fluid and transparent, whose Particles are so small, and so little clinging together, that they may with the least force be separated from the Globuli of the second Element and by a peculiar motion be carried independently about their own Center.* The *Fluidity* of the *Air* proceeds, from its being compos'd of very *subtil* and *thin Particles*; for tho' their irregular *Figures* seem to dispose them to cling together, yet are they forced to continue separate, because the minuteness of their Branches makes them yield to the *motion* of the *Subtil matter*, which by its great Mobility keeps them disunited, and makes them continue in a *Liquid form.* And forasmuch as its *Particles* are thin and disjoyned, every one of them moves independently from any of its *Neighbours*, and takes up that whole little *Sphere*, which is needful to its being whirl'd about its own *Axis*, keeping all other *particles* out of it.

IV. *The Property of the Air is to Polish and Smooth.* The *Air*'s Property is to polish and smooth *moist Bodies*, and to keep them from being easily penetrated; as appears in the *Water*, which easily bears a *Steel Needle*, or a Pane of *Glass*, as long as its *surface* is not broken. Now the Cause of this is, because the Parts of the *Air* are moved otherways than the Parts of the *Water*; so that by their rubbing against one another, both their *surfaces* are hardned, and made more unfit to be divided.

V. *What Vapours and Exhalations are.* But because the more *subtil parts* of *Exhalations* do compose the *Air*, it will not a little conduce to our better understanding of the Nature of the *Air*, if we explain what *Exhalations* are, and how they are distinguish'd from *Vapours*. *Vapours* therefore *are* nothing else, but *Particles of Water, which the Heat of the Sun, and the Circular motion of the Earth, have separated from one another, and raised into the Air.* And, *Exhalations are certain Particles, which by the same Causes have been separated and raised from Earthly Bodies.*

VI. *How they are said to be raised by the Sun.* When it is said that *Vapours* and *Exhalations* are raised into the *Air* by the *Sun*, it is not so to be understood, as if the *Sun* did attract *them* by his *Beams* (for such an *Attraction* is unintelligible) but only that at the *presence* of the *Sun*, or some other *Cause*, the *Subtil matter* which pierceth the *Pores* of *Bodies*, doth separate some *Particles* from them; which finding no other place but the *Air*, wherein they can move, do tend that way, in a manner not much unlike to that, whereby the *Dust*, which in *Summer* time we tread upon with our Feet, mounts upwards, and is raised up into many *Clouds*, according to the number of those that Tread it.

VII. *Another Property of the Air, is to be Rarefied and Condensed.* The *Air*, and all *Vapours*, are easily *condensed* and *rarefied*, according as they are more or less agitated. They become *Rarefied*, when they are more swiftly than ordinary tossed by the *Heat*: For seeing their *Particles* are *flexible*, the least commotion doth dilate them, and then they require a greater Space to continue their *motion* in. Again, they become *Condensed*, when they cease to be agitated by *Heat*; for then their *Particles* cling together, and are compress by *Cold*: For nothing else can be understood by *Heat*, but the *Agitation* of the *minute Particles* of *Bodies*; as by *Cold*, the Diminution or Cessation of that *motion.*

VIII. *The Air being compress, hath the power of springing back.* The *Air* that is forceably compress in any *Vessel*, hath a power of springing back (which is called its *Elastick virtue,*) and of extending it self into a larger space. By which means *Instruments* are made, which, with the help of the *Air* only, drive the *Water* upwards, as we see in *Artificial Fountains*; and others, that shoot Darts, like *Bows*. The Cause whereof is, for that when the *Air* is thus compressed, each of its *spherical Particles* hath not sufficient place left it, wherein to perform its *Circular motion*, by reason of the crowding in of other *Bodies*: And forasmuch as at the same time, the *agitation* of these *Particles* is continued, by the *motion* of the *Heavenly matter* perpetually *flowing* about those *parts*, it can be no otherwise, but they must hit against one another, and push each other out of their places; and thus at last, all of them together, make a strong push for it, to acquire a larger space.

IX. *Air condens'd, is more heavy than that which is rarefied.* *Condensed Air* is more heavy, than that which is *Rarefied*; because it contains less *Heavenly matter.* We may Experience this, by filling a *Bladder* first with a little, and *rarefied Air*; and afterwards with much, and *condensed Air.*

X. *The Distance of the Air from the Earth, is uncertain.* From the Greater or Lesser *Agitation*, or *Rarefaction* and *Condensation* of the *Air*, we conclude, that the *Compass* of the *Air* is greater in *Summer* than in *Winter*; and therefore that what is commonly said, that the *furthest distance of the Air from the Earth is of 52 Italian miles*, is vain and uncertain. And the same is to be said concerning the *three Regions* of the *Air*, and their several *Bounds*; as when they ascribe to the *Lowest Region*, the height of half an *Italian mile*; to the *Middlemost*, of three and an half; and to the *Highest*, the heigth of 48 *miles.* For seeing there are no certain Bounds whereby these *Regions* are discriminated, it is a Fond undertaking, to go about to determine their Limits.

XI. *The Air is Heavy.* Another Property of the *Air* is *Heaviness.* For as we find that the *Water* presseth the bottom it lies upon; so likewise the *Air*, which encompasseth the *Earth*, doth press it on every side; and so much the more vehemently presseth it, by how much it is nearer to the *Earth*: As appears in a *Bag-Pipe* or *Bladder* fill'd with *Air*, which thereby becomes *heavier* than it was before. The same also may be proved, by the running of *Quicksilver* out of a *Pipe* that is stopt at the Top; for the *Quicksilver* changeth its height, according as it is carried along a low, or high place; so as to be depress'd *deeper* in a high place, and mount up *higher* in a low place.

XII. *Why the weight of the Air is not felt.* If you demand, How comes it then to pass, that we are not sensible of the *weight* of the *Air*? I answer, That the Reason is, because there is as great a Force in our *Body* to resist, as there is in the *Heavy Air* to press. For our *Body* being full of *Blood* and *Spirits*, doth with no less Force resist the *pressure* of the surrounding *Air*; which is the Reason, why the *Air* with its *weight* cannot move our *Nerves*, nor impress a sense of *Heaviness* upon us.

XIII. *Whence the Heaviness of the Air proceeds.* Now the *Heaviness* of the *Air*, is to be ascrib'd to the *watry Particles* that are mingled with it; because that part of it which is diffus'd about the *Earth*, and reacheth to some certain distance, doth approach to the Nature of a *watry Vapour*, especially when many *Steams* are mix'd with it. Yea, if we may believe some Men, *Thick Air* is not only

only fill'd with *Steams* from the *Earth* and *Water*; but receives also the *Breathings* of all other *Bodies*, and abounds with their *Spirits*.

XIV. *Why the Lower Region of the Air is hotter than the higher.* The *Region* of the *Air*, which is *neareſt* to the *Earth*, is hotter than that which is at a good diſtance from it; becauſe the *Solar Rays* being more copiouſly reflected from the compact *Body* of the *Earth*, do produce a greater agitation of its *Particles*. And therefore it is that the *higher Region* of the *Air* is cold, where *Clouds*, *Snow* and *Rain* are generated; becauſe the *Rays* that are reflected from the *Earth*, do not ſo copiouſly mount up to it.

XV. *The Air is not Moiſt, as the Peripateticks ſuppoſe.* The *Peripateticks* hold the *Air* to be *Moiſt*, but without any ſufficient ground, that ever I could underſtand; ſave only, becauſe they thought it convenient to attribute two of their invented *Qualities* to the *Air*, which they call an *Element*. For tho' the *Air* be ſometime called *Moiſt*, this doth not ſuppoſe it to have an *Eſſential Humidity*; but is ſo denominated, becauſe of thoſe *Watry particles* reſolv'd into *Vapours*, that are joyn'd with it; which, when they are removed, it is called *Dry*: In which condition it cannot be turn'd into *Water*, no not by the moſt extream *Cold*.

CHAP. XIV.

Of the Elaſtick or Spring-like Force of the Air.

I. *What a Spring is.* BY the word SPRING is commonly underſtood, *that whereby a thing that is forceably bent and reduc'd to a leſs Extenſion, doth explicate it ſelf again, and ſtrive to return to its former Expanſion.*

II. *Wherein the Elaſtick or Spring-like force of Bodies doth conſiſt.* This *Elaſtick*, or *Spring*-like *Force* in *Bodies*, proceeds from the *Subtil* or *Æthereal matter*; for when any *hard Body*, by Example, the *Blade of a Sword is bent*, its parts are by this means deflected from the Convex or Jetting-ſide of the *Blade*, and approach nearer on the Concave or Hollow-ſide of it; by which means the *Pores* on this ſide, muſt needs be made more narrow. Now becauſe the *Subtil Matter* cannot exert its Force, to return through thoſe *parts* of the *bended Body*, it paſſeth through; but ſtrives at the ſame time, to reduce the *parts* thereof to that ſtate wherein they were before, it muſt neceſſarily follow, that this *Body* muſt fly back.

III. *The Air is eaſily Condenſed and Rarefied.* This Affection is moſt peculiar to the *Air*; which being nothing elſe, but a company of thin *Particles* of the *third Element*, which comply with the *motions* of the *Heavenly matter*, becomes eaſily condens'd; not only when by the decreaſe of *Heat*, and the leſs agitation of its parts, they do not with ſo great Force puſh againſt one another, as before they did; but alſo becauſe they are ſhut up within the parts of another *Body*, which compreſs them more than ordinary. And on the contrary, the *Air* is as eaſily *Rarefied*, as ſoon as thoſe *Cauſes* are removed, which reduc'd it to a leſs Space. Whether this happens by means of *Heat* let into its *Pores*, if before it was condenſed by *Cold*; or by opening the *Priſon* wherein it was ſhut up before, if by Compreſſion only it was reduced to a leſs Bulk.

For the *Air* can be dilated three ſeveral ways, either by its *Elaſtick virtue*, whereby it reſiſts its being Compreſt; or by the *Force* wherewith the *Subtil matter* ſtrives to enter again into the *Pores*, whence it hath been driven away; or, *laſtly*, by the extream *Agitation* of the ſaid *Matter*, which moving the parts of the *Air* more ſtrongly than ordinary, cauſeth it to extend it ſelf farther. And on the contrary, the *Air* becomes condenſed, either becauſe it is preſſed; or, becauſe the *Subtil matter*, which before moved its *Particles*, is ſlipt away from them; or, becauſe the ſaid *matter* having loſt part of its *Agitation*, hath no more the Force to move them as much as it did before, which makes them to lye more cloſe together.

IV. *The Air can be Rarefied and Condenſed divers ways.*

But we are to take notice, that this *Dilatation*, whereby the *Air* removes all Obſtacles that compreſs it, is and muſt be very ſudden; becauſe its *parts*, which before could not move without clinging together, do then with joynt Forces leap back, and by the force of the *Heavenly Globuli*, continually flowing about them, make an aſſault together, in order to take up a larger Space. There are various Experiments that are founded on this *Affection* of the *Air*, which we admire in *Artificial Fountains*, and *Wind Guns*, which ſhoot *Leaden-bullets*, and other things.

V. *The Action whereby the Air flies back like a Spring, is very ſudden.*

VI. *An Example of an Artificial Fountain.* For let the *Air* be compreſt in the *Pneumatick Veſſel*, the lower part of it being fill'd with *Water*, and the *Water* will ſpout out thence with ſo great force, that it will ſurpaſs almoſt any ſuppoſed height. For Example, Let the *Pneumatick Veſſel* be A B C, the lower part whereof B C contains *Water*, and the ſuperiour B A C *Air*; which being crowded into it by the *Pipe* A D, at ſeveral times; let it be compreſt, as is wont, in the upper *Cavity* B A C; then let the *Tube* or *Pipe* A D be well ſtopt, by turning the Key of the *ſide Pipe*, appearing above B. This ſuppoſed, if the Key of the greater *Pipe* D A be open'd, the *Water* will ſpout forth through the ſaid *Pipe* with great force to E, being forc'd upwards by the compreſt and condenſed *Air*. And foraſmuch as the *Air* is ſtill capable of greater degrees of Compreſſion, it is certain that the *Air* may alſo be puſh'd upwards with ſtill greater and greater force. Figure 47.

The Reaſon of this *Experiment* is this, that the *Particles* of *Air* contained in the *Pneumatick Veſſel*, being *thin*, and ſeparate from each other, do yield to the *motions* of the *Globuli* of the *ſecond Element*: But when theſe *Globuli* are by ſome force thruſt out, the *Particles* of the *Air* are forc'd to come nearer together, and entangle one another, ſo as that they can no longer whirl round, as they were us'd to do. Now being toſs'd about by the *Subtil matter*, they with their *Corners* hit one againſt another, and thruſt each other out of their place: By which means they ſo bend their Force, to get more room for themſelves, as that by that Effort they ſpout out the *Waters* with great force towards E.

VII. *Muſical Wind-Inſtruments may be play'd upon by the Compreſſion of the Air.* And for the ſame *Reaſon* a *ſtrong Wind* can be excited, by means of the Compreſſion of the *Air*, which will be able to expreſs all Variety of *Sounds*. For ſo we Experience, that even great *Organs*, by the *Pneumatick Art*, can *play* variety of *Tunes*, without any aſſiſtance of a *Muſicians Hand*, to wit, by our blowing into ſome *Pipes*, and thereby turning a *Wheel*, whoſe

Teeth ſhall tuneably ſtrike the *Keys* of the *Organ.*

VIII. *How the Wind-Gun can diſcharge Leaden Bullets.*

As for the *Wind-Gun*, which by means of *Air* only doth diſcharge *Bullets* with an extraordinary Violence, the ſame may be made after this manner. Suppoſe C A, in the *Figure*, to be a *Braſs Pipe*, or *Bore*; and let the end thereof, marked A, be well ſtopt, and be furniſh'd with its Stock, and with two Keys I and K, ſo as that one of them may touch the other; and having open'd both the *Keys*, let a *Plug* be put in at the Mouth of the *Bore* C, by the help of a *Screw*, the Operation being ſeveral times repeated, in order to a ſtronger Compreſſion; then let the *Key* K be ſhut home, and the other *Key* I be a little open'd, that by letting in of *Air* the *Plug* may be drawn forth; then let a *Bullet* be put into the *Bore*, with a little *Tow*, to keep it in; then open firſt the *Key* I, and afterwards K, and there will follow a forceable exploſion or diſcharge of the *Bullet* at a great diſtance, by force of the Compreſt *Air.*

Figure 48.

IX. *The Compreſſion of the Air raiſeth Quickſilver two Foot high, and keeps it ſo ſuſpended.*

It is from the ſame Compreſſion of the *Air*, that *Quickſilver* contain'd in a *Glaſs-Pipe*, open at one end and ſtopt at the other, remains ſuſpended 2 Foot and a quarter high; whereas *Water* is raiſed to almoſt 32 Foot. For take a *Glaſs-Pipe* A B, 3 Foot long, being open at the one end A, and *Hermetically* ſealed at the other B; let it be fill'd with *Quickſilver*, and turn'd upſide down into the Veſſel C D, alſo full of *Quickſilver*; it will clearly appear, that the *Quickſilver* will not ſink down to the bottom of the *Glaſs*, but will continue ſuſpended in the ſame almoſt 27 Inches high, at E. And the Reaſon is, becauſe the *Quickſilver* cannot ſink lower, but by preſſing the *Ambient Air*, which being already condenſed by that which lies upon it, and endeavouring to regain its former Expanſion, ſtrives againſt it, and by reaſon of the rowling of its complicated *parts*, cannot ply or give way. For tho' the *Quickſilver* be very heavy, yet can it not force the *Air*, conſiſting of thickiſh, vehemently extended, and continually rowling Parts, to a farther Compreſſion.

Figure 49.

X. *The Air proved to be the Cauſe of this Effect.*

Now that this Effect doth wholly depend on the *Elaſtick Power* of the *Air*, may be perceiv'd chiefly by this; becauſe in the *Pneumatick Engin*, invented by Mr. *Boyle*, if the *Pipe* fill'd with *Quickſilver* be thruſt into other *Quickſilver*, as ſoon as the *Air* is exhauſted, the *Mercury* no longer continues elevated 27 Inches high, but ſinks by degrees, and falls into the *Veſſel.* But as ſoon as the *Air* is let in again into the *Engin*, the *Quickſilver* riſeth again, and takes poſſeſſion again of its former ſtation.

XI. *This Sinking of the Quickſilver doth vary, according to the difference of Places.*

Yet we find that the *Air* hath not the ſame Force in all *Countries*, nor reſiſts the weight of *Quickſilver* alike; but according as the ſame is purer or more groſs, ſo the ſinking thereof is different. For tho' the *Air* be a *Liquid Body*, and be ſo ranged about the *Center* of the *Earth*, that its *ſurface* is of a *Round Figure*; yet becauſe about the *Poles*, by reaſon of the great *Cold* it is more condenſed, than in other places, it muſt needs be found there in greater abundance; and conſequently muſt lye more heavily upon the *Earth* of thoſe *Countries*, than upon thoſe that are nearer to the *Æquinoctial.* Upon which account it is, that the *Quickſilver* ſinks leſs in the *Glaſs-Pipe*, in *Holland*, *Denmark* and *Sweden*, than in *France*, where the *Air* is more thin and rarefied; and more at *Florence* than at *Paris*: So that in the Year 1643, in which this Experiment was firſt tried, the *Quickſilver* in a *Weather-Glaſs*, at *Florence* in *Italy*, ſtopt at 2 Foot and almoſt 3 Inches: At *Paris*, at 2 Foot 3 Inches and an half; and in *Holland*, at 2 Foot, and 6 or 7 Inches.

XII. *And of the Weather.*

And not only ſo, but this Riſing and Falling differs alſo, according to the Change of the *Weather*; for we find that the *Quickſilver* in a *Weather-Glaſs*, ſinks more in *Fair* than *Rainy weather*, and on a high *Mountain*, than in a low *Valley*, or any other place, where the *Air* is more Thick and Groſs, and ſo ſtrives more againſt the weight laid upon it. For the *Air* is condenſed according to the Proportion of the *weight* of the *Air* that is above it, which is always ſo much the greater, by how much the *Air* is lower; and conſequently it is neceſſary, that this Virtue be greater in that part of the *Air*, which is nearer unto the *Earth*, than in that which is farther from it.

XIII. *All the Motions that are commonly attributed to the avoiding of a* Vacuum, *are cauſed by the Weight of the Air.*

From this *Weight*, or *Elaſtick Power* of the *Air*, proceed all thoſe *motions* which are commonly aſcribed to Natures abhorrence from a *Vacuum*, and may be readily explained by it: For no other Reaſon can be given why the *Water* riſeth in a *Pump*, but only this, becauſe it is preſſed by the *Air*, that is about it, and ſo tends thither, where there is either very little or no *preſſure* at all of the *Air*, *viz.* within the *Bore* of the *Pump*, out of which the *Plug* is pull'd; as hath been explained in our *General Phyſicks*, by many Inſtances.

CHAP. XV.

Of Meteors in General.

I. *What Meteors are.*

WE come now to treat of thoſe things that are generated in the *Air*, commonly called METEORS: Which *are* nothing elſe but *certain various impreſſions made upon the Elements, exhibiting them ſometimes in this, and ſometimes in another Form.* And becauſe for the moſt part they appear on high in the *Air*, they have got the Name of *Meteors* from their Elevation.

II. *Meteors are Threefold.*

METEORS are Threefold, *viz. Fiery*, *Airy*, and *Watry*, according to the Predominion of that *Element*, which is moſt conſpicuous in them.

III. *Fiery.*

FIERY METEORS, *are thoſe that conſiſt of a fat, ſulphureous kindled Smoak.* And theſe are various, according to the diverſity of their *Figure*, *Situation*, *Motion*, and *Magnitude.* For when a *Fat kindled Smoak* appears in the form of a *lighted Candle*, wandring up and down, it is called an *Ignis Fatuus*, or *Will with the Wiſp*: When it hath the appearance of a *Croſs Bar* or *Beam*, it is called *Trabs*; when of a *Pillar of Fire* ſtanding upright, it is called *Ignis Pyramidalis*; when its parts are of unequal thickneſs, the middle parts being thicker and broader, and the ends ſmaller, 'tis called *Draco Volans*, that is, a *Flying Dragon*; when the *Fiery Meteor* ſeems to skip like a *Goat*, appearing ſometimes kindled, and at other times extinguiſh'd, it is called *Capra Saltans*, that is, a *Skipping Goat.* But the moſt wonderful and terrible

XII. And of the Weather.

XIII. All the Motions that are commonly attributed to the avoiding of a Vacuum, are caused by the Weight of the Air.

I. What Meteors are.

II. Meteors are Threefold.

III. Fiery.

This Plate is humbly

Dedicated by Richard Blome

terrible of all the reſt are *Thunder* and *Lightning*, of which hereafter.

IV. *Airy.* AIRY METEORS, are thoſe which *conſiſt of Flatuous and Spirituous Exhalations*, ſuch as the *Winds* are.

V. *Watery.* WATERY METEORS *conſiſt of Vapours or Watry Particles, by the Action of Heat ſeparated from each other, and variouſly modified.* Theſe are manifold.

VI. *As Clouds, Snow, Rain.* For if theſe *Vapours* be elevated above the *Earth*, and hanging in the *Air*, are either by a *Weſt-wind*, oppoſing the ordinary motion of the *Vapours* Weſtward; or by *Two other Winds*, blowing from different *Quarters*; or by the alone *Coldneſs* of the *Air*, condenſed and joyned into ſome ſmall *Icy particles*, *Clouds* are generated. If theſe *Icy particles* chance to be reſolved by the *Heat of the Sun*, or of ſome *Wind* blowing from a *hot Quarter*, and the *Wind* driven together, do entangle with one another like *Carded-wool*, they make *Snow*; but if they be wholly melted into Drops, they conſtitute *Rain*.

VII. *Hail.* But when a *Cold wind* blowing congeals theſe *Drops*, when they are either altogether or almoſt diſſolved, they become turned into *Hail*.

VIII. *Miſt, Dew, and Hoar-Froſt.* If the *Vapours* hover near the *Earth*, they are called a *Miſt*, which continues either till it be drawn upwards by the *Rays* of the *Sun*; or that by its own weight, or ſome other External Cauſe, it falls down to the *Earth*; where, by a leſs degree of *Cold*, it is changed into *Dew*, and by a greater, into *Hoar-froſt*.

IX. *Appearing Meteors.* There is another ſort of *Meteors*, which are called *Appearing*; ſuch as are *Mock-Suns*, *Mock-Moons*, the *Meteor* called *Virgæ*, in the appearance of a *Fire-brand* or *Rod*, the *Rainbow*, *&c.*

X. *A Mock-Sun and Mock-Moon.* What theſe are, and how they are formed, take this ſhort account: When the Extremities or Ends of a *Snowy Cloud*, being diſſolved by *Heat*, are by a ſupervening *Cold wind* conſtipated into thin *Ice*; and ſuch a *Cloud* as this happens to be oppoſite to the *Sun* or *Moon*, then is the *Image* of either of them reflected in the ſaid *Cloud*, as in a *Looking-Glaſs*. That of the *Sun* is called *Parelius*, or a *Mock-Sun*; and the other of the *Moon*, *Paraſelene*, or a *Mock-Moon*.

XI. *Virgæ, a Meteor in the form of a Bundle of Rods.* Again, when a *watry Cloud* is compos'd of Parts, whereof ſome are more cloſe and compact, and others more looſe and lax, and the *Sun-beams* chance to pierce the more lax and open parts of it, then it exhibits a *Meteor*, repreſenting a *Bundle of Rods*, which the Latins call *Virgæ*.

XII. *The Rainbow.* Laſtly, If a *Cloud* be reſolved into ſmall *Drops*, and the ſame be illuſtrated by the *Sun* plac'd over againſt it, then is form'd a *Semi-Circle* of divers Colours, called the *Rainbow*; whereof more hereafter.

CHAP. XVI.

Of Meteors in particular; and firſt, of the Winds, Clouds, and Miſts.

I. *What Wind is.* WIND *is a Vapour agitated and rarefied, which by paſſing from a narrow place, into one that is more large and wide, ſenſibly drives the Air before it.*

II. *What is properly to be underſtood by the word, Wind.* The Name of WIND is improperly attributed to the Agitation cauſed by a *Fan* or a *Bellows*: Neither can *Air* that is moved or rarefied by *Fire*, be called a *Wind*; ſeeing that the *Air* may be variouſly moved, when yet there is no *Wind* at all; as when *Drums* are beaten, or *great Guns* diſcharged. For we ſpeak here only of a *Natural Wind*; which is nothing elſe, as hath been ſaid, but *an Agitated Vapour, which being diſtended, makes its way out of a narrower Space, wherein it was pent up, into a larger; and by this means ſenſibly driving the Air before it.* If there chance to be a meeting of many *Vapours* together, then, according to the Quantity of *Matter*, the *Wind* is ſo much the greater, and diffuſeth it ſelf far and near.

III. *Whence Vapours and Exhalations do proceed.* VAPOURS derive their Original, not only from the *ſurface* of the *Water*, but likewiſe from the *moiſt Earth*, *Clouds*, *Snow*, *&c.* for the parts of theſe *Bodies* being not ſo firmly united, are eaſily disjoyned, and ſo break forth into the *Air*; where meeting with ſeveral *Exhalations* in their way, they together with the *Air* carry them along with them; becauſe the *Air*, as well as *Exhalations*, contribute much to the Force and Violence of *Winds*. Tho' *Vapours* proceed promiſcuouſly from the *Earth* and *Water*; yet the *Sun* ſhining raiſeth more of them from the *Sea*, than from the *Earth*. And on the contrary, the *Earth* being heated with the *Sun-beams*, in the *Night* time, ſends forth more *Vapours*, than the *Sea*; becauſe the *Earth* longer preſerves the *heat* of the *Sun*, than the *Sea*. Whence it is, that in the *day time Winds* are frequently perceived to blow from the *Sea*, and in the *Night time* more from the *Land*; as at *Jamaica*, and other of the *American* Iſlands.

IV. *How Winds are raiſed, by the Example of an Æolipyle.* Foraſmuch therefore as the *Globe* of *Earth* and *Water* doth furniſh a vaſt number of *Vapours* and *Exhalations*, which for the moſt dilate themſelves between *Clouds*, *Mountains*, and other *Bodies* that are about them, by the force of this their *dilatation*, they ruſh from the places where they are ſtreightned, into thoſe where they find more Room and leſs Obſtacles, and there vehemently toſſing the *Air*, produce a *Wind*; much in the ſame manner, as we find that *VVind* is excited in *Æolipyles*. Suppoſe we therefore an *Æolipyle* A B C D E of *Braſs*, all hollow, with a very narrow *Orifice* D, by which *water* is poured into it, the part A B C, to be full of *VVater*; and other A E C, to contain nothing but *Air*. This *Æolipyle* being ſet near the *Fire*, as ſoon as it is thorough hot, many of the *watry Particles* begin to whirl round, and being elevated above the *ſurface* A C, and variouſly daſhing againſt one another, ruſh through the narrow hole D, (where they find the leaſt Reſiſtance) with great Violence, and putting the *Air* into a great Commotion, they produce a *wind* from D to F. *Thus we may know and judge by this little Inſtance, of the great and wonderful Cauſes of VVinds.* Figure 50.

V. *Mountains compared with Æolipyles.* For the Hollow of *Mountains* may be compared, to the Cavity of this *Æolipyle*: The *Heat* ſhut up in the *Bowels* of the *Earth*, to that whereby the *water* in the *Æolipyle* becomes dilated and elevated: The *water*, which the *Sea* by *Subterraneous Channels* conveys into the *Earth*, to that which is contained in the ſaid *Veſſel*: And laſtly, the *Clefts* of the *Earth*, at which the *Vapours* and *Exhalations* come forth, to the Orifice thereof.

thereof. Only with this difference, that the smallness of the Hole in the *Æolipyle* causeth the *Vapours* to rush forth with greater violence, than they do from the more open and manifold Clefts of the *Earth*. Yet doth not this hinder, but that sometimes *VVinds* may have as violent a Blast, as that which is perceived to rush through the small Hole of the *Æolipyle*; because some *Mountains* are so situated, that the *Vapours* that come from them, can but go one way, which makes them move with great *violence* and swiftness. Tho' sometimes also *VVinds* may rise in those *Countries*, where there are no *Mountains* at all, *viz.* when the *Vapours* that move from a higher to a lower Place, are by the *Clouds* or *Mists* they meet with, forced to discontinue their course, and to turn off side-way.

VI. *Which are the Cardinal Winds.*

According to the various parts of the *Horizon*, or *Quarters* whence the *VVinds blow*, they are denominated *Cardinal* or *Collateral*. The *Cardinal VVinds* are four, so called, because they blow from the four Corners of the *VVorld*. The *East wind*, from the *Sun-rising*; the *South wind* from the *South*; the *VVest wind*, from the *Setting of the Sun*; the *North wind* from the *North*.

VII. *Which the Collateral.*

The *Collateral winds* are those, which are inserted between two of the *Cardinal*; and these, according to the Account of our Modern *Seamen*, amount to 28; *viz.* 7 between the *East* and *South wind*, 7 between the *South* and *VVest wind*, 7 between the *West* and *North wind*, and as many between *North* and *East wind*. So that the *Cardinal* and *Collateral winds* put together, make up the Number of 32.

VIII. *The Names and Order of the Winds.*

To the end that the Order of the *Winds* may be the better understood, it will do well to mind the *Figure*, where they are all set down by their usual Names. The first is the *North wind*, the second is the *South-wind*, the third is the *East-wind*, and the fourth the *West-wind*; which are called *Cardinal winds*. The 4 that follow are called *Collateral*; each of which is placed in the midst of 2 *Cardinal winds*, and hath its Name composed of the 2 *Cardinal winds*, between which it is placed, *viz.* the *North-east wind*, the *North-west wind*, the *South-east wind*, and *South-west wind*. The 8 remaining *Winds*, which are placed each of them betwixt a *Cardinal* and *Collateral wind*, take their Denomination from them both: Thus that which is between the *North* and *North-east wind*, is called *North-North-east*; and so of the rest.

Figure 51.

IX. *Why the East-wind blows in the Morning, and the West-wind at Even.*

The *East-wind* is chiefly found to blow in the Morning, because the *Sun* heating the *Air*, doth dilate, rarefie, and makes it to move in one and the same *Country*; sometimes one way, sometimes another, according as he is placed with respect to that *Country*. For this diversity of Position produceth variety of *VVinds*. As for Example, When the *Sun* riseth to us, he dilates the *Air*, as hovering perpendicularly over it, and doth so whirl it round, that one part of it rusheth towards the *VVest*, where we are; whence it is that we then perceive an *East-wind*. On the contrary, when the *Sun* sets, the *Air* that is opposite to him becomes dilated, and thereupon one part of it must betake it self to the *East*, where we are then with respect to the *Sun*, and therefore must perceive a *VVest-wind*. And the same happening in all the *Countries* that are situate without the *Torrid Zone*, it follows, that in the Morning *East-winds* must blow, and at Even-tide *West-winds*: As I have expreſt it in a *Figure*, in my *History of Nature*, *Part* VI. *Chap.* II.

X. *Why the North-wind, for the most part blows in the day time.*

And with the like facility a Reason may be given, why *North-winds* most frequently blow in the *Day time*; by observing that the *Earth* E B F D, under the *Poles* E F, where it is not much heated by the *Sun*, is surrounded with *Clouds* and *Mists*; and that at B, where the *Sun* sends down his direct and perpendicular *Rays*, many *Vapours* are raised, which are carried upwards till they come thither, where, by the force of their own weight, they are more easily turned Side-ways, to continue their way towards I, and M, above the *Clouds* G, and K, than to mount higher in a *Right line*. And foraſmuch as these *Clouds* G, and K, become rarefied by the *heat* of the *Sun*, the *Vapours* proceeding from thence, do rather take their progress from G, to H, and from K, to L, than to E, or to F: For the thick and gross *Air*, which is under the *Poles*, makes a stronger resistance, than the *Vapours* that rise from the *Earth*, towards the South; for these being strongly pusht, and on all sides ready for *motion*, do easily give way to them. So that if we suppose the *Northern Pole* to be towards F, the *motion* of the *Vapours* from K, to L, will excite a *North-wind* blowing in the *Day time* through *Europe*. Figure 52.

XI. *Why the South-wind mostly blows at Night.*

Altho' the *Sun* ceaseth its Action in those *Countries*, where it is *Night*; Yet because the *heat* imparted to the *Earth* in the *Day time*, is for some time preserv'd in it, it so happens that many *Vapours* are thereby raised, which the *Air* at P, being condensed by the *Cold* of the *Night*, hinders from roaming towards Q, and R; like as those which are in the other part, wander towards I, and M; but they are there (for we suppose it to be *Night* in the part D) gather'd into *Clouds*, which hindring other *Vapours* raised out of the *Earth* from ascending to any great Height, do on every side beat them down towards N, and O, and so produce a *South-wind*, which commonly riseth at *Night*.

XII. *The East-wind is much stronger than the West-wind.*

As *Winds* proceed from different *Quarters* of the *World*, so they differ in their Properties: For those that blow from the *East*, are more violent than those that proceed from the *West*; and this partly, because these comply with the *motion* of the whole *Body* of the *Air*; and partly, because the *Air* that is dilated and blows towards the *West*, tends to a *place*, where for 18 *Hours* it hath not been *Noon*: So that by this long absence of the *Sun*, the *Air* is much more condensed, than that to which the *Western-winds* tend; because there it is not above 6 *Hours* since it was *Noon*, and the presence of the *Sun*, caused a great *heat* and rarefaction of *Vapours*.

XIII. *The North-wind is more forceable, than the South-wind.*

The *North-wind* for the most part is very *strong* and impetuous, because it is excited by the greatest *heat*, *viz.* that of *Noon-day*; and because it consists of a Matter that is most easily dissolved into *Vapours*, *viz.* *Clouds*. And for the contrary Reason, the *South-wind* must be the most gentle, as well because the *Thickness* of the *Nocturnal Air*, is a stop to its Course, as likewise because the *Matter* whereof it consist, as proceeding from the *Earth*, or from the *Water*, cannot be so readily, nor so copiously dilated, as is the *Northern matter*, which

which, as we have already said, is pour'd forth from the *Clouds*.

XIV. *The East-wind is more dry than the West.*

As to the other *Qualities* of the *Winds*, it is notorious that *East-winds* for the most part are *dryer*, and produce a more serene and clear *Air*, than those that come from the *West*; because these latter, by striving against the *Natural Course* of the *Vapours*, do stop them, and drive *Clouds* together, whereas the former do dispel and dissipate them.

XV. *Which Winds are said to be Dry, Moist, Hot and Cold.*

Hence it is evident, that the *North-wind* is of a more *drying Quality*, that is, hath a power of *driving watry Particles* out of the *pores* of *Bodies*, or from their Outsides, whilst they are expos'd to the *Air*; because, for the most part, it is composed of the grosser parts of *Fresh-water*, mix'd with the *Air*. The same *VVind* is likewise *cold*, because it carries along with it the most *subtil Northern matter*, towards the *South*, which is the *Primary Cause* of *Cold*. But the *South-wind* is *hot* and *moist*: *Moist*, because it consists of the more gross, and *subtil parts* of *Fresh-water*, elevated together from the *Earth*: And it is *Hot*, because it brings along with it the *Subtil matter*, which was in the *Southern quarter*, towards the *North*. For the *VVinds* are much alter'd, according to the place through which they pass; and therefore, according to the Nature of the *Region* through which they go, are either *Hot*, *Cold*, *Moist*, or *Dry*.

XVI. *The Regularity of the Winds is sometimes hindred by particular Causes.*

All these things we have here spoken concerning the 4 *Cardinal-winds*, would happen so continually, if the *Earth* in all its parts lay equally above the *VVater*, and there were no difference of *Soils* and *Springs*, nor any other Cause, but the *presence* of the *Sun*, to dilate the *Vapours*; but there are so many other *Causes* that conduce to the production of *VVinds*, that it is no wonder to find them so irregular, and not to rise in the same Order. Wherefore we cannot with Reason expect *Regular winds*, save only in those parts of the *Sea* which are most remote from the *Land*. Forasmuch as there is no such great inequality in the *surface* of the *Sea*, as there is in that of the *Earth*; and because the *VVinds*, which are driven that way from the *Shoars*, very rarely can reach so far, as to disturb the Course of those *VVinds* that blow there.

XVII. *What Winds are called* Perennes, *or Continual.*

Besides the foremention'd kinds of *VVinds*, some *VVinds* are called *Perennes*, that is, *Continual*; others *stati*, or such as blow at certain Times and Seasons; others, *Provincial*; and others, *Free*.

The *Continual VVinds* are 2; the one in the *Torrid Zone*, which continually blows from *East* to *VVest*: The other in the *Temperate Zones*, which, as far as about the 40*th Degree*, blows also from the *East* to *VVest*. These *VVinds* are very observable at *Sea*, but are scarce discernible at *Land*.

XVIII. *What* Venti stati *are, that is, such as blow at certain Seasons.*

VVinds, Named by the *Latins*, *stati*, are such as return at certain and set Times. The most famous of this kind are the *VVinds* called *Etesiæ*, which return every *Year*, towards the end of *July*, and continue 40 *Days* together, especially in *Italy* and *Ægypt*: They blow at *Night*, about 3 *hours* after *Sun-set*, and for the most part cease at the approach of the *Evening*. Their Course is from the *East* or the *North*, or from between them both.

XIX. *Provincial Winds.*

Provincial VVinds are such as *blow* in certain *Provinces* or *Countries*: Such is the *North-wind*, that *blows* on the *North-side* of the *Alpes*, according to the Course of a *River*, about 1 or 2 *Leagues* in length, but much less in breadth. This is a *Daily-wind*, and seems to blow continually, and with great evenness, like a *River*.

XX. *Free Winds.*

Those are called *Free-winds*, which without any order of *time* or *place*, do blow from different *Quarters*. Thus the *VVest-winds* blow most commonly about *Noon*, or after, when the *Sun* is hastning towards its *setting*. The *South-wind* frequently riseth at *Night*, and blows more vehemently than in the *Day* time; whereas the *North-wind* blows more in the *Day* time, than at *Night*.

XXI. *The Original of Clouds.*

As *Vapours* that are dilated in the *Air*, do produce *Winds*; so when they are compress and condens'd, they make *Clouds*. Which then happens, when their *motion* is diminished; for then their little *Particles* come closer together, which as soon as they are *joyned*, rise up in little heaps, and these gather'd together compose vast Bulks. For the *Clouds are* nothing else, but *Vapours and Exhalations sublim'd so high, that the Coldness of the Air makes them come together, and so to constitute a Whole, which is so loose and spungy, that it cannot by its weight overcome the Resistance of the Air, which oppeseth its descent.*

XXII. *How Clouds come to darken the Light of the Sun.*

Clouds do often interrupt the *Action* of *Light*; for tho' the *Drops* of *Water*, and the *flocks* of *Ice* whereof they consist are singly *transparent*; yet their multiplied *Surfaces* do repress the *Light* of the *Sun*. As appears in *Froth*, which because of the various *surface* of its Parts, cannot receive the *Light*. The Cause of this *Condensation* is, either the *Winds* which compress the *Vapours* together, especially if they be opposite, and blow from divers *parts*; or else the figuration of the *Particles* that compose the *Vapours*, whereby they are more fit to cling and close together.

XXIII. *How Clouds are supported in the Air.*

The Reason why *Clouds* do not fall down out of the *Air* upon the *Earth*, is, because their *Particles* are very thin, and have large *Surfaces*, their *Matter* consider'd, and therefore are easily born up by the *Air*, which is ever thicker near the *Earth*; or else are hindred by the *Winds* from coming down: Much in the same manner, as a deep loaden *Ship*, is born up by the *weight* of the *Water*. Hence it is, that according to the less, greater, or equal *weight* of a *Cloud*, it doth either ascend, descend, or hang equally pois'd in the *Air*; even as a *Ship*, proportionable to its less, greater or equal *Gravity*, doth rise, sink, or is evenly pois'd in the *Water*. But when the *particles* of the *Clouds* are so thick, that they can no longer be kept up by the resistance of the *Air*, then are they resolved into *Water*, and by their *weight* fall down to the ground.

XXIV. *The difference between a Mist and a Cloud.*

A MIST differs from a *Cloud*, only by the diversity of its place; for *Mists* are *Vapours* that reach to the very *surface* of the *Earth*; whereas those that constitute the *Clouds* are pois'd in the *Air*. For a *Mist* is nothing else, but a *Duskish Vapour*, *hovering on the Earth, which continues either till it be drawn up by the Rays of the Sun, or by its own weight, or some other outward Cause, falls down to the Earth.*

XXV. *The Original of Snow, Hail, and Rain, falling from the Clouds.*

We are to take notice that the Parts of *Ice*, whereof I have said that *Clouds* consist, are not so joyn'd together; but that there is some distance between, so as to make up several little Heaps: So that if they chance to be shaken with any strong *Wind*, they are easily separated, and fall down to the *Earth*. If these *Hillocks* or *Flocks* are not wholly dissolved, they make *Snow*. But if the *Air*, through which they are carried, be so *hot* as to make them to melt, they come down in *Rain*. It happens also sometimes, that after they are turn'd into *Drops* of *Water*, a *Cold wind* meeting with them, congeals them into *Hail*; for *Hail* is nothing else but frozen or congealed *Rain*.

CHAP. XVII.

Of Rain, Dew, Hoar-Frost, and the Cool Evening Air.

I. *What Rain is.*

RAIN is nothing else, but *those Drops into which a Vapour elevated above the Earth, is resolved.* We have a resemblance hereof in *distill'd Liquors*; for the *rising Vapour*, being condensed by the Coolness of the *Air*, returns to its former state, and runs together into *Drops*, which at first are insensible, but in their falling down are commonly increased, by others joyning with them; and those commonly are the largest, that fall down from the highest place.

II. *Whence the difference of Rain doth proceed.*

We must not therefore suppose, as some do, that *Rain* is produc'd in the *Air*, as *Water*, that by being poured from on *high*, becomes dispersed into many *Drops*; or that it is generated in manner of a *Pool*, the *Water* whereof falling from the *Clouds* is dissolv'd first into greater, and then into less *Drops*; but only by degrees and by parts: For the *Drops of Rain*, are formed of the *particles* of *Vapours* joyning together, and being joyned fall down to the *Earth*. Hence *Rain* hath got several Names, according to the different bigness of the *Drops*, whereof it consists: For the *Rain* that falls down in small or midling *Drops*, is called by the common Name, *Rain*; if it drops very small, 'tis called a *Drizling Rain*; if it falls down in great *Drops*, and those close and thick, 'tis called a *Shower*; if it comes down in great *Drops*, and fiercely, 'tis called a *Storm*.

III. *Whence the Greatness of the Drops of Rain proceed.*

The *Drops* of *Rain* are *great*, when the *Heat* acts upon the upper part of the *Cloud*; because then the *Drops* that descend do increase in their passage, by the addition of other *Drops* they meet with from the top of the *Cloud* to the bottom: Whereas on the contrary, when the action of *Heat* is only exerted on the lower part of the *Cloud*, as it commonly happens in the *Winter*, the Drops are so *small*, that they are not called *Rain*, but only a *Mizling Dew*.

IV. *How the Rain falls down from the Clouds.*

Tho' it be evident enough how *Clouds*, that consist only of *Watry Drops*, come down in *Rain*, *viz.* either by their own *weight*, when the *Drops* by the coalition of many *particles*, have attained to a sufficient thickness; or, when that the *Air* that is under them, by its withdrawing, or that which is above, by pressing upon them, inclines them to a descent; or, when many of these Causes chance to concur: But yet it is not so evident to all, how *Rain* is generated at first out of a *condensed Cloud*.

V. *Rain is sometimes caused by Wind.*

Now this will be easily made out, if we consider how 2 contrary *Winds* do gather great abundance of *Vapours* into the middle Space between them, and thereby cause the production of a *Mist* or *Cloud* there. For let us suppose, for Example, a *Wind* to blow upon the *Earth* A B, from the *West* D, and another to blow the contrary way, from the *East* C, so as that both these *Winds* come to stop one another about the Space F G P; it must necessarily follow, that the *Vapours* intercepted between the *wind* D, and the *wind* C, being driven together, must be there condensed, and make a kind of confus'd Mass. In like manner the *Wind* that drives against this *Cloud*, yet not with that Violence as to carry it along with it, must drive the parts of it closer together; by which means many of the *watry Particles*, which before were insensible, and separate from each other, are by the force of the *wind* driven together, and so become *great Drops*, which by their own weight fall down. For as in your common *Stills*, *Drops* are not formed as soon as the *Vapour* is got to the Head of them, for that other *Vapours* ascending to the top of the *Still*, must increase their bulk. So neither can *Rain* be generated, as soon as the *Vapours* are got up to the *Region* of the *Clouds*; but it is necessary, that those *Particles* of which the *Vapours* do consist, be by the *Wind* driven together, and more closely joyned; and that being thus become more heavy, so as to be able to vanquish the resistance of the *Air*, they fall down to the *Earth*.

Figure 53.

VI. *The more common Cause of Rain is Heat.*

Notwithstanding that by this way *Clouds* are often turned to *Rain*, yet is the *Heat* of the *Air* a more frequent and efficacious Cause of it. For this *heated Air* clinging to the *Clouds*, makes the *subtil Snow*, whereof they consist, to dissolve, and separates it into many little *Flocks*, which have then force enough to drive away the *Air* that opposeth their descent; and so by the action of the *Heat* they meet with in their passage, they are quite melted, and turn'd into *Drops*: Which sometimes are *large*, when the *Cloud* is thick and close, and comes down by the pressure only of the *Air* that is above it; because the *upper Drops* meet with others in their way downward, that increase them and make them larger, as before hath been mentiond.

VII. *Why the Drops of Rain are Round.*

The *Drops* of *Rain*, as they fall down, are made *round*: For a *Liquid Body* then becomes Round, when all its Parts are by an equal force driven towards some Common *Center*; for all the Parts of that *Circumference* being moved by a like force, are at an equal distance from the *Center*. Now *Rain* is a *Liquid Body*, all whose Parts, when the *Air* is calm and free from *Winds*, are compress by an equal Virtue to some Common *Center*. For the *Calm Air* doth on all sides equally compress these *Drops*, there being no Reason to be given why it should press them one way, more than another.

VIII. *How the Dew is formed.*

Having premised thus much concerning *Rain*, it will not be difficult to conceive how the DEW is formed, if we observe that when the *Air* is clear and not ruffled with *Winds*; many loose and thin *little Bodies* are dispersed abroad, especially in the *Summer time*, when *Vapours* and *Exhalations* are copiously elevated from the *Earth*:

Which

Which small *Bodies* flying in the *Air*, in the form of *Vapours*, when the *cold* of the *Night* comes on, do lose their *agitation*, and many of them clinging together, produce insensible *Drops*, which falling down upon the *Dry ground* are suck'd up; but falling upon the *Leaves* of *Trees*, or the *Spires* of *Grass*, are there gather'd into greater *Drops*. This chiefly happens in the *Night*, or before *Day-break*; because then the *Earth* is most *cold*, as being turned from the *Sun*. Whence it follows, that the *Dew* is nothing else, but *certain Vapours, that have by Heat been elevated in the Day time; and which being condensed by the Coldness of the Night, fall down in small insensible Drops upon the Leaves of Plants; where many of them joyning together, they become sensible.*

IX. *What Hoar-Frost is, and how it is distinguish from Dew.* HOAR-FROST is generated, when the *Vapours*, that are near the *Earth*, are congealed by the *coldness* of the *Night*: Which only happens in the *Winter*, when *Cold* predominates. For tho' when the *Coldness* of the *Night* is yet temperate, it be sufficient to compress the *watry Particles* up and down dispersed through the *Air*, into sensible *Drops*, yet not to congeal them: But the *Cold* of *Winter-Nights* being more intense, congeals the said *Drops* in the form of *Snow* or *Hail*. So that it appears, that the difference between *Dew* and *Hoar-Frost* is this, That *Mists* do turn to *Dew*, if they consist of *Drops* of *water*; but into *Hoar-Frost*, when they consist of *Vapours* that are *frozen* before, or are congealed in their passage down to the *Earth*.

X. *Why Hoar-Frost makes Coleworts tender.* It is observed, that the *Hoar-Frost* makes some *Herbs*, and particularly *Coleworts*, tender; the Reason whereof is, because the *Cold* acting upon them, doth very much condense them, and causeth many *humid Particles* to congeal together; which afterwards are easily resolved again by any supervening *Heat*, and by this means their *fibres* become in a manner clean dissolved, which is the cause of the Tenderness of those *Plants*. The like also happens in *Flesh*, which having been *frozen*, doth thereby grow very Tender.

XI. *What the Cool Evening Breez is, which is consequent upon clear Summer days.* As to that COOL EVENING-AIR, or *Breez*, which is consequent to fair *Summer-days*, we find that it commonly happens when the *Heat* of the *Sun* hath been very intense all the *Day* long, and thereby greatly agitated the *Air*; by which means the *surface* of the *Earth* also is moved to send forth abundance of *subtil Exhalations* upwards, to the *Region* of *Vapours*; and because these *Exhalations* do more easily lose their agitation, than the *Vapours* do, as soon as they are deprived of the *Sun*'s *Heat*, the former of these fall down. And herein doth chiefly consist the Nature of this *Cool Air*, or *Breez*; which according to the difference of *places*, is endued with different *Qualities*: For it is probable, that those *Particles* which exhale from places *Infected*, or *poisonous Plants*, are far more hurtful, than simple *Vapours* that arise out of the *Earth*.

XII. *When the Cool of the Evening is hurtful.* The *Cool Air*, or *Breez* of the *Evening*, is never more hurtful, than when the *Day* fore-going hath been very clear, and the *Heat* of the *Sun* moderate: For the immoderate *Heat* of the *Day* doth much extenuate these *Vapours*, and elevates them on high, so that they cannot so readily be condensed by the *Cold* of the *Evening*. It is also very hurtful after that the *Sun* is set, because the more heavy *Exhalations*, which have less of *Vapour* mix'd with them, as soon as they are left destitute of the *Sun-beams*, do immediately come downwards.

XIII. *If when the Air is duskish, the Sun shines in the East, it is a sign of Rain.* The *Air* cover'd with *Clouds*, is a sign of *Rain*, if the *Sun* shine in the *Morning*; for this is an evident Token, that there are no other *Clouds* in the Neighbourhood of our *Air*, towards the *East*, which can hinder the *heat* of the *Sun* from condensing those that hang over our Heads, or from raising new *Vapours*, whence they might be increased, out of the *Earth*. But this *Cause* only takes place in the *Morning*; for if it do not *Rain* before *Noon*, it cannot afford any signification of what is to happen in the *Evening*. Neither are those *signs*, which are taken from the *Croaking* of *Frogs*, or *Crows*, the *Præsentions* of *Beasts*, the *Redness* of the *Sun*, the *Paleness* of the *Moon*, and other such like, any whit more certain, but generally very fallacious: And he that would take the pains to observe them diligently, will frequently find the contrary, to what is commonly expected from such like *Presages*.

XIV. *When no Dew falls in the Morning, it is a sign of Rain.* Yet we find, that when no *Dew* falls in the *Night*, or the *Mist* is carried upwards, leaving the *Earth* destitute of all *Moisture*, this is a sign of *Rain*; because this seldom happens, but when the *Earth*, having not been sufficiently cooled in the *Night-season*; or been agitated by too much *heat* in the *Day time*, doth send forth abundance of *Vapours*, which driving the *Mist* upwards, make its Parts to run together; by which means they become so great and weighty, as that they are forced to come down in *Rain*.

CHAP. XVIII.

Of Snow and Hail.

I. *What Snow is.* SNOW may be said to be *a dissolved Cloud, which being driven downwards by its own weight, falls down to the ground in Flocks*. It is said to be a *Dissolved Cloud*; because a *Cloud* is nothing else, but a great heap of *Snow* close clinging together. And it is said to be *Dissolv'd*, because when the union of the *parts* of a *Cloud* are broken by force, one *part* of it becomes sever'd from its next *part*, and being more weighty than the *Air*, comes down in the form of *Snow* or *Rain*. It is said in the next place, that it is *driven downwards by its own weight*. For a *Dissolved Cloud*, by its own weight, either turns to *Snow*, *Rain*, or *Hail*. And lastly, it is said, that it comes down in sever'd or *distinct Flocks*. For as a *Flock* of *Wool*, consists of many *particles* of *Wool*, entangled together; so the *Flocks* of *Snow* are compos'd of may *Shaggy particles* clinging together.

II. *How Snow and Hail are formed, and why they are white.* It is not always necessary, that the *parts* of *Clouds* should be wholly melted before they come down, since it is common for them not to be *dissolved*, or to turn to *Drops*, before that they come near the *Earth*, where the *Heat* is strongest, as exceeding that which is on high. Wherefore, when the *parts* of a *Cloud* that are only condensed, without being *melted*, do meet with the *cold Air*, which is no longer able to bear them, they fall down with their own *weight*, and that in *Flocks* of *Snow*, and not in *Drops*.

To

III. *How the Snow, whereof Clouds conſiſt, is condenſed.* To underſtand the way how the *Clouds* come to be condenſed, we are to ſuppoſe that the *Heat* which commonly rarefies moſt *Bodies*, doth notwithſtanding *condenſe* that of *Snow*; whoſe Parts are ſo ſeparate from each other, that the leaſt agitation is ſufficient to bring them together. Whence it comes to paſs, that when the *Air*, which is near the *Earth*, and is always more *hot*, than that which is at a greater diſtance from it, comes to elevate it ſelf to the *Clouds*, either by the Force of ſome *VVind* that carries it along, or by the Action of ſome new *Fermentation*, which cauſeth it to ſwell, it is neceſſary that it condenſe the *Snow*, whence the *Clouds* are compoſed.

IV. *How Hail is produc'd, and what is the figure of it.* The *Flocks* of *Snow* are of a *white Colour*, becauſe the *watry Matter*, whereof they are compoſed, contain a great deal of *Air*; and its *pores* are ſo diſpoſed as to reflect the *Light*, rather than to afford it a free paſſage, as *Ice* doth. But if theſe ſmall *Flocks*, after that they are *melted* by warm *Air*, do afterwards meet with other *Air* that is *cold*, and by it are congealed; then they turn to *Hail*, whoſe *Stones* are of a different *Figure*, according to the various Solution of the *Flocks*. For if the *Cold wind*, that congeals the *Hail*, doth meet with the *Flocks* of *Snow*, when they are almoſt diſſolved, but not yet rounded into *Drops*, then they obtain an *Horned figure*; and when the *wind* meets with the *Drops* of *water* already formed, it produceth little tranſparent round *Pellets*, ſave only that commonly they are ſomewhat flattiſh on that ſide where the *wind* beats upon them.

V. *Why the Hail is ſometimes of a Conical figure.* So that from the divers degrees of *Heat* wherewith the *Air* is agitated, and whereby the *Cloud* muſt be diſſolved, there ariſeth a great variety of *Effects*. For if the *Heat*, which by the *Cold wind* is driven into the *pores* of the *Flocks*, and penetrates their inmoſt Parts, chance to drive them towards the *Center* and condenſe them, whilſt the *External parts* being become ſtiff and bound by the *Cold*, cannot follow, they muſt of neceſſity be ſlit, according to *Right lines* tending to the *Center*; and as the number of theſe Slits do increaſe, as the *Cold* penetrates deeper, they muſt at laſt fly in pieces, into many longiſh and *Pyramidal particles*, which are ſo many *Hail-ſtones*, which at the firſt approaching of *VVinter*, fall down to the ground, eſpecially if a *Spring*-like conſtitution of the *weather* have gone before.

VI. *Why it ſeldom Hails in Winter.* For it is apparent, that it cannot *Hail* much in the *Winter*; or if it doth, the *Stones* cannot be great. The Reaſon is, becauſe during that *Seaſon* there is ſeldom *heat* enough ſo high as the *Clouds* to melt them; but only when they are ſo low, as that being *melted*, or near melted, they have no time to be congeal'd again before they reach the *Earth*. Whence *Hail* may be deſcribed to be *a Cloud that is melted, either whole or in part, and being driven downwards by its own weight, becomes ſo congealed by a Colder wind, that it falls down commonly in round and tranſparent Pellets.*

VII. *Whence the different Figures of Hail do proceed.* The *Hail-ſtones* are ſometimes of an *Oval figure, viz.* when a melted or diſſolved *Cloud* is ſtronger compreſt on one ſide, by the *wind*, than on the other. Sometimes they are rough, by reaſon of many *Angles*, which happens when a *Cold wind* ſeizeth the *Flocks* of *Snow* as they are *melting*, but before they are turn'd into round *Drops* of *Rain*. To which may be added, that the *Hail-ſtones* are ſometimes ſo violently daſh'd againſt the *Earth*, as thereby to be broken to pieces, and ſo loſe their Natural *figure*.

VIII. *The various Figures of Snow.* But much more wonderful is the *figure* of *Snow*, which ſometimes is *Hairy*, as in M and Z, ſometimes *Six-corner'd*, and conſiſting of 6 equal *Rays*, like *Stars*, as in O; ſometimes like a *Roſe*, as at Q; ſometimes in the *figure* of 6 *Rays*, or like 3 *Rods* laid Croſswiſe, which like greater *Branches*, ſhoot out leſſer *Branches* from them, the broadeſt whereof are neareſt to the *Center*, ſo as to reach and entangle one another; and the ſhorteſt or narroweſt towards the Top, making a Corner'd or Angulous *Ray* or *Beam*, as in R. Figure 54.

IX. *How Snow comes to be of a Hairy figure.* HAIRY-SNOW MZ, is produc'd, when the *particles* of *Ice*, which conſtitute the *Flocks* of *Snow*, being condenſed by the *heat* of the *Air*, and ſeveral times after congeal'd by the *Cold*, whirl round their own own *Centers* in the *Air*: In which *motion* they are cover'd with ſome longiſh and ſlender *particles* of *Ice*, as with *Hair*, and ſo exhibit the *figure* of *Hairy-Snow*.

X. *How Snow comes to be formed into the figure of Stars.* *Snow* of a 6 *Corner'd* or *Starry figure*, O, is formed, when the *Wind*, which hath diſpos'd the *Flocks* of *Snow* into the form of *Leaves*, by paſſing freely betwixt them, doth melt the *particles* of *Waters*, that ſtand upright like *Hairs*; ſo that afterwards inſinuating it ſelf into the 6 *Corner'd Spaces*, it melts the moſt *ſubtil* and looſe *Snow* that is about the *Circumference* of them; and the *particles* of *Water*, being agitated by the force of *heat*, joyning themſelves with others that are not *melted*, do preſently congeal them; and ſo their *Hair*-like *Extremities* being bent this way and that way, the *Flocks* grow leſs, and are changed, as it were, into a ſmall *plate* of *Ice*. And as to thoſe *Hairy prominences*, which are melted in the Circumference of theſe *Intervals*, theſe become condenſed, whilſt they withdraw themſelves towards thoſe which joyn every one of theſe *Flocks*, to 6 others that ſurround it: By which means 6 *Breaches*, or *Slits*, are made in the 6 *parts* of the *Circumference*, where the *Heat* is moſt predominant.

XI. *How the Flocks of Snow are formed into the Figure of Roſes.* *Snow* is formed into the *figure* of a *Roſe*, Q, when the *Heat* of the *Air* is ſomewhat greater, than what we juſt now ſuppoſed: For then daſhing againſt theſe 6 *prominent Points*, it makes them ſhorter; and cauſeth the *plate* of *Ice*, which before reſembled the *figure* of a *Star*, to become like a *Roſe* with 6 *Leaves*, the *points* being rounded like the Teeth of the *Wheels* we ſee in *Watches*.

XII. *How the Flocks of Snow come to reſemble Lillies.* If the *Flocks*, whereof *Snow* is compoſed, be bigger than ordinary, it may happen that by this means it may be not only divided into 6 *places*, in order to the forming of 6 *points*; but that alſo every one of thoſe 6 *points*, be divided into 6 others, by the intervening of 2 *Breaches* or *Slits*, from the *Hairy prominences* or *Capillaments*, which reach the *Capillaments* of another *Flock* of *Snow*: So that by this means 2 *points* might be formed, bending outwards; becauſe the *Heat* there acting with more vehemence, produceth a greater Condenſation: And thus inſtead of one *Starry-point*, or a *Roſe-leaf*, there muſt appear the *Leaf* of a *Lilly*, as is repreſented in R.

X.
How Snow comes to be formed into the figure of Stars.

XI.
How the Flocks of Snow are formed into the Figure of Rose.

XII.
How the Flocks of Snow come to resemble Lilies.

To the Right Honourable William Wentworth Earle of Strafford, Viscount Wentworth, and Baron Wentworth Woodhouse, Newmarch, Oversley, and Raby, Knight of the Garter &c.

This Plate is humbly Dedicated by Richard Blome

XIII. *How some of these Snowy Stars come to be white, or pellucid.*

Some of these *Snowy Stars* are white, like refin'd *Sugar*; and others of them are Transparent. The *Whiteness* of them proceeds from the *Mediocrity* or *Temperateness* of *Heat*; as when it hath not force enough to pierce to the *bottom* of the *Matter* whereof they are compoſed. Or becauſe in their paſſage through the *Air*, they have joyn'd to themſelves ſome *particles* of *Water*, before they got down to the *Earth*. Whereas other *Flocks*, that are more thin and ſmall, are *tranſparent*; becauſe the *Heat* hath wholly penetrated them, and made their *particles* to come nearer, and to be joyn'd more cloſely together.

XIV. *How there comes to be a Point in the midſt of the Roſie-Snow.*

One thing remains ſtill to be noted, *viz.* that there is ſeen a *white Point* in the *Center* of the *Roſie-Snow*, as is repreſented in Q. The Reaſon whereof may be, becauſe the *Heat* that hath formed theſe *Stars*, is ſo moderate, that tho' it makes all their other *parts* pellucid; yet not being ſtrong enough to pierce to their *Center*, it leaves them *white*.

CHAP. XIX.

Of Thunder, Lightning, and Coruſcation, or Flaſhes.

I *Lightning and Coruſcation follow after Thunder.*

TO the end that the Nature of *Lightning* and *Coruſcation* may be the better underſtood, we muſt premiſe ſomething concerning THUNDER; for uſually they are Concomitants of it, and depend on it, as their *Cauſe*. Now *Thunder* is produc'd, when many *Clouds* ruſh down upon others that lye directly under them. For it comes to paſs ſometimes, that the higheſt *Clouds* being condenſed by *Heat*, and made more weighty, fall down upon others that lye under them, and cauſe that Noiſe which we call a *Thunder-Clap*. For it cannot be queſtion'd, but that in the *Summer time* eſpecially there are abundance of *Nitrous*, *Fat* and *Sulphureous Exhalations*, in the *Air*. It is certain alſo, that *Snowy Clouds* are condenſed by *Heat*, and thereby become more Heavy. It is alſo as apparent, that all *Clouds* are not of the ſame height, but ſome higher, and others lower; ſince beſides *Reaſon*, *Senſe* it ſelf comes to confirm it, which often ſhews us one *Cloud* moving over another. Theſe things being thus preſuppos'd, we proceed to the Explication of *Thunder*, *Lightning*, and *Coruſcation*.

II. *What is the Cauſe of Thunder.*

When any *Clouds* condenſed by *Heat*, and by this means being become more Heavy, ruſh down upon an *Inferiour Cloud*, the intermediate *Air* being thereby ſtrongly agitated, is the cauſe of a *dreadful Sound*, which is called *Thunder*. For let us ſuppoſe two *Clouds* A and B, compoſed of looſe and much dilated *Snow*; let us alſo ſuppoſe, that there is a warmer *Air* about the upper *Cloud* A, than about the lower *Cloud* B; it is evident, that for this Reaſon it muſt be more and more condenſed, and conſequently become more Heavy: So that its moſt outward *parts* falling down firſt, puſh others they meet with in their way, and hurrying them along with them, do at laſt ruſh down all together, with great Violence, upon the *Lower Cloud*, with a dreadful rumbling Noiſe.

Figure 55.

III. *Heat condenſeth the Clouds.*

I have ſaid, that *Heat condenſeth the Clouds*: For tho' *Heat* do rarefie ſome *Bodies*, yet it ordinarily is wont to condenſe *Clouds*, as hath before been ſaid of *Snow*, which conſiſts of the ſame *matter* as a *Cloud* doth. For if *Snow* be laid in a warm place, it contracts it ſelf into a leſs *Figure*, before that any *water* drop from it, or its weight be diminiſhed. The *Clouds* therefore being thus *condenſed*, do eaſily deſcend, and oppoſe the paſſage of others that moved upwards, by reaſon of their Looſneſs, and thruſt downwards whatſoever oppoſeth them in their way. And foraſmuch as this cannot be without a violent concuſſion of the *Air*, therefore it is accompanied with that terrible Noiſe, the reſounding *Air* making it ſtill louder. *denſeth the Clouds.*

IV. *What Thunder is.*

Thunder therefore is a Noiſe excited by the *Air*, which hath been intercepted between two *Clouds*, whereof the Upper falling upon the Lower, and which being forc'd to retire thence, by the weight of the middle part of the Upper *Cloud*, which continues to come down, forceth for it ſelf narrow and irregular *Gaps*, to get out by, which produceth a dreadful *Sound*, being much augmented by the Rarefaction cauſed by the enkindling of the *Nitrous Sulphurs* betwixt theſe 2 *Clouds*.

V. *Why Thunder is much more frequent in Summer, than in Winter.*

It *Thunders* but rarely with us in the *Winter* time, becauſe then the *Heat* that is ſufficient to diſſolve the Upper *Clouds*, cannot reach ſo far. But in the *Summer time*, when the *Heat* is violent, and more eſpecially when the *North-wind* makes the *Heat* to be more cloſe and ſtifling, *Thunder* is produc'd; becauſe this *wind* is wont to carry the *heated Air*, that is near the *Earth*, upwards, to thoſe higher *Clouds*; by which means not only thoſe Superiour *Clouds* are condenſed and ruſh'd downwards, but alſo the Lower continue ſo looſe and dilated, and by the Dilatation of the *Air* that is under them, are ſo thruſt upwards, that they, as it were, meet the others falling down upon them, and ſtop them there, hindring any part of them from coming down to the *Earth*.

VI. *Why every Clap of Thunder is commonly follow'd by a Shower of Rain.*

Thunder is commonly follow'd by a *Shower of Rain*, and when the *Rain* is very copious, it is a *ſign* that little more *Thunder* will follow; becauſe when the Force wherewith the *Upper Cloud* ruſheth down from the *Lower*, is ſtrong enough to make it come down wholly, the *Thunder* muſt needs ceaſe: And if it be not ſtrong enough, and the *Lower Cloud* diſſolves into *Rain*, the ſame thing will ſtill happen; becauſe the *Air* that is ſhut up betwixt the 2 *Clouds*, can now with eaſe get forth, becauſe of the ſmall reſiſtance of the *Lower Cloud* diſſolving into *Rain*.

VII. *The Noiſe of Bells conduceth to make Thunder ceaſe.*

The *Sound* of *Bells*, and of *Canons* diſcharged, makes *Thunder* to ceaſe; becauſe thereby the *Air* is ſtrongly agitated, and communicating its *motion* to the Neighbouring *Air*, and that again to the Intermediate, till it reach and ſhake the *Snow*, whereof the inferiour *Cloud* conſiſts, occaſions its deſcent. Which Experience makes evident to thoſe, who are us'd to Travel in thoſe *Vallies*, where the falling down of *heaps* of *Snow* from the *Hills* is apprehended; for fearing leſt the *Sound of their Voice*, by ſhaking the *Air*, ſhould bring down the *Snow*, they are afraid ſo much as to Cough, to prevent that danger.

VIII. *What is the Cauſe of Coruſcation.* The *Exhalations* that are found in that Space which is between the 2 *Clouds*, are the *matter* of *Coruſcations* and *Lightning*, and according to the degree of *Rarefaction* and *Condenſation*, produce either the one or the other: For *Coruſcation* proceeds from an abundance of very *ſubtil Exhalations*, and very inflammable. For theſe *ſubtil* and *ſulphureous Exhalations* in the *Air*, become kindled by this *Agitation*, by reaſon that the *Matter* of the *firſt Element* being by this Concuſſion deliver'd from its Bonds, doth moſt ſwiftly run through them, which is the Reaſon of thoſe *Flaſhes*. This does frequently happen after great *Heat* and *Droughts*; for then by the daſhing together of *Light Clouds*, a *Flame* is kindled and breaks forth, which often reacheth our *Eyes*, without the *hearing* of any Noiſe; becauſe the *Clouds* daſhing againſt each other, is too ſoft to be heard at ſo great a diſtance.

IX. *What is the Cauſe of Lightning.* But if the *Exhalations*, which are intercepted between 2 *Clouds* ruſhing againſt one another be thicker and cloſer, then with great vehemence breaking through the ſhatter'd *Clouds*, and obliquely darted down to the *Earth*, they conſtitute the *Lightning*; by which (according to the condition of its own *Matter*, which ſometimes is more thick, or groſs and copious, and therefore more Violent; and at other times, more ſubtil and in leſs quantity, and ſo more penetrative; or of the *matter* of its *Objects*, whereof the more hard and ſolid, do make a greater and ſtronger Reſiſtance, becauſe they cannot give way, and ſo are diſſipated by it: Whereas the *ſofter* and *porous Objects* do eaſily give way, but withal more readily take *Fire*) thoſe wonderful and ſtupendous Effects are produc'd, which ſtrike Mens *Minds* with Aſtoniſhment, and force the moſt impious *Minds*, tho' ſore againſt their wills, to revere the *Divine Power*.

X. *Of the Thunderbolt.* It is commonly believ'd, that beſides the *Coruſcation* and *Lightning* which proceed from the 2 *Clouds*, there comes forth alſo a hard *Stony ſubſtance*, which is called a *Thunderbolt*, tho' it is own'd that the ſame is not always diſcharg'd, as oft as it *Thunders*; but ſome think this is only aſſerted, and not proved. Yet if any ſuch thing ſhould be, we muſt ſuppoſe it to be generated of ſome groſs *Matter*, which in its deſcent, hath by the great *Heat* been reduc'd to that hardneſs.

XI. *How the Lightning differs from Coruſcation.* The difference between *Lightning* and *Coruſcations* or *Flaſhes*, is this: *Coruſcations* or *Flaſhes*, may be cauſed by *Exhalations* that lye under one *Cloud* only; whereas *Lightning* doth not proceed, but from ſuch *Exhalations* as are intercepted betwixt two or more *Clouds*. Becauſe *Lightning* is an *Exhalation* with a great force breaking through the *Clouds*, which cannot be, but by *Clouds* that lye one upon another, when by the heavy fall or ruſhing down of the upper *Cloud*, the *Exhalations* are kindled, and through a Breach made in the *Lower Cloud*, are darted downwards towards the *Earth*. We muſt conceive that the whole *Upper Cloud* ruſheth down upon the *Lower* equally and altogether; for then it *Lightens*, by reaſon of the kindled *Exhalations* breaking through the *Lower Cloud*.

XII. *The Definition of Flaſhing and Lightning.* For *Flaſhing or Coruſcation is* nothing elſe, but *an Exhalation ſpread under a Cloud, which by the motion of the ſaid Cloud ruſhing downwards, is ſet on fire, and flaſheth.* Much after the ſame manner, as a *Torch* newly put out, and yet *ſmoaking*, is by ſome violent and ſudden *motion* again enkindled. But *Lightning is an Exhalation intercepted between two or more Clouds, which by the Heavy Fall of the Superiour Cloud is not only kindled, but through the Lower Cloud is thruſt down to the Earth.*

XIII. *Why the Lightning commonly ſtrikes Mountains and the Tops of Steeples.* The *Lightning* doth more frequently ſtrike the Tops of the *Mountains* and *Steeples*; for ſeeing that the *Clouds*, where the *Thunder* is generated, are high, and that the breach is uſually made at the end of them; it cannot well be conceived, but that the *Exhalation* that breaks forth thence, ruſhing down ſlantingly, muſt needs meet with the higheſt *Bodies* firſt. To which we may add, That if 2 *Clouds*, whoſe Ends are ſeparate from each other, were to open in the Lower part of them, we muſt ſuppoſe that it would rather happen in that part which anſwers to the High *Body*; becauſe the ſame, by hindring the deſcent of the *Air*, doth determine it by its Reſiſtance, to break rather in that place, than in any other.

XIV. *The various Effects of Lightning.* The various Effects of *Lightning* are to be attributed to the compoſition of the ſeveral *Exhalations*. It burns the *Cloaths* or *Hair* of a *Man*, without touching his *Body*; becauſe the *Exhalations* whereof it conſiſts, is of the nature of *Oil*, whoſe flame is weak. Sometimes it melts the *Gold* that is in a *Mans Purſe*, and the *Sword* in the *Sheath*, without hurting the *Purſe* or *Sheath*; which happens, becauſe the *Exhalations* are very *ſubtil*, as participating of the Nature of *Salt* and *Aqua-Fortis*, by which means they paſs through *porous Bodies* without any Impediment or hurt to them; but diſſolve whatſoever reſiſts entrance. As we find much the ſame effect of *Aqua-Fortis*, which diſſolves the *Hardeſt Bodies*, and yet leaves *Wax*, and other *Soft Bodies*, in a manner untouch'd.

CHAP. XX.

Of the Rainbow, Circles about the Sun and Moon, and of Mock-Suns and Mock-Moons.

I. *The Definition of a Rainbow.* THE RAINBOW may be defin'd *a Bow of diverſe Colours, which the oppoſite Sun paints on Drops of Water by a various Modification of his Light.* It is called a *Bow*, becauſe it is repreſented in the *figure* of half a *Circle*. For the *Rainbow* is a portion of that *Circle*, which is drawn from that *Line*, as from its *Center*, which paſſeth from the *Sun*, through our Eye, called the *Axis Viſorius*. It is ſaid to be *of many Colours*; becauſe of the ſeveral *Colours* which may be diſcern'd in it. And laſtly, it is ſaid, That the *oppoſite Sun paints*, or repreſents it, *in Watry Drops*, theſe being indeed the *Matter* of a *Rainbow*.

II. *What things are to be noted in a Rainbow.* We ſhall the better be able to underſtand the nature of a *Rainbow*, by taking a view of all the particulars that are contained in it. *Firſt* then, we ſay that the *Rainbow* is repreſented in a *Dewy Cloud*. *Secondly*, That the *Dewy Cloud* conſiſts of innumerable drops oppoſite to the Sun. *Thirdly*, That

That every one of these *drops* are like a *Globe* of *Glass* filled with *Water*. *Fourthly*, That all and every one of these *drops*, being heavy, and consisting of *particles* of *water* joined together, are carried downwards. *Fifthly*, That the *Rainbow* is produced in such a manner in that part of the *Air*, which is opposite to the *Sun*; that the *Spectators* are in the middle between them, so that if a *line* drawn from the *Sun* to the *Eye* of the *Spectator*, should be continued, it would pass through the *Center* of the *Rainbow*, and consequently that the *Center* of the *Rainbow*, the *Eye* and the *Sun*, are placed in the same line. *Sixthly*. That the *drops* of *water*, illustrated by the *Sun*, must be *round*, and send back the *Sun-beams* from each part of their *surface*, either by *Reflexion* or *Refraction*.

III. *How many ways the Solar Rays may be transmitted to us from objects.*

To the end we may the better conceive, how the various *colours* of the *Rainbow* are represented to us, we are to presuppose that we can never perceive them, but when the *Sun shines*, whose *Rays* are either *reflected* to our *Eyes* from the *surface* of some *Opake Body*, or are transmitted to us by passing through a *Body* that is partly transparent, yet ting'd with some *colour* or other: Or, *Lastly*, They reach our *Eye* by passing through some *Diaphanous Body*, wherein they have met with some *Refraction*. For no other way can be imagined for *Beams* to come to us, besides one of these three. Now because these *Beams* which proceed to our *Eye*, from a *Dewy Cloud*, cannot be said to be reflected from an *Opake Body*, seeing it is not at all probable that any such can be so suddenly form'd in the *Air*: or any *Body* that is in some sort *Transparent*, but yet *coloured*, to send back the *Rays* of *Light* to us in such a manner as is necessary for us to see the appearance of a *Rainbow*: and that we find by experience, that when a *Rainbow* appears, the *Air* is full of *watry* or *dewy Drops*, which are transparent, without any *colour*; therefore we may with good ground conclude, that the *Rainbow* represents these *colours* to us, only by the mode or manner of the *Sun-beams* acting upon the *Drops* they pass through, and so suffering some *Refraction*.

IV. *There be many other things that represent the Colours of the Rainbow.*

This may be confirm'd by many Examples, as by *water* spouted out by *FULLERS* when they bedew and moisten their *Cloath*. In those *Bubbles* which *Children* make by dipping a *Straw* or other small *Pipe* in a Lather of *Soap* and *Water*. And in *Artificial Fountains* that cast up *Water* to a great *height*, which being there dispers't in the *Air* do exhibit the form of a *Rainbow* on these scatter'd drops, illustrated by the *Sun*.

V. *What are the Primary and Secundary Colours of the Rainbow.*

The chiefest *colours* are *Scarlet* or *Crimson Red*, which is seen in the utmost part of it; next to which is *Yellow*, the third *Green*, and the inmost *Purple* or *Violet colour*, or as others will have it *Blew*. I said that these are the chiefest *colours*, because by the mixture, passage and termination of these, many other *colours* arise. The foresaid *colours* are chiefly seen in the *Primary Rainbow*, which many times appears alone. But in the *Secondary Rainbow*, which is higher and more large than it, these *colours* are weaker, and turn'd the contrary way: for in it the *Purple* is the utmost *colour*, the next *Green*, the third *Yellow*, and the lowest *deep Scarlet*. And the same thing happens in a *Prism*, according as the same is beheld upwards or downwards, for accordingly the order of those *colours* appears inverted to us.

VI. *What is the Cause of the Colours in the Rainbow.*

As to the cause of these various *colours* that appear in the *Rainbow*, it will be sufficient for us to know that Light is nothing else but a certain action or *motion* of a *subtil matter*, whose *particles*, like so many *Globuli* or round *Pellets*, are conceived to roul through the *Pores* of *Earthly Bodies*; which *Globuli*, according to the variety of the *Causes*, which determin their *Actions* or *Motions*, are diversly moved. So that if we suppose them to be so determined, that they *whirl round* with a greater force, than they move according to a *Right Line*, they produce a *Deep Red Colour*: if they be not whirl'd about altogether so strongly they imprint the sensation of a *Yellow*. And on the contrary, if they be not whirl'd about so fast, as used to be at other times, when there is no such Cause to resist their *motion*, they produce a *Green colour*; and a *Blew* when they are mov'd much more slowly.

VII. *How these various Colours do appear in the Rainbow.*

How these *Colours* are produced, we shall easily apprehend, by exposing a *Globe of Glass* B C D, to the *Sun*; for then we shall see, supposing the *Sun* to shine in the part of *Heaven* A F Z, and the *Eye* placed in the point E, that the part D, of the *Bottle* or *Globe* of *Glass*, will be ting'd with a deep red *colour*. And that whether we bring it nearer, or remove it farther from us, the same *colour* will still appear to us, provided we keep the same station; and that the line D E, with the other E M, which we are to conceive drawn from the *Center* of the *Eye*, to the *Center* of the *Sun*, do constitute an *Angle* of about 42 *degrees*, for then the part D will be equally *coloured Red*. But if we should dilate this *Angle* a little, this *Redness* will disappear; and if we contract the said *Angle*, then will it not altogether vanish, but will first be divided into two parts less bright, in the which *Blew*, *Yellow* and other *colours* will appear. Figure 56.

Afterwards if we proceed and view the part of the *Glass Bottle* K, we shall observe, by making the *Angle* K E M, of about 52 *degrees*; that the said part K, will be likewise ting'd *Red*, but not so bright and lustrous as that of D; and that upon dilating the said *Angle*, as before, other *colours* will appear, but more weak and fading, and that upon our contracting the same, or by dilating the same much wider, they will wholly vanish.

From which instance we are plainly inform'd, that the whole space of the *Air* to M, being filled with such *Glass Globes*, or which is equivalent in this case, with *drops* of *Water*, some point of them must be ting'd with a *Red colour*; from whence the lines drawn to the *Eye* E, will with the line E M, constitute a line of about 42 *degrees*, such as we suppose those to be that are marked by the *Letter* R; and that these points considered altogether, without observing the *place* wherein they are, save by the *Angle* under which they are beheld, will appear like a continuous *Circle* of a *Red colour*; and so likewise that there must be some points in those *Drops*, which are at S and T, from whence *lines* drawn to E, will constitute somewhat more acute *Angles* with E M, by which the *Circles* of the more weak and fading *colours* are composed. And that in this the *Primary* or *Inward Rainbow* doth consist. Then supposing the *Angle* M E X, to be of 52 *degrees*, that a *Red Circle* must appear in

in the *Drops* at X, and other *Circles* of a leſs *deep colour*, in the *Drops* at Y; and that in this the *Secondary* or outward *Rainbow* doth conſiſt. And laſtly, that by all the other drops marked V, no *colours* at all are produced.

VIII. *A Primary Rainbow is repreſented in the drops, after two Refractions and one Reflexion.*

A *Primary Rainbow* therefore is produced by thoſe *Rays* which come to the *Eye* after 2 *Refractions*, and one *Reflexion*; whereas the *Secondary* is generated of the *Solar-beams*, reaching the *Eye*, after 2 *Refractions* and 2 *Reflexions*. For if we make a more accurate ſearch whence the *Red colour* proceeds, which appears in the part D, of the *Round Glaſs*, we ſhall find that it depends on the *Sun beams* (which we look upon as ſo many *parallel lines*, becauſe of the vaſt diſtance of the *Sun* from us) which coming from A, to B, entring the *water*, are *refracted* in the *point* B, and go on to G, whence being *reflected* to D, and there coming out of the *water*, and a ſecond time *refracted* tend to E. For as ſoon as any *Opake Body* ſhall be oppoſed to any of the *Lines* A B, B C, C D, or D E, immediately the *Red colour* will diſappear; and tho' we ſhould darken the whole *Ball* of *Glaſs*, excepting only the 2 *points* B and D, and ſhould round about beſet it with *Opake Bodies*, provided nothing do hinder the *Action* of the *Rays* A B C D, yet the ſame will ſhine brightly. Afterwards having in the ſame manner ſearched out the *Cauſe* of the *Red colour* appearing in K, we ſhall find that the ſame depends on the *Solar Beams*, which coming from F to G, are there *refracted* towards H, and in H, *reflected* to I, and again from I, *reflected* to K; and laſtly being again *refracted* in the *point* K, tend towards E. And therefore a *Primary Rainbow* is repreſented in a *Dewy Cloud*, or in the ſeveral *drops* oppoſit to the *Sun*, after 2 *Refractions* and 1 *Reflexion*; but the *Secondary* after 2 *Refractions*, and as many *Reflexions*.

IX. *It always rains in that place where the Rainbow appears.*

If any object that *Rainbows* ſometimes appear in thoſe places where there falls no *Rain* at all; and therefore they do not always proceed from thoſe Cauſes we have here aſſigned to them. I anſwer that a *Rainbow* is ever repreſented in *Rainy Drops*, and that they never appear but in *rainy weather*; for the *Rainbow* is an individual companion of *Falling Rain*, tho' poſſibly it may not rain in that place from whence the *Rainbow* is ſeen, yet ſure it is that it muſt rain in that place where it appears.

X. *Rainbows appear variouſly according to the different poſition of the Spectator.*

Tho' a *Rainbow* be viſible to all, yet it is not ſeen by all after the ſame manner: For ſeeing that the *Drops* which appear ſtain'd with ſome *colour*, are perceived about the *Axis Viſorius*, under a certain *Angle*, and that all *Spectators* have a different *Axis*, it follows that every one of them muſt have his peculiar *Rainbow*. Yea, if the ſame perſon chance to go back, or forward, only ſome few ſteps, he will not behold the ſame, but ſtill a different *Rainbow*; ſeeing that the *Drops* of *Water*, are for example, repreſented under a certain *Angle* of *Refraction*, as the ſaid *Angle* is enlarged by going forwards, or diminiſht by going backwards, the *Rays* of *Light* will be variouſly returned, and will make a different *Rainbow*. So that there are as many *Rainbows*, as there are places, from whence they are beheld; wherefore it is no wonder what the Proverb ſaith, *that the Rainbow flies from thoſe that follow it, and follow thoſe that flee from it.*

XI. *What Halos are, and wherein they agree with the Rainbow.*

HALOS, or the *Circles* which appear about the *Sun* and *Moon*, are much of the ſame nature with the *Rainbow*. For they are round like the *Rainbow*, or approach to it, and have always ſome *Star* for their *Center*; for how ſwift ſoever the *Stars motion* may be, it is always found in the *Center*; which is a manifeſt Argument, that theſe conſpicuous *Circles* or *Crowns* are produced by *Reflexion* or *Refraction*. They agree alſo with the *Rainbow* in this, that they are of various *colours* like it; whence we muſt conclude that *Refraction*, and a ſhadow that may terminate the *Light*, are neceſſary to the Production of theſe *Circles*.

XII. *How theſe Ciroles differ from a Rainbow.*

Yet theſe *Circles* differ alſo from a *Rainbow*, becauſe a *Rainbow* is never ſeen but in *rainy weather*, tho' it be not neceſſary that it ſhould always rain where the *Spectator* is. Whereas theſe never appear in *rainy weather*, which is a plain argument that they are not generated by *Refraction* made in the drops of *water*, but by that which is made in the *particles* of *Ice*, found in the *figure* of *Stars*; for we cannot meet with any other Cauſe to which we may aſcribe this effect.

XIII. *How theſe Circles are formed in the Clouds.*

When therefore at any time there be *Clouds* in the *Air*, of a moderate thickneſs, the *Light* of the *Sun* or *Moon*, piercing the little *particles* of *Ice*, whereof they are compoſed, becomes refracted in ſuch a manner, that not being viſible ſave only to a certain diſtance from thoſe *Stars*, it produceth the appearance of ſeveral *colours*, *viz. Red* on the ſhady ſide, and *Blew* or *Purple* on the ſide toward the *Sun* or *Moon*.

XIV. *A further Explication how theſe Circles are formed about the Stars.*

As for example, when the *Beams*, proceeding from the *Sun* or *Moon* A B C, darting againſt a *Heap* of *Icy Stars* G E F, lying upon one another, are *refracted*, and reach the *Eye* of the *Spectator* D. For if the *Beam* proceeding from the point A, to the end of the *Icy Star* G, and the *Ray* from the point C, to the end of the little *Star* F, be *refracted* towards D, it is plain, that beſides the *Beams* A D, and C D, and ſuch like, which paſſing in a *right line*, do repreſent the *Sun* or *Moon* in their proper form; others being refracted in E E, will make the *Air* comprehended in this *Circle* F F, very Bright, and repreſent its *circumference* betwixt the *Circles* E E, and G G, in the form of a *Crown* or *Circle* diſtinguiſht with the *colours* of the *Rainbow*. So as that the *Red colour* will appear on the inſide about F, and a *Blew colour* on the outſide at G. Figure 57.

XV. *How thoſe Circles are produc'd in which Mock-Suns are formed.*

There are likewiſe other *CIRCLES* formed in the *Clouds*, but very different from thoſe we have now mentioned: becauſe they appear only of a *White colour*, nor have they any *Star* in their *Center*, as the *Circles* or *Halos* have; but for the moſt part paſs through the *Centers* of the *Sun* or *Moon*, and ſeem to be altogether, or almoſt *parallel* to the *Horizon*. And theſe are only ſeen in Great and Round *Clouds*, covered with *Ice*, in which *Mock-Suns* are repreſented by means of *Reflexion* or *Refraction*. For the *Sun* darting its *Beams* againſt a *Snowy Cloud* that is covered with *Ice*, and from the *Ice* reflecting into the *Snow*, muſt repreſent the ſame to the *Eyes* of the *Spectators* ſtanding on the *Earth* under it, in the form of a great *Circle*. Hence it is that theſe *PARHELIA* are called *Mock-Suns*, *becauſe they are reflected re-*

pre-

XI. What Halos are, and wherein they agree with the Rainbow.

XII. How these Circles differ from a Rainbow.

XIII. How these Circles are formed in the Clouds.

XIV. A further Explication how these Circles are formed about the Stars.

Figure 57.

XV. How these Circles are produc'd in which Mock-Suns are formed.

To the Worshipfull Thomas Phillips
of Southampton in Hant Shire Esqr
Second Engineer of England &$^{c.a}$

This Plate is humbly Dedicated by Richard Blome

presentations of the true Sun in a Cloud, as Images in a Looking Glass.

XVI. *How six Suns may be seen in this Circle.* In such a *Circle* as this, there sometimes appear 2 *Suns*, sometimes 4, yea and sometimes 6. For let D E F G H I, be a great and round *Cloud*, the upper part whereof D E F, we suppose to be thicker, as being more exposed to the *Wind* and the *Heat* of the *Sun*. The *Sun* being sufficiently High to the *South* A, and the *Eye* of the *Spectator* K, 6 *Suns* may appear in this *Circle*: The *first* and chiefest at E, by *Beams* proceeding from the *Sun* A, at right *lines*: the *second* and *third* at D and F, *by refracted Beams*, that penetrate the *Ice* in those places; where its thickness decreasing by degrees, they are on both sides crooked or bent inwards. Whence it is that these two *Suns* cast a *Red Colour* towards their Circumference, on that side where they look towards E, where the *Ice* is thicker; and a *Blew Colour* on the other side, where it is more thin. The *fourth* at H, is seen by directly *reflected Rays*: And lastly, the *fifth* and *sixth* G and I, by *Rays reflected* to equal *Angles*.

Figure 58.

XVII. *How it happens that less than six Suns are seen.* But in case the *Spectator* be not at K, but somewhere nearer to the *point* B, so as that the Circle, whose *Center* is supposed in his Eye, and to pass through B, do not cut the Circumference of the *Cloud*; then will not he be able to see the 2 *Suns* G and I, but only the other 4. And if on the contrary he go back much to H, or somewhat further to C, he will see 5 only, *viz.* D E F G and I, and removing much more backwards, he will see 3 only, and those 2 not contained within a *white Circle*, but as it were pierced with a *white Cloud*.

XVIII. *What a Mock-Moon is.* When such a like *Image* is beheld under the *Moon* it is called *PARASELENE*, that is, a *Mock-Moon*, which admits of a like application with that of the *Mock-Suns* already spoken of; for as a *Mock-Sun* is the Image of the *Sun reflected* in a *Cloud*; so is a *Mock-Moon an Image of the Moon appearing in a Cloud*. Such were those which appeared in the year 1671, the 25*th* of *May* about 11 a *Clock* at *Night*, when the *Moon* was very much declined towards the *South*, and near the *Horizon*.

CHAP. XXI.

Of Fire.

I. *What Fire is.* *FIRE is a Company of Particles of the Third Element, moved with the most rapid motion imaginable.* Or, it is a *Lucid* and *Fluid Body*, consisting of *Earthly Particles*, most swiftly moved by the matter of the *First Element*, upon which they swim, as it were.

II. *Why Fire is said to be hot and shining.* *Fire* is said to be *hot*, by reason of the various agitation of its *Particles*, whereby they are most rapidly agitated every way. It is said to be *Lucid* or *shining*, because the *subtil matter*, which agitates the *Terrestrial Particles*, is whirl'd round, whence whilst it endeavours to recede or withdraw it self, it presseth the *Heavenly Globuli*, in which pression *Light* consists.

III. *The variety of Fire.* Nevertheless every *Fire* is not *Hot* and *Shining*; for there is one sort of *Fire* which is only *shining*, as in *Rotten Wood* and *Glow-worms*; and another sort which is *hot* only, as in *Dung*, and a third sort that is both *hot* and *shining* together.

IV. *What is the Cause of these various Fires.* *Fire* is only *shining* when the most *subtil matter* of the *First Element* running this way and that way in the strait *pores* of *Earthly Bodies*, which resist the entrance of any other matter, doth push forwards the *Heavenly Globuli*: or else when the said *matter* is in so small a quantity, that it can only press the *Cœlestial Globuli*, which of their own nature are sufficiently incited to *Motion*, without being able to agitate the *Terrestrial Particles*. Again, the *Fire* will be only *hot*, when the *subtil matter* is in such abundance, that it can also agitate those *Earthly Particles*, but yet withal is so entangled with the *Earthly* and *Watry Particles*, that it cannot explicate it self, nor push forwards the *Heavenly Globuli* every way, in a *right line*. And Lastly, *Fire* is both *shining* and *hot*, when it is so at liberty as both to be able to press the *Heavenly Globuli*, and most swiftly to move the *Terrestrial Particles*.

V. *Violent Motion produceth Fire.* Violent *Motions* are very proper to produce this effect, because the *Earthly Particles*, to which they communicate themselves, tho' they be at first encompast with the *Second Element*, yet they move fast enough to drive them away from about themselves, and to admit nothing but the *First Element*, which much augmenting their agitation, doth dispose them soon to separate themselves from one another, and to take upon them the form of a *Flame*.

VI. *Fire is kindled by driving out the Globuli from the Intervals of the Terrestrial Particles.* In order therefore to the *kindling* of *Fire*, that is, to the gathering such store of the matter of the *First Element*, as may both *shine* and *burn*, it is necessary that the *Globuli* be driven out of the Intervals of some *Terrestrial Particles*, which being afterwards separated from each other, and only swiming in the matter of the *First Element*, may be snatched away with its most swift *motion*, and driven every way. That this is so, we shall easily conceive, if we consider that the matter of the *First Element* doth in swiftness much exceed that of the *Second Element*, and that those little *Bodies* which swim amongst the *particles* of these 2 Elements, can only be carried along by the motion of the *Second Element*, for that its *Globuli* do break the force of the *First Element*, and resist its *motion*: whereas on the contrary, whilst those *Earthly Bodies* are surrounded with the matter of the *First Element*, they must necessarily comply with its agitation, in like manner as we see that a piece of *wood* is carried away by the swiftness of the stream wherein it *swims*.

VII. *Whence it is that the Brightness of a Flame is greater in a dark than in a light Place.* Thus we find that the *Brightness* of a *Flame* is greater, and more conspicuous in a dark *Place*, than in one enlightned by the *Sun*; because in a place so illustrated, many *Globuli* of the *Second Element* from the *Sun*, are sent into the *Flame*, which lessen the agitation of the *matter* of the *First Element*, and consequently also the violence of the *Fire*. Whence also it is that when our *Optick Nerve* is strongly affected by the *Fulgid Light* of the *Sun*, the light of a *Candle*, compared with that of the *Sun*, seems to be none at all, as being scarcely discernable by our *Eyes*.

VIII. *Why Fire is hot and shining.* From what hath been said, we may gather the chief *Qualities of Fire*: for seeing that its *particles* are solid, and most swiftly moved, they cannot but produce *heat*, which, as shall be said in the following *Chapter*, is nothing else save *the actual various motion of the little parts of the Body*, affecting

the *sense* of *feeling*. And so also if together with this we call to *mind*, what before hath been said concerning *Light*, *viz.* that it consists in an endeavour of receding from the *Center*, or in the pressure of the *Heavenly Globuli*. For seeing that the subtil matter, that constitutes *Fire*, is constantly whirled round, and endeavours to recede thence, it cannot but procreate the sense of *Light*, and make the *Fire Bright* and *Shining*.

IX. *Of the several ways whereby Fire may be kindled.*

Fire may be kindled several ways: *First* out of *Flints*, for they being of a hard substance, if other *stiff Bodies* dash against them, by this means the *Globuli* of the *Second Element*, because of the narrowness of the interjected space, are forced to march off, leaving only behind them the matter of the *First Element*, and so the *Earthly Particles* which swim upon it, and follow its *motion* produce *Fire* and are turned to *Sparks*. Which may be the Cause why we find that in *Subterraneous Places Fire* is often kindled. For since there is always in those places a *viscous slimy matter*, and many *exhalations* are sublimed there by the *Suns heat*, it may so happen that one *Flint* dashing against another, may send forth *sparks*, by which the *exhalations* that cleave to the kindled *viscous* or *sulphureous matter*, may communicate a *flame* to the *Bodies* that are neareſt to them. Now that there are such fat and *sulphurous Flames* in the *Bowels* of the *Earth*, is well known to the *Miners*, and Reason evinceth the same; for seeing that there is a *Fire* in the *Bowels* of the *Earth*, there must be *Fumes* arising from it; seeing also that there are *sulphurous hot Bathes*, and *veins* of *Jews Lime*, and other oily *matter* boyling in the hidden Channels of the *Earth*, we may easily judge that from these also a continual *Smoak* or *Fume* must proceed by way of *exhalation*. And it seems probable, that the first kindling of those *Fires* which burn in *Mount Ætna* in *Sicily*, and *Vesuvius* in *Campania*, hapned after this manner.

X. *How Fire is kindled by a Burning Glass.*

There is also another way of *kindling Fire*, *viz.* when the *Beams* of the *Sun* are concentred in a *concave Glass*, for by this means the *Globuli* acting with their joint forces, do excite a various and vehement excitation of the *Terrestrial Particles*, whence proceeds a *Flame*, the *Heavenly Globuli* being beaten back, by the swift agitation of the *Terrestrial Particles*, so as that the *Particles* of the most *subtil matter* can freely flow together and continue this agitation.

XI. *Sharp Spirits can also kindle a Fire.*

A *Fire* also may be kindled by *sharp Spirits*, as appears in *Hay*, which if it be laid up before it be sufficiently dry, it becomes hot by degrees, and at last breaks forth into a *Flame*, because the *Spirits* of *Herbs* that are shut up in it, have not so free an egress, as when they were *Green*, and before they began to be dried; and therefore being no longer able to enter into the same passages, with the *Globuli* of the *Second Element*, they become surrounded only by the matter of the *First Element*, which putting them into a most swift *motion*, makes a *Flame* to appear. But this never happens in *Wood*, tho' it be struck never so much, because its *substance* is not stiff enough, that by a *concussion* of another *hard Body*, the *Globuli* of the *Second Element* should be driven away, because the part that is struck bends towards another, before that the Second begins to bend towards the Third, and that again towards those that are next to it, by which means its force of flying back is lost.

XII. *How Fire is Nourisht or Fed.*

But forasmuch as *Flame* is perpetually turn'd to *Smoak*, and is no more the same than a *River*, which is continually supplied by an access of new *waters*, it is of absolute necessity that it have some *Food* or *Fewel* whereby it may be preserved and maintained. And this is no other but those *Terrestrial Parts*, which being agitated by the *matter* of the *First Element*, have a power to drive away the *Air* or any other *Body*, that might extinguish it. It is also requisit that these *particles* be very *thin*, that they may be able to supply the room of the vanishing *Smoak*: for the thicker *particles* are easily surrounded by the *Globuli* of the *Second Element*, and possessing themselves of the places which the *particles* of the *First Element* have left, do much break the force of the *Fire*, and choak its *Flame*.

XIII. *Oily and Sulphurous Bodies are a proper fewel to preserve Fire.*

For which reason also all *Oily*, *Sulphurous* and *Bituminous Bodies* are of all others most conducive to maintain and preserve *Fire*; for that by reason of the contexture of their *Branch-like* Parts, and their fit *Thickness*, they are most fit and disposed to be agitated by the *particles* of the *First Element*, and being thereby driven out of their places, to communicate their *motion* to other *Bodies* with such force as that they drive away the *particles* of the *Second Element*, which otherwise would extinguish the *Fire* into which they strive to enter on every side.

XIV. *How Flame is produced.*

These things premis'd, it will be easie to conceive, that *Flame* is nothing else but a *Fire* wholly at liberty, that is, a *Fire* whose parts are so agitated, that they entirely separate themselves from each other, and do only swim in the matter of the *First Element*. It will be likewise readily conceived how a *Flame* is produc'd, by viewing the *Candle* A B, and *reflecting* that there be many parts of *Wax* that move very swiftly throughout the whole space C D E, where they constitute a *Flame*, because they swim alone in the *matter* of the *First Element*. We must also consider, that the parts of *Wax* that constitute the *Flame* do continually strive to mount still higher, for that by reason of their great agitation they are more light than the *Air*, that surrounds them, which having been forced to descend continually, endeavours to return to its place again, and to which indeed it would return, if the new *particles* of *Wax* that come forth from the Wick, and which begin to follow the Course of the *First Element*, did not hinder it; which is confirmed by experience, which shews us that as soon as the *particles* of *Wax* cease to proceed thence, or tho' they do, yet have not force enough, the *Flame* ceaseth in the space C D E, and the *Air* possesseth it self of its place. Figure 59.

XV. *Why the Flame always mounts upwards, and ends in a point.*

It is peculiar to *Flame* to mount upwards, and to end in a *sharp point*: the reason whereof is, because the *Flame*, by reason of the great abundance of the matter of the *First Element* that is in it, being lighter than the *Air* that surrounds it, must of necessity tend upwards: and because the middle parts of the *Flame* G D E, are more strongly agitated by means of their greater solidity, than those which are about the utmost parts C C, whose *motion* is much diminisht by the neighbouring *Air*, this makes the *Flame* to *end in a point*, and its *Smoak* to break forth chiefly at the top H, where the

the *Terreſtrial particles* begin to loſe their agitation. As for Example, When the *Smoak* aſcends towards H, it makes the *Air* to deſcend by I and K, towards B, where razing the *Wick*, it puſhes the *particles* of *Wax* towards the *flame*, which ſerve to nouriſh it: Which Circular motion of the *Air* towards the *flame*, Experience ſhews us, in that when a *Chamber* is cloſe ſhut, ſave only ſome little Hole or Chink, and a *Fire* be kindled in it, a *Wind* is perceived to enter in by the ſaid Chink; and which is ſo much the ſtronger, by how much the *Fire* is greater.

XVI. *The force of Fire upon Earthly Bodies.*

Fire is extreamly *active*, and exerts its Force upon the *hardeſt* Bodies; for its *Particles*, as ſo many ſharp *Needles* penetrate their *Pores*, and driving out the *particles* therein contained, they divide its *parts*, and turn them into their own Matter; and in caſe the *particles* of the *Bodies*, the *Fire* acts upon, are eaſily ſeparable, then they *melt*. For to be *melted*, or in a *liquid* form, imports nothing elſe, but that the *Body* in that ſtate conſiſts of *Particles* that are divided from each other, and in ſome agitation. As on the other hand, *Bodies* are *dried*, when by approaching to the *fire*, their thin and ſlippery *Particles* are exhaled, the more thick Parts being left, which being thereby more cloſely joyn'd together, conſtitute *hard Bodies*.

XVII. *The Ventilation of the Air is neceſſary, to the preſervation of Fire.*

The *Ventilation* of the *Air* is neceſſary to *Fire*; becauſe the *Air* being puſh'd upwards by the mounting *flame*, cannot enter into another place, which the *Fire*, by conſuming its Fewel, leaves open for it; and whilſt it thus ſucceeds, it like a *Fan* or *Bellows*, drives the *fire* into the more inward parts of the *fewel*, and diſſipating thoſe that are more Heavy, doth thus by blowing preſerve the *fire*: For where this is not, and the *Air* is hindred from ſupplying the ſaid place, the *flame* not being able to give way, becomes choak'd by the more heavy and groſs *Fumes*.

XVIII. *Fire is extinguiſh'd by any Liquor poured upon it.*

Fire is put out, when any *liquor* or *moiſture* is poured upon it in a greater quantity, than can be put into motion by the force of the *fired Particles*; which is the Cauſe why a little *Water* increaſeth the *Fire*, whereas a great deal of it doth put it out.

XIX. *Why the Air muſt have free acceſs into a Chamber, that the Fire may not fill it with Smoak.*

Hence it is, that when a *Fire* is kindled in a *Chamber*, if the *Air* hath no free acceſs to it, the whole *Chamber* becomes preſently fill'd with *Smoak*. Becauſe the *Air* drives away from it great ſtore of *Air*, together with the *Particles*, of combuſtible *Bodies*: For it is theſe that being mix'd with the *Air*, conſtitute the *Smoak*, as the more ſolid Parts of thoſe *Bodies* are turn'd to *Aſhes*. And ſince it is repugnant that there ſhould be any *Vacuum* in Nature, it is neceſſary that ſo much *Air* enter the *Chamber*, as there is *Smoak* going out: For except this be, the whole *Chamber* will be fill'd with *Smoak*.

CHAP. XXII.

Of the Nature of Heat and Cold.

I. *Heat and Cold do not belong to any ſpecies of Quality really diſtinct from the Subject.*

HAving already rejected all *Qualities* really diſtinct from their *Subjects*, we ſhall not trouble our ſelves with the enquiry, to what Species of theſe Qualities, *Heat* and *Cold* do belong. And the rather, becauſe theſe *Forms* are unknown to us; and if we ſhould admit them, the Enquiry will ſtill remain, by what Virtue they operate, if they be *Active*; and how the Senſe ſuffers by them, if they be *Patible*. Wherefore it remains only for us to determine, to what *General Head* of things *Heat* and *Cold* do belong; *viz.* Whether they be *Subſtances*, or are only to be accounted amongſt the *Modes* of *Subſtances*.

II. *Wherein the Nature of Qualities in general doth conſiſt.*

Qualities that belong to Matter are nothing elſe, but certain diſpoſitions in the *Subjects*, conſiſting in *Magnitude*, *Figure*, *Motion* and *Situation* of *Parts*, whence they produce ſeveral ways of Senſation: Tho there be nothing in theſe *Bodies* like to thoſe *Idea's* they awake or excite in us; ſo that tho' the *Particles*, for Example, of an *Hot Object* be otherwiſe diſpos'd than thoſe of a *Cold*, yet in neither of them is there any thing like to thoſe *Idea's* or *Modes* of *Senſation* they ſtir up in us.

III. *Qualities are certain Modes in Bodies.*

If any one therefore enquire, whether theſe *Qualities* are *Modes* exiſting in *Bodies*? We Anſwer that they are ſo, if they be taken for the various diſpoſition of *Parts*; but not ſo, if they be taken for thoſe *Modes* of *Perception* which they excite in us.

IV. *What Heat and Cold is.*

Heat therefore is a *Quality ariſing from a greater and unequal Motion of the Terreſtrial Particles*: And *Cold* is a *Quality proceeding from the quiet of the Parts, or at leaſt from a leſs degree of Motion in them.*

V. *Heat conſiſts in Motion, and Cold in Reſt.*

We aſſert therefore, That *Heat* is nothing elſe, but the *motion* or *agitation* of the ſmall *Parts* of a *Body*; and *Cold*, their *reſt* or *conſiſtence*. Now that *Heat* is nothing elſe, but *motion*, may be proved from its Increaſe and Decreaſe; for we find that *Liquid Bodies* become hot, when their *Particles* are put in *motion* by *Fire*. Thus we find that *boyling Water*, *melted Metals*, and all other things, when ſet on *fire*, are very much agitated, neither is *heat* to be perceived in them, till their *Parts* be put in *motion*. In *conſiſtent* or compact *Bodies* we likewiſe find, that when they are ſtruck or rub one againſt the other, provided it be done with ſome Force, (as when two pieces of *Wood* are rub'd againſt each other, or a *Knife whetted* upon a *Whetſtone*) *heat* is excited in them both. For the *Heat* in any *Body* becomes increaſed, and grows ſtronger, by how much the *agitation* is greater. Hence it is, that nothing, amongſt *Natural Bodies*, is more hot than *Flame* is, becauſe nothing hath its *Parts* more agitated, as daily Experience teacheth. And if there appear any difference between one *Flame* and another, that proceeds only, becauſe the *Parts* whereof they are compoſed, are more or leſs *thick*; and conſequently more or leſs powerful to agitate thoſe *Bodies*, on which they exert their Forces.

VI. *All the Particles of Fire are moved, but not the whole Fire it ſelf.*

When we ſay, That *Heat* is *Motion*; we are not ſo to be underſtood, as if the whole *Body* that is *heated* were agitated: For it is repugnant that the ſame *Body*, ſhould at one and the ſame time be moved by various *Motions*; but only that the ſmall *particles* thereof be in *motion* and variouſly agitated; that is, that they change their *ſituation*, and are differently apply'd to the different *parts* of *ambient Bodies*, ſo as to be toſſed with various determinations, to the Right, to the Left, Upwards, Downwards, Forwards and Backwards, according to their ſeveral diſpoſitions and *figures*.

If

VII. *In what sense Liquid Bodies are said to be hot.*

If any one Object, That according to this Explication it will follow, that all *Liquid Bodies*, as *Water*, *Wind*, *Air*, and the like, are *hot*; because, as hath been said in our *General Physicks*, their *parts* are variously moved. For *Water* is no other ways distinguish'd from *Ice*, but because its *parts* are in continual *motion*; whereas those of *Ice* continue always in the same situation.

VIII. *The Answer to the foregoing Objection.*

Before I come to give a satisfactory Answer to this Difficulty, I would have it noted, that every *agitation* cannot be called *Heat*, but that only which is of force enough to affect the Sense of *Feeling*, and to shake the *Filaments* of our *Nerves*: For if the *motion* be not strong enough to produce this effect, we cannot give it the Name of *Heat*; that being an *Appellation*, which is attributed to things with relation to our *Senses*. Thus when a *Sound* is so weak, as not to reach our *Ears*, tho' it may wave the *Air*, it cannot be called a *Sound*. And so to denominate any thing *hot*, it is requisite that there be such a *motion* of the *Particles*, as to affect the *Nerves* of our *Hand*, or some other part of our *Body*. *Fluid Bodies* therefore, consider'd in themselves, and without any respect to our *Senses*, may be called *Hot*, tho' not *comparatively*, that is, with reference to our Sense of *Feeling*; except it should happen, that the *Particles* of our *Hand*, which is the ordinary *Organ* of *Feeling*, be more slowly moved than the *Particles* of the *Body* that is *felt*: As it happens, when with a *hot Hand* we touch a *Body* that is *Lukewarm*, which then feels *cold* to us; and yet we shall feel the same *Body* hot, if we apply our other *Hand* that is cold. *Water* therefore absolutely consider'd, may be said to be *hot*, because it contains some *heat* in it self, and is capable of being more *cold* by many degrees, as when it begins to *freez*: But with regard to our Sense it is *cold*, because it excites no such Sensation as we call *Heat*, in our *Organs*.

IX. *The Nature of Cold consists in Rest.*

Having discover'd the *Nature* of *Heat*, we cannot be ignorant of that of *Cold*: For as *Heat* is the various agitation of the insensible *parts* of a *Body*; so *Cold* is their *Rest*, or at least a diminution of their *Motion*. For we find by daily Experience, that *Hot-water* grows by so much the *colder*, as the Agitation of its *parts* ceaseth, till at last, by a total Cessation thereof, it be changed into *Ice*, which of all others is the most *cold Body*. Thus the things that are said to be *cold*, are endued with little or no Agitation, and consequently are not able to move our *Senses*, but rather moderate and put a stop to the *motion* of our *Animal Spirits*. Thus, as long as our *Fingers* are warm, we can do any thing with them; but when once they are seiz'd with *cold*, they become useless to us in the performing of any work.

X. *Why hot things take up more place, than such as are cold.*

A *Hot thing* therefore differs from a *Cold thing*, as a thing that is at rest or less moved, differs from that which is *moved*, or more swiftly moved. Whence it is that those *Bodies*, whose Parts are agitated by *heat*, contrary to their Custom, cannot be comprehended in so small a space or room, as those which are at rest, or are less moved; forasmuch as by means of this *motion* their small *particles* are rendred *irregular*, which therefore require more room, than when they are united, and are not separated by any agitation.

Some suppose *Cold* to be nothing else, but a *Privation* of *Heat*; but these seem not to have understood the Nature of *Rest*; which is nothing else, but *an abode in the same situation*: Now *Abode* or Continuance, is something *Positive*, yea, more *positive* than *motion* it self. For that which is unchangeable, must without doubt more partake of the Nature of an *Entity*, than that which consists in continual Change and Vicissitude. Wherefore we must conclude, that *Rest* or *Quiet* is a positive *thing*, as having no less efficacy than *Motion*. For which of the two shall we reckon to be most positive; that which keeps together and preserves other *Bodies*, or that which dissipates and destroys them? Now it is the Property of *Rest* to preserve many things, that by *Motion* are spoil'd and damnified: Wherefore *Rest* ought to be look'd upon as being more positive than *Motion*. For who will assert, that *to abide in a place*, *to continue in time*, *to rest in a Seat*, or the like, which belong to *Rest*, to be less positive, than *to take a Journey*, *to run a Race*, or *to be in a continual flowing*, which belong to *Motion*? Indeed it is an Error of our Mind, whereby we take *Rest* to be something *Privative*, and *Motion* to be *Positive*; because we experience, that the one depends on our *Will*, whereas the other is scarcely taken notice of by us.

XI. *Cold is something that is Positive.*

It seems strange to some, that by *Rest* only, which constitutes the Nature of Cold, *Rivers* and *Seas* should be *frozen*, and the Life of *Animals* should be destroy'd: And yet it is evident, that all this is done by *Rest* alone, not the least of *Motion* being to be found in any of these Effects. For what doth the *freezing* of *Rivers* and *Seas* import, but such a union and clinging together of their *parts*, whereby they do consist and are at *rest*? For no stronger *Argument* can be alledg'd to prove, that any *Bodies* are joyn'd, than to say that they lye at *rest* together.

XII. *It is by Rest alone that Rivers are frozen, yea, the Sea it self, and that Living Creatures die.*

XIII. *The parts of Ice are at Rest, tho' the whole may be carried along by the stream of the River.*

For tho' a whole *Body* of *Ice* may be carried along the *Water*, yet its Parts notwithstanding are at Rest together; for in case they were in agitation, then would they no longer constitute *Ice*, but *Water*; as we find, that when the *Frost* breaks, the parts of the *Ice* that lay still together before, by being separated through *motion*, turn to *Water*.

XIV. *Cold, as it is a Rest of the Parts of a Body kills Living Creatures.*

That *Cold* is the Cause of the *Death* of *Living Creatures*, must not seem strange to us, seeing that our *Bodily Life* consists in the various agitation of the *Blood*, *Spirits* and *Humours*, upon the diminution or cessation whereof, *Life* it self must cease also. For as by too intense *Cold*, that is, by the consistence of the insensible *Particles* of the *Air* and *Water*, the *Water* that turns a *Mill* is congealed; so the total cessation or diminution of the *motion* of the *Blood* and *Spirits* in the *Bodies* of *Living Creatures*, deprives them of *Life*. As we find, that in the *Winter* time, *Flies* and many other *Living Creatures* consume and *dye*, especially when the *cold* is very intense.

XV. *What Potential Heat and Cold is.*

As there is an *Actual Heat* and *Cold* found in *Bodies*, so some *Bodies* are said to be *Potentially hot* or *cold*. Those are called *Potentially hot* [illegible] *which have an aptitude or disposition to grow hot, or heat other things*; which ariseth from hence, that their *particles* are so disposed, that they are liable to be more violently moved by the *Subtil matter*,

matter, which runs through all *Bodies*. Thus *Quick-Lime*, which is *cold* to the Touch, is said to be *hot Potentially*, because the *Subtil matter* can easily excite an Agitation in its *Pores*. In like manner all other *Bodies*, which can produce such a *motion* in the *Particles* of other *Bodies*, are said to be *Potentially hot*; such as are *Pepper*, *Ginger*, *Spirit of Wine*, and the like. And on the contrary, that *Body* is said to be *Potentially cold*, whose *Particles* cannot be agitated by the *Subtil matter*; or whose disposition of *parts* is such, as to hinder the *particles* of any *Body* to be put in agitation by others; such as are *Lettice*, *Vinegar*, *&c.*

CHAP. XXIII.

Of the various Effects of Fire.

I. *Some Effects of Fire remain still to be explained.*

HAving hitherto consider'd the Nature of *Fire*, and how it diffuseth *Light* from it self through the *Air*, and communicates *heat* to those *Bodies* that are near it; it remains now that we explain some other of its *Effects*, *viz.* how it *rarefies* and *condenses* some *Bodies*, *softens* and *melts* others, and again *hardens* and *dries*; changeth some into *Calx* or *Ashes*, and others into *Glass*. In order to the giving of a Reason for these different *Effects*, we are to presuppose that *Rule* of the *Philosophers*; that, *Every Action is received, not so much according to the manner and condition of the Agent, as according to the Disposition of the Patient.* The *Action* of the *Fire* is every where one and the same; but the difference of the *Effect* proceeds from the diversity of the Matter whereon it acts.

II. *How the Fire rarefies Bodies.*

In the *First* place therefore, if a *Body*, whose Parts are pretty close together, be very much heated, let those *parts* be of what *figure* they please, provided only that they be not *Round*, whilst they are whirl'd about their own *Center*, they cannot but meet with their *Corners*, and push one another, and then such a *Body* is said to be rarefied; as appears in *Milk*, when it *boils*, as well as in other *Liquors*. The same may be often perceived in *hard Bodies*, which being heated, do lose few of their *Particles* by *Exhalation*. Thus *Red-hot Iron* is more *turgid* than that which is *cold*.

III. *How it condenseth them.*

But in case the *Parts* of a *Body* be very *light*, and very susceptible of Agitation, and yet have some slight Coherence; yet so, as that they scarcely touch one another, and constitute a Whole, that is, of a very *loose* and incompact *Substance*, the least *heat* supervening to such *Bodies* as these, and communicating some *motion* to their *parts*, disposeth them to a nearer *Conjunction*, and by this means condenseth the whole *Body*: As when *Heat* reduceth *Snow* to a less *bulk*, by making the *parts* of it closer together.

IV. *How Bodies grow soft by the force of the Fire.*

The *Fire* softens *Bodies*, by agitating their *Particles* with so moderate a *Motion*, as doth only move them, without separating them from one another. Which happens only in those *Bodies* that consist of such *parts*, as are with equal facility separated from each other; as in *Wax*, *a hot Hand*, *Lead*, and other such like, whose insensible *parts* are not wholly without *motion*, tho' the slowness of it make it imperceptible.

V. *How Bodies are melted by the Fire.*

The *Fire* melts *Bodies*, whilst it not only moves their *Particles*, but also separates them from each other, as to their *situation*. For by the violent agitation of the *Fire*, the *particles* of *Bodies* are separated from one another, and most swiftly moved. And accordingly *Metals*, tho' otherwise *hard Bodies*, are by the force of *Heat* melted, and resolved into *Homogeneal Particles*, as they are usually called.

VI. *How Bodies by Fire are resolved into Vapour, and afterward turn to Water, or other Liquor.*

A like Effect of *Fire* is *DISTILLATION*, by means whereof a *Body* is changed first into *Vapour*, and afterward, as that *Vapour* condenseth, is turn'd to *Liquor*: Which may be done several ways, according to the several *degrees* of *Fire*, as by the *moist Heat*, as the *Chymists* call it, which is that of a *Balneum*, or by the *dry heat* of *Ashes*, *Sand*, or a *naked Fire*. And by this separation of *parts*, there are distill'd from *Bodies* first *Burning Spirits*; then *Phlegm* or insipid *Water*; and lastly, a sharp and *corroding Liquor*, which by a very violent *Fire* is distill'd from *Salts*.

VII. *How Bodies come to heat and boil, by means of Fire.*

But if the *agitation* of the *Liquid particles* be so great, that some of them be carried *upwards*, or be changed into *Air* or *Fire*, and so requiring a greater Space wherein to dilate themselves, and to pursue their *motion*, do thrust other *Bodies* out of their places; then these *Liquid Bodies* become very *hot* and *boil*. Now this great *Heat* or effervescence is carried on with an equal *motion*, and without any great perturbation of their *parts*, when the said *Liquid Bodies* do not contain much *Heterogeneous matter*; as it happens in *Wine* and *pure Water*. But they *boil*, where the Matter of *Bodies* is more *Heterogeneous*, partly *spirituous* and *volatile*, and partly *thick* and *clammy*, or ropy: These being the two Matters that concur to the making of *Bubbles*; for *viscous* and *clammy Matter*, serves to make the *Skins* of the *Bubbles*, and the *volatile Matter* furnisheth that *Aiery Spirit* that fills and distends them. But if the *agitation* of the *Heat* be not strong enough to overcome the *Heaviness* of *Bodies*, then it cannot dilate those *Bodies*, so as to make them take up a greater Space. And therefore it is, that the *particles* of *Metals* do not fly up into the *Air*, because the force of Heaviness that is in them, surpasseth the Activity of the *Fire*.

VIII. *How it comes to pass, that the Fire harden and dries some Bodies.*

As the *Fire* softens and melts some *Bodies*, so it *hardens* and *dries* others, *viz.* such as are compounded partly of *thin*, *flexible*, *slippery* and *volatile Parts*; and partly of *Thick* and *Branchy parts* mix'd together, but not very firmly sticking to one another. For that *Body* is said to be *dry*, which *wants those fluid Particles*, *which when united together do constitute Water*, *or any other Liquor*. Such *Bodies* as these therefore, as soon as they come near the *fire*, their fluid and thin *Particles* being exhaled or turned into *Vapour*, become *dry*, and their thick and branchy *Particles* are left alone by themselves; which being more nearly and closely joyned, and with greater firmness hanging together, do constitute *hard Bodies*. As is manifest in *Clay*, some of the *pores* whereof are by *heat* shut up, and others again dilated and left more open.

IX. *How Fire turns Bodies into a Calx and Ashes.*

Another Effect of *Fire* is, that it separates most *Bodies* either into a kind of *Calx*, or into *Ashes*, according to the various application thereof. For when those *Bodies* that are apt to melt, are so

placed, as that a violent *flame* of *Reverberation* may beat upon them, they become turned into a *Calx*. For all *Hard Bodies*, which by the Action of *Fire*, are reduc'd to a *powder*, by expulsion of some of their thinner *Particles*, which joyned the other *parts* together, are said by the *Chymists* to be turned into a *Calx*. So that *Calcination* is an *Operation*, whereby a *mix'd Body*, especially *Stones* and *Metals*, are reduced into a small *Powder*. Neither is there any other difference between *Ashes* and a *Calx*, save that *Ashes* are the Remainders of those *Bodies*, whereof a great part hath already been consumed in the *fire*: Whereas a *Calx* is of those *Bodies*, which suffer little or no diminution at all by the Action of *fire*, as not being inflammable. And both of them agree in this, that they consist of solid and thick *Parts*, such as by the ordinary force of the *fire* cannot be changed into *Vapours*, and are of *irregular* and many *Corner'd figures*; so that they only lye upon one another, without sticking close together, and probably do not touch one another, but in some very small Points.

X. *How these Calces, and the Ashes of Bodies are by Fire turn'd into Glass.*

If afterwards these *Calces*, or the *Ashes*, are committed to a strong and long continued *Fire*, their *Corners* or *Angles*, which are the cause of the Roughness and Opacity that is in *Ashes*, become bended, by which means the *particles* being agitated and tost together, are at last more closely joyned, polished, and made more smooth, which touching each other only, according to little *Surfaces*, do constitute that *hard*, *transparent* and *brittle* Body, which is commonly called *Glass*.

XI. *Why Glass is hard, stiff, transparent, and brittle.*

GLASS is a *hard* and *stiff Body*, because it consists of thick and inflexible *particles*, which are not joyn'd together by any intangling of the *Branchy parts*, but by contact only. It is *Transparent*, because after its concretion or coagulation it still retains its *Pores*, through which the *Heavenly Globuli* can continue their *motion* to *Right Lines*, according as they were moved before, when it was *Liquid*. Lastly, It is *Brittle*, because the *Surfaces*, in which its *particles* touch one another are very small.

XII. *How Earthquakes are caused by Fire.*

Fire not only exerts its Activity upon the *Surface* of the *Earth*, but also in the *Cavities* or Inward parts of it; where it is the cause of EARTHQUAKES, as often as any great store of *Exhalations* are found there: Not that they of themselves are able to produce this effect, seeing their *Particles* do only constitute the *Air*; but because they easily mingle themselves with the more *Subtil particles* of *Spirits*, and being heated and kindled by them, seek for a larger *place* wherein they may dilate themselves; and being not able to find that, they shake all that stands in their way: Much in the same manner as *Gunpowder*, shut up in a Mine, as soon as it is kindled, by endeavouring to make room for it self, makes a great Concussion, making the *Earth* to *quake*. Which is the reason why those places are most subject to *Earthquakes*, which abound with Veins of *Saltpeter*, *Brimstone*, or other *Oleaginous matters*; these being easily kindled by *Spirits*, or by any *spark* of *Fire*, from the dashing together of *Stones* or *Flints*. And as soon as they are kindled, not being able to contain themselves in the same Space, they are carried upward, and break through their Prison Walls, to make room for themselves.

XIII. *Subterraneous Fires act differently.*

EXHALATIONS, kindled in the *Holes* of the *Earth*, do break forth outwardly on the *Surface* of it, when they are of force enough to make a way for themselves thro' the outward *Crust* of the *Earth*; but when they are not of strength enough to do this, they only cause a *simple Earthquake*, that is, they only make the *Country* round about to rise a little; as *Gun-powder* raiseth the *Terrasses* that lead to the Mines. *An Earthquake* therefore *is* nothing else, but *the Shaking of any Place or Country, which is accompanied sometimes with a breach of the Ground, and a terrible Noise.*

XIV. *What Fermentation is, and the Cause of it.*

FERMENTATION is accounted amongst the Effects of *Fire*; and happens, when the Matter of the *first Element* is so shut up in the narrow *Pores* of *Earthly Bodies*, that tho' many thick *Particles* swim in their little Spaces, yet are they so agitated by some *Watry* and *Airy particles* that are insensibly mix'd with them, as to be able to affect our *Nerves*, and produce the perception of *Heat*. Such a fervescence or rising is found in *Dough*, and in the working of *New Wine*, Beer, and other potulent *Liquors*: So likewise in *Oil of Vitriol*, mix'd with *Salt of Tartar*; *Aqua-fortis*, in which *Copper* is put, and other such like. Because the *Particles* of these *Bodies* are so agitated by the *Æthereal matter*, that runs through their *Pores*, as not only thereby to be heated, but also rarefied and subtiliz'd; so that the Hooks and Intanglements, whereby their *Particles* before were held and kept together, are dissolved. *Fermentation* therefore *is* nothing else, but *the adventitious and expansive Motion of the insensible Heterogeneous parts of fermenting Bodies, excited without any sensible Cause.*

XV. *Heterogeneous Particles are required to the Motion of Fermentation.*

Bodies subject to *Fermentation* are not of one kind; for they may be either *Animate*, or without *Life*, *Thin* or *Thick*, *Natural* or *Artificial*, provided they do consist of *Heterogeneous parts*. Now this *Heterogeneity* of *parts* is found in those *Bodies*, which are compounded of *Particles*, whereof some are in continual *motion*, and others again are *Earthly*, *thick*, and more *fix'd*, which hinder the more *Volatile parts* from flying away. For on this contrariety and *strife* of the Parts *fermentation* chiefly depends; for where the *Particles* are of the same *figure* and *conformation*, no *fermentation* can be excited. Thus we find, that *New Beer*, or *Wine*, when shut up in narrow Mouth'd *Bottles* do ferment or work with such Violence, that they often break the *Bottles*: Whereas if the *parts* of these *Liquors* be separated by *distillation*, they will no longer be capable of *fermentation*. For which Reason, *Stillatitious Oils*, *burning Spirits*, and *distill'd Waters*, will continue a vast while without the least change by *fermentation*. Thus *Spirit of Wine*, shut up in a *Bottle*, is very far from falling into a fret or effervescence; but if you add some *Oil of Turpentine* to it, it excites such a commotion of the *parts*, as endangers the breaking of the *Bottle*, in case it be close stopt.

CHAP.

CHAP. XXIV.

Of the Mixtion of Bodies: As likewise of their Changes, Converſion, Generation, Corruption, Alteration, Augmentation and Diminution.

I. *There is a twofold Mixtion of Bodies.*

THAT it may be the better apprehended what *Mixtion* is, we are to obſerve that things may be mingled after a twofold manner; the *firſt* way is, by a *Compoſition* or rather *Appoſition* of the things to be mingled. The *ſecond* by their *Coalition* or *Confuſion*.

II. *What Appoſition and Confuſion is.*

Thoſe *Bodies* are ſaid to be mingled by *Appoſition*, whoſe parts do not wholly mix and run through one another, but only *ſuperficially* touch one another, keeping their diſtinct natures, as when *Fruits* of ſeveral ſorts are heaped together, and make one heap. But the *Mixtion* by *Coalition* or *Confuſion* of *Bodies* is, when they are ſo mingled, as that they wholly run through one another, ſo that there is not the leaſt *particle* aſſignable in the *mixt Bodies*, which doth not conſiſt of every one of them. According as ſome think that the parts of *Water* pour'd into *Wine*, are ſo throughly mixed with the parts thereof, as to be ſuſceptive of the ſame *Action* and *Paſſion*. This laſt kind of *Mixtion ARISTOTLE* ſeems to defend *lib.* 1. *de Generat. cap.* 10. where he aſſerts that a new *ſubſtantial form* is produced in *Generation*, and that there is no part of the *mixt Body* ſo ſmall but is mixed.

III. *Ariſtotle's miſtake about the Mixtion of Bodies.*

But this opinion of *Ariſtotle* is not at all probable, for if we ſhould ſuppoſe the moſt perfect *mixtion* of all the moſt minute parts of a *Body*, this would deſtroy the very nature and notion of *mixture*; ſince it is the common notion of *mixture*, that the *things* mixed muſt ſtill continue; for if they do not abide, then it is not a *mixture* of ſeveral things, but a deſtruction. Beſides, if the *parts* of a *Mixt Body*, do wholly through and through pierce one another, ſo as to be coextended every way, then two *Bodies* will be in the ſame place, ſeeing there is no part ſo ſmall that is not mixed, and that is not partaker of all the parts both in *ſubſtance* and *quality*. From hence alſo it will follow, that a ſmall *Body*, by example a *Pint of Water*, will be equal and coextended to a far greater *Body*, *viz.* a *Gallon of Wine*, ſeeing that there is no part ſo ſmall, which does not conſiſt of *Wine* and *Water*.

IV. *The opinion of the Peripateticks concerning Mixture.*

Some *Ariſtoteleans*, to avoid theſe abſurdities, tell us, that all *Miſcibles* are not of the ſame *Power* and *Virtue*, and that the weaker do yeild to the ſtronger. So that when *a drop of Water* is caſt into a *Hogſhead* of *Wine*, it produceth no *mixture*, but that the form of the weaker part, *viz. Water*, is by the more powerful *Wine*, changed into its own nature, ſo that by the addition of this drop of *Water*, the *Wine* contained in the *Hogſhead* is encreaſed one drop.

V. *The Peripateticks confuted.*

But this Evaſion doth not agree with Reaſon; for I will only demand of them, whether this *drop* of *Water* caſt into the *Hogſhead* be changed into *Wine*? They will ſay it is. But if after this firſt drop, another and another be put in, and this continued, till the firſt quantity be 2 fold, 10 fold, 100 fold, 1000 fold encreaſed, what will be the kind or ſubſtance of this *Liquor* then? The *Peripateticks* according to their *Principles*, muſt ſay that the whole Maſs of this *Liquor* will be pure *Wine*, tho' inſtead of one *Gallon* of *Wine*, a 1000 of *Water* may have been pour'd into it drop by drop, ſince according to them, every drop of *Water*, by the overpowering quantity of *Wine*, was turned into *Wine*. But is not this abſurd? If they will not own this, let them tell us when the *VVine* began to loſe its form; and at what particular *drop* of *VVater*, the whole maſs of *VVater* became deprived of its form. But here they muſt be ſilent, and tho' ſore againſt their wills, acknowledge their Ignorance.

VI. *That Mixture is cauſed by Appoſition.*

Wherefore rejecting this *Sentence*, we muſt adhere to the former, and maintain that the *Mixtion* of *Bodies* is performed by the appoſition of *particles* to each other: Thus when *VVine* and *VVater* are mixed together, the parts of each *Liquor* continue in their diſtinct natures; ſo as that the *particles* of *VVine* and *VVater* are not in the ſame, but in diſtinct places, as black and white *Threads*, in the Weaving of any *Stuff* or *Cloath* do each poſſeſs their diſtinct intervals. Neither muſt it ſeem contradictory to what we here aſſert, that the mixture of *VVine* and *VVater*, cannot be perceived by our *Senſes*, becauſe the *particles* of *VVine* and *VVater* are ſo ſmall and ſubtil that they cannot be perceived by our *Sight*, nor diſtinguiſht by our *Taſt*.

VII. *Experiments proving Mixtion to be by Appoſition.*

And certainly we have great reaſon to believe that *Mixtion* is performed after this manner, ſince we find that *Bodies* that are *mixed* may be ſeparated again from each other. Thus *VVine* that is mixed with *VVater* may be ſeparated from it, either by a *Spunge* dipt in *Oyl*, or by a *Cup* made of *Ivy*, or by extream *Cold*, which *freezing* the *VVater*, leaves the *VVine*, or at leaſt the moſt *Spirituous Part* thereof in the center of the *Icy maſs unfrozen*. And the ſame is almoſt perceived in every *Body*, wherein there is but a little quantity of *Sulphur* and *Spirit*; for if you *diſtil* out of *Vitriol*, *Tartar*, *Saltpeter* and the like, their *Phlegm* and *Acid Spirit*, and after *diſtillation*, put them again to the remaining dregs, which the *Chymiſts* call their *Caput Mort*, you will find the ſame *Body* reſtored, which was before *diſtillation*, and almoſt of the ſame quantity or bigneſs as it was before. *Chymiſts* obſerve that when they mix the *Spirit of Vitriol* with the *Salt of Tartar*, there at firſt happens a great effervеſcence or ebullition, and when that is over, both the *Liquor* and *Salt* do quite loſe their ſharpneſs and acrimony, ſo that the *Body* remaining after this their effervеſcence, is a meer inſipid *Body*: But if then by *diſtillation* you ſeparate the *Spirit of Vitriol* from the *Salt of Tartar*, you'l find that neither of them are deprived of their former *virtue* and *force*, but that they are as ſharp and corroſive as before. All which *Experiments* do give us an undoubted evidence, that things after *mixture* retain the ſame nature they had before, and that *Mixture* is performed by *Appoſition* of the *Particles* of one *Body* to thoſe of another.

VIII. *What Mixture is, and how many ſeveral ways the ſame may be.*

Mixtion therefore or *Mixture is* nothing elſe but *the Collection of divers Bodies into one, and that by way of Appoſition.* It may be performed divers ways. 1*ſt*. By *Percolation* or ſtraining; thus *Blood*, *Urin*, *Medicinal VVaters*, *Stones*, almoſt all *Juices*, *VVine*, *Oyl*, &c. are made. 2*ly*.

2*ly*. By *Coction* or by Baking, thus *Salt*, *Bricks*, *Earthen ware* and *Glass* become one mixt *Body*. 3*ly*. By *Sublimation*, thus *Soot*, *Snot* or *Snivel*, and, it may be *Metals* also, and some *Salts* used by Chymists are made. 4*ly*. By *Distillation*, as many sorts of *Water*, *Rain*, *Dew*, *Manna*, and other things are made. 5*ly*. By *Dissolution*, thus *Salt-water*, the *Chyle*, or *nutritive Juice*, and dissolved or *melted Bodies* are made. 6*ly*. By *Exhalation*, as *Flame*, *Steams*, *Clouds* and other such like. 7*ly*. By *Concretion* or growing together, as *Snow*, *Frost*, *Hail*, the *Stone* in *Mans Body*, &c. 8*ly*. By *Calcination*, as many sorts of *Salts*, *Ashes*, *Quick-lime*. 9*ly*. By *Simple Commixtion*, as *Wine* mingled with *Water*, *Ointments*. 10*ly*. By *Simple Expression*, as *Wine*, *Oyl*, and most other *Juices*.

IX. *The Changes of Natural things.*

Mutation or Change *is the Vicissitude or Alteration of any thing, but chiefly of such as are bodily.* The nature whereof we shall the better apprehend, by taking notice that all Changes are of two kinds, *viz. Accidentary* or *Essential*. An *Accidentary Change* is that whereby only some *Accidents* are changed, which do not constitute the essence of a thing, such as are the changes of *Heating* and *Cooling*. *Essential Changes* are those wherein the *essences* of things are changed by the *Introduction* of a *New Form*, and by depriving them of the Form they had before. And forasmuch as according to what hath been said in our *General Physicks*, there are in the usual sense of the *Peripateticks* no substantial Forms, besides the *Soul* of *Man*, it follows that neither can there be in their meaning any *substantial change*, save that in the *production* of *man*, because in no other *production*, any such new *substance*, as they understand, is made; but in all Alterations and *Generations* the *matter* or common *subject* is only Accidentally or Essentially modified according to *Measure* or *Quantity*, *Rest*, *Motion*, *Position* and *Figure*.

X. *What Conversion is.*

To be more particular, *Conversion is that Action, whereby one thing is changed into another, by the Alteration of its former Modification, and the introduction of another, diverse from the former, the same common subject still remaining.* It is said that the *same Common Subject remains*: For the *Matter* which is the *Subject*, is numerically the *same* after the *Change*, as it was before, being only *Modified* anew. And this is well to be observed, because that otherwise it will not be any true *Conversion* or *Change* of one thing into another, but rather an *Exchange* of one thing for another.

XI. *The difference between an Accidental, Essential and Substantial Conversion.*

That *Action*, which is terminated in those *Modes* or *Accidents* that may be present or absent without the destruction of the *Subject*, is called an *Accidental Conversion*. But that which is terminated in that peculiar Modification, which is *Essential* to any thing, and doth distinguish it from all others, the same is called an *Essential Conversion*, and sometimes *Substantial*, inasmuch as it affects the very *substance* or *subject* it self, so and so modified. For indeed by the *substance* of any thing we are not to understand that *bare Entity*, which is conceived to be the *Subject* of the *Form*, and to be specificated by it, but both *Subject* and *Form* taken together, to wit, that *Thing* which consists of them both, or rather the *Subject*, as I said, it self, as considered with its peculiar *Modification*: So that when this *Constitution* or *Modification* is changed, and another introduced into the common *Subject*, it is evident that then the former *substance* is also changed, and turned into another. Thus when that peculiar *modification*, which constitutes the nature of *Wood*, is changed, and the *Essential* disposition that constitutes a *Stone* is introduced, in this case we must say that the *Wood* is *essentially* and *substantially* changed into a *Stone*. And so likewise in the case of *Nutrition*, when *Corn* is reduced to *Flower*, that to *Bread*, and the *Bread* into the *Blood* and *Flesh* of our *Bodies*, this I say is an *Essential* and *Substantial Conversion*.

XII. *What Generation is.*

So likewise *Generation* is nothing else but a certain disposition of matter according to the foresaid *Modifications* of *Measure*, &c. as in the Production of *PLANTS* and *BEASTS*; because in the *generation* of either of these, a new *substance* is no more produced, than in the framing of a *Statue*, or the building of a *House*. Now what happens to *Stone* or *Wood* when it is framed into a *Statue*, more than a new form or habitude in the matter of *Wood* or *Stone*? So likewise in the building of a *House*, there is no other change but what ariseth from the joining of *Stones*, *Boards*, *Tiles*, *Nails*, &c. which before were separate, but now being set together make such a composure or *structure* as hath the form of a *House*. And tho' the framing of a *Statue*, and the building of a *House* do terminate in a *Substance*, for both the *Statue* and *House* are *Substances*, yet no new *Substance* other than I have before asserted, is found in either of them, there being nothing superadded to them besides a new *Modification*, with which both these *Substances* are affected. Accordingly, *Generation is* nothing else but *a translation or new ranging of the parts of matter*, which is alike in Natural and Artificial *Compositions*.

XIII. *What Corruption is.*

As for *Corruption*, *it is* nothing else but *the dissolution of parts that were before united*. Thus as a *House* is said to be destroyed when its several parts are separated from each other; so *Wood* or other combustible *matter* is said to be corrupted or destroyed, when by *Flame* it is resolved into *Ashes* and *Smoak*. The Cause of the *Corruption* of *Bodies* is when strange *particles*, by thrusting themselves into their *pores*, do thereby change and destroy the Texture, Connexion and order of their *Parts*. Hence it is that those *Bodies* that have less *pores*, are for the most part more durable than others, and less subject to *Corruption* or *Destruction*.

XIV. *What Alteration is.*

Alteration is nothing else but the *change*, whereby a *subject*, still abiding the same, becomes changed as to some *Accidents*. So *Water* is said to be altered, when it is *heated* by the *Sun* or *Fire*: and a *Man* is said to be altered, when of *Healthful*, he becomes *Sick*, and of *Ignorant*, *Learned*, &c. Because *Man*, by supervening *Sickness* or *Learning* is not changed into another thing than he was before. And therefore *Aristotle* in the 1*st*. *Book of Generation chap.* 4. defines *Alteration to be that whereby a sensible subject, abiding still the same, becomes changed in its affections*.

XV. *What Augmentation or Growth is.*

Augmentation or *Growth*, to speak properly, is nothing else, but *Nutrition*, whereby more *substance* is restored, than was lost or dissipated. For *Augmentation* is never performed without *local Motion*, since nothing can grow or encrease, but by the

the acceſs or appoſition of *aliment* to its parts, and by the union thereof with them. Thus when the *Innate Heat*, and *Temperament* of the *Body* are ſuch, as that more prepared *Food* or *Aliment* is added to it, than it has loſt, that *Body* is ſaid to grow or encreaſe. As when a *Tree* by the *Juice* it draws out of the *Earth* grows taller, and ſpreads wider.

XVI. *What Diminution is.*

The *Diminution* or *Decreaſe* of *Bodies*, is when this *Nutrition* ceaſeth, and when leſs *Subſtance* is reſtored than has been diſſipated or loſt. The *Cauſe* of *Diminution* is, either the want of *Food*, or when the *Food* is not ſuch as is proper to feed the *Body*; or becauſe of the weakneſs of the *Innate Heat*, as happens in thoſe that are *Old*; or becauſe the ſaid *Heat* is too ſtrong, as in thoſe who are of a *Cholerick Temperament*; or when the *Body* is ſo diſpoſed, that it cannot be ſupplied with ſufficient *Food*: Or laſtly, when the little *conſtitutive parts* of the *Body* begin to waſte and are conſumed, whatſoever may be the cauſe of it; for then the *Muſculous Parts* fall down, and grow *Flaggy* for want of a ſufficient acceſſion of new *Subſtance*, cauſed by a too ſparing ſupply of *Food*, or becauſe the ſame is not fitly prepared or concocted. Whence we underſtand that *Augmentation* or *Growth*, and *Diminution* do conſiſt in *Local Motion*.

The Seventh Part
OF THE
INSTITUTION
OF
PHILOSOPHY.
OF
LIVING CREATURES
In General: And Specially of
PLANTS and ANIMALS.

The INTRODUCTION.
Of the Diviſion of Living Creatures.

I. *The Diviſion of Bodies into ſuch as are living and deſtitute of Life.*

HItherto we have conſidered the Nature of *Inanimate Bodies*, whether hid in the *Bowels* of the *Earth*, or expoſed in the Face of the *Heavens*. And now we proceed to *Living Bodies*, viz. *Plants* and *Animals*, which are comprehended under this *General Notion*, becauſe they are endued with *Life*, and are furniſht with *Inſtruments* appropriated to *Nutrition*, *Growth* and *Propagation*. For all Bodies in the Univerſe are either *Living* or *devoid of Life*. Amongſt thoſe that are without *Life* are reckoned *the Heaven*, *the Stars*, *Fire*, *Air*, *Water*, *Earth*, *Metals*, *Stones* and *Foſſils* or things dug out of the *Earth*: So that of all the *Creatures* contained in the World, *Plants* and *Animals* only are endued with *Life*.

II. *What Living Bodies are.*

Now we call thoſe *Living Bodies*, *that have received from the Author of Nature ſuch a Diſpoſition of an Organical Body, as that by innumerable paſſages and conveyances it hath, the Alimentary juice, being by motion thruſt into them, is by the Soul every way diſperſed and diſtributed, for their Nouriſhment, Growth and Conſervation.* They are called *Living* Bodies from the *Life* they poſſeſs, and *Animate* Bodies from their *Soul*.

III. *What the Vegetative Soul is.*

This *Soul*, a fit Diſpoſition of *Parts* being firſt ſuppoſed, chiefly conſiſts in the *Innate* or *Inborn-heat*, which is a *Heating*, but not a *Shining Fire*, *generated* in *Bodies* at their firſt *Production*, by means whereof the *Alimentary Juice*, for their *conſervation*, is duly prepared, and diſtributed throughout the whole *Body*, and joined to the ſeveral parts of it, for a ſupply of that which daily waſtes away, by which means *Vegetation*, that is, *Nouriſhment* or *Nutrition*, and Encreaſe or Growth are performed. And therefore this *Soul* is called *Vegetative*.

IV. *Why a Body is ſaid to live and die.*

The *Life* flows from this *Soul*. For if the *Heat* be preſerved and maintained by convenient *Moiſture*, as its proper *Food*, then that *Body* is ſaid to *Live*; and on the contrary to *Die* or *Periſh*, when *Cold* and *Drineſs* do ſo predominate in it, as that the *Inborn Heat* becomes thereby diminiſhed or quite taken away.

V. *There are two General Heads of Living Bodies, Plants and Animals.*

Now foraſmuch as *PLANTS* and *ANIMALS* do both of them enjoy the common degree of *Life*, and reſort under *Vegetable* as under their Immediate *Genus* or *General Head*, we muſt firſt conſider their *Affections*, and whatſoever doth in general belong to them; as for Example, *wherein chiefly the Nature of Living Bodies doth conſiſt; how ſuch as are Vegetable differ from thoſe that are devoid of Vegetation; what that Heat is whereby they are Cheriſhed and Live, and whence their difference is deriv'd.* For there are two *General Heads* of *Living Bodies*; the *Firſt* whereof are thoſe, which according to their outward and inward *ſhape* exhibit a *ſubſtance* equally extended; and wherein from the top to the bottom we perceive but one and the ſame progreſs of *Nature*; ſo that all their *parts* are nouriſhed, grow and are generated, without any diſtinction in their *operations*; their *Bodies* being as ſo many *Channels* and *Pipes* through which the *Food* is tranſmitted, and in which it undergoes ſeveral changes. And theſe are called *PLANTS*, which draw up an *Alimentary Juice* out of the *Earth* by their *Roots* into the *Stem* or *Stalk*, which from thence is conveighed and ſublim'd to all the utmoſt parts.

VI. *The Definition of a Plant.*

A *PLANT* therefore *is a Living Body furniſht with a Skin, Strings, Root, Stalk or Stem, and other Organical Parts, and is nouriſht, grows and produceth its like from prolifick Seed, only by means of a Vegetative Soul.* So that all theſe *Plants* which ſpring out of the *Earth*, or grow in ſtanding *Pools* or *Water*, or elſewhere, provided they grow and are nouriſhed, whether they have *Roots* or not, whether they have *Leaves* or not, whether they have *Flowers* and *Fruit*, or have only a *Root*, all theſe, I ſay, are called *Plants*.

VII. *Plants are divided into Trees and Herbs.*

But foraſmuch as the name of *Plant* doth not only belong to thoſe *Bodies* which grow out of the *ground* by their *Roots*; but alſo to all thoſe that grow upon other *Plants*, or that ſpring out of the ground ſome other way; therefore *Plants* by a general diviſion may be diſtinguiſhed into *TREES* and *HERBS*, as the two members that comprehend all *Plants*. A *Tree* is a *Plant* riſing out of the *ground* with a *woody Stem* or *Stalk*, and growing up to conſiderable Height. An *Herb* is a *Plant* conſiſting of *Leaves* and a tender *Stalk*, never riſing to the tallneſs or thickneſs of *Trees*. Some *Authors*, beſides theſe 2 members, place a *SHRUB* as a third thing between a *Tree* and an *Herb*, but, as it ſeems, without any neceſſity, foraſmuch as there be no *Plants* but may be conveniently reduced either to *Trees* or *Herbs*; a *Shrub* being nothing elſe, but a *Tree*, which riſing out of the *Earth*, variouſly ſpreads it ſelf into *Branches* and *Leaves* from the *Root*. For a *Shrub* riſeth higher from the ground than an *Herb* doth. As to *Muſhrooms*, &c. they may be reckon'd amongſt thoſe *Plants*, that grow upon other *Plants* or ſpring forth at their *Roots*. To which alſo may be referred ſome *Plants*, which do not ſpring out of the *Earth*, but from other *Plants*, ſuch as are thoſe ſmall Strings that grow upon *Pulſe*, and being intangled with them are carried upwards into the *Air*. As for *Moſs* it may be well called an Excrementitious *Plant*, becauſe from its original *Seed* it grows upon barren *Ground*, and *Stones* it ſelf, in which its ſpreads its *Roots*.

VIII. *The Diviſion of Trees into Wild and Domeſtick.*

Trees are commonly divided into *Wild* and *Domeſtick*, or ſuch as are *cultivated* at home, and thoſe that are *Outlandiſh*: Not but that all *Trees* as to their firſt original may be called *Wild*, as having grown firſt wild in the *Fields*: but becauſe there are many *Trees*, which men do not take the pains to *Tranſplant* and *Cultivate* in their *Gardens*, and if they ſhould, yet would not they thereby change their wild *Nature*, whereas others being *Tranſplanted* and *Cultivated* by the induſtry of *men*, are much improved thereby.

IX. *The Second General Head of Living Creatures are thoſe we call Animals.*

The Second General Head of *Living Bodies* are ſuch as conſiſt of a far greater variety and multiplicity of *Parts*, have peculiar *motions*, and ſeem to conſtitute many *whole Bodies*, which yet are joined together with that proportion, as to produce proper and neceſſary *motions*; ſo that from theſe different *Parts*, certain *Machines* or *Engines* do ariſe, moſt curiouſly wrought and contrived, which are called *Animals*, whoſe members are not only complete in themſelves, but are alſo joined with that exact *Symmetry* and *Proportion*, as to conſpire to the Good and Profit of the *Whole*, and concur to one *motion*. And notwithſtanding that in the *Prædicamental Line*, and the *Genealogy* of *Things* and *Modes*, an *Animal* is, according to the common way of *Philiſophizing*, conſtituted by ſomething *Senſitive*, which is true too, in a certain meaning; yet we are to take heed that we do not by theſe means *attribute* to an *Animal* ſuch a *Soul* and *Senſe*, as has *Perception*; ſince the *Senſe* of an *Animal* purely and alone conſiſts in the impreſſion of the *Object* on the *Bodily Organ*, which may be done without the Help of a *Soul*.

X. *The various kinds Animals.*

Animals are divided into ſuch as *flie* in the *Air*, *ſwim* in the *Water*, *go* on the *Earth*, *creep*, *ſlide along*, or ſuch as are altogether *immoveable*. They may likewiſe be diſtinguiſht from the difference of their *Generation*, *Parts*, *Actions* and other ſuch like. And accordingly ſome are *Viviparous*, ſuch as bring forth *Living Creatures*; others *Oviparous*, which lay *Eggs*, out of which *Animals* afterwards are hatched. As to Parts, ſome have *Wings*, others *Fins*, ſome go on two *Feet*, others on *four* or more. And others again want all theſe. As to their *Actions* or *Manners*, ſome are *Tame*, others *Wild*; ſome *Domeſtick* and *Sociable*, others delighting in *Solitude*; ſome *Stupid* and *Dull*, others *Quick* and *Cunning*. As to the *places* where they are *bred* and *live*, ſome are *Fiery*, others *Aquatick* or *Watry*, and others *Terreſtrial*. Some live both on the *Earth* and in the *Water*, which are therefore called *Amphibious*; ſome are *Subterraneous*, or living under *Ground*, &c.

XI. *The Sum and Order of things to be treated of in this Seventh Part.*

The moſt Noble and Excellent of all *Living Creatures* is *MAN*, for the handling of whom we deſign the *Eighth* Part of our *Inſtitution*, as being the Complement of all *Animals*, and to expreſs my ſelf, as ſome of the *Ancients* have done, *the Horizon of Heavenly and Sublunary Creatures.* Now foraſmuch as theſe *Living Things* do agree in ſome *affections*, we will here firſt touch upon thoſe, which are *common* unto them all; and then in *ſpecial* apply our ſelves to the Contemplation of *Plants* and *Animals*, and ſhall at large ſet forth the *diſtinction* that is between them.

CHAP.

CHAP. I.

How Living Bodies differ from those that are Inanimate, and destitute of Life.

I. *The word* Life *is taken in a threefold signification.*

IT appears from what hath been already said, that *Living Bodies* differ from *Lifeless things* in this, that the one have *Life*, and the other are devoid of it. But forasmuch as the word LIFE is *Æquivocal*, and attributed to things that are said to *Live* under different Notions; we must first consider what *Life* is, and how many significations it admits of. For the *Notion* of *Life* is very various and vagrant, but reducible to 3 General Heads. Sometimes we make use of this word to signifie *Simple Existence*; sometimes, *Active Existence*; and sometimes also, *Coexistence*, or the *Duration of one thing with another*.

II. *What a Life of Simple Existence is.*

That is a *Life of Simple Existence*, when the word *to Live* is taken simply for *Existence*: As when *BOETHIUS* defines *Eternity*, an *All at once* and *perfect Possession* of an *Interminable Life*. And in the same meaning *ARISTOTLE* calls the *Life* of *Animals*, their *Being*; because when they *die*, and cease to *live*, he thought they ceased to be also.

III. *What an Active, or Actuous Life is.*

An *Actuous Life*, is *a Life of Existence*, *accompanied with Action*; and in this Sense *Life* is taken for *Action* and *Operation*. Thus *Fire*, or a *Candle*, whilst it sends forth a *flame* is said to *live*; and so the *Vital Spirits* are said, to *live* in a *Body*, as long as they are in continual *motion*, and flow through the *Veins* and other hidden *Channels*. Thus we call *Spring-water*, *Living*, because it bubbles up, and flows continually; but *Dead*, when it stands still, and is without *motion*. In like manner, *Love* is said to be *alive*, whilst it is strong and active. So *Virgil*, in 1*st Æneid*:

——— *with Lively Love*
Strives to fore-stall.

IV. *What the Life of Existence with another is.*

The Life of Existence with another is, when *Life* is taken for the Duration of one thing with another; or for the *Duration* of some *Substance*, in conjunction with some *Accident*, whereby it is perfected. Thus the *Life* of *Man* is commonly said, to consist in the *Conjunction* of *Soul* and *Body*, and his *Death* in their *Separation*: As when CATULLUS saith, *Let's Live my* Lesbia: Where, by the word *Live*, he understands *Existence* in conjunction with *Joy* and *Pleasure*. So that *Life* taken in this Sense, consists in the union of two *Substances*; or in the union of a *Substance* with some *Accident*, from which it borrows some kind of Perfection.

V. *Of the difference that is between Living and Lifeless things.*

Living things are chiefly distinguish'd from *Lifeless things*, by the *Life of actuous Existence*, or because they are endowed with a certain Efficacy and Activity: For their *Life* properly consists in *motion*, which the Purest part of the *Blood*, if they be *Animals*, or of the *Alimentary Juice*, if they be *Plants*, communicates to the grosser parts of their *Bodies*: So that we find that *Plants* and *Animals* do soon perish, when the *Blood* by its *Circulation* ceaseth to quicken the *Members*, and when the *Juice* does no more enter through the *Pores*. For as *Bodily Life* consists in *Motion*, so *Death* consists in *Rest* or ceasing from *Action*. But for all this, we must not suppose, that there are any *Immaterial Souls* in *Living Bodies*, that perform these *motions*, and the Functions of *Feeding* and *Growth*; it being sufficient that their Parts be so disposed, as that the prepared *Alimentary Juice* may freely enter into their *Inward parts*, and by its apposition, restore and supply their dissipated *Substance*. Now all this may be done by *Motion* alone, provided only that the *Parts* be rightly disposed, and that there be an equal *distribution* of the *Juice* by means of *Heat*. I say therefore, that *Living Bodies* differ from *Lifeless things*, in that the former, by reason of the want of *Organs*, cannot admit such a distribution of *Aliment*, for the Restoration and supply of what is lost.

VI. *By what force or virtue the Alimentary Juice is distributed through the Pores of Living things.*

If so be any one demands, by what Force or Activity this *Juice* is diffused through the *pores* and *passages* of the *Body*, to all its *parts*, so as that they grow not only in *length*, but also in *breadth* and *depth*?

I Answer, That this is done by means of *Heat*, proceeding either from the *Sun*, or from *Fire*. For such is the Efficacy of the *Heavenly matter*, that is, of the *first* and *second Element*, that by passing through the thicker *Particles* of the *third Element*, it doth agitate them, and in so doing doth produce or excite *heat* in them; by which means these *particles* being rarefied, are carried upwards through the *Pores* of the *Roots*, to the *Stalk* or *Trunk*, and all other *parts*. Besides, there is in all *Living Bodies* a certain *Inborn* or *Native heat*, or rather a *fire* that is *hot* only, without *Light*; by the assistance whereof the *Alimentary Juice* is distributed through the whole *Body*, and joyning it self to it, doth preserve, enlarge and perfect it.

VII. *Lifeless Bodies are not subject to any certain figure, as Living Bodies are.*

Living Bodies also differ from such as are *Lifeless* or *Inanimate*; because these latter are not determin'd to any certain *figure*. Thus *Stones* may subsist under any *figure*: Some are 6 Corner'd, as *CRYSTAL*; some have a *crooked Surface*, as *FLINTS*; some have a plain *surface*, like a Plate, as *TALCK*; some have the *figure* of a *Lozenge* or *Quarry* of *Glass*. So likewise *Metals*, and all other *things* dug out of the *Ground*, do not require any *One precise figure*. But *Plants* and *Animals* cannot admit this variety of *figures*, as requiring a certain and determinate Conformation. For a *Plant* cannot be of any *figure*, but must have such a one, as is necessary for the drawing, concocting, digesting, and distributing of its *Aliment*. And 'tis for this Reason, that *Living things* only are furnish'd with *Organical Bodies*, which consist of such *Instruments*, as are proper to perform the several Functions of *Life*; such as are the *Root*, the *Stem* or *Stalk*, the *Branches*, the *young Shoots* in *Plants*; and the *Feet*, *Belly*, *Head*, *Bones*, *&c.* in *Animals*. Wherefore also a greater Beauty is found in the *Bodies* of *Living things*, than in *Artificial*; for since *Beauty* consists in Variety, it is evident that in *Living Bodies* there is a much greater diversity of *Parts*, than in others, whose *parts* are not so numerous, nor so fine and curious, nor so exactly and neatly joyn'd together.

VIII. *Artificial Bodies are not capable of Growth and Nourishment.*

Altho' in an *Artificial Engin*, or *Machin*, as likewise in a *dead Carkass*, or a *wither'd Plant*, there be many such like *Organs*, as are found in *Living Bodies*; according to what *Historians* relate of that *Wooden Eagle*, made by REGIOMON-

MONTANUS, which did fly in the *Air*, and ſhewed the way to the *Emperour*, as he was going to *Nurenberg*; and of the *Wooden Venus*, made by DÆDALUS, which could *walk* by the Artificial putting of *Quickſilver* into the Inward parts of it: Yet for all this, *Living* Bodies are very diſtinguiſhable from ſuch *Artificial* or *Dead* Bodies; becauſe they are nouriſhed and grow, by the *Alimentary Juice* admitted into their *Pores*; whereas *Artificial* and *Dead things* are neither capable of *Growth* nor *Nouriſhment*.

IX. *Living Bodies are productive of their like.* Laſtly, Herein alſo are *Plants* and *Animals* differenced from *Metals*, and other *Dead* Bodies, in that they can produce their like, and preſerve their *kind* by a ſucceſſive propagation of *Individuals*; which things dug out of the *Earth* are not capable of, as being deſtitute of *Seed*, or any Virtue whereby to *generate* an Off-ſpring.

CHAP. II.

The Life of Bodily things conſiſts in Moiſture and Heat.

I. *Living Bodies ſtand in need of Heat and Moiſture.* FOraſmuch as ſuch is the Conſtitution of *Living Bodies*, that they conſiſt of ſeveral *fibres* or ſmall *threds*, between which lye many large Conduits or Paſſages, through which the *Alimentary Juice* is ſtrained, and diffuſed into all parts; it cannot be queſtion'd, but the *Life* of *Plants* and *Animals* is ſupported by 2 things, *viz. Heat* and *Moiſture*, which mutually ſtand in need of, and aſſiſt each other. For *Moiſture* is the *food* of the *Heat*: And accordingly *Phyſicians* tell us, that *Life* conſiſts in *Moiſture*, as its *Paſſive*; and in *Heat*, as its *Active Quality*; and that all *Vegetative* Bodies do ſubſiſt and are preſerved by the ſame.

II. *The Fire that is in Living Bodies, is Hot only.* But to remove all Difficulty that might ariſe from the word *Heat*; we are to take notice, that we do not ſpeak here of a perfect *Fire*, which is both *hot* and *bright*, but of that which is *hot* only; ſuch as is found in *Horſe-dung*, and putrifying *Hay*: Which is therefore diſtinguiſh'd from the *Cæleſtial fire* in the *Sun*, and from the *Elementary*, which burns upon our *Hearths*; becauſe it doth not conſiſt as thoſe *fires* do, of *Particles* that ſwim in the *firſt Element*, and are toſt with a vehement *Motion* within themſelves; but proceeds from a kind of *fermentation*, cauſed by a mixture of *Heterogeneous* little *Bodies*. Tho' indeed, if we well mind its Operations, we ſhall find it to differ from the 2 former *fires*, *Solar* and *Culinary*, rather in degrees, than in nature and eſſence.

III. *There is a twofold Temperament in Living Bodies. The one according to Juſtice.* But foraſmuch as *Fire* is very *Active*, and cannot long be preſerved without *food*, we find that *Moiſture* is of abſolute neceſſity required for its preſervation and ſupport. From hence ariſeth the Temperament of *Living Bodies*, when *Heat* and *Cold*, *Moiſture* and *Drought*, are ſo temper'd and proportioned, that none of theſe *Qualities* hinder each other, but with an agreeing Diſcord harmonize together. And this kind of *Temperament* is by *Phyſicians* called, a *Temperament* according to *Juſtice*, when theſe *Qualities* are ſo mixed, that the *Heat* in *Living Bodies* is qualified by *Cold*, and the *Moiſture* by *Drought*, according to the requirings of each particular *Nature*. Becauſe the ſame *Temperament* is not always found in *Living things*, but is changed according to the variety of *Ages*, or the ſeveral Stages of *Life*. For in *Animals*, to every different *Age*, a different *Temperament* is appropriated; to *Childhood*, a *hot* and *moiſt Temperament*; to *Youth*, *hot* and *dry*; to *Manly Age*, *cold* and *moiſt*; to *Old Age*, *cold* and *dry Complexion*. And theſe *Temperaments* are therefore ſaid to be according to *Juſtice*, becauſe they of Property and Juſtice belong to ſuch and ſuch *Ages*.

IV. *The other according to Weight.* To this *Temperament* another is oppoſed, which is called a *Temperament* according to *Weight*, wherein all the *Qualities* are in an Equal poiſe; ſo as *Heat* doth not exceed *Cold*, nor *Cold*, *Heat*: *Moiſture* doth not exceed *Drought*, nor *Drought*, *Moiſture*; but are altogether equal in degrees. But it does not ſeem probable, that any Body is poſſeſt of ſuch a *Temperament*, neither is there any Cauſe aſſignable that might thus temper and poiſe theſe *Qualities*; and therefore this is a *Temperament* in Notion only, as *GALEN* ſaith, and not Real.

V. *The increaſe of Living things, is from Heat.* Foraſmuch therefore as *Heat* and *Moiſture* are required to a due *Vegetation* of *Living* Bodies, it happens, that according to the Exuperance of either of theſe *Qualities*, a more abundant production of *Living things* is occaſioned. Thus in *Summer time*, when *Heat* bears ſway, abundance of *Magots* breed in *Fleſh*, *Bees* in the Carkaſs of an *Heifer*, *Humming-Bees* or *Drones* in that of an *Aſs*, *Hornets* in that of a *Mule*, and *Waſps* in the Carkaſs of an *Horſe*: It is in the ſame Seaſon alſo, that *Dead Flies* recover *Life*. And accordingly it will not be difficult to give a Reaſon, why *Spices* grow only in *Hot Countries*, becauſe they ſtand in need of a great degree of *Heat* before they can arrive to that Purity, by a ſeparation of the *Heterogeneous particles*, that ſo the *Homogeneous* may come together, and conſtitute thoſe *Odoriferous* Bodies. And therefore, as my Lord *VERULAM* tells us, *Trees* planted on a *hot*-Bank, and expoſed to the South and South-Eaſt, do *bud* ſooner than others, and bring forth more early *fruit*. And the ſame he ſaith of *Trees* planted near the *Wall* of a *Chimney*, wherein continual *fires* are kept; and that it is good for the ſame purpoſe, to let the *Branches* of *Trees* ſpread into thoſe places where frequent *fires* are uſed. Of which we have a pregnant Inſtance in *Vines*, which according as they are more advantagiouſly ſituated, do by a whole *Months* time, ſooner than others, bear Ripe *Grapes*.

VI. *Dung, by its Heat, doth haſten the ſpringing of Plants, and makes the Ground fruitful.* It is for this very Reaſon, that *Country-men* do *Dung* their *Grounds*; not only becauſe the *Dung* doth fatten the *Earth*, whereby more plentiful Nouriſhment is conveigh'd to *Plants*; but alſo becauſe by its *warmth* it comforts and refreſheth the *Ground*, which was weak and languiſhing by reaſon of *cold*. For the *Dung* of *Animals* is *Salt*, and contains an *Inward heat*. And accordingly we find, that thoſe who deſire to haſten the *ſpringing* and *growing* of their *Plants*, do take care very well to *Dung* their *Gardens* and Plots of *Ground*, before they *ſow* their *Seed*. To this end alſo they pour ſtale *Urine* at the *Roots* of *Vines*, to make them more fruitful.

VII. *How Moiſture is a cauſe of the increaſe of Living things.* As ſtore of *Heat* doth conduce to the great increaſe of *Plants* and *Fruits*, ſo much *Moiſture* alſo is a great help to the multiplication of them, when

when accompanied with convenient *heat* and *warmth*. Thus we find, that in Moiſt places *Graſs* grows thicker, and riſeth to a greater height, than in Dry *Grounds*. In like manner we ſee, that *Herbs* will grow in *Glaſs Vials*, fill'd only with *Water*. We find alſo, that the *Hair* of *Young-men* and *Children* grows much faſter and thicker, becauſe *Moiſture* abounds in them: And *Trees* and *Plants*, that are much *water'd*, do thereby thrive the more; for by frequent *watring*, the Dryneſs of the *Soil* is temper'd, and the *Roots* are ſoftned, and thereby made more fit to ſuck the *Juice* out of the *Ground*, and to ſend it up to the utmoſt *Branches*. So the fitteſt time for the *watering* of *Plants*, is the *Evening*; becauſe the Cool of the *Night* following, gives the *Moiſture* leave to ſink down to the *Roots*, and refreſh them.

VIII. *Mouldineſs proceeds from Moiſture.* How greatly *Moiſture* conduceth to *Germination*, may be gather'd from *Moſs*, which delights in *moiſt places*, and grows even upon thoſe *Rocks* and *Stones* that are continually *water'd* with *Springs*. Hence it is alſo, that *Bread* that is kept in a *moiſt Cellar* grows *Mouldy*, and many other things that are laid up in *moiſt places*.

IX. *Heat, when exceſſive, is hurtful to Living things.* As an equal *Temperature* of *Heat* and *Moiſture*, is the Cauſe of the great increaſe and multiplication of *Living things*; ſo the Exceſs of either, and more eſpecially of *Heat*, is hurtful to them, and hinders them from arriving to their due *growth*. Thus we ſee that *Bodies*, wherein the inborn *heat* predominates, are of a low *ſtature*, becauſe it conſumes the *Moiſture* too faſt, not ſuffering it to ſpread and diffuſe it ſelf; and ſo alſo ſuch *Perſons*, in whom *Heat* abounds, are commonly *lean:* Whereas on the contrary, thoſe in whom this innate *Heat* is weaker, and allay'd with *Moiſture*, are apt to grow *fat*, and ſpread in *bulk*; as is evident in *Women*, who commonly are more Plump and Fat than *Men*, except *Sickneſs*, or any Præternatural Cauſe hinder the Effect.

CHAP. III.

The Death of Living things proceeds from contrary Principles, viz. *from Cold and Drineſs.*

I. *Wherein the Death of Living things doth conſiſt.* FOraſmuch as contrary *Effects* proceed from contrary *Cauſes*, we may eaſily conclude, That the *Death* of *Living Creatures* are owing to *Cold* and *Drineſs*. For as the *Bodily Life* conſiſts in the due Temperature of *Heat* and *Moiſture*; ſo *Death* happens to them through the predominance of *Cold* and *Drought*, whereby the *Vital Principle* of *inborn Heat*, becomes weakned and deſtroyed. *Bodily Life*, as hath been ſaid, conſiſts in continual *Motion*; wherefore when any Cauſe happens to fore-ſlow, or put a ſtop to this *Motion*, *Life* muſt ceaſe alſo. Now, ſince nothing is more oppoſite to *Motion*, than *Reſt*, wherein the Nature of *Cold* doth conſiſt, it cannot be queſtion'd, but that where *Cold* prevails, *Death* muſt enter. Thus we ſee *Flies* dye at the approach of *Winter*; and that *Frogs*, tho' they live in the *Water*, and are in a great meaſure habituated to *Cold*, yet periſh in *Froſty-weather*. For as great *Cold* doth congeal the *Waters*, and hinder their *Motion*; ſo the over-ſlow agitation of the *Spirits* and *Humors* in the *Body* of *Man*, is hurtful to the *Life* of the *Body*; and where it is of long Continuance, quite deſtroys the ſame. And in like manner alſo, exceſſive *Cold* cauſeth the dying of *Plants* and *Trees*.

II. *Cold drieth as well as Heat.* For tho' *Heat* and *Cold* be contrary *Qualities*, yet do they by oppoſite ways produce the ſame Effect, *viz. Drought*. For we find that *Clay* is dried by *hard Froſt*, as well as by great *Heat* in *Summer*: The Reaſon whereof is, becauſe all *liquid* and *moiſt Bodies*, loſe the agitation of their *Particles*, by *Cold*, and by this means become hard and dry: And therefore it is no wonder, if *Clay*, which is nothing elſe but a *Mixture of Water* and *Earth*, ſhould grow hard and dry, becauſe the *Water* which ſoftned it, is by the *cold* congealed. Seeing therefore that *cold* works the ſame effect in *Plants*, it cannot ſeem ſtrange to us if *Plants* periſh, when the *Juice* wherewith they were nouriſhed, is *frozen*. It has been of Old told us, that extream *Cold* ſcorcheth and burns up *Plants*, by congealing and drying up their *Moiſture* and *Alimentary Juice*.

III. *Why the Leaves of moſt Plants fall in Autumn.* Hence alſo it is, that in *Cold Countries* the *Leaves* begin to fall from the *Trees* towards the latter end of *Autumn*; becauſe about that time, the *pores* of *Plants* are ſhut up at the approach of *Cold*, and the Paſſages along which the *Juice* is conveyed, are dried up and contracted.

IV. *Heat is hurtful to the Aliment of Living Creatures.* And as *Cold* produceth theſe Effects in *Living Bodies*, ſo doth exceſſive *Heat* alſo; for *Heat* exhauſts the *Spirits* and *Humours*, and attenuates and waſtes the *Bodies* in which it doth predominate. For as a *Mill*, without the aſſiſtance of *Wind* or *Water*, ſtands ſtill without any *motion* at all; ſo *Plants*, upon the conſumption of their *Alimentary Juice, periſh*; and *Animals*, when their *Spirits* and *Humours* are weakned by extream *Heat*, languiſh and are ſlowly moved. Whence it comes to paſs, that when great *Heats* happen in *Hot Countries*, at the time when the *Ears of Corn* begin to break forth, they are ſtopped in their coming forth; becauſe the *Moiſture* being by the *heat* diſſipated into the *Air*, the *Heat* finds nothing to feed upon, or whereby to maintain it ſelf.

V. *When the Death of Living Creatures happens.* The *Death* therefore of *Living Bodies* happens, when *Moiſture*, which is the *food* and *fewel* of *Heat*, is waſted; or when *Heat* is ſeparated from, and leaves the *Moiſture*, which then ceaſeth to be agitated, and diſtributed to all *parts* of the *Living Body*. For as *Fleſh* laid before a ſlow *fire*, is *roaſted*, and by exhaling of the greateſt part of its *moiſture* becomes quite dried up; ſo the Temperament of *Living Bodies* becomes ſpoiled, when the *Spirits* and *Humours* are alter'd and waſted by exceſs of *Heat*. Thus *Fruits* are frequently ſpoil'd by over-much *heat*, which ſcorching their outſide, leaves their inward *ſubſtance* raw and unripe; as it happens to *Grapes* and other *Fruits*, whoſe outſide is often ſcorched with that *heat*, which ſcarcely toucheth their *Inward parts:* As *Bread* put into an *Oven* that is over-heated, hath its *Cruſt* burnt up and ſcorched, whilſt the midſt of it wants *baking*, and is *dougby*.

VI. *How Fiſhes are dried up in the Water.* But you'l ſay, If *Drineſs* be the Cauſe of *Death*, how can *Fiſhes* that live in the *Water*, ever arrive to that degree of *Drought*, which may cauſe their *periſhing* or *death?* I anſwer, That the *Water* in which the *Fiſhes* ſwim, cannot hinder the waſting and drying up of their *Natural moiſture:* As

we find that *Flesh*, which is suffer'd to *boil* in a Pot full of *Water*, till all the Natural moisture be consumed, becomes harder than that which is *roasted*. Yea, we find also that some sorts of *Wood*, that have lain long in the *Water*, are found drier and lighter when they are taken out, than when they were put in.

VII. *Excess of Heat is an Enemy to all Bodies.*

Neither is excessive *Heat* only an Enemy to *Living Bodies*, but even to all in general: Thus we find that when the *flame* of a *Candle* or *Torch* is increased, it doth so much the sooner consume and waste the *Body* that serves it for *fewel*; and by a parity of Reason, when the *Heat* either outward or inward exceeds, it procures the *Death* of *Living Bodies*: As we find that *Plants* wither by excessive *heat*; and that *Men*, by indulging themselves in the *drinking* of *hot Liquors*, do hasten their own *Death*.

VIII. *Death sometimes is caused by the want of Food.*

Sometimes *Death* happens to *Living Bodies* by *defect* of *Food* convenient; as when *Nature* ceaseth to furnish them with *Matter*, whereby they might grow and be nourished: For so in *Plants*, tho' it may be there wants no *Moisture* for the *Heat* to act upon, and tho' the *Sun* have force enough in *Summer time*, to draw up the *Juice* out of the *Earth*; yet is not that *Fervescence*, or *Fermentation* of the *Alimentary Juice*, which is requisite to their *Vegetation*, always performed alike; for it requires a certain and determinate Season of the *Year*, which being once past, it cannot afterwards be expected. An Example whereof we see in *Quick-Lime*, which upon the affusion of *Water* causeth an *Effervescence*; but that being once ceased, it cannot be renewed again, tho' you should pour never so much *water* upon it. And for this cause it is that *ripe Fruits*; as *Apples*, *Pears*, *Plums*, *&c.* do fall down to the Ground, as soon as their *Stalk*, whereby they were joyned to the *Tree*, begin to want *aliment*, and those *fibres* that held them fast are dried up. And the same is the Reason, why all other *Fruits* and *Grains* fall out of their *Husks* and *Pods*.

IX. *The Destruction of Bodies, is sometimes caused by a too great opening of the Pores.*

And much like Effects do sometimes proceed from the too great relaxation and opening of the *Pores* of *Bodies*: For thereupon the *Bodies* contained in those Intervals must needs fall down, except that by some means or other their *bulk* be coextended to the amplitude of the *pores* wherein they are. Thus, when in the *Summer Season* the *pores* of the *Skin* are more open, the *Hides* of *flay'd Beasts*, have the *Hairs* more easily pluck'd off. Thus likewise it seems probable, that the falling out of the *Teeth* of *Children*, is caused by the dilatation of the *Sockets* of the *Jaw-bone*, wherein the *Teeth* are fixed; for they growing wider, as the *Child* advanceth in bigness, they can no longer keep the *Teeth* steady. But in *Old People* this falling out of *Teeth* is caused by the defect of *Aliment* and *Moisture*; because the *fibres*, through which the *Aliment* was used to be convey'd to them, grow dry and are contracted.

CHAP. IV.

What is the Cause of that Hardness, which is observ'd on the outside of living Bodies.

I. *Whence the Hardness of the Surface of Living Bodies doth proceed.*

THe *Hardness* of *Bodies* consists chiefly in this, that they resist the *Touch*, and that their *parts* are not easily separable from each other. And forasmuch as this Resistance to the *Touch* is perceiv'd on the outside of *Living Bodies*; it will be worth our enquiry, What might be the Cause of it, that when their Inward substance is so soft, their outside should be hard. Whereof no other Cause seems assignable, but this, That the Outward parts of *Living Bodies*, are expos'd to the continual impulse of other *Bodies*. For it is certain, that the *Heavenly matter* (under which Name we do not only comprehend the Matter of the *first* and *second Element*, but also the *Air*, with the *Particles* of the *third Element* that are mix'd with it) carries the *Earth* round; and forasmuch as all these Small *Bodies* cannot pass through the *Earth*, or any of the *Bodies* which belong to it, it cannot be otherwise, but that vast numbers of them must dash against *Living Bodies*, and by their continual beating upon them, render them *hard*. For by this impulse, their Outward parts are driven closer together, and so become more Compact and Hard.

II. *Wherein the Hardness of any Bodies doth consist.*

For to speak properly, the *Hardness* of *Bodies* is nothing else, but the *Rest* of many *Essential* or *Integral parts*, caused by the Pression of the *Air*, or of the *Subtil matter*; which acting only on the outside, doth so much drive those *Particles* inwards, that they can no more be separated, without a perception of some Resistance. For tho' the *Subtil matter* doth penetrate all *Bodies*; yet we are to consider, that the Parts of many *Bodies* are so great and irregular, that they are able to resist its Action and continue at *Rest*, and by this means constitute *Hard Bodies*; because they resist or oppose their being divided, and are outwardly so compress't by the *Air* and the *Subtil matter*, that it is oftentimes more easie to move them altogether, than to separate them from one another.

III. *Whence the Covers of some Living Bodies do proceed.*

This is the Cause of those Coverings, which do invest some *Living Bodies*; as we find that *Acorns* have *Cups*; *Nuts* have *Shells*; *Beans* and *Pease*, *Pods*; and *Trees*, *Barks*: So likewise *Fish* have *Scales*, and some of them hard and stony *Shells*; as *Oysters*, *Crabs*, *Lobsters*, *&c.* All which without doubt are formed, by the continual impulse of outward *Bodies*; much in like manner as we find, that the *Palms* of the *Hands* of *Delvers* and *Ditchers*, by continual handling of the *Spade*, grow very hard; and as the *Soles* of our *Feet* become brawny and thick Skin'd, by assiduous beating against the Ground.

IV. *The same is the Cause of the Hardness in Inanimate Bodies.*

They are the same *Causes* also that produce *Hardness* in *Inanimate Bodies*. For *Snow* laid near the *Fire* becomes harder and more compact; and the outside of *Bread* becomes hardned to a *Crust*; and so likewise the outside of *Flesh roasted*, *broiled*, or *fryed*, grows harder than the inside. Neither can any other Reason be given, why *Broath*, *Boil'd Milk*, and other kinds of *Supping Meats*, presently after they are removed from the *Fire*, get a *skin* or *film* on the top of them, but this, that the agitation of the *Heat* is diminished by the contact of the *cold Air*, and in a manner quite stopt.

V. *Th Surface of Water is smooth, and more difficultly divided than its inward parts.*

Hence it is also, that the *Surface* of all *Liquors* is smooth and even; for tho' the Parts of *Water* be uniformly moved, as well as the *Air*, which immediately toucheth them; yet because the *parts* of the *Water* are moved after another manner, than those of the *Air*; and that the *Subtil matter*

matter which ſurrounds the parts of the *Air* is quite otherwiſe moved than that which *ſwims* amongſt the *particles* of the *water*; by this means the *ſurface* of either of them becomes *ſmooth*, much after the ſame manner as when two Hard *Bodies* are rub'd againſt one another; only with this difference, that this ſmoothneſs is with much more eaſe produced in liquid *Bodies*, becauſe of the eaſie and ready Mobility of their *Parts*. And this is the reaſon alſo why the *ſurface* of the *water* is divided with more difficulty, than its inward parts.

VI. *The Hardneſs of Bodies ſometimes proceeds from Cold.*

Cold alſo conduceth much to the *Hardning* of *ſeveral* Bodies: for we ſee that the *ſurface* of *water* in a *River*, by *cold* is congealed, whilſt that which is at the bottom, by reaſon of the ſtronger motion of *heat*, ſuffers not the leaſt alteration; and ſo alſo are many other *Bodies* ſometimes hardned by *cold*, and thereby attain that degree of firmneſs, which is cauſed in them, by other *Bodies* beating upon them: For *frozen Fruit*, if it be put into cold *water*, and ſet in a *warmiſh place*, will appear covered over with a *Cruſt of Ice*, and in like manner the *Fleſh* of *Beaſts* or *Fiſh* that is *frozen*, if it be ſet in a warm place covered with *Snow*, there will appear a hard Cruſt of *Ice* on the *ſurface* of it.

VII. *But more naturally from Heat.*

But tho' *cold* may ſometimes contribute to the hardning of *Bodies*, yet this effect may with greater Right be attributed to *Heat*, whoſe property it is to agitate the parts of *Bodies*, and bring them cloſer together, by exhaling their ſuperfluous *moiſture*. Thus a *Body* expoſed to the *Beams* of the *Sun*, as by this means it becomes better digeſted and riper; ſo likewiſe it attains a greater degree of firmneſs and hardneſs. This is manifeſt in *Apples*, *Pears*, *Cherries*, *Plums* and ſuch like, whoſe outſide by the *Heat* of the *Sun* becomes hardned, and covered with a *Skin*.

VIII. *All theſe ways are reducible to one general way of Hardning of Bodies.*

But which way ſoever this *Hardneſs* may be produced in *Bodies*, it ſeems that they are all reducible to one general Cauſe, foraſmuch as their outward *parts* endure the impulſe of other *Bodies* ruſhing againſt them and daſhing upon them, and by hindring their ingreſs, do reſiſt and beat them off.

CHAP. V.

Of the Different Degrees of Heat in Living Bodies.

I. *There is a different degree of heat in Living Bodies. Firſt according to the Diverſity of Age.*

THO' *Living Bodies* may be diſtinguiſht according to the *External Heat* that Acts upon them, as they are in *Countries* or *Places* nearer or farther from the *Sun*: yet may they much better be differenced by that *Internal Heat*, which produceth divers *Effects* in them with relation to their *Age*, *Sex* and *Nature*. For as to their *Age*, it is evident that *Heat* in *Living Bodies* is not always in the ſame ſtate and vigor. For in *Infants* and *Youth* the natural *Heat* is much weakned by the abundance of *moiſture*, that it cannot exert its full ſtrength; which is the reaſon why *Infants* are ſo prone to *ſleep*, and apt to ſhed *tears*. But in the Height and *Vigour* of *Age*, the *Heat* is more ſtrong and active; and the *moiſture* being much leſſened, the *Spirits* become more hot and fiery. For which cauſe thoſe who have attained to *Manly ſtrength*, are more ſtrongly inflam'd and *Amorous*, whereas in *Old Men*, by the decreaſe of *heat*, and the increaſe of *cold* and *drineſs*, their *natural faculties* are much weakned and decayed.

II. *Secondly according to the difference of Sexes, and what the difference of Sex in Plants is.*

Difference of Sex alſo produceth great diverſity of *Heat*; for *Females* are commonly of a more *cold* and *moiſt* complexion than *Males*. Which difference is obſerved in *Plants*; for thoſe are accounted *Female Plants*, which are more *cold* and *moiſt*, and have leſs *virtue* and *ſtrength*; ſo that tho' they bring forth *Flowers*, yet for want of *Heat* they don't produce either *Fruit* or *Seed*. Whereas the *Male Plants* are more *beautiful*, as to their outward appearance, and have both *Fruit* and *Seed*. And for this cauſe it is, that the *Female Plant* delights in the Company and Proximity of the *Male*; according to what *PLINY* relates of the *Palm-tree*, which by ſome influence proceeding from the *Male*, doth conceive and become fruitful, and as ſoon as the *Male*, which ſtood near it, is cut down, dies preſently.

III. *Amongſt Animals the Females are colder than the Males.*

Amongſt *Animals* alſo the *Females* are much colder and moiſter than the *Males*. As may be gathered from hence, that *Males* generally exceed *Females* in Bulk and Stature, as appears in *Men*, *Pheaſants*, *Peacocks* and the like. The *Males* in *Birds* are commonly more beautiful and pompous for their *Feathers*. Amongſt *fourfooted Beaſts* the *Males* and *Females* are diverſly diſtinguiſht; thus *He-Goats* have *Horns*, which their *Females* want; and *Rams* have greater and more crooked *Horns* than the *Ewes*. *Cocks* are adorned with *Combs*, and armed with *Spurs*; whereas *Hens* have in a manner no *Combs* at all. And in general all *Males* have a ſtronger and deeper *Voice* than *Females*, who generally have but a ſhrill and weak voice. All which effects cannot be better aſſign'd to any other cauſe, than to the greater degree of *heat* which is in *Males*, beyond that which is in *Females*. And the ſame may likewiſe be gathered from hence, that *Males*, in their tender *years*, whilſt their inborn *heat* is overpowered with too much moiſture, do much reſemble *Females*, neither is any difference in their Temper to be diſcern'd between them. So likewiſe *guelded Animals* do more reſemble *Females*, for the ſame defect of *heat*.

IV. *Why Men in the Winter time are more brisk, and Women in Summer.*

Another inſtance of this diverſity of *Heat* in *Males* and *Females* is this; that *Men*, during the *Winter Seaſon*, are more *Brisk*, and *Women* on the contrary, in the *Summer* and hot weather. The reaſon whereof is, becauſe the *Vital Spirits*, which are in continual *motion* in a *hot* and *dry complexion* of *Body*, ſuch as *Mens* are in the *hot ſeaſon* of the *Year* are more diſſipated; but in a *cold ſeaſon* are more condenſed, and thereby better preſerved. Whereas in *cold* and *moiſt Bodies*, ſuch as thoſe of the *Female Sex* generally are; the *Heat* of the *Summer* cheriſheth and excites the *Spirits*; and the *cold* of the *Winter* doth render them dull and ſluggiſh.

V. *Of the four degrees of Heat that are in Living Bodies.*

There is alſo a diſtinction and difference of *Heat* with relation to the different kinds of *Living Things*. And accordingly *Phyſicians* diſtinguiſh *Heat* into 4 degrees: They call that the *Firſt Degree* of *Heat*, when that *Quality* is ſomewhat predominant above the reſt that are in the mixt *Body*: The *Second* when the *Heat* ſenſibly diſcovers its predominance in the *Body*: The *Third*, when it ſtrongly and powerfully diſplays it ſelf:

ſelf: And the *Fourth* when that *Quality* is prevalent in the higheſt degree. Thus amongſt *Plants*, *Borage*, *Flowers of Betony*, *Beets*, *Sweet Almonds*, &c. becauſe they impart ſome ſmall effect of *Heat* to a well tempered *Body*, are ſaid to be *Hot* in the *Firſt Degree*. *Smallage*, *Betony*, *Balm*, *Roſemary*, *Wormwood*, *Saffron*, *Sage*, *Cinnamon*, &c. becauſe they produce a moderate *Heat*, and that very ſenſibly, are called *Hot* in the *Second Degree*. And becauſe others impart a ſtrong *Heat* to thoſe that take them, as *Origany*, *Hyſop*, *Celandine*, *Mints*, *Radiſh*, *Mother of Tyme*, &c. they are accounted *Hot* in the *Third Degree*: And laſt of all, becauſe *Garlick*, *Pepper*, *Muſtard*, *Creſſes*, *Pellitory of Spain*, &c. communicate a much more vehement degree of *Heat*, they are called *Hot* in the *Fourth Degree*.

VI. *Animals are diſtinguiſht according to their ſeveral degrees of Heat.*

This Diſtinction of *Heat* is not only obſervable in *Plants*, but alſo in *Animals*. For we ſee daily that thoſe Excrements which remain after that the *Meat* hath been digeſted by the heat of our *Stomachs*, ſerve for *food* to *Hogs* and *Hens* after having paſt through a new *Fermentation* in them; and that the remainders thereof being laid to the *Roots* of *Plants*, are conſumed again by the *Heat* of the *Sun*, leaving only the groſſer parts behind them. Which different changes could not be wrought upon thoſe *Excrements*, if there were not different degrees of *Heat* in the *Bodies* of *Living Creatures*, foraſmuch as that which can no further be wrought upon by the *Fermentation* of our *Stomachs*, may yet be further altered and digeſted by a new *Fermentation* in the *Stomachs* of other *Animals*. Thus a *Maſs of Dough* that hath been fermented by *Leaven* or *Yeſt*, tho' it cannot be made to riſe again with the ſame *ferment*; yet may it for all that undergo a new *Fermentation* in our *Stomachs*: Which *Alterations*, I ſay, do prove a diſtinction of *Heat*, and a different power of diſſolving *Bodies* to be in *Living Creatures*.

CHAP. VI.

The Virtue and Nature of Aliments remain in the Bodies that are Fed and Nouriſhed by them.

I. *The whole Aliment is not changed into the ſubſtance of the thing nouriſhed.*

THO' *Aliment* or *Food* in *Living Bodies* be digeſted by the *Natural Heat*, and by that means becomes changed into their nature, yet it is not ſo entirely aſſimilated to them, as not to retain ſome of its former *Nature* and *Virtue*. This appears from our *Excrements*, which tho' by the *heat* of our *Stomachs* they have been ſeparated from the thinner parts of our *meat*, and as it were changed into a quite different *ſubſtance*, yet retain ſomething of the *virtues* and *qualities* of thoſe *Bodies* whence they have been ſeparated, and often preſerve ſomething of their *colour* and *ſmell*. Thus they who eat any quantity of *Black Cherries* or *Myrtle Berries*, will find their *Excrements* ting'd of a *Black Colour*. And *Sparagus* and *Turpentine* after having paſſed through the *Stomach* and other *Organs* of *Nutrition* communicate their *Odour* to the *Urine*.

II. *Some part of the Aliment is kept or remains with the Body that is fed.*

If therefore ſo great *virtue* of the *Food* do ſtill remain in the *Excrements*, with much more reaſon may we conclude, that the ſame much more abides in the *Bodies* that are nouriſht by, and receive their encreaſe from them; foraſmuch as the more pure and *Juicy* part of the *Food* abides with them, which doth moſt abound in *virtue*. And tho' *Animals* void many *particles* of their *Aliment* by *Siege*, by *Urine*, by *Sweat* and by *inſenſible Tranſpiration*; yet cannot this hinder us from concluding that many *Particles* of *Aliment* muſt remain in the *Bodies* of thoſe *Animals* that are nouriſht and grow by it. Hence it is that *Country People* that feed upon *Beef*, *Bacon*, *Cheeſe*, and ſuch like ſtrong *Food*, which nouriſh much, but are ſomewhat hard of Digeſtion, are much more ſtrong in *Body* than thoſe who *feed* upon Dainties, who generally are weak and unfit to endure labour. Who doth not find in himſelf a different ſtate of *Body* when he *drinks Wine*, than when his ordinary drink is *Beer*, *Ale* or *Water*? And do not thoſe that that fare deliciouſly and *feed* high, find themſelves more ungoverned in their Paſſions and *Luſts*, than thoſe who live abſtemiouſly, and content themſelves with neceſſary *Food*?

III. *Milk is differently qualified according to the difference of the Paſture the Cows graze in.*

The virtue of *Aliment* is more particularly diſcernible in the *fruits* and products of *Plants* and *Animals*, which differ, according to the diverſity of the *matter* whereof they are formed. Thus *Milk* is not always qualified alike, but according as the matter of it is drawn from ſuch or ſuch *Plants*, its *virtues* and *qualities* vary. *Cows* that feed upon *Graſs* yield a very different *Milk* and *Butter* from thoſe that eat *Straw*. It is a matter alſo of common Experience, that *Cows* that in their feeding light upon *wild Garlick*, communicate a ſtrong taſt of *Garlick* to their *Milk*; and that the fleſh of *Sheep*, which feed upon *wild Thyme* hath a much more grateful *taſt* than that of others. *GALEN* makes mention of a certain *Medicinal Milk* which is very prevalent in the cure of the *Schirrus* or hard *ſwelling* of the *Liver*; the *Cow* that yields it being made to feed on ſome peculiar *Herbs* conducing to that end. The ſtory alſo of that *Young Woman* is well known, who having uſed herſelf to the eating of *Wolfs bane* (which is a moſt poiſonous *Herb*) tho' ſhe found no hurt by it herſelf, yet was the death of thoſe *men* that lay with her.

IV. *Herbs after they are turned to Blood retain their purging virtue.*

Phyſicians likewiſe do obſerve, that if the *Milk* of a *Goat*, that hath fed upon ſome purging *Plant*, be eaten by a *Nurſe* that ſuckles a *Child*, it will communicate its purging *virtue* to the *Nurſes Milk*, and purge the *Child* that ſucks it. It is known alſo that the *Milk* of *Cows*, and the *Butter* made of it is far better in the *Spring*, when *Cows* feed upon tender *Herbs* and *Flowers*, than at other times. So likewiſe it is obſerved that the *Honey* which the *Bees* gather from *Thyme*, *Sage*, *Savory* and *Tree Trefoile*, being the *Herbs* they moſt of all delight in is the beſt of all other. For this reaſon the *Honey* of *Sardinia* hath a bitter *taſt*, becauſe it is moſtly gathered from *Wormwood*. And *Hiſtorians* tell us, that the *Honey* made about the City *Heraclea* in *Pontus*, had a venemous quality, becauſe it was gathered from the poiſonous *Aconite*.

V. *The Ground or Soil in which the Vines grow, communicates to the Wine ſome of its virtue.*

The ſame may be alſo experienc'd in *Wine*, which being adulterated with *Quick Lime*, *Plaiſter of Paris*, *Rocket*, *Wild Myrtle or Butchers Broom*, *Jews Lime*, *Clary* and the like, becomes pernicious to the *Body* of *Man*. There are alſo ſome ſorts of *Wine* which do particularly affect our Diſpoſitions.

tions. It is an Observation of *LEMNIUS*, that the Common People in *Holland*, by their much *drinking* of *Poitou Wine*, which sends sharp Fumes up to the *Brain*, are thereby inclined to be very peevish and quarrelsom; whereas those of them that drink *Rhenish Wine*, are not so. And it is observed, that the *Fruits* and *Plants* which are the product of *dung'd Grounds* are not so good and wholsom, as those that grow, where no such Art hath been used: As likewise, that the *Grain* or *Pulse* that grows on such *ground*, cannot be so long kept from becoming *musty*, or being eaten by *Worms*; and that the *Beer* brewed of such *Grain* doth sooner turn Sower.

VI. *Living Creatures retain the Qualities of their Aliment.*

The *Virtue* of *Food* is also perceiv'd and distinguish'd in *Animals*. For in some parts of *Holland*, which is a *Watry Country*, and abounding with *fish*, they fatten their *Hogs* with them; which tho' they soon fat them, yet it is observed that the *Flesh* of these *Swine* is more flaggy and less firm, neither is it so wholsom; and differs much in Taste from the *flesh* of those *Swine*, which have been fed with more convenient *Aliment*: Because *Fish*, as *GALEN* observes, generates a thinner *Blood*, and more Excrementitious, than the *flesh* of *Terrestrial Animals*.

VII. *Many Diseases arise from the Qualities of Food.*

So likewise from the *Qualities* of *Aliments*, remaining in the *Body* of *Man*, many *Diseases* are generated; as the *Scurvy*, the *Gout*, *&c.* Thus we find that the *Scurvy* is an *Epidemical Disease* in those *Countries*, where they eat *Meat* much *salted*, and dried in the *Smoak*, and brew their Beer of *Brackish Water*. And those are commonly troubled with the *Gout*, who live intemperately and luxuriously, especially if they feed much upon *salt Meats*, and drink much *Wine*. For as the Learned *Dr. WILLIS* observes in his *Pathologia Morborum*, by this means a raw and indigested *Chyle* is prepared; and then, by the intemperate *drinking* of *Wine*, those *Saline Dregs*, which otherwise would go to the Excrement, and be carried forth with them, being too much exalted, are conveyed into the *Blood*: To which Enormities of *Diet*, if a *Sedentary Life*, *Idleness*, and *Sleeping after Dinner* do concur, whereby those Superfluities are hindred from exhaling, or being discust by Labour and Exercise, they will the more certainly produce the *Gout*, and that in the worst manner.

CHAP. VII.

Living things do vary and alter, according to the difference of Place and Time.

I. *What the Alteration or Change of Bodies imports.*

A *Body is* said to be *alter'd*, *when it suffers any change in the figures of its Sensible or Insensible parts*; *or when it loseth some Parts, and acquires others.* Thus a *bruised Apple* is said to be changed or *alter'd*, because many of its *parts* have acquired another *Position*; and some of them may have quite changed their former *figures*. This *Alteration* is caused two several ways in *Living Bodies*, either by being removed from one place to another, as from a *hot* to a *cold Country*; or on the contrary; or by the different *Seasons* of the *Year*, which is the diversity of *Time*.

II. *The Difference of Countries contributes to the variety of Living things.*

Living things, that are removed from one *Country* to another, are by this means variously alter'd, being sometimes meliorated, and sometimes again degenerating, as the *Climat* doth agree, or disagree with them: And this, because of the difference of *Heat* and *Cold*, *Moisture* and *Dryness*, that predominates in those *Countries*; for according as the *Climat* or *Soil* of any *Country* differs, so the disposition of those *Bodies* that are there differ also. Thus some *Plants* grow much taller and fairer in some *Countries* and *Soils*, than in others. Some *Plants* being removed to a better *Air* and *Soil*, are thereby meliorated and bring forth wholsom *Fruits*; whereas in their *Native Soil*, they brought forth *deadly* and *poisonous Fruits*. As *COLUMELLA* acquaints us with a certain *Plant*, which by being removed from *Persia* to *Egypt*, loseth its venemous *Quality*, and becomes wholsom to those that *eat* it.

III. *Herbs vary according to the diversity of the Soil or Country where they grow.*

Thus *Herbs* that grow in *Barren Grounds*, are very different from those that grow in a rich and fat *Soil*, which are far more large and fair, than the former. Thus *Bugloss*, *Comfry* and *Avens*, change the *colour* of their *Flowers* by the Industry of *Gardiners*, and the Fruitfulness of the *Soil* where they are planted. *Violets* also, whose Natural *colour* is *Purple*, are changed into a *Blew*, when they grow in rich Ground. In like manner, some *Plants* that are armed with *Thorns* and *Prickles*, being transplanted to some certain places, lose much of their *Pricklines*.

IV. *Plants degenerate, when transplanted from a fruitful Soil, to a barrin.*

And on the contrary, *Plants* removed from a fat and rich *Ground*, to a dry and Barren place, do frequently degenerate. So we find that the *Plants* brought from the *Canary Islands*, and other *hot Countries*, if they be planted in our *Northern Climat*, lose much of their *genuine Virtue* and excellence; as we see in the *Herb* called *Master-wort*, which tho' it retain the same outward shape and appearance, yet differs very much in force and virtue, from what it is in those *hotter Countries*. Yea, it is reported by some, that the *Earth* brought from the *Fortunate Islands*, and other far distant *Countries*, into *Italy*, hath brought forth several strange *Plants*, different from those that grow in *Europe*.

V. *All Plants have particular places which they delight in.*

All kinds of *Plants* affect some particular *Climat* and *Soil*, and especially those places where they sprung up at first, whence they cannot be removed without danger of being prejudiced thereby. For some love *shady* and *moist places*; others, *high grounds*, and expos'd to the *Sun*; some delight in *morish* and *fenny Ground*, others in *dry* and *sandy*; which, if they be removed from these places, lose much of their *virtue* and *fairness*. Those which delight in *hot Countries*, will not grow in those that lye far North; neither will those that thrive in *cold Countries*, live under the *Torrid Zone*. Thus *Wormwood* grows plentifully in *Pontus*; *Orrus*, in *Dalmatia*; *Hellebore*, in the Island *Anticyra*; *Sea Purslan*, on the *Sea shoar*. *VIRGIL*, in the Second Book of his *Georgicks*, does elegantly set this forth:

All Grounds not all things bear, the Alder-*Tree*
Grows in the Fens; *with* Sallows *Brooks agree*;
Ash, *craggy Mountains*; *Shoars sweet* Myrtle *fills*;
And lastly, Bacchus *loves the Sunny Hills.*

VI. *Those that thrive in Hot Countries, commonly dye in Cold Countries.*

For the Plants that thrive in *Arabia*, the *East* or *West Indies*, *Brazile*, *&c.* being transported to *France*, *Flanders*, or *Germany*, do not grow there without great Pains-taking, and after all do not answer the *Virtues* of those that grow in those *hotter Countries*. Yea, the curious lovers of *Plants*, when they transplant any *Herbs* or *Trees*, take diligent observation of their standing in the *places* where they Naturally grew, what part of them was turned towards the *Pole*, *&c.* that they may set it again in the very same manner as it stood before; because they suppose that the change of their former *situation* may very much hinder the thriving of them, and *spoil* the inward disposition of their Parts. See the *History of Nature*, *concerning* Plants, Chap. VI.

VII. *Change of Place is the Cause of Alteration in Animals also.*

Much a like Alteration we shall also find in *Animals* that are transported from one place to another. For we find that *Youths*, upon any considerable changing of the *Air* wherein they were born, do shoot up strangely in a few Months time, more than they would have done, had they continued at home in several *Years*. Others again, upon changing of their *Native Soil*, do grow thin and meager, and lose their fresh and lively *colour*. It is also notorious, that some persons have an Antipathy against some *places*, because that where they were born is of a quite opposite Temperament.

VIII. *Difference of Time and Season, is the Cause also of alteration in Living Bodies.*

Neither doth the Difference of *Time* occasion a less change in *Living things*, than that of *Place*. For tho' *Plants* be nourished all the *Year* through, yet do not they always shew forth the same effects of their *Nourishment*; for during *Winter* they are divested of their *Leaves* and *Seeds*, excepting only some few, *viz.* the *Bay-tree*, the *Yew*, the *Ivy-bush*, *&c.* which by reason of the *clammy Juice* where with they are nourished, do not shed their *Leaves*, as the rest do. Accordingly also Care is taken, that such *Seeds* which can endure the *Frosts* of *Winter*, be sown in *Autumn*; and others again at the beginning of *Spring*, or a little before the *Humour* begins to move, lest by the too abundant affluence of it, the *Roots* should perish. For as some *Seeds* are spoiled for want of *Moisture*, so others perish by an overplus of it. *Fruits* also are subject to *Alteration*, according to the several *Seasons* of the *Year*, most of which are only *green* in *Summer*, but attain perfect maturity in *Autumn*, and losing their former *taste*, *smell*, and *colour*, do acquire new *Qualities*, and accordingly affect our *Senses*.

CHAP. VIII.

Of Plants; and first of all of their several Parts.

I. *The Parts of Plants are either Simple or Compound.*

HAving hitherto spoke of *Living Bodies* in *General*, we come now to the handling of *Plants* in *Particular*, to the end that having explained their *Nature*, what we have to say concerning *Animals* may be the more readily understood. The first thing to be considered in *Plants*, is their *Parts*, which are either *Simple* or *Compound*. I call those *Simple parts*, *which consist of Particles of the same Texture and Constitution*; such as are the *Juices* or *Liquors* contained in them. The *Compound parts* are those that *are made up of parts of a different Nature*; and are also called *Organical parts*, because they concur to some one *Action* or other; as the *Root*, *Stalk*, *Leaves*, *Flowers*, *&c.* Some whereof are *Perficient* and *Integral*; others *Conservative* of the kind; others *Ornamental*, and others *Defensive*. The *Parts* belonging to the *compleating* and perfecting of a *Plant*, are the *Root*, and *Stem* or *Stalk*; those that concur to the *propagating* of their *kind*, are the *Fruit* and *Seed*; and those that *defend* them from the Injuries the *weather*, and otherwise, are the *Bark Tho* of or *Prickles*, *Shells*.

II. *The Simple parts of a Plant.*

The *Simple* or *Similar parts* are the *Juice*, or *Moisture*, the *Nerves*, the *Windpipe*, and the *Flesh* of *Plants*.

III. *Juice or Moisture.*

The *Juice* or *Moisture*, *is the liquid part of a Plant*, *diffused through the substance of it*. This *Juice* is, as it were, the *Blood* of the *Plant*, which if it chance to burst through any part of it, whether of its own accord, or by the *heat* of the *Sun*, or by cutting or lopping of the *Plant*, is called a *Tear*, because it breaks out of the *Tree* like a *Tear*, or *Drop*. Which *Drops* are twofold: The first are such as are of a *Watry Nature*, having something of an *Earthly* consistence joyn'd with them, and are called *Gum*; which is that congealed and thick *Liquor*, that proceeds from the *Trunks* of *Trees*, and cleaves to the *Barks* of them; and the other more oily and fat, which is called *Rosin*.

IV. *The Nerves or Sinews.*

Nerves in a *Plant*, are those *fibres* or *strings*, which give consistence and strength to the softer Parts of a *Plant*; and *by which the Alimentary Juice ascends*. The *Spirit* contracts the *fibre* or *string*, and so drives the *Moisture* upwards, which descends through the little *Bougets* or *Membranous passages*. For in every *Plant*, besides the *Sensible Body*, there is a *Subtil vigorous Body*, the Producer of *Motion*, *viz.* the *Spirit*, which runs through the whole *Body* of it.

V. *The Wind-Pipe.*

The *Trachea* or *Wind-pipe* of a *Plant*, being also a *Similar part*, is an open and wide *Vessel*, consisting of little thin *Plates*, ranged like the *Scales* of a *Fish*, or writhen and twisted together, being for the most part of a *Silver colour*; and may be easily stretched, prest and bent. In the *Trunk* or *Stem* of a *Tree* they run upwards; in the *Leaves* they are made like a *Net*, and take up great Spaces in them; in the *Sprouts*, *Buds*, and *Shoots* they are twisted, and are called by a Learned Man, *Vasa spiralia*, *Spiral Vessels*.

VI. *The Flesh.*

The *Flesh* is another *Similar part* of a *Plant*, which is *thick*, but somewhat soft, and is outwardly cover'd with the *Bark*: Of which hereafter.

VII. *The Compound Parts.*

The *Compound*, or *Dissimilar parts* of a *Plant* chiefly, are the *Root*, the *Stem* or *Stalk*, the *Bark*, the *Pith*, the *Branches*, *Leaves*, *Flowers*, and *Fruits*.

VIII. *What the Root is.*

The *Root* is the lowest part of a *Plant*, sticking in the *ground*, through the *passages* and *pores* whereof the *Alimentary Juice*, being moved by *Heat*, is driven upwards. This *Part* is so necessary to *Plants*, that none can subsist without it. There is one kind of the *Herb* called *Chamæleon*, which wants a *stalk*; *Wheat* hath never a *branch*; the *Fig-tree* hath no *flowers*, *Jesamin* hath no *fruit*; but there is no *Plant* without a *Root*, nay, there are some that are nothing else but a *Root*, *viz.*

viz. a *Muſhrom.* For the *Root* is, as it were, the *Mouth* by which the *nouriſhment* is taken in, or like the *Hand* by which *Plants* draw *Juice* out of the *Earth*, and ſend it up into the *Trunk* or *Stem*. And to this end it is *porous*, and full of many looſe *paſſages* for the humour freely to aſcend that nouriſheth the *Plant*. The *Roots* are very different in their *Figures*, ſo that almoſt every different kind hath *Roots* of a different *figure*. In a *Fig Tree* and *Olive Tree* the *Root* is ſingle, and ſinks very deep, yet ſends forth ſeveral little *twigs* from the ſides of it. In *Leeks* and *Onions* the *Roots* are manifold, as conſiſting of innumerable ſhreads or *Hairs*; in *Turneps* it is *Round*; in *Beets* it is without *Joints*; in *Orris* it is full of *Joints*; ſometimes it conſiſts of many round *knots*, as in *Birthwort*. Yet all *Roots* generally agree in this, that they end in a *Cone*, or ſharp *point*; for the upper part of the *Root*, drawing to it ſelf more *Aliment*, doth grow to a greater bulk than the lower part.

IX. *The Trunk or Stock.* The *Stock*, *Trunk* or *Stalk* is that part of a *Plant*, which riſeth up from the *Root* above the *Earth*, and tranſmits the *Moiſture* it receives from it to the utmoſt parts of it. In *Herbs* it is properly called the *Stalk*; when it is hollow, it is called *Calamus* the *Reed*, and in *Corn Culmus*, the *Blade* or *Straw*, and in *Pulſe Scapus*, the *Shaft*. The *Stock* or *Stem* of a *Plant*, before it be turned in to *wood*, conſiſts of a *ſpungy ſubſtance*, ſomewhat ſoft, and full of a coagulated *Juice*, from the abundance whereof its *Green Colour* proceedeth. If the *top* of it chance to fall off, it grows ſo much the thicker, becauſe then it enjoys that part of the *Aliment* which was appointed for the *nouriſhment* of the *top*, and thereupon dilates its ſelf and grows bigger in bulk. It is common to the *Trunks* of *Plants* to become *crooked*, and to bend one way, when the *ground* begins to be dry and ſapleſs, and furniſheth a more hard *Alimental Matter*, than can be well digeſted by the *Tree*. Tho' the *Stocks* of *Plants* be generally *Cylindrical*, yet there are ſome that are corner'd: In *Daffodils* the Stalk is two-corner'd; in *Cyperus*, which is a kind of *Ruſh*, it is three-corner'd; and in *Horehound* the Stalk is 4 ſquare.

X. *The Bark.* The *Bark* is, as it were, the *Skin* or *Hide* wherewith the *Plant* is cover'd; and the ſame is manifold in one and the ſame *Plant*, *viz.* the *outward*, which reſembles the *Cuticle* or thin outward *Skin* in *Man*; the *middlemoſt* which is *thicker* like a *Hide*; and the *inmoſt* which is like a thin *Membran*. And therefore the *Bark* is reckon'd amongſt the *Diſſimilar Parts* of a *Plant*, becauſe it conſiſts of a great variety of *Strings* and *Fibres*, and of ſeveral *Coats*. For it is not the ſame in all *Plants*; for in ſome it is thick, as in the *Poplar Tree*; in others thin, as in the *Bay Tree*; in a *Reed* it is like a *Membrane*; in a *Vine Nervous* or *Sinewy*. In the *Spring* time the *Bark* is with eaſe ſeparated from the *Tree*, becauſe of the *Juice* that aſcends between it and the *Tree*, which diſſolves that Glew whereby it was before faſtned to the *wood* of it.

XI. *The Pith.* The *Pith* of a *Plant*, which by way of excellence is called the *Heart*, *Brain* and *Matrix*, is that middle part whereby the *Aliment* is conveighed from the *Root* to the upper parts. The ſame is alſo very different; for in ſome *Plants* it is ſoft and ſpungy, as in the *Elder Tree*, where it reſembles *froth*; in others again it is harder, as in the *Pine Tree*, whoſe *Pith* is *woody*. The *ſeminal virtue* of the *Plant* is ſuppos'd to be lodg'd in the *Pith*, foraſmuch as not only the *Branches*, but the *Fruit* and *Seed* are derived from it.

XII. *The Branches.* The *Branches* are the upper parts of a *Plant* which ſpread themſelves from the *Stalk* or the *Trunk* of a *Tree*, as ſo many *Arms* ſtretched forth, to which they are joined by a *glutinous ſubſtance* hardned, which they call *Nodus* or a *Knot*, and in their ſprouting forth from the *Trunk* make an *Angle*, which in Latin is called *Sinus*, reſembling the *Arm-pit*, or the joining of the *Arm* to the *Body*. In many *Trees* the *Branches* grow without any order, but in the *Pitch* and *Firr Tree* they appear in a curious and beautiful ranging; the thinner and utmoſt parts of the *Branches* are called *Sprigs*, which are more tender than the reſt of the *Branch*, having not long been expos'd to the intemperature of the *Air* or *Weather*. The ſwellings that appear in the *Joints* of them, are called *Buds*, as long as they continue round, and are not yet open'd. And the thin tops of the *Sprigs* are called *Sprouts*.

XIII. *The Leaves.* *Leaves* are the ornament of *Plants*, and the *coverings* of the *Flowers* and *Fruit*, ſhading them from the *Heat*, and defending them from the diſtemperature of the *Weather* or *Air*. They generally proceed from the more thin and tender part of the *Bark*: ſo that when the *Bark* is pluck'd from a *Bough*, we find that the *Leaves* ſtick to it, and are pull'd off together with it. Yea, if the whole hollow of the *Bark* be pull'd off from a *Branch*, and the lower part of it be put into *water*, in the *Spring* time, *Leaves* will ſprout forth from the upper part of it. The *Figure* of *Leaves* is manifold; for in ſome *Plants* they are large and broad, as in a *Gourd*; in others very ſmall, as in a *Pine Tree*; in ſome thick and fleſhy, as in *Purſlain*; in others nervous and full of *Sinews*, as in *Wheat*; in *Onions* they are hollow like a *Pipe*; in *Aloes* partly round, and partly angulous. The *Stalk* or *Stele* of *Leaves* is alſo various; in thoſe of an *Olive Tree* it is ſhort; that of *Vine Leaves* is ſomewhat long; in *Colts-foot* and *Herbs* that grow in *Ponds*, the ſtele of the *Leaves* is very long, becauſe in them it is inſtead of a *Stem* or *Stalk*. Sometimes only one Leaf grows upon one *Stele*, as in the *Poplar* and moſt other *Trees*, ſometimes more, whence thoſe *Plants* are called 3 *leav'd*, 5 *leav'd*, 7 *leav'd*.

XIV. *The Flowers.* *Flowers* which are the moſt beautiful product of *ſporting* Nature, do greatly conduce to the *Ornament* of a *Plant*. They conſiſt of a fourfold *ſubſtance*, or rather of ſo many *parts*, *viz.* of the *Knot* or *Cup*, the *Leaves*, the *Threads* or *Thongs*, and the *Stalk* or *Stele*.

The *Knot* or *Cup* is that part which covers the *Flower* and keeps the *parts* of it together; as being the Baſe and ſupport of it; and therefore is of thicker and ſtronger *ſubſtance*, and not ſo beautiful as the *Flower* it ſelf.

The *Leaves* of the *Flower* compoſe the *Body*, and Beauty of the *Flower* it ſelf, being remarkable for their *Tincture*, but very fading, and of a very tender Complexion and Texture.

The *Threads* are thoſe long and ſlender parts in the middle or *Navel* of a *Flower* like *Hairs* or *Threads*, which in ſome *Flowers* are thicker than in

in others, and often have little Spires at the top of them; and are set round about the *Stele*, which is a long, but thicker part of a *Flower*, rising up from the middle of the *Navel* of it.

The *Stele* is the middlemost part of the *Flower*, sticking to the Rudiment of the *Fruit* or *Seed*. It is called in Latin *Stylus*, because of its being thin and long. All these parts are very distinguishable in a *Rose* and *Lilly*.

XV. *The Diversity of Flowers.*

Some *Flowers* want a Stele, as those that grow upon the *Bay Tree*; some instead thereof have a *Stalk*, as *Saffron*. All others generally have a *Stele*, as appears in the *Apple Tree* and in a *Rose*. But more particularly they differ in *colour*, which in a *Violet*, is Purple; in a *Marygold*, Yellow; in a *Blue-Bottle*, Blue; in a *Lilly*, White, and in a *Rose* various, there being *Red Roses*, *Damask Roses*, *White Roses* and party *colour'd*. Neither do *Flowers* less differ by their *smell*: And what is worth our consideration, we find a most grateful odor in a *Rose*, and none at all in the *Plant* whence it grows; whereas in *Sage*, the *Flower* is without any *smell*, tho' the *Herb* it self be very odorous: In *Borage* we perceive both *Plant* and *Flower* destitute of any *scent*; whereas in *Lavender* both the one and the other are odoriferous.

XVI. *The Fruit.*

The *Fruit* as it includes the Seed, and Flesh or Pulp of the Fruit, is the last work, and, as it were, the Masterpiece of the Plant; and to the producing whereof all the other parts of the Plant do concur. Its Fashion or Figure is various; some are partly of a *Conical* figure, as *Pears*; others of a solid Elliptick figure, as *Olives*, *Plums*, &c. some are *Round*, but somewhat flatted at both ends, as *Apples*; some perfectly *Round*, as *Cherries*, *Grapes*, *Berries*, *Correns*. They have also different Coverings; for *Wheat* is cover'd with a single *Membran*; a *Chesnut* with a *thick Skin* full of *Prickles*; an *Acron* with a *scaly Shell* or *Cup*; *Almonds* and *Wallnuts* inwardly with a hard *Shell*, and outwardly with a green *Shell* or covering.

XVII. *How Plants are said to bring forth their Fruits.*

Plants are said to *bring forth*, when they *bloom* or flourish, and when the *Flowers* break forth from the *Knops* or *Buds*; but the *Education* or *Rearing* of their *Off spring* is in the *Fruit*, for the sake whereof a *Plant* grows, and is therefore call'd the *Mother* and *Nurse* of her *Fruits*.

XVIII. *Whether Leaves, Fruits and Flowers be the true Parts of a Plant.*

It hath been a long controverted *Question* amongst the *Ancients*, whether *Leaves*, *Flowers*, and *Fruits*, were to be accounted parts of a *Plant*. THEOPHRASTUS seems inclin'd to the negative, as supposing them to be no more the parts of a *Plant* than the *Births* of *Animals* are any part of them; for they being after a certain term separated from their *Parents*, cannot after that properly be called *Parts* of them. But this Controversie seems only to be about *words*: for if *Leaves* may not be accounted as the *Parts* of those *Trees*, whence they are yearly separated at the Fall, as in the *Oak*, *Wallnut-tree*, &c. why may not they as well be denied to the *Pine*, *Olive Tree* and such others which never are without *Leaves*, seeing that those *Trees* also lose their *Leaves*, tho' not altogether, but by a continual succession of new ones, shooting out in the room of the old ones. Therefore those who account only that to be a part of a *Plant* which always continues with it, have good reason to bar *Leaves* of that Priviledge; for otherwise I see no reason, but they may well enough be admitted to be parts of a *Plant*.

CHAP. IX.

Of the Original of Plants.

I. *There is Virtue in the Earth, whereby it is impowered to bring forth Plants.*

IT cannot be questioned, but that in the *Beginning* of the *World* there was a Power communicated to the *Earth* of producing *Plants*, and that great variety of *Vegetables* that are found in all *Countries*. In the first Chapter of *Genesis* we find these words, *Let the Earth bring forth Grass, the Herb yielding Seed, and the Fruit-Tree yielding Fruit after its kind, whose Seed is in it self after his kind.* Now this *virtue* imparted to the *Earth* continues still in its full vigor, neither doth any thing spring out of the *Earth*, but by this *virtue*. But forasmuch as many *Vegetables* seem to spring of themselves, whereas others are manifestly beholden to *Root* or *Seed*, for their *Growth* or *Production*; we are to enquire how this twofold *Production* is performed, and how it comes to pass that some *spring* as of themselves, whereas others stand in need of a manifest *Seed* for their *Production*.

II. *What those Plants are that grow of themselves.*

Those *Plants* are said to *spring* of themselves, which the *Earth* produceth without the *sowing* of *Seed*, and to grow by accident, as the *Schools* express it. Such as are *Purslain*, *Housleek*, *Pennyroyal*, &c. which, as some tell us, do of themselves grow out of the *Earth* that is dug up, in a *shady* and *moist Wood*, being put into *Earthen Pots*. PORTA tells us, *lib. 2. Phyt. cap. 1.* that having exposed some *Earth* that had been dug up from the deepest *foundations* of a *House*, to the *Air*, within a few days, several kinds of *Herbs* sprung up from it, familiar to the *Soil* and *Climat* of of *Naples*. And the famous *Lord VERULAM* assures us, that the *Earth* dug up from the *foundations* of *Houses*, or from the bottom of *Wells*, being put into *Pots*, will after a set season produce several sorts of *Herbs*. For if you take up *Earth* not above an *Ell* deep, it will be fruitful the first year; but if you take up that which lies deeper, it will not produce any thing till after a years time, and sometimes 2 years.

III. *The Plants which are said to grow of themselves, owe their Rise to Seeds.*

Some *Philosophers* are of opinion, that such *Plants* as these are produced without any *Seeds* at all, and that the *Earth* produceth them by an innate *vertue* of their own. But that which hinders me from assenting to this *opinion* is, because I find that all *Countries* do not produce the same *Plants*; which could not so happen if there were not diverse dispositions in them, proper for their several *Productions*. But what can these different *Dispositions* be, but *Seeds*; or those first *Buds* from whence *Plants* arise? For what else doth the *Sun* do, when it cherisheth the *Earth* with its heat, mixeth it with Water, exhales the moisture from it, dries the *Particles* of it, *&c.* but work such dispositions in the *Earth*, and so fit the insensible parts of it, as that from the due ranging of them, the *Roots* of *Plants*, their *Strings*, *Ribs* and *Veins* are formed, through which their *Aliment* may be conveighed, and being sufficiently prepared, break forth in the other parts of it?

The

IV. *What are the Seeds of Plants, that are said to grow of themselves.*

The *Seeds* therefore of these *Plants*, are those *Insensible Particles*, which by the agitation of the *Subtil matter* do obtain such a *situation*, *figure*, and *motion*, as are needful to form the first Rudiment of a *Plant*. And forasmuch as this *dispostion* of *parts* is not to be found in all Parts of the *Earth* alike; therefore it is no wonder, that all *Plants* grow not in all *Countries*. We are to take Notice also, that there is no difference betwixt these kind of *Seeds*, and those which are the Product of *Plants*; save only this, that the Parts of these latter are more closely compacted together, and more orderly framed: Whereas those which arise from the various *Motion*, *Spreading*, *Mixture*, and *Composition* of concurring *Particles*, are not so exactly joyn'd and formed, and therefore *Plants* are more slowly produc'd by them.

V. *The first Trees were produc'd without Seed.*

Some *Authors* relate as Miracles, that sometimes tall *Trees*, yea, whole *Woods*, have sprung out of the *Earth*, without *Seeds*: But they did not consider, that vast store of *Seeds*, which are hid in the *Earth*, and are the beginnings and first Draughts of those *Seeds* that are the products of *Herbs* and *Trees*. THEOPHRASTUS observes, 3 *Histor.* 2. that the *Earth* in *Crete*, presently after it was dig'd up, did bring forth *Cypress* Trees, which are also propagated by *Slips*. Can any one believe, that the first *Trees* were the product of *Seeds* fallen from Trees? Or, that the Great *Woods* that are found up and down, were *sown* by *Men*? For seeing that the *World* had a Beginning, and that we cannot admit a progress to Infinite, we must come at last to those *Trees* which had no such *Seeds*, whence they were produc'd, and for the production whereof the Nature of the *Climat* and *Soil* were sufficient. For *Cinnamon*, *Myrrh*, *Frankinsence*, and *Cassia*, did always abound in *Southern Countries*; as the *Northern Grounds* never wanted *Willows*, *Oaks*, *Firr-trees*, *Elms*, *&c.* which delight most in those places, and will not without care and difficulty grow elsewhere. According to that of *Virgil*:

The blackest Ebony from India *comes,*
And from Sabæa *Aromatick Gums.*

VI. *Calcin'd Earth produceth great abundance of Plants.*

Some observe, that *Earth* that is *burnt* or *calcin'd*, when expos'd to the *Air* and *water'd* with plentiful *Showers*, doth immediately bring forth great store of *Vegetables*; because the *Pores* of the *Earth* being opened by this means, the *Seeds* are set free from their Prisons, and meeting together are entangled, and so constitute little *Masses*, from whence those *Plants* proceed. It is a thing very notorious, that in *Walks* that are thick overspread with *Sand*, the *Earth* the first Year produceth only *knotted Grass*, the following Years a *thick* and *swoln Grass*, like the blade of *Corn*; because the *hardness* of the *Sand* or *Gravel* hath hindred the due coagulation of the *Seeds*; but as the *surface* of the *Earth* comes to be more freed from the *Sand*, the *Seeds* can the better come together, and thus produce common *Grass*; to which *Showers* do very much contribute, by moistning the *Earth*, and thereby setting the *Seeds* that are in it more at liberty.

VII. *How Plants are produc'd from*

As to *Plants* that are *Sown by Men*, the Explication of their way of *Production* is not difficult. For when, by Example, a *Pea* or *Bean* is put into the *Earth*, and there meets with a due *moisture* and moderate *heat*, it first begins to swell, and distends its *Skin* or *Husk*, and having at last broke it, the same Causes continuing, do afford it new *Matter*, and the first beginning of the *Plant*, which we call the *Bud*, appears; which by thin *Fibres* or Strings, spreading it self through the *pores* of the *Earth*, and the Parts of it pressing upon it, must needs grow hard; and thus is the *Root* of the *Plant* formed. The Matter being thus digested into a *Root*, being recruited by new Incoms of *Heat*, and dilated by the same mounting upwards, the tender and green *Substance*, which is commonly call'd the *Leaf* or *Bud*, riseth and springs up; which still growing higher, turns to a *Stalk*: For a *purer Juice* being now duly prepared in the *Roots*, doth by degrees ascend from thence into the *Stalk*, which Motion upwards is much promoted by the *pores* of the *woody Stalk* or *Stem*. Moreover, *Heat* being active and impatient of *Idleness*, continually drives the *moisture* or *Juice* upwards; and so the *Stalk* becomes extended, and riseth to a considerable height. Now when the *Juice* doth not ascend so fast, and that the *parts* of it, by the agitation of *Heat* are more depurated, they are by the driving of the *Fire* carried above the *Stalk*, where meeting with the *cold Air*, they are stopt from mounting any higher; where still more *particles* of the said *Juice* joyning them, they swell into a *Bud*. And whereas the affluence of *Heat* through the Stalk still continues, is bursts open, or splits the *Bud*, and by this means makes way for the *Subtil matter* to break forth, and display it self in the appearance of a *beautiful Flower*. And lastly, after that the *Alimentary Juice* hath still attain'd a further degree of Perfection, another *Substance* succeeds in the room of the *Flower*, which being hollow within, contains the *Fruit*, that is, the *Pea* or *Bean*, and is a defence to it, against the Injuries of the *Air*. For in all *Natural things* there is, as it were a kind of *Circle*, whilst the *Seed* of the *Plant*, under a different respect, is called the *Antecedent Principle*; and the *Fruit* the *Consequent*.

perfect form'd Seeds.

CHAP. X.

Of the Nourishment, and Growth or Increase of Plants.

HAving spoken of the *Forming* of *Plants*, we now proceed to Treat of their *Nourishment*, which seems to be nothing else but a continued *Generation*; because all the Parts of that which is generated would fall away immediately and waste, without the supply of *food*, that preserves them from perishing.

I. *The Generation of Plants, is accompanied with their Nutrition or Nourishment.*

II. *What the Nutrition or Nourishment of Plants is.*

The *Nutrition of a Plant* therefore *is the distribution of the inwardly received, and altered Aliment, into all the Parts of it; and the transmutation of it into their Substance, for the supply of what continually wastes and evaporates by the force of Heat.* For the Moister parts of *Plants*, as well as *Animals*, are in a continual *flowing*, as is manifest from the *Leaves* and *Flowers* that are pluck'd off from them; for these immediately grow limber and wither, by the want of that *Juice*, which used to distend their *Vessels* and *Bladders*.

III. *Nutrition in Plants, is not an effect of Choice.*

Not that *Plants* make uſe of choice in attracting of their *Aliment*, ſo as to take in that which is agreeable to them, and reject the contrary; forasmuch as no ſuch *attraction* can be found in *Natural things:* But we muſt rather conclude, that the *pores* of the *Roots* are of ſuch a *figure*, as are fit to admit thoſe *particles* that are proper to nouriſh the *Plant*, and exclude the reſt; after the ſame manner as the *Liver*, by tranſmitting the *Gall*, and the *Kidneys* the *Urine*, do thereby ſeparate them from the *Blood*.

IV. *Heat is neceſſary to the Nutrition of Plants.*

This will be ſtill more manifeſt, if we ſuppoſe 2 things in *Plants*, *viz. Heat* and *Pores*, which are the *Inſtruments* of *Nutrition*: For by *Heat* the *Alimentary Juice* is driven upwards, not only from the *Earth* into the *Root*, but alſo into the *Trunk*, *Branches*, and the utmoſt *Leaves*: And in this its paſſage the *Nouriſhment* is further concocted, prepared, diſtributed and coagulated, ſo as to be fit for the *Aliment* of *Plants*. For in every *Plant* or *Vegetable* there is ſomething, which with reſpect to the *Earth* whence they grow, has the Nature of a *ferment*.

V. *Whence this Heat proceeds.*

If you demand, whence this *Heat* proceeds; and what that Agent is which begets a *fire* in *Plants*? I anſwer, That the *primary Cauſe* of this *Heat* is the *Sun*, whoſe *Rays* in the *Summer* time do continually beat upon the *Earth*, and the *Plants* that grow out of it: Neither is the *Earth* in the *Night*, or during the *Winter*, altogether deſtitute of *Heat*, but preſerves always ſome portion of warmth communicated to her by the *Sun*, whereby ſhe foſters the *Plants* in her *Bowels*, and aſſiſts their *Nutrition*. Tho' it cannot be deny'd, but that ſometimes this *heat* in *Plants* is owing to *Subterraneous*, or any other *fires*: As we find that *Aloes*, *Onions*, *the Roots of Saffron* and *Leeks* will grow, being hung up in Rooms, eſpecially where conſtant *fires* are kept.

VI. *Pores alſo are neceſſary to the Nutrition of Vegetables.*

Pores likewiſe are of great uſe to the *Nutrition* and *Increaſe* of *Plants*, ſince they are the *paſſages* by which the *Juice* is received, and through which it is diſtributed to all the Parts of the *Plant*. For as the *Lacteal Veins*, and the *Subclavial Branches* of the *Vena Cava*, are neceſſary for the receiving of the *Aliment*, and the conveying of it from one part of the *Body* to another; ſo likewiſe there are found in *Plants* innumerable *Paſſages* and *Channels*; like to the *Lacteal Veins* in *Animals*, by which the *Juice* is tranſmitted from the *Root*, to the utmoſt parts. For ſuch is the diſpoſition of *Pores* in *Vegetables*, that the *Aliment* is much more conveniently tranſmitted by them, than it could be through the free and open *Air*; for by this means the diſſipation of the *Alimental Juice* is prevented, and its *motion* is more ready and without interruption: As we find that *Bullets* move more readily through *Pipes*, and *Smoak* through the *Funnel* of a *Chimney*, than in the open *Air*. And hence it proceeds, that *Lands* that have been often *ſown*, are thereby more exhauſted, than thoſe that lye Fallow.

VII. *How Plants are nouriſhed.*

Theſe things being underſtood, it will be no longer difficult to conceive, how the *Nutrition* of *Plants* is performed, and how they are increaſed; for *Vegetables* are nouriſhed whilſt the *Juice* is by the *Sun*, and the reſt of the *Subtil matter*, driven into the *pores* of the *Root*, and being there prepared by Concoction, after it hath paſt ſeveral ſtrainings, doth ſpread it ſelf in *length*, *breadth*, and *depth*. The ſoftneſs alſo or tenderneſs of the *Sprout* or *Sprig*, doth much further the conveyance of the *Nouriſhment*; becauſe it makes the *Pores* to be eaſily widened and diſtended. For as we find that the *pores* of *Bread*, being dipt in *Wine* or *Water*, become immediately diſtended thereby; ſo likewiſe the *Alimentary Juice*, when driven into the little Channels of *Vegetables*, doth open and extend them: Which doth not happen ſo in a dead or wither'd *Plant*; becauſe in it the parts of the *Pores*, and ſmall *threads* or *fibres*, are otherwiſe diſpoſed, ſo as not to be able to admit the *Juice*, which the *Subtil matter* hath driven into the *Roots*.

VIII. *The Nouriſhment of Plants conſiſts of a Moiſture, mingled with the Fatneſs of the Earth.*

The *Aliment* of *Plants* muſt be *Liquid*, becauſe it would not be fit to be carried upwards, or ſtrained, in caſe it were dry or hard. Yet is not this *Juice* a *moiſture* deſtitute of all Clammy-fatneſs of the *Earth:* For ſeeing that the parts of a *Plant* muſt ſtick and grow together, and that this cannot be without the entanglement of *Heterogeneous particles*; it is evident, that *Water* alone cannot be a fit *Aliment* for *Plants*, except it be well temper'd, with a ſufficient proportion of the Slimy-fatneſs of the *Earth*. And accordingly we find, that *Waters* in which *Salt* is diſſolved, or mingled with ſome Fat matter, are moſt proper for this *effect*, and make the *Vegetables* that are *watred* therewith, to thrive mainly. And it is for the ſame Reaſon, that *Countrymen* do recruit their barren Grounds with *Dung*, *Marle*, and the like. For *Water* alone too ſwiftly penetrates the Parts of *Vegetables*, nor ſtays long enough with them, ſo as to become their *Aliment*.

IX. *Different Plants require different Nouriſhment.*

Tho' the *Aliment* of all *Plants* be Moiſture, temper'd with the Fatneſs of the *Earth*; yet is not every ſuch *mixture* fit Nouriſhment for every *Plant*. For as *Vegetables* affect particular places; ſome delighting in *ſhady* and low *Valleys*, others in *high* and *upland Grounds*; ſome in *dry* and *ſandy*, and others in *moiſt Ground*; ſome in a *fat* and *rich Soil*, and others in a *barren* and *hungry:* So accordingly do they ſtand in need of a different *Nouriſhment*, which when ever they miſs of, they ſoon languiſh. For the *Particles* of theſe *Juices* being various, they muſt needs conſtitute different *Liquors*, whereof thoſe only are a fit *Nouriſhment* for ſuch and ſuch a *Plant*, which have an affinity with it, by the ſuitableneſs of the configuration of their Parts. Thus it is obſerved, that thoſe *Roſes* ſmell ſweeter, that have *Garlick* growing near them; becauſe the *particles* proper to produce a ſtrong and ungrateful *Scent*, are taken in by the *Garlick:* So that few or none of them can come to the *Roſe*, to allay or diminiſh the ſweetneſs of its *Odour*.

X. *The Stocks and Branches of Trees grow every year.*

The *ſtocks* or *ſtems* of *Trees* and *Shrubs*, with the *Branches* proceeding from them, are every *year* increaſed by new *woody* acceſſions; forasmuch as every *year*, a new round of *Fibres* is added to the inward *Bark* or *Rind*; which being divided in two parts, the outward part of it is added to the *Bark*, and the Inward part growing harder and harder, before the end of *Autumn*, acquires the compactneſs of *wood*, and ſeparating it ſelf from the *Bark*, becomes joyned to the *Wood*, and ſo increaſeth the *Trunk* or *Stock* of the *Tree*. But tho' we find, that the *Trunks* and *Branches* of *Trees*

are

are encreaſed this way only, yet muſt we not conclude from hence, as is commonly believed, that the *Juice* or *Sap* of a *Tree*, mounts upwards only betwixt the *Bark* and the *Wood*, but alſo through thoſe *Veſſels* that lie hid in the *Subſtance* of the *Wood*. This is evident in that the deeper any hole is bored into the *Trunk*, the *Branch* or *Root* of the *Tree*, the more *Juice* will diſtill from it, and that proportionably to the depth of the hole; ſo that out of a *hole* that is twice as deep as another, almoſt a double quantity of *Sap* will proceed in the ſame time.

XI. *This illuſtrated by the Example of a young Cheſtnut-tree.* This may be eaſily underſtood by the *Example* of a young *Cheſtnut-tree*; for if the Progreſs of its growth be narrowly obſerved, we ſhall find, that after 6 *months* time, there will be formed in its *Bark* (which is very thick) 2 rows of *woody Fibres*; and after 18 *months*, we ſhall find 4 of them; and a year after 8, and ſo on, ſo that always the laſt *Rows* do incloſe and involve the former, and make, as it were, a Circle about them, which is ſurrounded with another *Circle*, and that again with another; whence it follows, that when the *Stem* of any *Plant* is cut acroſs, the Section muſt appear compoſed of 2 ſorts of *ſubſtances*, *viz.* of theſe *Circles*, and of *inſertions* that are diſpoſed or ranged in the ſaid *Stock*, much like *Circles* of *Longitude* and *Latitude* in a *Terreſtrial Globe*.

XII. *How Pants grow and encreaſe.* *PLANTS* therefore grow or encreaſe, when greater or more *Particles* of *Alimentary Juice* are received by them, than their narrow *Pores* are able to contain. Hence it is that thoſe *Vegetables*, the ſides of whoſe *Pores* are more hard and compact, do not grow ſo faſt as others, whoſe texture is more looſe and open. Thus we find that *Peach-trees*, *Poplars* and *Willows* grow apace, becauſe they have pliable *pores*, and ſo crooked and bending, that the *Particles* of *Juice* that are driven upwards by the agitation of the *ſubtil matter*, can neither advance forward, nor return, and conſequently they muſt enlarge and diſtend the *Plant*. And for this reaſon it is that a *Vine*, frequently *watered*, thrives and advances ſo faſt; and that the *Chryſanthemum* or *Marygold* of *Peru* in 6 *months* time grows 18 or 20 foot high; and by the thickneſs of its *Branches* ſeems to challenge the talleſt *Trees*. But on the contrary, *Oaks*, *Medlars*, *Box*, and *Pine-trees* grow very ſlowly, becauſe the compactneſs of their *ſubſtance*, will not ſuffer their *pores* to admit ſufficient ſtore of *Aliment* for their ſpeedy growth and encreaſe. Thus *Golden Maiden-Hair*, *Whitlow-Graſs*, &c. grow very ſlow: and for the ſame reaſon *Trees* advance little or nothing in their growth during the *Winter Seaſon*, becauſe their *pores* being then ſhut up by *cold*, the agitation of *heat* is not of ſtrength enough to widen them, and to ſend up the *Juice* from the *Root* through them.

XIII. *How the Juice comes to be joined to the Plants, and ſtay with them in order to their encreaſe.* It may be queſtioned here, how the *Alimentary Juice*, which is forceably driven into the *Pores* of a *Plant*, comes to ſtay there, without being carried upwards into the *Air*, or without falling down to the *Root* again.

XIV. *Anſwer.* To which I Anſwer, that this effect may be aſſign'd to 2 *Cauſes*: the *Firſt* is a ſpecial conformation of the *Pores* of *Plants*; for we may ſuppoſe that by the continual aſcent and percolation of the *Alimental Juice* through the *pores* of the *Plant*, many of their ſmall *Fibres* muſt be bent in ſuch a manner, as to make the paſſage rough, by which means, tho' the liquid and fat *moiſture* eaſily mounts up through them, yet cannot ſo eaſily run back again, becauſe of the prominent extremities of the *Branchy particles*, which oppoſe their return the ſame way they entred. Daily experience confirms this, for we find that when with a *Knife* we cut or ſcrape a piece of *wood* with the *grain*, that is following the natural poſition of its *fibres*, we do it with much more eaſe, than when we attempt the ſame the contrary way. The *other* cauſe is the *Winter Froſts*, and the *coldneſs* of the *night*, which do fix and condenſe the *Juice* conveighed to all the *parts* of the *Plant*, and by obſtructing the *Pores*, hinder it from ſubliming into the *Air*. For it is certain, that in the *Nutrition* of *Plants*, *Heat* and *Cold* both act their parts, the one being not ſufficient to perform it without the other.

XV. *The Alimental Juice in Plants is circularly moved.* It is to be obſerved, that as the *Blood* in *Animals*, ſo likewiſe the *nouriſhing juice* in *Plants* is prepared by a kind of *Circulation*. For the *Juice* that is in their *Roots* or other *parts*, being toſt by a continual *motion*, cannot throughly be diſſolved, mingled or ſtrained, without frequently returning to the ſame part again, and being altered by various impreſſions. Which *Circulation* of the *Alimental Juice*, depends on the *Mechanical Structure* of the *Fibres*, the various diſpoſition whereof performs the ſame effect, which the *Valvulæ* do in the *Veins* of *Animals*; ſome of them being ſo formed, that the *Juice* finds a ready way to mount up between them; and others, ſo as to afford it an open and free Deſcent. Which may be proved by ſeveral *Reaſons* and *Experiments* in thoſe *Vegetables*, which are nouriſhed by a thick *Juice* reſembling *Milk*.

XVI. *The Proof of this Circulation in Plants, from thoſe of them that have a Milky Juice.* Mr. *MARIOTTE* aſſures us that he hath obſerved, that upon the cutting off the *Tops* of *Milky Plants*, and the parts nearer the *Leaves*, a greater quantity of *Juice* hath proceeded from them, than by cutting the parts nearer to the *Root*. That he experienced this in *Celandine*; and the ſtructure of *Fibres* in *Spurge*, and other *Milky Plants* perſuades the ſame; for theſe *Fibres* by the help of a *Microſcope* appear *white*, and are nearer unto the *Rind*, whereas the *Juice* in the other *Fibres* is of a more *Watry Colour*. Whence it ſeems probable, that the ſerous *Juice*, doth mingle with the other thicker, whether *Yellow* or *White*, in certain *Pipes* appointed for that uſe, much after the ſame manner as the *Chyle* entring into the *Veins* is there mixt with the *Blood*, and *circulates* with it. Tho' it be not yet diſcovered whether this *Juice* in *Plants* be carried in the ſame *Pipes* from the *Branches* to the *Roots*, and again from the *Roots* to the *Branches*; or whether diſtinct *Pipes* are aſſigned to theſe different *motions*, as the *Veins* and *Arteries* in *Animals*.

CHAP. XI.

Of the Diviſion and Difference of Plants.

I. *The Diviſion of Plants.* A Perfect *Plant* is by *BOTANISTS* commonly divided into a *Tree*, a *Shrub*, an *Underſhrub*, and an *Herb*.

A Tree

II. *A Tree.* *A* Tree *is a woody Plant, in thickneß and height exceeding all the reſt, whoſe ſtock is laſting, and one only by nature, which ſpreads it ſelf into many Branches and Boughs,* as an *Oak*, *Pear* and *Fir-tree*. I ſay it is *laſting* or perpetual, becauſe it hath no certain time of duration.

III. *A Shrub.* *A* Shrub *is a Plant of a mean thickneß and height amongſt thoſe that are woody, whoſe Stem is manifold by nature, and which by cutting off its Shoots or Suckers, is eaſily changed into the nature of a Tree.*

IV. *An Under-ſhrub.* *An* Under-ſhrub *is the leaſt of woody Plants in height and thickneſs, having a laſting Stem or Stalk, which ſometimes is ſingle, and ſometimes manifold like Bruſhwood, with a ſmall and ſlender Leaf,* as *Roſemary, Lavender, Southernwood,* &c.

V. *An Herb.* *An* Herb *is a Plant which conſiſts only of Leaves,* as *Harts-tongue,* &c. *or ſometimes of a Stalk, but periſheth away every year, and is not woody till after it be dried.*

VI. *The Diverſity of Plants may be deduced from ſeveral Heads.* The variety of *Plants* is aſſignable either to the *Soil* whence they grow; or to the *Pores* or channels through which their *Alimentary Juice* is conveighed; or to their *Structure* or *Figure*; or to the *Fruits* they bear; or to their differing *Qualities*, or laſtly to the *Changes* and *Alterations* to which they are obnoxious.

VII. *From the Place of their Growth.* With regard to the *place* of their *growth*, ſome are upon *Rocks, Walls*, the *Tops of Houſes*, when the *water* falling in abundance, doth leave ſome limoſity upon thoſe *places*. Some grow upon other *Plants*, or upon *great Stones*; as *Moſs* which grows upon the *Barks* of *Trees*; and *Touchwood* which ſticks to the *Oaks* and *Nut-trees*. Some proceed from the rotten *Wood* or *Roots* of *Trees*, as *SCALIGER* tells us, that *Bearsfoot* doth, *Exercitat.* 140. Others grow upon *Dunghills*, as *Sow-thiſtle*, which *Hogs* delight in, and other ſuch like. Some grow upon the *Bodies* of *Living Creatures*, as is related of a *Shepherd*, who had a little *Plum-tree* or *Sloe-buſh* growing out of his *Breaſt*, becauſe falling by chance upon one of them, he had forgot to pluck out one of the *thorns* of it which ſtuck in his *Breaſt*, and afterwards ſprouted out thence.

VIII. *From their different Pores.* *Plants* are alſo diſtinguiſht by their *Pores*; for the *Alimentary Juice*, according to the different ſtructure of the *pores* it paſſeth through, acquires a different *Temperature* and *Qualities*. According to which different diſpoſition of the *Pores*, ſome *Plants* are more early in their coming forth, and others later. For thoſe that want a *Stalk*, or have only a ſhort one, are more ſlowly nouriſhed: others that have a more favourable *Texture* of their *Pores*, and the *Fibres* of whoſe *Stems* are more yielding, grow ſooner, and to a greater *Size* and *Bulk*, eſpecially if the *Climate* and *Soil* agree with it. Thus *Gourds* and *Sallows* do in a little time encreaſe to a great *Bulk*; whereas on the contrary *Oaks* and *Pine-trees*, by reaſon of the ſtraitneſs of their *Pores*, are as ſlow in their advance. And therefore becauſe the *Fir-tree*, and others of that nature conſiſt of looſer and more open *Pores* than the *Ebone-tree*, and other-like hard and compact *woods* brought from *Brazile*, they are eaſily bent, but not without difficulty pulled aſunder: whereas the parts of theſe latter are very Brittle and break upon the leaſt bending, becauſe of the very cloſe and compact texture of their *Parts*. It is alſo from this various diſpoſition of the *Pores*, that the ſame Rain furniſheth nouriſhment to ſuch a vaſt number of different *Plants*, becauſe it is changed according to the difference of the *Soil*, and the variety of the *Pores* doth diverſly affect the ſaid *moiſture* and alter it, ſo as to become the proper nouriſhment of ſuch and ſuch a *Plant*. To which may be added, that the *Juice* which is drawn from one part of the *Earth*, doth furniſh it with other *Alimentary Particles*, than another doth.

IX. *How the Juice of the Earth aſcends in Plants.* But if any one ask, how the *Juice* aſcends from the *Root*, into the *wooden Fibres*; they may take this for an Anſwer, that the *Juice* aſcends in *Plants*, after the ſame manner as *water* mounts up into thoſe *Pipes* that are made uſe of in the *Experiments* of a *Vacuum*; that is to ſay, becauſe the weight of the *Air* drives them upwards. Which effect of the *Air* is much encreaſed by the *Circular Motion* of the *Earth*, for it being the Property of that *Motion*, to drive all the moſt agitated parts far from the *Center*; accordingly it alſo drives all the *Juices* of the *Earth* into the *Pores* of the *Plants* that are more agitated than the *Air*; whether this their *agitation* proceed from *Subterranean Fires*, or from ſome particular fermentation in the out parts of the *Earth*.

X. *From their Figure.* A great variety likewiſe ariſeth among *Plants* from their *Structure* or *Figure*; for ſome are low, as *Onions* and other creeping *Plants*. Others grow to a vaſt Height, as *Cedars* whoſe height and thickneſs is wonderful; *Hiſtorians* mention one that grew in *Cyprus* to have been 130 foot high, and of that thickneſs that 3 men could ſcarcely fathom it. And ſo likewiſe the *Fir-tree*, *Abies*, which takes it *latin* name from *Abire*, that is, to go away, becauſe of the vaſt height it oft riſeth to. *Hiſtorians* tell us, that in the *Ship*, that by command of the *Emperour CAJUS* brought the *Obeliſk*, placed in the *Vatican Circus* or *Piazza*, from *Egypt*, there was a *Fir-tree*, whoſe Trunk was as much as 4 men with their ſtretched-out-arms could compaſs. Some grow of a round *Figure*, as *Puffs*, others in the form of an *Umbrella*, as *Muſhromes*. Some have the ſtrings of their *Barks* extended long-wiſe, others a-thwart and Croſſ-wiſe. Some naturally have crooked *Stems* or *Trunks*, as the *Vine*, others ſtrait and upright, as *Reeds* and moſt *Trees*.

XI. *From their Fruits.* *Plants* are alſo differenced according to their ſeveral *Fruits*: and thus ſome are called *Glandiferous* or *Acorn-bearers*, as the *Beech*, the *Oak*, the *Cork-tree* and the *Cheſtnut-tree*, which latter, for thee goodneſs of its *Fruit*, excells the reſt of the *Trees* of this ſort. Others are *Coniferous*, bearing a *Fruit* like a Cone, that is ſmaller at one end and like a Top; ſuch as is the *Cedar-tree*, which formerly grew in great abundance upon *Mount Libanus*, but are reduced to 24 only. So alſo the *Cypreſs-tree*, and the *Firr*, tho' this is reckoned amongſt the *Reſiniferous* or *Roſin* yielding *Trees*. Others are *Pomiferous*, or *Apple-bearers*, as the *Apple-tree*, the *Citron-tree*, which is always green, of a moſt fragrant *odor*, and its fruit of a *golden Colour*; the *Orange* and *Lemon-tree*, the *Pomegranate-tree*, ſo called from the great number of *grains* of *Seed* which its *Fruit* doth contain; and the *Apricot-tree*, whoſe *fruit*, from the *golden colour*, were by the Greeks called *Chryſomela* or *Golden Apples*.

IX.
How the
Juice of
the Earth
ascends in
Plants.

X.
From their
Figure.

XI.
From their
Fruit.

To the Right Worshipfull S.r
Denis Hampson of Taplow in
Buckingham Shire & of Bradwell in
Oxford Shire Baronet
This Plate is humble Dedicated by Richard Blome

XII. *Of Nut-bearing, Berry-bearing, or Cod-bearing.*

Of *Fruit-bearing Trees*, some are *Nuciferous* or *Nut-bearers*; as the *Nut-tree* and *Almond-tree*, which have their *Fruit* contained in hard *Shells*; others *Baccíferous* or *Berry-bearers*; as the *Plum-tree*, the *Olive-tree*, the *Mulberry-tree*, and the *Cherry-tree*, which bear a *Fruit* that consists of a more soft and moist *flesh*, and cover'd only with a thin *Skin*: Other *Siliquiferous* or *Pod-bearers*; as *Cassia*, *Tamarinds*, *&c.* because their *Fruit* is contained in *Cods* or *Husks*, or in a *Juicy shell*, of a longish *figure*.

XIII. *From their various Propensions or Inclinations.*

There is also a considerable variety in *Plants*, from their different *Inclinations*: For some of them have an Antipathy against others. Thus the *Vine*, and *Cabbage* or *Coleworts*, cannot endure the Neighbourhood of one another; and so likewise the *Olive-tree* and the *Oak*, the *Bay-tree* and the *Vine*, the *Olive-tree* and *Coleworts*, the *Nut-tree* and the *Oak* are at variance. Not by reason of any inborn *Antipathy*, as some do imagine; but because when those *Plants* stand near together, they rob one another of sufficient *Aliment*, because they are nourished with one and the same kind of *Juice*; which being taken in by the stronger and more vigorous *Plant*, the other must needs languish. And on the contrary, those *Plants* are said to be friendly to each other, which are nourished by different *Juices*; so that what is necessary for the *Aliment* of the one, is never touched by the other. And herein doth the *Antipathy* and *Sympathy* of Plants properly consist; according to what we have more largely explained in our *History of Nature, concerning Plants*. Thus the *Fig-tree* and *Rue* thrive in the Neighbourhood of each other, because they delight in a quite different sort of *Nourishment*; and not by reason of any Consent or Friendship, but by substraction of the contrary *Aliment*, which the one draws to feed its *sweet-scent*, and the other to feed its *bitterness*. And on the contrary, *Rosemary* loseth part of its *sweetness* and *savour*, when it grows in the Neighbourhood of the *Bay-tree* or *Lavender*; because both these *Plants* delight in the same *Alimental Juice*, and are like Robbers one to another, whenever they stand close together.

XIV. *From Artificial Transmutation.*

A Diversity is likewise to be found in *Plants* that springeth from *Transmutation*; as when *Plants* are made more fair and beautiful, by the Art and Industry of *Gardiners*. Thus that vast variety of *Gilly-flowers*, proceeds from this Cause. And in like manner there is now the *Calathiana*, a kind of *Violets*, not only of *Blew colour*, but also *White*, *Red*, and of a mixed *Colour*, by the Curiosity of Ingenious *Florists*. For the Industry of *Gardiners* doth conduce much to the variety of *Plants*; according to what *Virgil* tells us in his *First Book* of *Georgicks*:

I have seen many would Anoint their Grain,
With Nitre first, then Lees of Oil would spread,
That the Husk swelling might enlarge their Seed;
Then with lent Fire ripen the tender Grain.

XV. *From the Negligence and Carelessness of Gardiners, &c.*

And on the contrary, by the Negligence of *Gardiners*, or some fault in the *Soil*, Plants *degenerate*, and are turned into others not so good as themselves: So *Wheat* turns to *Darnel*, *Basil* into *wild Thyme*, *Barley* into *Oats*, *Turneps* into *Rhadish*, as SENNERTUS assures us; *Water-mint* into *Spear-mint*; the *Blak-Vine* into *Briony*, *Spelt* into *Wheat*, and *Wheat* into *Spelt*. It is also a common Observation, that if the same *Seed* be for several years together *sown* in the same Ground, it will degenerate; according to that also of *VIRGIL*:

When oft the fairest Barly i'th' same Ground we sow,
Darnel instead thereof, and blasted Oats do grow.

The same happens almost to all *Plants*, when they are transpos'd to different and disagreeing Places: As when *Herbs* that grow in *Pools* and *Running-water*, are removed to the Tops of *Hills*, or *Champion-ground*. Thus if the *Water-flag* should be transplanted to *Hilly-ground*; or the *Seed* of *Lettice*, *Cucumber* and *Cabbage*, to a *Sandy place*: And on the contrary, *Heath*, *Fern* and the *Thorn-bush*, to *moist* and *Marshy-ground*; they would soon degenerate to other *Plants*, and cease to answer to their *Names*.

CHAP. XII.

Of the Propagation of Plants.

I. *Plants are propagated by Sowing, Setting, and Grafting.*

PLANTS may be propagated or multiplied several ways; as either by *Seed*, or by a *Sprig* cut, or pluck'd off from the *Stock* and set into the *Ground*; or by *Graffing*.

II. *The Soil is to be prepar'd for the Reception Seed.*

But before that the *Seeds* of *Plants* are committed to the *Earth*, the *Soil* must be duly prepared; that is, it must be turn'd up by the *Plough*, or dug with a *Spade*, or cut with a *Weeding-Hook*, or broke with a *Pick-ax*, and the *Clods* broke with a *Harrow* or *Rake*. All which pains is taken, partly to root out the *Weeds* and unprofitable *Herbs*; and partly to make the Ground more light and loose, that the *Seeds* or *Slips* may the more easily take *root* in it, and spread their *fibres* far and near, and by this means attract a more copious *Aliment*.

III. *The fittest time for Sowing.*

Nature directs us to the most proper *Seed* time, *viz.* when the *Seeds* have attained their full growth and maturity; or, when by the opening of their *Husks* they fall to the *Ground*; or by the contraction or shrinking of them are thrust out; or by the *Down* that grows about them, they are by the Wind scatter'd up and down through the *Air*.

IV. *Of Propagating Plants by Slips or Sprigs.*

The other way of propagating *Plants*, is by setting a *Sprig* or *Slip*, whether cut or pluck'd quite off, or whilst it sticks yet to its *Mother*, thrust down into and cover'd with the *Earth*, till it hath taken root. These *Sprigs* or *Slips* may be bigger or less, according to the Nature of the *Plant*. For some are set from a greater *Branch*, others from a *Slip*, others from a *Twig*, and others from a *Shoot*.

V. *What kind of Twigs or Sprigs are to be Set.*

The *Twigs*, *Sprigs* or *Slips* that we would set, must be fresh and green: Yet *VIRGIL* tells us, that the *dry Sprigs* of an *Olive*, if set, will grow notwithstanding:

An Olive Branch, tho' dry, will shoot,
If set i'th' Earth, and spread its diving Root.

It is alſo obſervable, that the more tender any *Plants* are, the later muſt their *Sprigs* or *Slips* be ſet, that is, about the middle or latter end of the *Spring*, in theſe *colder Climats:* And if the *Weather* permits, they muſt be *watered* as ſoon as ſet; I ſay, if the Weather permits; for in *cold Weather*, too much *Moiſture* is apt to ſpoil them. And ſo alſo, if it be a clear Sky, and the *Sun* ſhine hot upon theſe new ſet *Twigs* or *Slips*, they muſt be ſhaded, leſt the *heat* of the *Sun-beams* ſhould ſcorch and dry them up.

VI. *What Graffing is, and how it is performed.* In the Second place, *Plants* are propagated by *Graffing:* Now *Graffing*, being taken in the largeſt Senſe, *is ſuch an application of a Graff or Bud to its own Stock or Branch, or to that of another Tree, whereby they become united and grow together.* Now foraſmuch as the moſt part of the *Sap*, aſcends between the *Inner Bark* and the *Wood*, the whole Art of *Graffing* conſiſts in this, that the *Inner Bark* and *Wood* of the *Stock* and *Graff* do anſwer exactly one to another; or that the *Scion* or *Bud* be ſo applied to the *Stock* or *Branch*, that the inner and outward *Bark* both of the *Stock* and *Scion* may ſo exactly anſwer, and make one continued *Body*, and one Even *Surface*, that the *Juice* may readily and freely flow from the *Stock*, to the *Graff* or *Bud*.

VII. *What Graffing is, and to what end it is done.* The End of *Graffing*, is to meliorate the Nature of *Plants*, by changing them into others. For ſince there is a twofold *Concoction* of *Food*, the one in the *Stock*, and the other in the *Graff*; it cannot be otherwiſe, but that the *Alimental Juice*, by theſe different Strainings, muſt be the better prepared, and partake of new *Qualities:* And therefore we find, that *Plants* by *Graffing*, do not only bring forth larger, but alſo better *Fruit*, than the *Tree* doth from whence the *Graff* is taken: And it is found by Experience, that the *Tree* which grows from the *fruit* of a *Graffed-tree*, or the *Sprig* thereof ſet in the *Ground*, doth bring forth leſs and meaner *fruit*, than doth the *Graff* it ſelf, from whence it was taken. Hence it is alſo, that we ſee one and the ſame *Tree* laden with diverſe *Fruits*; yea, and the ſame *Fruit* having a different *taſte*, *ſmell* and *colour*, in one part of it, from that it hath in the other, as alſo late Ripe *Fruits* to become early Ripe, and ſuch as are *Green* to become *Red*.

VIII. *There be three ways of Graffing: The Firſt is Infoliation.* There be three ways of *Graffing:* The firſt is within the *Inner Bark*, when the *Graff* is put in between the *Wood* and the *Bark*, and is ty'd faſt with a *Thread* or ſmall *Cord*. This way of *Graffing* is moſt proper for *Trees* that have a thick *Bark*, and abound with *Sap:* Becauſe the *Bark* draws abundance of fat *moiſture* out of the *Earth*; ſuch as are the *Fig-tree*, *Cherry-tree* and *Olive-tree*. Wherefore, he that would *graff* after this manner, muſt have a little *wedge*, made of ſome very hard *Wood*, and drive it in between the *Bark* and the *Wood* gently, ſo as not to rend the *Bark*, and in that aperture muſt *graff* his *Scion*. This way of *Graffing* was by the *Ancients* called *Infoliation*, and is ſtill in uſe with us, where the *Bark* is thick, and a ſmall *cleft* to *graff* in cannot ſo well be made.

IX. *The ſecond way of Graffing is in a* The *ſecond* way of *Graffing* is, by means of a *Cleft* made in the *Stock*, into which the *Scion* is put, ſo as that the *pith* of the one may be joyned with the *pith* of the other; and then the *ſlit* muſt be ſtopt up with *Clay*, and bound up with the *Bark* and *Moſs*. This way of *Graffing* is made uſe of in thoſe *Trees* that have a thin *Bark*, and are of a drier Complexion, their *Moiſture* living not much in the *Bark*, but within the *Pith*; ſuch as are the *Citron-tree* and *Vine*. And this way is properly call'd *Graffing*, which muſt be quickly done, leſt the *Scion* which is to be *graffed*, ſhould by delay become over dry.

X. *The third way of Gaffing is called, Inoculation.* The *third* way of *Graffing* is done by *Inoculation*, wherein the *Bark* of the *Scion* that is to be *Inoculated*, is ſo joyned to that of the *Stock*, whence the like quantity of the *Bark* is taken, that the *Buds* and *Eyes* of the one, may exactly anſwer to the *Buds* and *Eyes* of the other. For there is a certain *fat clammy Moiſture* between the *Rind* and the *Stock*, by which the *ſtrings* of the *Scion* are glewed and joyned to the *ſtrings* or *fibres* of the *Trunk* or *Stock*.

XI. *All other ways of Graffing are reducible to theſe three.* There be other ways of *Graffing*; as that which is done by *Emplaſtration* or *Plaiſtering*, whereby ſome part of the *Bark* of a *Scion*, with its *Buds*, is put into the *ſlit* of the *Bark* of a *Stock*, and the *Bark* of the *Stock* ſo cloſed again upon it, as that no mark of the *ſlit* remains; and afterwards is plaiſter'd and bound up. Another way is by *Boring*, when the *Graft* is put into the Hole that is bor'd into the *Stock*. There is alſo another way, which the *French* call *En perche*, when many little *Sprigs* with their *Buds* are graffed into a *perforated Perch*. But all theſe, and other ſuch like, are reducible to the 3 ways already mention'd: Foraſmuch as all of them agree in this, that the *ſtrings* of the *Sprig* or *Bud*, muſt agree and anſwer to the *ſtrings* of the *Stock* whereinto they are graffed; and that by this mixture or coaleſcence, the *wound* may be cover'd or grow together, leaving the *Bark* ſomewhat rough in that place. They agree alſo in producing the ſame effect, that is, the *melioration* of *Plants*, by reaſon of their Coction, both in the *Stock* and in the *Graff*, where the *Alimentary Juice* is further prepar'd and purified.

XII. *The Nature of the Graff becomes changed in proceſs of time.* By this *Art* of *Graffing*, not only *Trees* of the ſame Nature are mingled, as it were, and united; as *Apple-trees* with *Apple-trees*, *Pear-trees* with *Pear-trees*, *&c.* but alſo any other *Trees*, tho' never ſo different in Nature. Yet they who would have their *Graffs* to thrive, had beſt ſet them on a *ſtock* of the ſame kind; becauſe the *ſtrings* of *Plants* that are of a like Nature, do better agree together, and have their *pores* and *paſſages* diſpos'd in one and the ſame manner. However it is obſerv'd, that in proceſs of time the *Seed* of the *Graff* doth very much degenerate: The Reaſon whereof is, becauſe the *Seed* proceeds from the *Matrix* or *Pith* of the *Tree*, which being the product of the *wild Stock*, by degrees affects the *Seed*, and makes it to degenerate.

XIII. *What Pores of the Stock correſpond or agree with the Pores of the Graff.* Some, it may be, will queſtion how it comes to paſs, that the *Scion* unites with the *Stock*, ſeeing that their *pores* do not anſwer to one another, but differ in their *ſituation* and *figure*. To which I Anſwer, That it is not neceſſary that all the *pores* of the *Stock* ſhould agree with thoſe of the *Graff*, or that every one of both their *ſtrings* ſhould be united; it being ſufficient if the greateſt part of them anſwer to each other, and give way to the paſſage of the *Alimental Juice*. As we ſee that 2 pieces of *Glaſs* laid upon one another, tho' all the

the *pores* do not exactly agree, do notwithstanding transmit the *Light*. For we must not imagine, that the *Graff* is joyned to the *Stock*, into which it is *graffed* with the same firmness and evenness, as its own connatural Parts are; since it hath often been found, that in an *Old tree*, the Part that hath been graffed on it, hath been torn off by a strong *Wind*, tho' for many years together, it had been united to it no otherwise, than as if it had been a Connatural part of it. For in order to the conveyance of the *Juice* from the *Root* to all the parts of the *Tree*, it is not necessary that all the *Pores* should exactly agree; because we find that the *Earth* affords Nourishment to *Plants*, notwithstanding that their *Pores* do not every way agree with those of the *Earth*. And tho' we should grant, that such a conformity of *Pores* should be necessary for the common Nourishment of the *Stock* and the *Graff*; yet I see no reason, but that the same conformation may be wrought in process of time, because the *Sap* that comes from the *Root* hath power of making to it self *Channels* and *Passages*, as hath been hinted before: For the *Fire*, by the *motion* whereof it is driven upwards, thrusting it forwards, helps it to make these *Passages* and *Channels* for it self.

XIV. *In Graffing, many things are to be observed.*

To the end that *Graffing* may be duly performed, we must take heed, *First*, That the *Scion* to be *Graffed*, be not too *soft* or tender; for then, because of the tender texture of its *strings*, it will not be able to bear the hardness of the *Stock* into which it is *Graffed*. Neither on the other hand must it be too *dry*; for in that case it will not unite and grow into one with the *Stock*. *Secondly*, That the *Graff* be taken from a *fruitful* and good *Tree*, and, as near as may be, of the same kind; as the *Graff* of an *Apple-tree*, upon the *Stock* of an *Apple-tree*. For if they be of different kinds, the *Fruit* thereby becomes spoiled; as if one should graff an *Apple-tree* upon a *Willow* or an *Ash*, the *Apples* will be found like to a *Crab* or *Wilding*. *Thirdly*, That the *Scion* be without any delay graffed, lest the *Air* entring into the *Pores*, should hinder their growing into one. *Fourthly*, That the *Stock* be duly slit, lest the *slit* being made too deep, should hinder the closing of it up again. *Fifthly*, That the *Graff* be so cut, as that the *Woody part* of it may joyn with the *Wood*, and the *Bark* of it with the *Bark* of the *Stock*. *Sixthly*, That the *Stock* on which we intend to *graff*, have stood in the *ground* for some Months, lest in case it should not be well *rooted*, it might not furnish *Sap* enough to feed its young Nursling. *Seventhly*, The top of the *Scion* is to be cut off, that by beating back the *Juice* it may swell and grow bigger. *Eighthly*, That when the *Graff* is put into the *slit*, the place must be pasted about with *Wax* and *Gum*, or with *Clay* and *Moss*, to keep out all external Moisture. *Ninthly*, That a fit *Season* of the Year be observed; which is, after the *Winter Solstice*, and after the Blowing of the West *Wind*; that is, from the *7th* of *February* to the *Spring Solstice*. *Tenthly*, It is also to be noted, that some *Trees* are altogether unfit for *Graffing*; as the *Oak*, the *Fir-tree*, and other *Resiniferous-trees*; because the *Oak*, by reason of its hardness, will not be slit; and when slit will not grow together again: And *Resiniferous-trees*, because of their clammy *Liquor*, have their *pores* so obstructed, that the *Juice* cannot be readily conveyed to the *Graff*. And, *Eleventhly*, That the parts of the *Scion* may retain the same situation when graffed on the *Stock*, as it had before it was cut off from its own *Tree*: As by Example, If the *Graff*, before it was cut off from the *Tree* did lean towards the South, in *Graffing* it must likewise be turned that way. See the *Natural History concerning Plants*.

CHAP. XIII.

Of the Colours of Plants.

I. *What Colour is.*

AS to our present purpose, it is sufficient for us to know, that *Colours* are nothing else, but certain *modificatious* of *Light*, caused in *Bodies* by the different disposition of their *Surfaces*. Whereof we have a manifest proof in cutting of an *Apple*, the inner parts whereof appear *white* at first; but soon after turn *yellow*, and lastly become of a *brown Colour*, according as its outward parts are more dried. Such a modification of *Light* does especially belong to *Plants*, since that all their *parts* are ting'd with some *Colour* or other, and are remarkable for their *whiteness*, *yellow*, *red Colour*, *&c.* yea, and sometimes are successively *green*, *yellow*, *red* or *white*, according as the *Texture* of the little *particles*, whereof they are compounded, is changed, and the disposition of the *surface* alter'd. The Matter therefore in question is, What that is in *Plants* that makes the *Light* reflected from them to acquire such and such *Modifications*, which impress these Sensations on the *Eye*.

II. *Why the Roots of Plants are commonly White.*

The *Roots* of *Plants* are generally *white*; because they contain much *Spermatick matter*, which being compress't by the *Earth* that lies round it, and hindred from flying up into the *Air*, is forced to return into the *substance* of the *Plant*; where, by the warmth of the inner part of the *Earth*, it is concocted anew, and being coagulated into a kind of *frothy Substance*, doth reflect the *Light* on all sides, and so produce a *white Colour*. For the Reason why *Snow* and *Froth* are *white*, is, because they consist of little round *Bodies*, which from every point reflect the *Sun-beams*. For the smaller these *Bubbles* are, the more white doth the Subject appear; for seeing that every one of them, from all their parts reflect the *Light*, it must needs follow, that the more there are of these, within that determinate Space, the more *Rays* will be reflected; that being a *white Colour*, which comes neares't to the Nature of *Light*. Hence it is that *Liquor*, tho' it be of never so *black* a *Colour*, turns *white* as soon as it is turned to *Froth*; as appears in the *froth* of *Ink*; and therefore it is no wonder that the *Root* of a *Plant* being cover'd with *Earth*, appears *white*, because it consists of *clammy Humours*, which by the warmth of the *Earth* is easily turned into little round Pellets.

III. *For the same Reason a Lilly is White.*

And it is for the same Reason that a *Lilly* is *white*; because the *surface* of it riseth into *Bubbles*, from all the several *parts* whereof it reflects the *Light*. For in a *Lilly*, the *Alimental Juice* is very exactly percolated, and its *substance* being well concocted, turns to round *pellets* or *bubbles*. In like manner as we see, that our *food* becomes turned into *Chyle*, when after digestion in the *Stomach*, it is resolved into little round *Bodies*; which

Chyle

Chyle afterwards in the *Breasts* becomes turned into *Milk*. The Reason therefore of the *whiteness* of a *Lilly* is, because the little *Skin* wherewith its *Substance* is covered, consists of round *Pellets*, as is manifest to those that look upon it through a *Microscope*.

IV. *Whence the Red Colour that is in Flowers proceeds.* Some *Flowers* are *Red* as *Roses*, and *Tulips*, because their parts are so disposed that the *Globuli* of the Second *Element*, which constitute *Light*, are by them more swiftly whirl'd about than they move to right *lines*. Wherefore whensoever the *light* in any *Body* is so modified, that its *Æthereal Globuli* are more swiftly turned round, than they move right forwards, than the surface of those *bodies* from whence the *Light* is reflected appears *Red*. Thus a *white Flame*, when *smoke* comes to it, turns *Red*. The *Sun* through a Mist, the *Planet Mars* by night, the *Moon* in the *Clouds*, a glowing *Coal*, and many other things are *Red*. Some *Fruits* therefore as *Cherries*, *Grapes*, *Mulberries*, &c. are of a *Red Colour*, because the *Juice* whereof they consist, having never been exactly strained, and therefore containing several *Particles* that are not sufficiently digested, makes those *Fruits* to appear of that *colour*, by reflecting the *Light* accordingly.

V. *The Cause of the Yellow Colour that appears in the Leaves of Plants.* A *Yellow Colour* is peculiar to the *Leaves* of *Trees* and *Fruits*, whilst they are *ripening*; because having lost the moisture, which gave them their *Greeness*, they now contain nothing but such a *Juice*, as is well strain'd and prepar'd; which makes their outside to rise into greater *Bubbles* or round *Bodies*, which because they leave great *intervals* between them, must needs cause a great variation in the *Reflexion* of *Light*. For if you look upon *Yellow Bodies* with a *Microscope*, you will find them wholly rough and uneven, and full of innumerable protuberances; by which means the *Light* reflected from them becomes so modified, that the *whirling* about of the *Globuli* is somewhat more rapid than their *motion* to right *lines*. For the *Yellow Colour* mediates betwixt *White* and *Red*; which may be demonstrated to the *Eye* from the mingling of *Liquors*; for if you mix any *White* and *Red Liquor* together, the result will be *Yellow*. And the same will be if we twist a Lace or Girdle of the smallest *White* and *Red Threads*.

VI. *The Blue Colour is peculiar to some Flowers.* *Blue* is the peculiar *Colour* of some *Flowers*, because the *Juice* that nourisheth them, is in such a manner concocted and percolated, that from thence such a *degree* of *Darkness* and *Transparency* results, as produceth such a Reflexion of the *Rays*, that the *Globuli* of them, have more of a straight, than of a circular *motion*. For a *Blue Colour* comes between a *Black* and *Red*; as appears in the *Air*, which in the day-time looks *Blue*, by reason of the *Bodies* that are tost up and down in it, and reflect the Rays to us. And forasmuch as these *Rays* are but few in number, and the *Shades* many, therefore it is necessary that the *Heaven* should appear of a middle colour between *Black* and *Red*, that is of a *Blue*, in the day-time. This will be made manifest to us by mixing a very fine *Red Powder*, with another that is *Black*, or by laying a black *Glass* upon a red *Glass*, and looking through them, for by either of these ways we shall find a *Blue Colour* produced.

VII. *The General Colour of Plants is the Green Colour.* The most common *colour* belonging to *Plants* is the *Green*, which is observed in all of them as well at their *springing* out of the *ground*, as in their *growth*. The cause of this *Colour* is the abundance of *moisture* that is in *Plants*, when it is but slightly strained and elaborated. Hence it is that those *Herbs* and *Leaves* have more of this *Greeness* by how much the more they abound with *moisture*, and less of it, as the *moisture* is less, and better digested. This *Green Colour* is mixed of *Yellow* and *Blue*; which may be made out by several experiments; for if we look upon the *Sky*, which is *Blue*, through a *Yellow Glass*, it will appear *Green*; so likewise if we lay a *Blue Glass* upon a *Yellow*, and look through it upon any *Object*, it will appear *Green*: and so we shall find that by mixing a *Blue* and *Yellow Colour'd Liquor* together, the mixture will be *Green*.

VIII. *What is the Cause of that variety of Colours that is in Tulips.* There be many *Flowers* that are of divers *colours*, as *Tulips*; which cannot proceed from any other cause, but the different concoction of the *Alimental Juice*; because the matter is better preserved and purified in the great *Bulbous Roots* of *Tulips*; and better strained through their long and thick *Stalks*, wherein also it is the better concocted and distributed. But yet it cannot be expected that *Tulips* every year should retain the same *colours*; for the temper of the *weather* changing considerably every *year*, it cannot be otherwise but that thereupon a different *concoction*, *preparation* and *distribution* of the *Alimental Juice* must follow, and consequently the *colour* also be changed. Yea, we find sometimes that *Tulips*, in one and the same year do change their *colours*, and that such as before were *White*, turn *Red*, and the *Red*, *White*. When streaks of a *Purple Colour* appear in a *white Tulip*, it is a sign that the thicker parts of the *Juice* do cause an obstruction, whereby the free *motion* thereof to the utmost parts of the *Flower* is hindred.

IX. *Why Leaves and Flowers change their Colours.* And the same may be said of the *Leaves* and *Fruits* of *Trees* changing their *colours*. For the *Leaves* are *Green* at first, by reason of the plenty of *Moisture*, and the *Juice* that is not throughly elaborated or prepared; and from this *Green Colour* they are changed into a *Reddish*, and lastly from that to a *Yellow*; because the *Moisture*, which at first was the cause of the *Green Colour*, being diminished gives way for the *Red Colour* to succeed, and afterwards flying all away, they are thereby changed into a *Yellow Colour*, till at last extream driness turns them *White*. In like manner *Fruit*, as it comes to be *ripe*, quits its *Green Colour*; which becomes changed into some other; because the *Juice*, which before was raw, as wanting due preparation, when the *Fruit* grows *ripe*, becomes depurated and percolated to *perfection*: so that the contexture of parts being by this means changed, it is no wonder that the *Fruit* loseth its green *Colour*, and becomes *Red*, or *Yellow*, or of a *Colour* mixt of both.

CHAP. XIV.

Of the several Tasts of Plants.

I. *What Taste or Savor is, and wherein it consists.* BY the *word Taste* or *Savor*, we understand that *virtue* in *Bodies*, whereby they are able to produce in us the *sense* of *Taste*. Which virtue consists in the *Particles* of *Bodies*, inasmuch as they are sufficiently diluted, subtil and agitated to

to enter the *pores* of our *Tongue*, and to move those *Nerves*, wherewith the *Instrument* of *Tasting* is is furnish'd. For tho' *Taste* be properly in the *Mouth*, and that the *Tongue* or *Palat* is formally that which *tastes*; yet it may be said, that the things themselves, which are taken into our *Mouths*, are the Causes of the said *Taste*, and according to their several *magnitude*, *figure* and *motion*, do produce different *tastes* or *savours*. So that things *savoury*, or endued with *taste*, are said to be such, only because they move the *Filaments of the Nerves* of our *Tongue* in such a manner, as is necessary to produce in them the *sense* of *Tasting*. And forasmuch as *sensible Objects* cannot affect those *Nerves*, except they be endued with a certain *motion*, *figure*, and *magnitude*; therefore to these three we must assign all the diversity of *Tastes* or *Savours* we meet with in any *Objects*.

II. *Why some Fruits are insipid.*

This is evident from the *Insipidness* we sometimes find in *Plants*, and their several *parts*. For if we enquire into the Reason why some of them are *Insipid*, and do not affect the *Tongue* or *Palat*, we shall find the Reason to be, because they do not furnish such *Particles*, as by the assistance of *Moisture* can enter the *Tongue*, and strike its *Nerves*. Thus we find, that when *Grapes* are first knotted, they impress no affection upon the *Tongue*, and do only touch the outside of it, without entring its *pores*; because the *particles* of *Juice*, which come up from the *Root* to compose them, do stick close together, and are not easily separated. Daily Experience also teacheth us, that *Water* is in a manner wholly insipid, because its *Particles* are so thin and subtil, that they can affect the *Organ* of *Taste* very little or nothing. In like manner *Air* is void of all *Taste*, because it floats only upon the *Spittle*, and the Parts of it, by reason of their extream lightness and subtilty, can make no impression upon the *Tongue*.

III. *What is required to make a thing sapid or savoury.*

That a thing be *savoury*, it is necessary for its Parts to be separated from each other, that so joyning themselves to the *Spittle* in our *Mouths*, they may variously affect the *Nerves* of our *Tongue*. Now this is done by means of *Heat*, the Property whereof is, to resolve *Bodies*, open their *pores*, and to make a ready way for the *Moisture* to enter. Whence it is, that when *Fruits* tend to Maturity, by means of the *heat* of the *Sun*, reconciling their *driness* and *moisture* together, various *Tastes* are impress upon them, according to their different degrees of Maturity: First, an *Astringent taste*, then a *Harsh taste*, afterwards a *Sowr*, and last of all, a *Sweet taste*; and if the *Heat* be too great a *smart* or *biting*, and *bitter Taste*.

IV. *Why Sloes have an Astringent taste.*

An *Astringent taste* we find in *all unripe Fruit*, and more especially in *Sloes*, which with great *harshness* and *astringence* affect the *Tongue*, as if they prick'd it with *Pins* and *Thorns*; because they consist of *keen* and *stiff Parts*. For the *Juice* whereof they consist being not well strained, contains many stiff and inflexible little *Bodies*, such as are the *particles* that compose *Salt*; so that it is no wonder that they exasperate the *Tongue*, and astringe or contract the same.

V. *Onions and Pepper have a smart and biting Taste.*

In *Onions*, *Ginger*, *Pepper*, *Mustard-seed*, *&c.* we perceive a *smart* and *biting Taste*; because the *particles* of these Objects do prick the *Tongue*, and cause the same Division in it, which *Fire* would, if applied to it. The Reason is, because they consist of long, thin, and stiff *particles*, which make the *Bodies* whereto they belong dry and stiff. But being *boil'd* in *Water*, they lose their *Acrimony*; for that the *Moisture* penetrating them, dissolves their *Salt* and other smart little *Bodies*, and opening their *pores*, carries them away. Yea, some of these may be so macerated or soaked, as that by quitting all their *Biting* and *Harsh particles*, they may become *sweet*, and at last *insipid*.

biting Taste.

VI. *How Sweetness is produc'd in Ripe fruits.*

We meet with a *Sweet taste*, almost in all *Ripe Fruits*, which with great smoothness and evenness affect the *Tongue*. For in *Ripe Fruits*, by the continual *heat* of the *Sun*, the *Alimental Juice* is very exactly and throughly strained, and the *particles* that before were entangled, are resolved, by which means they readily enter the *pores* of the *Tongue*, and affect it with a pleasing Titillation. This *Taste* is most pleasant and grateful to young *Children*, the small strings of whose *Nerves* are more fine, small and subtil; but is not so acceptable to those who have a thicker *Texture* of *Nerves*, being affected by what is *acrimonious*, and therefore look upon a *sweet Taste*, to be unpleasant.

VII. *A Sowr taste proper to Limons.*

A *Sowr taste* is found in *Limons*, *Sorrel*, and the like, which do prick and cut the *Tongue*. It is felt somewhat in the same manner, as a *smart* or *biting Taste*, saving only that *Sowr things* are accompanied with a *sense* of constringent *Cold*. The Reason is, because this *Savour* consists in *subtil* and *sharp Particles*, which do easily penetrate the *Organ* of *Taste*, and pierce it like so many *Thorns*. And therefore we must conclude, that these *Bodies* consist of longish and stiff *particles*, somewhat like *Needles*: Which we shall readily admit, if we consider that all *Fruits*, before that they come to their full *Ripeness*, are of a *Sowr taste*; which could not be, if that *Taste* did not include something that is common to them all. Now we can meet with nothing that is common to them all, except that *Disposition of Parts*, seeing they consist of an *Earthy Juice*, which did cleave to the long and thin *pores* of the small Twigs, whence these *Fruits* do grow.

VIII. *Whence that Bitterness that is observed in Rotten Apples, doth proceed.*

A *Bitter Taste* is perceived in some rotten *Pears* and *Apples*, *&c.* in the eating whereof the strings of the *Nerves* are unduly affected, and unpleasantly vellicated. For *Pears* and *Apples*, when they begin to putrifie, get rough, uneven, and prickly *particles*; because then the more subtil and refined *particles* fly away, leaving none but the grosser and thicker behind them. For *Putrefaction* is such a *Resolution* of *Parts*, by which things become worse than they were before. Hence it is that they who drink *Wine*, immediately after they have eaten a *tainted Apple*, and tending to *putrefaction*, do perceive a *Bitter taste*; because the *Wine* mingling it self with those putrid *particles*, conveighs them to the inmost *pores* of the *Tongue*. This *Bitterness* is sometimes occasion'd by too great *Heat*, when it is continual, and acts for a long time together upon *Fruit*. So that if *Fruits*, after their full Maturity, should continue long upon the *Trees*, it is not to be question'd, but that by being too long expos'd to the *Heat* of the *Sun*, their *particles* would become so rugged and twisted, that none would be left in them, to affect the *Tongue* with a *Sweet taste*, but would all ex-

asperate and bite it. A confirmation whereof we have in *Flesh*, which by too great *heat* of the *Fire* becomes scorched and burnt, and by this means acquires a *Bitter taste*, as doth also the *Crust of Bread* that is burnt, by being baked in an overheated *Oven*.

IX. *Mixt Tastes are found in some Fruits and Plants.* Neither are these simple *Savours* or *Tastes* only found in *Plants* and *Fruits*, but also compound *Savours*; as the *sweet* and *sowr Taste* which is commonly found in *Fruits*, that are not yet arrived to the utmost degree of *Maturity*: As when some of their *parts* are longish and stiff, which prick the *Tongue*; whereas others, more smooth and pleasant, softly flowing over the *Nerves* of the *Tongue*, do only produce a kind of pleasant *Titillation* on the *Tongue*. Another *Taste* is that which is *Harsh* and *Sowr*, which is that we perceive in those we call *rough Wines*. Another, *Sowr* and *Astringent*, which *taste* is found in the *Juice* of *unripe Grapes*, called *Verjuice*; the Cause whereof is this, that the *particles* which constitute the *Grapes*, are by the Heat of the *Air* separated from each other, and so acting independently, they produce both a *sowr* and *astringent Taste*.

CHAP. XV.

Of the Odour or Scent of Plants.

I. *Wherein Taste and Scent do agree,* *Odours*, or *Scents*, have some *affinity* with *Tastes*, as being much deriv'd from the same *Principles*. For as *Taste* consists in those little *Bodies* which penetrate the *Tongue* and *Palat*, and diversly affect them, according to their various *Magnitude*, *Figure* and *Motion*; so *Odour* consists in those *particles* which, flying in the *Air*, do enter our *Nostrils*, and variously affect the same. There is also another *Resemblance* between them, in that they are in a manner denominated alike, and are distinguish'd by the same Differences. For as *Tastes* or *Savours* are chiefly distinguish'd into *Astringent*, *Smart* or *Biting*, and *Sweet*: So of *Odours* or *Scents*, some are *sweet*; as in *Musk*, *Roses*, *Orris*, *&c.* Others *smart* and *stinging*; as in *Brimstone*: Others, *stinking* or *nasty*; as in *Bugs*, and some *Excrements*: Others, *sharp*, as the Scent of *Spike*, *&c.*

II. *How Savours and Odours differ.* But yet *Scents* and *Tastes* differ in this, that they do not consist in the same *parts*, nor affect the *Organs* after one and the same manner. For the *particles* that are productive of the *sense* of *Taste*, are moist; whereas those that cause *Odours*, are very dry and subtil. They differ also, in that a *savoury Object* cannot move the *sense*, except it touch the *Organ*; whereas a *scented Object* strikes the *Organ* at a distance: So that the *Tongue*, by its Moisture, takes out the *Taste* from the *Object*; whereas the *Nostrils* only admit the *Odour* transmitted to them from the *Object*.

III. *The Nature of Odours consists in the efflux of Particles.* Whence we may conclude, that the Nature of *Odours* consists in the *Efflux* of certain *particles*; which being diffus'd in the *Air*, enter the inmost parts of the *Nostrils*, and there affect some *Nerves* derived from the *Brain*. This we perceive in *Frankincense* cast upon *Coals*, and any other *Perfume*, which evaporates in the *Air*, and is dispers't into innumerable *particles*. Whence it is that *Hard Bodies*, which in their compact Nature afford no *scent*, when put to the *fire* yield an *Odour*; because, by the forceable *motion* thereof, some of those *particles* are set at liberty, and diffused through the *Air*. 'Tis for this Reason, that *Spanish Wax*, which we make use of to *seal Letters*, doth yield a *sweet Scent*, when put to the *fire*; as also that one *Stone* rubbed against another; and *Iron* violently struck by another *Iron* do send forth a *smell*, which before this motion was not perceptible. From which Instances it may appear also, that the *Odours* of *Flowers* consists in an *Exhalation* or *Evaporation* of some of the *parts* of them, which is the more evident, because when that is gone, they remain void of all *smell*.

IV. *Why some Bodies have no Scent at all.* Neither must we conclude from hence, that all manner of *Effluvia* that proceed from *Bodies*, must impress the *sensation* of *Odour*; for besides the emanation of *particles*, it is required that they move the *Organ*, and that in such a manner as is fit to produce this *sense*. For the *particles* of some *Bodies* may be so very fine and small, that they cannot sufficiently move the *Organ*: Thus we find, that neither the *Air* we draw in, nor the *Vapours* that arise from the *Water*, do excite any *sense* of *Smelling* in us. And on the contrary, some *Effluvia* are so gross, that they cannot reach the *Organ* of *Smelling*; or if they do, are more apt to spoil it, than to produce any *sense* of *Smelling* in it.

V. *The difference of Odours depends on the variety of Parts, that flow from a Body.* The Diversity of *Odours*, for the most part, depends on the same *Principle*, whence the variety of *Savours* doth proceed; that is, from that difference there is in the *magnitude*, *motion* and *figure*, of those *particles* that breath out from *Odorous Bodies*. Which we shall more readily assent to, if we consider that there is some Analogy or Resemblance between *savoury* and *odorous Objects*; and that those which agree in *taste*, do generally agree in *smell* also. Thus all *smart* and *biting Things* to the *taste*, are also observ'd to have a *sharp* and *stinging Smell*; and *bitter Things*, to have a *scent* that partakes something of *Bitterness*. The Reason whereof is, because the same *Particles*, which being mingled with *Moisture*, produce *Taste* or *Savour*, when exhal'd into the *Air*, and entring our *Nostrils* create the *sense* of *Smelling*. In like manner *Bodies* that are insipid, are commonly also destitute of *scent*. Thus *Unripe Fruits*, which have no more than an imperfect *Taste* (and the same may be said of *Flowers*) yield little or no *Odour*. I said, that it is so for the most part, because it sometimes happens, that there is not this agreement between the *Taste* and *Scent* in *Objects*; as appears in *Roses* and *Myrrh*, which tho' they yield a pleasant *smell* to the *Nostrils*, yet have a bitter and unpleasant *Taste*.

VI. *Why Odours are more perceived in Hot Seasons and Climats.* Nothing more conduceth to the production of *Odours*, than *Heat*; because it readily opens and resolves *Bodies*. For as we see that *Smoak* is excited by *Fire*, and that the more *subtil parts* of the *Wood* are carried up into the *Air*: In like mannner *Heat* divides the parts of *Bodies*, dissolves their *Texture*, and makes way for them to fly abroad. For we observe that *fruits* and *flowers* smell by so much the more, as their *Juice* is better prepared by *Heat*, and more throughly digested. A *Lilly*, the more it hath been concocted with a lasting *heat*, the more *odorous* it is. *Sweet Woods* and

Spices,

Spices, the *hotter* the *Countries* are they grow in, the more ſtrongly *Sweet-ſcented* they are; as appears in *Frankinſence*, *Storax*, *Myrrh*, *Balm of Gilead*, *&c.* Becauſe the *Juice* of *Plants* in thoſe *Countries* being exceeding well digeſted, is the more eaſily reſolv'd into an *Odoriferous breath* or *ſteam*. Wherefore it is not to be wondred at, that the *Plants* that grow with us are not ſo *odorous*, as thoſe that grow in *Arabia*, and other hot and dry *Countries*; becauſe the Concoction cannot be perfected for *want of Heat*, the ſuperfluous *moiſture* hindring the more dry *particles* from exhaling into the *Air*. Hence it is that moſt things, when dried, do acquire a ſtronger *Odour*; and for the ſame Reaſon, *Ripe Fruits* are more and better *ſcented*, than thoſe which are unripe. This proves all *Odorous things* to be *hot*, and that they ſuffer a continual efflux of their *parts*. And therefore thoſe who would preſerve the *Sweet-ſcentedneſs* of *Musk*, do wrap it in *Cotton*, which doth entangle its *Effluvia*, and hinder it from exhaling too faſt. Accordingly alſo we find, that in *Colder weather ſcents* are dull and weak, becauſe *Cold* ſtops the *Pores* of *Bodies*, and by keeping their *parts* at reſt, hinder them from breathing out in Exhalations.

VII. *Flowers ſmell more ſweetly at a diſtance.*

Flowers are obſerv'd not to ſmell ſo ſweet near at hand, as at a *diſtance*, if it be not too great. The Reaſon is, becauſe they who put the *flowers* to their *Noſtrils*, do take in many *Heterogenous parts* of *Herbs*, which are mingled or entangled with thoſe of the *flower*, but are not able to accompany them at any diſtance, but are ſoon ſcatter'd in the *Air*, or fall down, becauſe of their Thickneſs. Hence it is that a ſmall quantity of *Civet* ſmells *ſweet*, whereas a greater quantity of it rather ſtinks, and offends the *ſmell*. To which we may add, that the *Odorous Exhalations* ſcatter'd in the *Air*, become there ſtrained and defœcated of their more groſs and impure *parts*; as we ſee that *Water* mingled with *Wine*, doth dull and weaken the *ſmell*, as well as the ſtrength of it; and therefore it is no wonder, that an *Odorous Exhalation*, that hath been diffuſed through the *Air*, is more grateful, than that which we draw from the *Body* it ſelf, apply'd to our *Noſtrils*.

VIII. *Perfumes waſte continually.*

Foraſmuch as *Bodies* continually ſend forth ſome of their *Particles*, we muſt conclude they cannot but waſte by degrees. So we find, that thoſe *Sweet-ſcents* that are excited by *Heat*, do waſte by degrees, and at laſt loſe all their *Odour*. But thoſe *Perfumes* which do not ſtand in need of this Excitation by *fire*, as *Musk* and *Civet*, do not ſo ſoon conſume, but continue their *ſcent* for a long time, without any ſenſible diminution; becauſe the agitation of their *particles* is very moderate, and conſequently but a few of them are diſperſed or loſt in the *Air*.

CHAP. XVI.

Of the Diſeaſes and Death of Plants.

I. *What is the Death of Plants.*

FOraſmuch as Contraries diſcover each others Nature, and that *Life* and *Death* are Contraries, it will not be difficult to find out why *Plants* do periſh; and what the Cauſe is, why they ceaſe to be nouriſhed, to *grow* and *increaſe*, and to expreſs it in one word, why they *die*. For ſeeing that the *Alimentary Juice* is the immediate Principle of *Motion* in *Plants*, and that their *Life* doth conſiſt in the due diſtribution thereof by *Heat*; it evidently follows, that the *death* or *periſhing* of *Plants* muſt conſiſt in the defect of this *Alimentary diſtribution*.

II. *How many ſeveral ways Death may happen to Plants.*

But becauſe this Defect may proceed from many *Cauſes*, we will firſt ſpeak of the *Diſtempers* to which they are ſubject, and ſhew how many ſeveral ways their *Vital functions* may be perverted. For beſides the undue diſpoſition of their *Parts*; as when the Top of them is too much bended down towards the *Earth*; when they are full of *knots*, and when the diſtribution of their *Aliment* is interrupted by *callous Bumps*; when their *parts* are ſeparated; or when they exceed, or are defective: I ſay, beſides theſe, there are many other ways whereby they may be brought to their end; as by an undue *Temperature*, when they are either choaked with too much *Moiſture*, or conſumed by too much *Heat*; when they are ſhut up and grow ſtiff, by extream *Cold*; or wither and pine away, by too much *Drought*. The *Ancients* reckon up thoſe *Diſtempers* of *Plants*, which are deſcribed as followeth.

III. *The effect of Rubigo or Mildew, upon Pulſe and Corn.*

The *Diſeaſe* called *Rubigo*, or *Mildew*, in *Pulſe* and *Corn*, is cauſed by a *Dewy Moiſture*, which falling upon them, and continuing there, for want of ſufficient *Heat* of the *Sun* to draw it up, doth by its biting ſharpneſs, or Acrimony, ſcorch and corrupt the inmoſt ſubſtance of the *Seed*. This *Diſeaſe* alſo ſeizeth *Vines*; but may eaſily be prevented by *cutting* them later in the year; for the late *pruning* of them, makes them to *flower* ſo much the later, which generally prevents this Evil, becauſe it ſeldom happens towards the latter end of the *Spring*. *Moiſt* and *Dewy places* are moſt ſubject to this Damage; as *Vallies* and ſhut up places, where the *Winds* have not their free Courſe; *High ground* being not ſubject to it.

IV. *What Roration is.*

Roration; which is a *diſtemper* of kin to that of *Mildew*, is, when by too much *Rain* or *Dew*, *Vines* are blaſted in their *flowering*, and bring forth only ſmall and dwindling *Grapes*. And after the ſame manner other *Plants* are alſo ſpoiled, whilſt they are yet young and tender, and not ſufficiently rooted.

V. *Uredo.*

Uredo, happens either when the *Sun* with too great *heat* ſcorcheth the *Leaves* and *Cluſters of Grapes*, before that the *Rainy* or *Dewy Moiſture* is ſhak'd off from them; or when *Rain* or *Snow*, lying upon the *Tendrils* or *Buds* of the *Vine*, is by Cold congealed to *Ice*.

VI. *Carbunculation.*

Carbunculation, is the blaſting of the new ſprouted *Buds* of the *Vine*, in the *Spring* time; becauſe then the *Vines* are in danger to be *ſmitten*, either by the exceſſive *Heat* or *Cold*. For by too much *Heat*, the Texture of the *ſtrings* or *fibres* of the *Vine* become ſo diſſolved, as that thereby the Native diſpoſition of the *pores* becomes wholly changed; and again by *Cold* it is ſo compreſt, that the *pores* thereby are ſhut up, and leave no paſſage for the *Alimentary Juice*.

VII. *Vermiculation.*

Vermiculation is nothig elſe, but the *Infeſtation* of *Plants* by *Worms*; which Evil is very incident to *Apple-trees*, *Pear-trees*, and *Fig-trees*. For as *Men*, and other *Animals*, are ſubject to breed *Worms*, ſo *Plants* are obnoxious to the ſame *diſtem-*

per,

per, eſpecially ſuch as bear ſweet *Fruits*, for ſuch as bear bitter or ſharp *Fruits* (excepting only the *Olive-tree*) are never troubled therewith. The manner of theſe *Inſects* infeſting *Plants* is declared to us by MALPIGHIUS; *It is yet more wonderful*, ſaith he, *that commonly, by means of one or two Eggs of a Flie left upon the Leaf of a Vine, Oak, or other like, the whole Leaf becomes drawn together like a Purſe about the ſaid Egg, and ſo withers; yea ſuch is the ſtrange force of one of theſe Eggs, that not only the Leaf on which it is laid, ſuffers thus, but the infection being communicated to the Stalk of the Leaf, and from thence to the ſprig that ſticks to it, and the Leaves that are on it, the whole Branch is twiſted and writhed together, and ſo withers and dies.*

VIII. *Defluvium.* *Defluvium*, is a diſtemper whereby *Trees*, in the *Spring-time* eſpecially, loſe their *Barks*, by reaſon of ſome ſharp humour, that diſſolves the *Glew* whereby the *Bark* was faſtned to the *Wood*, whereupon they *wither* and *die*, being deprived of their *Barks*; except this Decortication be not round, but long-wiſe only, for then it is no prejudice to the *Plants*, unleſs it be very great indeed, eſpecially in *Reſiniferous-trees* whilſt they are *budding*. This *Diſtemper* alſo proceeds ſometimes from too much *Drought*, which young and tender *Trees* not being able to bear, they do eaſily ſhed their *Leaves* and *Fruit*.

IX. *A Wound.* A deep *wound* made in any *Tree* kills it, except the *Firr*, *Pine* and the *Turpentine-tree*, which delight in being *wounded*, and by this means become *fruitful*, whereas they were Barren before: for they abounding with a *Fat and Clammy Humour*, do void part of it by the *wound*, and thus being unloaden of ſome of their ſuperabundant *moiſture*, are afterwards better nouriſhed, and advance more in growth.

X. *How Plants Periſh by a Natural Death.* *Plants*, as *Animals*, periſh two ſeveral ways, *viz.* by a *Natural* or *Violent* Death. *Plants die* naturally when *Aliment* is no longer tranſmitted to them from the *Root*; or when the *Heat*, that drives it upwards, and diſtributes it into all parts, vaniſheth. For *Heat*, as is before mentioned, is the *Principle* of all motion in *Plants*, and therefore when that ceaſeth, all the *Functions* of *Germination* and *Nutrition* muſt needs ceaſe with it.

XI. *How many ways Plants may di: a violent Death.* *Plants*, may divers ways *die* violently; as firſt by a *wound* received; whereby we are not only to underſtand *Cutting*, *Slitting*, *Pulling* off the *Bark*, *Boring* or *Lopping* off the *Top*, but alſo *Bruiſing*, *half Breaking*, *Tearing*, &c. For tho' a *Plant*, whilſt it is pluckt up out of the *Ground*, doth not ſuffer any *wound*, yet becauſe the *Paſſages* whereby it drew in its *Aliment*, are ſtopt up, the parts that are towards the top muſt needs *wither*, and thoſe that are near the *Root* muſt be choaked with the too great abundance of it.

XII. *By over-much Heat.* *Plants* alſo periſh by *too much Heat*, when the *Earth* is parched by the *Heat* of the *Sun*, and all the *Moiſture* or *Juice* dried up. Whence it is that young and tender *Plants*, do much ſooner periſh than thoſe that are grown; for by reaſon of their tenderneſs the *Heat* more eaſily penetrates their *Pores* and opens them, and ſo makes way for the *Juice* to get out. Moreover their *Roots* being not ſo deeply fixed in the *ground*, when their *moiſture* is exhauſted, they cannot ſo readily draw in more, to reſtore the *Alimental Juice*, they have loſt.

XIII. *By extream cold.* In like manner *Plants* periſh by great *Cold*, which is very deſtructive to them when it is exceſſive, and eſpecially when it comes after great *Rain*; for ſince the *particles* of *Water*, that inſinuate themſelves into the *Bladders* of *Plants*, do very much diſtend them, they can no longer contain themſelves within their *Bounds*, but breaking out beyond them, do ſpoil the connexion of their *parts*, whence follows their total deſtruction. Accordingly we find that *Plants* by great *Cold* are parched and ſcorched, much in the ſame manner as if they had endured the moſt ſcorching *Heats* of *Summer*. We might now proceed to the anſwering of ſome Queries, as why *Trees* that are pluckt up by the *Roots*, and *Branches* that are lopt off from the *Tree*, do continue to live for ſome time, and do not *die* preſently; why *Wild Trees* are longer liv'd than thoſe that grow in *Gardens* and *Orchards*; but having fully ſpoken to theſe in the *IX. Chapter* of my *Natural Hiſtory concerning Plants*, I thither refer my *Reader*.

CHAP. XVII.

Of Animals, or Living Senſitive Creatures.

I. *What an Animal is.* AS Nature *proceeds* from ſimple *things*, to thoſe that are more compound, and from meaner and viler things to thoſe that are more noble; in like manner having now treated of *Plants*, that are a meaner kind of *Living Creatures*, I proceed to *Animals*, who beſides the *Life* which they have common with *Plants*, are partakers of a kind of *Senſe* and *Motion*. For ſo *Animals are uſually defined Living Bodies, furniſhed with variety of Organs, and endued with Senſe and Motion.* I ſay, *Living Bodies*, becauſe they conſiſt of ſuch a *contexture* of ſenſible and inſenſible *parts*, that they cannot only recover the parts they have loſt, but being excited by *objects*, can agitate themſelves by various *motions*. So that the *matter* of an *Animal* are its *Parts*, or thoſe *Bodily Subſtances*, that complete its *Body*, and are deſigned for the due performing of ſeveral *Actions*. And the *due* and becoming *Union* of theſe *Parts*, whereby an *Animal*, both in reſpect of his ſenſible and inſenſible *Parts*, viz. *Fibres*, *Nerves*, *Paſſages* or Conduits *Valvules*, &c. is ſo diſpoſed, as to be able duly to exert his ſeveral actions, is his *Form*. What their *Senſe* is, ſhall be declared anon.

II. *Wherein the Life of Animals doth conſiſt.* The *Life* of *Animals* conſiſts *in a due diſpoſition of Parts, and* intenſe *Heat*, whereby the *Alimentary Juice* is digeſted, attenuated, changed and agitated. For the *Parts* of *Animals* are not ſo diſpoſed, that the *Alimentary Humour* which is conveighed through them from the *lower part*, is from thence by an uniform tenor diffuſed every where, without any ſenſible heat, as in *Plants*: for in *Animals* there is a Part, which contains an encloſed *Fire*, to which the *Alimentary Juice* being conveighed by the *Veins*, doth there undergo an effervеſcence, and then from thence is driven through the *Arteries*, to moiſten and quicken the whole *Body*; till after having *circulated* through the whole *Body*, it return again through the *veins* out of the *Arteries* to the ſame living *Fire*, there to be heated and recruited *a-freſh*.

This

Book. 1. Part. 7. Chap. 17.
G. Freman Inv.
I. Kip

III. *What kind of Heat it is wherein the Life of Animals doth consist.* This Receptacle of *Fire*, in perfect *Animals* is the *Heart*, which is the most hot of all the rest of their *Parts*. Which *Heat* residing in the *Heart*, is called *Natural*, because it doth not presently vanish like to that *heat*, which is found in *inanimate* or *lifeless things*; but is preserved in the coldest *Season*, and as long as the *Life* of *Animals* doth continue. And accordingly it is said to be the first part that *lives*, and the last that *dies* in *Animals*.

IV. *This Natural Heat is various, according to the difference of Age.* Altho' this *Native Heat* do continue till the Death of the *Living Sensitive Creature*, yet it is not always in the same state, for as it encreaseth all the while *Animals* grow up to their perfection, so after that the same is attained, it decreaseth again and grows weaker, till it be wholly extinguisht. At the *beginning* of *Life*, when the more solid *parts* of the *Body* are yet soft and tender, they do not so much resist the motion of the *Fluid parts*, as when they are come to their full growth; and so because the *fluid parts* are less foceably moved, the heat excited by them is so much the weaker also. But in *Old Age*, when the more solid *parts* of the *Body*, and those more especially through which the *Alimentary Juice* or *Chyle* is strained, in order to the making of *Blood*, begin by degrees to grow harder, and have their *pores* less crooked and winding, the *native heat* must need thereby be changed and grow weaker.

V. *Wherein the Power of Sense and Motion that is in Animals doth consist.* The *Faculty* therefore of *Sense* and *Motion* (which by some is called the *Sensitive Soul*) in *Animals* consists in a *due disposition of the Parts*, viz. their *Nerves*, *Muscles*, *Spirits*, *Fibres*, *Joints and of their other Organs*; by the help whereof *Animals* become differently affected from outward and inward *objects*, and are carried from one place to another. For all *Animals* (*Man* only excepted) are a kind of *Watches* or *Clocks*, which by a fit adaptation of their *parts*, have a *Bodily Principle* of *Motion* in themselves, as long as they are well disposed, and have whatsoever is required to perform and exert the several *actions* to which they are design'd. For all the Effects we perceive in *Animals* (Man excepted) have no other cause or *Principle* but the *Body*, neither is their Sensitive Soul any thing, but the constitution and *affection of their Bodily Organs*, and the *Spirits* or the purest parts of the *Blood*, fitted to the *Animal Life*, and the exercise of the *Senses*.

VI. *What kind of Fire it is that is lodged in the Hearts of Animals* And forasmuch as *Heat* is the *Principle* of all *Motions* in *Animals*, and that whatsoever belongs to *Life* or *Sense* is to be attributed to its continual *motion*; we must enquire, what this *Fire* in the *Heart* is, and what its Effects are. This *Natural Fire* then, which *Physicians* generally adscribe to the *Blood*, is *hot*, but without *Light*, and not much unlike to that, which ariseth from the mixture of two *Liquors*, viz. *Oyl* of *Tartar*, and *Oyl* of *Vitriol*. The Reason is, because after that the greatest part of the *Blood*, which hath been rarefied in the *Ventricles* of the *Heart*, is conveighed thence, through the *Arterial Vein* and the *Aorta*, that *Blood* which still remains in the same *Ventricles*, and that which is a-new conveighed into them, from the *Ear-Lappets* of the *Heart*, have the same respect to one another, as the foresaid *Liquors*; the one being instead of a *Ferment* or *Leaven* to the other, to dilate and warm it.

VII. *How this heat in the Heart comes to be perpetual.* The *Cause* of the *Perpetuity* of this *heat* in the *Heart* is, partly because it is closely shut up and pent in there; and partly because this Fire is nourished and fed in the *Heart* by the *Blood* of the *Veins*, generated of the *Alimental Juices*, heated by a kind of *Fermentation*, and running into the *Heart*: yet so, as that at the same time this *Fire* doth also in its turn impart a heat to the *Blood*, and thereby preserve the Fluidity and *motion* of it.

VIII. *The First effect of the Fire in the Heart, is the Dilatation of the Blood.* The *first* effect therefore of this *Fire* is the *Dilatation* of the *Blood*, contain'd in the ventricles of the Heart, together with the *warming* and *attenuating* thereof. For it is common to all *Liquors*, that when they are distilled drop by drop into a very *hot Vessel* they presently *swell* and are *dilated*. Now the *Blood* being thus rarefied, wants a greater space, and therefore breaks forth from the *Heart*, much in the same manner, as the *water* resolved into *Vapours*, bursts forth from an *Æolipyle*; and the *Blood* that comes to supply the place of the former, rarefies in like manner as the former, and is extended to a far greater space.

IX. *Whence the Pulse of the Heart and Arteries doth proceed.* From this successive Ingress and Egress of the *Blood* into and from the *Heart*, not only the *Heart*, but all the *Arteries* together, swell and are depressed; whence follows the *Pulse* of the *Heart* and *Arteries*, which is as often repeated, as any new *Blood* enters into the *Heart*, and the *Arteries* are extended. For as soon as any part of the *Blood* enters into the hot *Heart*, it presently swells and becomes dilated, by which means it puffs up and distends the *Heart*, and endeavours to get out. Which since it cannot obtain through the same ways by which it entred into the *Heart*, because of the different situation of the *Valves* or *Floodgates* of the *Heart*, it forceth open the other *Valves* that favours its escape, and so gets out.

X. *The Blood is carried throughout the whole Body of the Animal.* And this is the true cause of the *Bloods Motion* throughout the whole *Body*; for seeing that the *Arteries* and *Veins* that are fill'd with it, are continuous, and do not in the least hinder it from continuing its *Motion*, it cannot be otherwise, but that it must alternately, or by turns, with force break forth from the *Heart*, and from thence be driven into the *Arteries* and *Veins*. And it is by this means that the *Blood* derives the *Heat* it hath acquir'd in the *Heart*, to all the other parts of the *Body*. For the more frequent this *motion* of the *Heart* and *Arteries* is, the more *Heat* we find in our selves, and in so much the less time the *Blood* is carried to the utmost parts of the *Body*.

XI. *The continual motion of the Blood is the Cause of the Animals growth.* By this constant *Circulation* of the *Blood* all the *Parts* of the *Body* are *nourished*; because the thinner and purer parts thereof, being separated from the *Excrements*, are added to the *parts*, taking up the place of some *particles* which they drive away thence, or also *grow* and encrease, when greater or more *particles* of *Blood* come to restore the parts, than can be received into their narrow *Pores*. And therefore we find, that whilst a *Body* suffers a continual loss of *Blood* it is not nourished, but wastes away, and consumes.

XII. *By the same motion the Animal Spirits are generated.* By this perpetual *Circulation* of the *Blood*, the *Animal Spirits* are also generated, which are the most subtil and swiftly moved *particles* of the *Blood*, which like a *most subtil Wind*, or rather like a *most pure Flame*, do continually mount up to the *Brain*, fill its *Cavities*, and from thence through the *Nerves*, penetrate into the *Muscles*,

and impart *motion* to all the *Members*. For we need not to seek for any other *Cause*, that makes those parts of the *Blood*, of which the *Spirits* are generated, to mount up towards the *Brain*, rather than to betake themselves elsewhere; but this, because all the *Blood* that proceeds from the *Heart*, doth by a Right line tend that way. And forasmuch as in the *Brain* there is not room enough to contain them all, and the *passages* they are to go through are very narrow, the more *subtil* only of them get through, whilst those that are weaker and less agitated, are diffused throughout all the other *parts* of the *Body*. And therefore we see, that the *Heads* of many *Animals* do move after that they are separated from their *Bodies*, open their *Eyes*, and bite the *Earth*, tho' indeed they be destitute of *Life*.

XIII. *How the Animal differ from the Vital Spirits.*

The difference between the *Animal* and *Vital Spirits* is very small, or to speak properly none at all. For the *Animal Spirit* is nothing else, but *the Vital better depurated, and freed from its grosser Particles in the Brain.* Yet they are distinguish'd in this, that the *Vital Spirit*, being diffused with the *Blood* throughout the whole *Body*, doth promote and execute the *Vital Functions*, viz. *Nutrition*, *Accretion*, and *Generation*: Whereas the *Animal Spirits*, collected in the *Brain*, and from thence diffused through the *Nerves* into the *Organs*, are chiefly subservient to the *Animal Functions*, *viz. Sense* and *Motion*.

XIV. *Why the Animal Spirits are unequally distributed through the Body.*

But here it may be demanded, why these *Animal Spirits*, do not always flow alike from the *Brain* into the *Muscles*; but are very unequally distributed, so as that frequently many more *Spirits* are sent to some *Muscles*, than to others?

I answer, That this proceeds chiefly from two Causes: The *First* is, the unequal *agitation* and *figure* of those *Spirits*, and the *Parts* that compose them. Which inequality may proceed from the various Dispositions of the *Heart*, *Stomach*, *Spleen*, and all other *parts*, which contribute any thing towards their *Production*. Or from the different *matters* of which the *Spirits* consist; as may be seen in those that have *drunk* a great deal of *Wine*; that the *Vapours* of the *Wine* swiftly entring the *Blood*, mount up from the *Heart* to the *Brain*, where they become turned into *Spirits*; which being stronger, and in more abundace than those that commonly are there, may be able to agitate the *Body* in many various and wonderful manners. The *other* Cause is the *Variety* of those *Motions*, which are excited in the *Organs* of the *Senses* by their *Objects*. For it may be easily conceiv'd, that the *figure* and peculiar *agitation of the Parts*, which constitute the *Spirits*; or the *Action of Objects* upon the *Organs* of the *Senses*; or the *Inclination of the Animal* to this or the other *Motion*, determining the *Spirits* to enter into this *Nerve* rather, than into another, cause the *Spirit* to run into one *Muscle*, rather than into another: For such is the make or structure of the *Muscles*, that they swell upon the entring in of the *Spirits*, and consequently are contracted, and so by drawing those parts of the *Body* to which they are fastned, effect the motion of them.

CHAP. XVIII.

What the Souls of Brute Beasts are.

I. *The Definition of a Brute Beast.*

A *Brute Beast* is by the *Peripateticks* commonly defined to be an *Irrational Animal*, or *an Animal endued with Sense*. Yea, they make them almost *Rational*, as supposing that some plain Foot-steps of *Reason* are observable in *Beasts*. But we on the contrary are persuaded, that a *Beast* is a meer *Automaton* or *Engin*; that is, an *Animal* destitute of all *Knowledge*, and consequently may be thus defined: *A Beast is an Artificial Engin or Machin of GOD, furnish'd with a various and wonderful structure of Organs, containing in it self a material Principle of Life, Motion and Sense.* For herein *Beasts* do differ from *Men*, that these have an *Immaterial* or *Intellectual Substance* joyned to *Matter*; which the former have not.

II. *What hath persuaded some, that Beasts make use of Reason.*

It cannot be deny'd, that there are some *Actions* in *Brutes*, which have a great resemblance with those that are in *Men*; whence some have concluded, that they had the use of *Reason*, tho' in an inferiour degree, in comparison of *Men*. How comes it to pass, say they, that when a *Dog* in *hunting* comes to a place where 3 Ways meet, having laid his *Nose* to 2 of them, he immediately casts himself along the third? How can it be conceiv'd, that *Birds* should be able to build their *Nests*, with such extraordinary *Artifice* and convenience for themselves and their *young*, if they be wholly destitute of Discourse and *Reason*? These and other Actions of *Animals*, have racked the *Brains* of several, and forced them to allow some foot-steps of *Reason* to *brute Beasts*. But this *Question* will be easily determin'd, by supposing 2 things.

III. *Brutes cannot express their own Thoughts.*

First, That no *brute Animals*, how perfect soever they be, can express their *Thoughts* (if they have any) by *Words*: Which yet all *Men*, how *dull* and *stupid* soever they be, can do; neither are any of them so far distracted, but that they can discover their Affections by *Words*. The Reason of which difference doth not proceed from the *Organs*, seeing that several *Animals*, such as *Parrots* and *Jackdaws*, utter *Articulate words*, and yet for all that can never attain to our way of *Speaking*, that is, they can never manifest to others, that they understand what they pronounce. Whereas on the contrary, persons that are born *Deaf*, and to whom Nature hath deny'd the use of *Speaking*, can by *signs* discover their Conceptions to others, and make known what they desire or refuse, by their *Gesture*, *Eyes*, and the like. Now the want of this in *Brutes*, doth not only argue a less degree of *Reason* in them, but also strongly prove them to have none at all.

IV. *There are no signs taken up at pleasure, to be found in Brutes.*

In the *Second place*, we must suppose that the *Signs* which have been invented by Men to represent their *Conceptions*, do differ very much from those Natural *Voices* and *Signs*, which are genuine Expressions of *Bodily Affections*. Wherefore seeing the former are not to be found in *Beasts*, and that they are not able any way to express their *Mines*; neither must we allow them to have any use of *Reason*.

V. *Whether Beasts do Discourse together.*

If any one will say, That *Beasts* do *discourse* and *talk* together; this they must prove before we can believe them: For seeing they have *Organs*

gans that are much like ours, why ſhould they not be able to communicate their *Thoughts* to us, as well as to one another? And tho' in ſome caſes they act with extraordinary *induſtry* and exactneſs; yet cannot we from thence infer, their *acting* according to *Reaſon*, for otherwiſe they would excel us in many things; but only this, that Nature works in them according to the diſpoſition of *Organs:* In like manner as a well-wrought *Watch*, doth more certainly and exactly diſtinguiſh the *Hours*, than we poſſibly could do with all our Study and Endeavour.

VI. *The Soul of Brutes conſiſts in the Diſpoſition of their Organs.*

I conclude therefore, that there is no *Soul* in *Brutes*, beſides the Diſpoſition of their *Organs*, and the *figure* of their *Bodies*; and that all their *motions* depend only on the Influence of their *Spirits*, and the due Diſpoſition of their *Organs*. Neither will this ſeem ſtrange, if we conſider, that even all our *Actions*, which we perform, *without minding or giving heed to them*, are produc'd by the ſame *Cauſe*, as *Reſpiration*, *the Motion of our Heart*, *the Digeſtion of our Meat*, and the like. For all theſe do not appear in the leaſt different from thoſe that are done by *Engins*. This is evident from one Inſtance, *viz.* that thoſe who fall from on high, ſtretch forth their *Hands* to ſave their *Heads*, which they do without any aſſiſtance of the *Soul*; but only becauſe the ſtructure of our *Body* is ſuch, that the ſight of an imminent Fall, being convey'd to the *Brain*, drives the *Animal* Spirits into thoſe *Nerves*, that move the *Arms* and *Hands:* Seeing all this is done without the leaſt advertence in the *Soul*. And thus we ſee the Reaſon, why a *Sheep* flees at the ſight of a *Wolf*, even becauſe the Light reflected from the *Body* of a *Wolf*, doth ſo agitate the *ſtrings* of the *Sheeps Optick Nerves*, and conſequently the *Brain*, that thereby the *Animal Spirits* are ſo driven into the *Nerves*, as to put the *Members* deſtinated for running into motion.

VII. *This confirmed by ſeveral places of Scripture.*

This *Doctrin* may be confirmed from ſeveral places of *Scripture*, which plainly aſſerts, that the *Soul* of *Beaſts* is their *Blood*; *Levit.* 17. 14. *For the Life*, or Soul, *of all fleſh*, *is the Blood of it.* *Gen.* 9. 4. *But Fleſh with the Soul thereof*, *which is the Blood thereof*, *ſhall ye not eat.* *Deut.* 12. 23. *Only be ſure that thou eat not the Blood*, *for the Blood is the Soul.* From whence we may evidently conclude, That the *Life* of *Animals* conſiſts in the continual *flowing* of the *Blood* and *Vital Spirits* to the *Brain*, and other parts of the *Body*. And therefore, that we need not ſearch for any other Cauſe of thoſe *motions* we find in *Beaſts*, but the *Influence of Spirits*, and the *Diſpoſition of their Organs*.

VIII. *How Dogs light upon the true Trace of the Hare.*

As to that Objection, That *Dogs*, after they have laid their *Noſes* to *two* Ways, without any further hæſitation, betake themſelves to the *Third*; we ſay, that this is not done by them from any *Reaſoning*, but only becauſe in that third Way they meet with the *Scent of the Beaſt*, which they did not find in the two other. Neither doth the *building* of *Neſts* argue any force of Reaſon to be in *Birds*; becauſe all the *Neſts* that are built by *Birds* of the ſame kind, are all of them built after one and the ſame manner, which would not be ſo, in caſe they acted according to the dictates of *Reaſon*: For we find that Men who act ſo, build their *Houſes* with the greateſt variety, according to the different Suggeſtions of their Rational Faculty.

IX. *How Life and Senſe may be allowed to Beaſts.*

Neither do we altogether deny *Life* to *brute Beaſts*, but freely allow them ſuch an one; the Activity whereof proceeds from the diſpoſition and ſtructure of their *Bodies*. Nor *Senſe* neither, if it be only taken for a *Bodily Affection* of the Members, outwardly and inwardly fitly diſpoſed and aptly joyned, to perform this or the other *motion*. We grant alſo, that *Beaſts* do many *Actions* by *Nature*, *like* to thoſe which *Men* perform of Choice and deliberately; but withal aſſert, that the various and ſudden *motions* of *Beaſts*, do not argue them to have a *Knowing Soul*, but only a moſt curious and exactly proportionate compoſure of *Parts*, ſo as that the leaſt thing is ſufficient to put it in *motion:* And that this is poſſible, we prove by that *Wooden Statue* of *Venus*, which was ſo Artificially made by *DÆDALUS*, that it could walk up and down: And by the *Wooden Dove*, made by *ARCHYTAS* of *Tarentum*, which did fly about in the *Air*.

X. *Whether Apes are to be accounted Rational Creatures.*

You'l ſay, that *Apes* do many things that manifeſtly prove them to have the uſe of *Reaſon*; as appears in that when they go out to fight, they obſerve exact Military Order, and range their *Armies* as *Men* do; as alſo, in that they *bury* their *dead*, and perform many other ſuch like Actions, which demonſtrate them to be, in ſome degree, *Reaſonable Creatures*.

To this I Anſwer, That all theſe *Actions* are performed by *Monkies* naturally. For as *Watches* point the *Hours*, ſo *Beaſts* perform their *Actions* by Inſtinct: Neither is it a matter of greater wonder, that *Monkies* do *marſhal* their *Armies*, ſuppoſing it to be true what *Hiſtorians* relate of them, or *bury* their *Dead*; than that *Dogs* and *Cats*, after they have voided their *Excrements*, ſcrape up the *Earth* round about, to cover them from the Eyes of *Men*; tho' indeed they ſeldom do it to any purpoſe; that is to ſay, ſo as to hide them wholly. Whence it is evident, that they act meerly by *Inſtinct*, and without any advertency of what they do; and that there is nothing more in them, than there is in any curious *Clock-work* or *Machin*.

XI. *If Brutes have a Soul, it muſt be Immortal.*

Conclude we therefore, that *Beaſts* perform all their *Actions*, whether *Senſitive* or *Motive*, only by the *Texture* and *Diſpoſition* of their *Parts*, without any thing of *Thinking*, tho' in the moſt imperfect degree imaginable. For if we allow *Brutes* to be endued with *Underſtanding*, be it never ſo mean and imperfect, then we cannot deny them the Priviledge of a *Soul*; and ſo ſhall be forc'd to own, that *Monkies*, *Dogs*, *Foxes*, *&c.* have *Souls*, as well as *Men:* And if we grant this, we muſt alſo allow, that this *Soul* is Spiritual and Immortal; becauſe *Thinking*, wherein the Eſſence of the *Soul* conſiſts, is not a Mode of the *Body*, neither doth in the leaſt depend on it.

XII. *If Brutes have Souls, they will not be diſtinguiſh'd from Men.*

Moreover, ſuppoſing the *Souls* of *Beaſts* to be *Spiritual* and *Indiviſible*, it will follow that they are alſo *Immortal:* Neither is there any *Argument* drawn from the *Light* of *Reaſon*, whereby we can prove the *Immortality* of *Human Souls*, which will not as well prove the ſame concerning the *Souls* of *Beaſts*. Beſides, if we allow *Knowledge* to *Brutes*, we muſt alſo make them capable of *Religion*; for to imagin a *Knowing* or *Thinking* *Creature*,

Creature, without being under an Obligation to obey *GOD*, and pay *Religious Duties* to him, is repugnant. For if the *Souls of Beasts* be *Knowing*, they will in the first place know themselves; and it is impossible, but that by knowing themselves they should be led to the *knowledge* of their *Creatour*. Which Opinions would pave a ready way to *Atheism*.

This *Question* is discust more at large in my *Dissertation, of the want of Sense and Knowledge in Brutes*; to which the Reader may have recourse.

CHAP. XIX.

Of Fourfooted Beasts and Reptils, or Creeping things.

I. *The Division of an Animal into Rational and Irrational, is no true Division.*

AN *Animal* is commonly divided, in the *Schools*, into *Rational* and *Irrational*, as into two *Members* that take in the whole Nature of *Animal*, and comprehend all its several *species*. But since ARISTOTLE himself doth not approve of this *Division*, because one of the *Terms* of it is a *Privation* of the other; for he declares, that all *Divisions* so expreſt are illegitimate; none will think strange if we reject it for the same Reason. For the word *Irrational*, or *Unreasonable*, represents no positive *Idea*, which yet is requisite to constitute the difference of several *species* or *kinds*. Besides, every *Division* must be expreſt in such *terms*, as do explain and lay open the Natures of the things divided; whereas by *Negative terms*, neither any *Attributes* nor *Properties* are declared; and consequently the Division of *Animal* into *Rational* and *Irrational*, is to be rejected, and to be reckon'd amongst those which are good for nothing else, but to render the Nature of things dark and obscure.

II. *Of Animals, some are Terrestrial, some Volatile, and others Aquatile.*

An *Animal* therefore may more commodiously be divided into *Terrestrial*, *Volatile* or *Flying*, and *Aquatile* or *Swimming*, from the places where they *live*, and the *motions* they exert.

III. *What a Terrestrial Animal is.*

We call those *Terrestrial Animals*, that live on the *surface* of the *Earth*; whereof some be *Fourfooted*, that go upon *four Feet*; and others *Reptils*, which wanting *Feet*, do move themselves by *Creeping*. *Fourfooted Beasts* do go by setting their *Feet* one before another, after the same manner as other *Animals* that have 2 *Feet*, or more than 4. To the performing of which progressive *motion* are generally required *Toes*, *Feet*, *Shinbones*, *Legs*, which together with the *Nerves*, *Muscles*, *Tendons*, *Ligaments*, *Gristles* and *Membrans*, constitute the *Organs* of *Progressive motion*. The *Bones* belonging to this *Organ* are in several places joyned by *Articulation*, the round *Head* of the one being lodg'd in the Hollow of the other. The *Toes* consist of many *Joints*, to which the *Instep* is joyned, and to that the *Heel*, and the *Bone* call'd *Navicularis* or *Cyboïdes*; the *Leg* is joyned by articulation with the *Ankle*, and the *Thigh* with the *Hip-bone*, and the *Shank* or *Leg*. Progressive motion therefore is performed, when one of the *Legs* standing still upon the ground, the other is thrust out forwards: For the *Legs* are not moved both together, but by turns; so that whilst *Animals* go forwards, the *Muscles* act their several Parts, and the *Thigh* is turned in the *Hip-bone*, and the *Ankle* about the *Leg*.

IV. *Circumstances accompanying the Progressive motion of a Man.*

Whence it follows, that a *Man*, for Example, cannot walk directly in a *Right line*; because as he goes, he rests himself sometimes on one *Leg*, and sometimes on another, so that both his *Legs* or *Feet* are not moved in a *Right line*, but according to 2 *Parallel lines*, which seem to be *Right lines*. It follows also, that a *Man* that *goes* or *walks*, doth continually rest or stay himself upon the *Earth*; because one of his *Feet* doth always stand firm on the *Earth*, till the other comes to take its turn: Whence it follows, that it is only the *Foot* that stands still, that makes the *Bulk* or *Trunk* of the *Body* to move forwards. *It follows* also, that the *advancing Foot* moves as fast again, as the *Trunk* of the *Body*: For seeing that the *Body* advanceth continually, and that the *Feet* advance only by turns, one half of the time must be allow'd for the Resting, and the other for the Advancing; and that consequently the *Foot* that advanceth, by moving as fast again, doth compensate the *delay* of its resting.

V. *Of Fourfooted Beasts, some are Viviparous, and others Oviparous.*

Amongst *Fourfooted Beasts*, some are greater; as the *Horse*, *Elephant*, *Camel*, *&c.* Some of a mean Bigness; as the *Dog*, *Lion*, *Sheep*, *Cat*, *&c.* Some Little; as the *Rat*, *Mouse*, *&c.* And of these, some are *Viviparous*, that bring forth *living Births*; and others, *Oviparous*, that lay *Eggs*.

VI. *What Animals are Viviparous, and what Oviparous.*

Those are *Viviparous*, that bring forth a *living* and *perfect Animal*; and *Oviparous* are those that lay *Eggs*, whence an *Animal* afterwards is *hatched*: Such as are the *Crododile*, the *Lizard*, *Frogs*, *Tortoises*, whether of the *Land* or *Sea*. It is matter of Wonder, that the *Crocodile*, so vast a *Creature*, which commonly grows to the length of 15 *Cubits*, should proceed from an *Egg* no bigger than that of a *Goose*. *Lizards*, whether those of the greater sort, that are *green*, or those other that are distinguish'd with shining *Stars*, are propagated by *Eggs*. The *Tortoise* of the *Earth*, lays *Eggs* with a Yolk in them, which it covers with *Earth*, and by the warmth thereof are hatched; whereas the *Sea-Tortoise* covers hers with the *Sand* of the *Sea-shoar*. *Serpents* also are *Oviparous*, and commonly lay their *Eggs* in *Horse-dung*, or near to the heat of an *Oven* or *Furnace*, because they cannot *hatch* them themselves, as *Birds* do.

VII. *How Reptils move forwards.*

Amongst *Reptils*, or *Creeping Animals*, are the *Viper* or *Adder*, the *Asp*, and the *Snake*: All which resting upon one part of their *Bodies*, shoot forth and advance with the other. Yet all *Reptils* do not perform their Progressive motion after the same manner: For *Snakes* creep by raising their *Bodies* into *Rings*, the former whereof advance, whilst the hinder rest, and support the *motion* of the other: For by the first of these *Rings* the *Body* is extended; and by the hinder, they contract themselves in more close *Rings*, and as it were gather up themselves. *Earth-worms* also *creep* by a Waving motion, that is, by contracting and unfolding themselves; so that whilst one part of their *Body* rests, the other is moved. To this way of *Creeping* may also be referr'd that of *Snails*, who by means of their *glutinous Moisture*, are fixed to the *Bodies* they creep upon, and by this means advance themselves. The Cause of all these *Motions* are the *Animal Spirits*, which being forceably

forceably, and in great abundance, driven into the Channels of the *Nerves* and their *Valves*; and not being able to go back, by reason of the make of those *Valves*, by distending the *Nerves* in *breadth*, and shortning them in *length*, do move that part, to which they are joyned, by way of *traction* or *drawing*.

CHAP. XX.

Of Flying Animals, or Birds.

I. *What Birds are, and why the Eagle is said to be the King of Birds.*

Flying Animals are commonly called *Birds* or *Fowl*; and are distinguish'd from others, for that they *fly* in the *Air*. The *Eagle* is accounted to be the *King* of them, because of the Strength of his *Body*, the Height of his *Flight*, the Sharpness of his *Sight*, and the Nobleness or Generosity of his *Temper*.

II. *The various kinds of Birds.*

There are innumerable Kinds of *Birds*; and forasmuch as it is next to impossible to speak of all the *Individuals* of them, I shall content my self to enumerate their *Principal kinds*, as they are distinguish'd according to their several ways of *Feeding*. Some are *Carnivorous*, or such as feed upon *Flesh*, commonly called *Ravenous*: And these again are of two kinds, *viz.* such as have *Crooked Bills*; as the *Eagle*, the several sorts of *Hawks*, *&c.* Others have a more strait and sharp-pointed *Bill* or *Beak*; as the *Raven*, the *Jack-Daw*, *Mag-Pye*, *Crow* or *Rook*, *&c.* Another kind are *Vermivorous*, or such as feed upon *Worms*; as the *Nightingal*, *Wood-Cock*, *Snipe*, *Wood-pecker*, *Titmouse*, *Wren*, *&c.* Another *Baccivorous*, or such as feed upon *Berries*; as are the *Thrush*, *Black-bird*, the *Starling*, *&c.* Others are *Granivorous*, that feed upon *Corn* and other *Seeds*: And of these again, some love to be scraping and tumbling in the Dust; as *Cocks* and *Hens*, the *Peacock*, remarkable for his beautiful *Tail*, the *Bustard* and *Partridge*. Others love to wash and dip themselves in *Water*; as amongst *Singing-Birds*; the *Linnet*, the *Ligury*, the *Lark*, *&c.*

III. *All Birds go upon two Feet only.*

Birds have only two *Feet*, and those either plain and flat; as *Swans*, *Ducks*, *Geese*, and all *Water-Fowl*: Or else have their *Claws* sever'd and divided; as *Eagles*, *Sparrows*, *Swallows*, *Pigeons*, *&c.* Some Report, that the *Manucodiata*, or *Bird of Paradise*, hath no *Feet*, but always hovers in the *Air*, and is never found upon the *Earth*, but when dead: But Reason and Experience evince the falshood of this Story. For all *Animals* stand in need of *Sleep*, which these cannot take in the *Air*, especially being always in a hovering motion.

IV. *That the Bird of Paradise hath Feet.*

And as to those who imagin, that the *Birds of Paradise* take their Rest hovering in the *Air*, by reason of the Lightness of their *Body*, and the Largeness of their *Wings* and *Feathers*, and never fall down to the ground till they be dead; I would fain know of these Men, why they do not fall down to the ground when they are *asleep*, as well as when they are *dead*; forasmuch as in *Sleep* all the *Senses* are lock'd up, and all *motions* of the *Members* cease? But that all Doubt may be taken away in this Point, let us consult such as have been Eye-witnesses. *ANTONY PIGAFESTA*, a Famous Traveller, in the *Diary* of his *Navigation* assures us, that they have *Legs* of a Hand-breadth long, and that they can go and fly like other *Birds*: And that none but *Strangers* suppose them to be *without Feet*; because the *Inhabitants*, whenever they take them, cut off their *Feet*, and take out their *Guts*, casting them away, and then expose them to the *Sun* to dry; which they then sell to *Strangers*, or stick them in their *Caps* or *Helmets*, for Ornaments sake.

V. *Birds proceed from Eggs.*

Birds are the Product of *Prolifick Eggs*, that is, such as have been invigorated by the *Male*, and presuppose the fruitfulness of the *Female*. For as an *Egg* without the *Cock*'s *Treading* is *addle*; so the *Hen*, by producing that Cavity which is in the *Yolk*, doth contribute likewise to the fruitfulness thereof. This will be the better understood by distinguishing the *Egg* into 2 Parts, *viz.* into the *Yolk* and *White*. The *Yolk* is of a *yellow Colour*, tending to *Red*, as being nourished by *Blood*; which is manifest from those *small Veins*, that are disperst throughout its outward Coat or *Membran*. Besides this *Coat*, there is also another very thin one, by means whereof the *Yolk* hangs to the *Cluster*, so called, and covers the whole *Yolk*, and conveys *Veins* and other *Vessels* to it, by means whereof the *Alimentary Juice* is transmitted. The *White* is the more Outside-part of the *Egg*, yielding copious Nourishment, but somewhat of a colder Temperament, and not so easie of digestion as the *Yolk*: It consists of a *fibrous* or *stringy Matter*, and therefore is easily coagulated, growing hard with the least *heat*. At the Broad-end of the *Egg* a little *Hollow* is found, where the *Chicken* begins to be formed; and this proceeds from the *Hen* only. Besides these, there are found in *Eggs* 2 *Specks*, call'd by us the *Cock*'s *Threadles*, in which the *plastick* or formative Virtue of the *Egg* is supposed to consist, according to the Opinion of the Common People; but it is a Mistake, seeing they are found in all *Eggs*, as well in those that are *addle*, as the *prolifick*. An *Egg* therefore becomes fruitful, when the *Seed of the Cock* is joyned to that Hollow or Scar in the *Egg* before-mention'd, which proceeds from the *Hen*. For it is not to be question'd, but that the *Seed* of the *Cock* doth reach the *Womb* of the *Hen*, and as it were, takes root in the *Cells* thereof; whence the Rudiment of the *Chicken* afterwards *buds* forth.

VI. *The Progress of the Forming of a Chick, the 1, 2, 3, 4, and 5th Day.*

When the *Hen* therefore sits upon the *Egg*, and excites the *Bud*, or *prolifick* part of it by its *heat*, the *strings* or *fibres* become dilated or extended into several concentrical Rounds or Circles, and the *Chicken* becomes formed by degrees. For the *second* day of the *Hens* sitting, the Hollow that is at the broad end of the *Egg*, begins to be dilated, and becomes a *Bubble*, the thinner *particles* of it being exhaled by *Heat*, those only remaining that constitute that most clear water, wherewith the *Bubble* is filled. On the *Fourth* day a Purple Spot, or Reddish point appears, which is the Rudiment and first beginning of the *Heart*, and from whence a short time afterwards proceed many little *Veins* of the same colour, but almost invisible by reason of their fineness and subtilty, and which afterwards end in the Umbilicary or *Navel Vessels*. On the *Fifth* day there appear in this *Rudiment* of the *Heart*, 2 *Ventricles*, and as many *Ear-lappets*; and because the *Ventricle* or *Right* Cavity is con-

tracted, when the *Ear-lappet* that is joined to it is dilated, they ſeem to be 2 B*ladders*. The ſame day, there appears ſomething in the likeneſs of a *Worm*, joined to the little *Vein*, to which the round little B*ody* is annexed, but bigger than it, being diſtinguiſht into 4 B*ubbles* filled with a moſt clear and *Chriſtalline Liquor*. Which 4 B*ubbles* do repreſent *both the Eyes*, the B*rain*, and the *Cerebellum* or hinder part of the B*rain*.

VII. *What is formed in the Chick the ſucceeding days.*

On the *Sixth day* the *Feet* and *Wings* of the Chicken are formed, the *Coats* and *Membrans* of the *Eye* begin to appear, as likewiſe the firſt beginnings of the *Lungs* and *Liver*. Alſo the B*ill* or B*eak* and all the *Guts* and *Inwards*. At the ſame time the *Chicken* begins to move it ſelf a little, and to lift up its *Head*. Then alſo the *Rudiments* of the B*ones* begin to be formed, appearing like ſo many thin *Spider Webs*. On the *Seventh* day all the parts begin to appear more diſtinct, and ſo encreaſing every day till the *Tenth*, wherein all its parts are compleated. For the *Head* then appears greater than all the reſt of the B*ody*; and the *Eyes* bigger than the *Head*; and in this ſtate the *Chicken* ſwims on the *Colliquamentum* or diſſolved White of the *Egg*. After the *Fourteenth* day, all its members appear ſtill more diſtinctly: for then it begins to be covered with *Feathers*, the inwards begin to be hid, and the *hinder part of the* B*rain* begins to be pent up in the *Skull*; the *Chicken* begins to Peep or Cheep, and being no longer able to bear the ſtraightneſs of his pent up Room, after having firſt conſum'd the *White*, and afterwards the *Yolk* alſo, it breaks through the *Shell* and comes forth.

VIII. *It is probable that a Chick and other Animals, are not formed by Parts, but all together.*

This is the Progreſs our Eyes diſcover in the forming of a *Chicken*, becauſe it appears ſuch to the unaſſiſted *Eye*. But when we take in the Verdict of the *Microſcope*, as *MALPIGHIUS* did, there will appear to us in every Fruitful or Prolifick *Egg* (for in the Addle, no ſuch thing is to be found) before the *Incubation of the Hen*, the firſt *Rudiments* of the *Chicken*; in like manner as ſometimes, even without the aſſiſtance of a *Microſcope*, we can diſcern the firſt *Lineaments* of a *Plant* in the B*ud* of it. This is very evident in a *Tulip*, for if in the *Winter* time we view the B*ud* of it, either with a *Magnifying Glaſs*, or only with our bare *Eye*, we ſhall not only ſee the *Leaves*, which afterwards turn Green, but alſo thoſe that conſtitute the Flower of the *Tulip*, with the Triangular part of it encloſed in the *Grain*, and laſt of all thoſe little 6 Pillars, which ſurround it, at the *bottom of the Tulip*. And accordingly it ſeems probable, that as a *Flower* contains a *Flower*, ſo an *Animal* contains another whole and compleat *Animal*, tho' ſometimes the ſame be not diſcoverable, but with the aſſiſtance of a *Microſcope*.

IX. *How Birds do fly in the Air by the Help of their Wings*

B*irds* with the help of their *Wings*, keep themſelves up, and move in the *Air*; becauſe the *Air* reſiſts the ſwift agitation of their *Wings*, and oppoſeth their deſcent or falling down. For tho' the *Air* be very pliable, and ready to give way to other B*odies*, yet it indeed makes a great reſiſtance, and like the *Water*, oppoſeth the entrance even of *Heavy Things*. For we ſee that when *Boyes skim Stones* along the *ſurface* of a ſmooth *River* or *Pond*, the *Water* reſiſts them, and makes them by ſeveral rebounds leap up from the *Water* which oppoſeth their entrance. Yea many times the B*ullets* diſcharged from great *Guns* are ſeen to graze along, and rebound from the *Water*, ſo that ſometimes men that are walking on the B*ank* or *Shoar* are ſometimes *wounded* and *killed*, by B*ullets* ſo rebounding from the *Water*. And in the ſame manner are B*irds* borne up in the *Air*, and tho' they be heavier than it, yet by the ſpreading and continual beating of their *Wings*, they are ſupported in the midſt of it.

X. *Two things are required to the Flight in Birds.*

To the *flying* of B*irds* 2 things are requiſit, *Firſt* the ſpreading of their *Feathers*, the ſingle *Hairs* whereof are ſo intangled, that the *Air* cannot enter through them without ſome difficulty, from whence the reſiſtance ariſeth. *Secondly*, the expanſion of their *Wings*, and their beating of the *Air* with them, and that either leiſurely, as *Kites* do, or more frequently like *Doves*, or very faſt as the *Felfare*. And accordingly by the *Prevalence* of this reſiſtance, the force of Gravity is overcome, and the Body of the B*ird* continues poiſed in the *Air*.

XI. *How Birds move themſelves this way and that way.*

Moreover foraſmuch as B*irds* do not only preſs the *Air*, and hover in it, but alſo move up and down; it is neceſſary that the *Wings* which bear them up, be thruſt backwards; that ſo by the reſiſtance of the *Air* behind them, they may be forwarded in their progreſſive *Motion*. For the ſtructure of a B*irds Wings* is ſuch, that the hollowneſs of them forward, and their prominence backward, do both concur to beat back the *Air*. A Reſemblance whereof we meet with in thoſe that *ſwim*, who if they do only preſs the *Water*, with their B*elly* and *Hands*, without beating it back with their *Feet*, they cannot move forwards; no more than a *Ship* can advance if the *Water* be only divided by the *Oars*, without they be thruſt or moved backwards. B*irds* therefore in order to their moving *forwards*, and paſſing this way and that way, muſt beat back the *Air* behind them. And whereas ſome B*irds fly* much more ſwiftly and ſtrongly than others, as the *Swallow*, the *Pigeon* and the long-winged *Hawks*; the reaſon thereof is, either the more advantageous make and frame of their *Wings*, or the ſtrength of their *Muſcles* wherewith they move them, or the proportion of *Heavineſs* or force that is in their B*odies*.

XII. *Birds are not moved in the Air, as a Ship in the Water.*

We muſt take notice that B*irds* do not move in the *Air* like a *Ship* or Boat in the *Water*. For a *Boat* or B*arge* being driven by *Oars* is puſht forwards, whilſt the *Oars* thruſt againſt the *Water*, which reſiſts, in a manner, as much as if all its parts were in reſt. Neither do B*irds* ſhake their *VVings* towards their *Tails*, as *Oars* drive the *VVater* towards the *Stern*, but do bend them downwards. The *Tail* of B*irds* ſerves to incline their *flight* upwards and downwards, but not ſide-ways, neither is it to them inſtead of a *Helm*, as is commonly believed; for it doth not perpendicularly cut the *Air*, as the *Helm* of a *Ship* doth the *VVater*, but hath an *Horizontal Situation*; and when a B*ird* turns ſide-ways yet his *Tail* continues ſtraight ſtretched out; and therefore we ſee that B*irds* fly tho' their *Tails* be cut off. B*irds* therefore are poiſed in the midſt of the *Air*, as a *Ship* in the *VVater*, to wit in the *Center* of their *Gravity*. And like as a *Veſſel* that hath his *Oars* more ſwiftly plied on the right ſide, turns about the *Center* of its Gravity towards the left: So likewiſe a B*ird* whilſt he beats the *Air*, chiefly and moſtly

X.

moſtly with his Right *Wing* towards the *Tail*, his fore-part by this means is turned towards the Left. As when thoſe who *ſwim*, by bending their *Right Arm*, and ſpreading their *Right Hand*, drive the *Water* towards their *Feet*; and by the ſame means turn themſelves about towards the Left-hand.

XIII. *The Tail of Birds only moves upwards and downwards.* And that we may the better apprehend how the *Tail* of *Birds* ſerves them to turn downwards or upwards: Let us ſuppoſe a *Bird* A B, whoſe *Center* of Gravity is C, flying *Horizontally* from G to F, and that in *flying* he rear his *Tail* B H; this ſuppoſed, it is manifeſt, that the *Air*, which reſiſts the *Tail* B H, makes the whole *Body* of the *Bird* turn about the Point C, that it may take the ſituation L K, wherein the *Head* raiſeth it ſelf from A to L; and on the contrary, when the *Tail* is turned downwards to B I, the reſiſting *Air* makes the *Body* of the *Bird* to turn about the ſame Point C, for to take the poſture N O, wherein the *Head* of the *Bird* doth lower it ſelf from A to O.

Figure 60.

CHAP. XXI.

Of Swimming Animals, or Fiſhes.

I. *The Whale is the greateſt of all Fiſhes.* FIſhes, becauſe they live in the *Water*, and move themſelves by way of *Swimming*, are called *Aquatiles*. The moſt bulky of theſe, and as it were the Prince of them all, is the *Whale*, very common in the *Indian Sea*, to whom PLINY aſſigns the largeneſs of 4 *Acres*, which make out in length 960 *Foot*. PARÆUS makes mention of one that was taken in the River *Schelde*, 10 Miles from *Antwerp*, in the *Year* 1577, which was 58 *Foot* long, 16 *Foot* high, and its *Tail* 14 *Foot* broad; the diſtance from his *Eye*, to the entrance of his *Mouth*, 16 *Foot*; his Under-Jaw was of 6 Foot furniſh'd with 25 *Teeth*, to which in the *Upper-Jaw* were anſwering ſo many Cavities, wherein, upon the ſhutting of his *Jaws*, they were hid. A *Whale* is diſtinguiſh'd from other *Fiſhes*, in that it hath, beſides *Lungs*, *Kidneys*, *Arteries*, *Bladder* and *Genitals*, a great *Pipe* in the fore-part of its *Head* inſtead of *Gills*, by which with great force it ſpouts again out the *Water* it receives into its *Body*.

II. *The Difference of Fiſhes with reſpect to the ſeveral places they delight in, and their coverings.* There be many differences of *Fiſhes* taken from the *coverings* of their *Bodies*, or from the *Place* they delight in. With regard to the *Place* ſome are *Sea-fiſh*, others *River-fiſh*, and others ſuch as delight in *Lakes* and *Ponds*. With reſpect to their covering, ſome are *Scaly*, ſome covered only with a *Skin*, and that either with a *ſmooth*, or *rough* one. Amongſt *Sea-fiſh* ſome are called *Littoral*, becauſe they delight in the neighbourhood of the *Shoar*, ſuch are amongſt the *Scaly Fiſhes* the *Roach*, and the *Trout*, *&c.* and of the ſmooth skin'd *Fiſhes*, the *Mackrel* and the *Eel*; others are called in Latin *Saxatiles*, becauſe they delight in *Stony Places*, as the *Gilthead*, common in the Sea of *Crete*, the *Gudgeon*, the *Hornback*, ſome paſs from the *Sea* into *Rivers*, as the *Salmon*, the *Lamprey*, *&c.*

III. *Fiſhes are propagated by Copulation.* Some have been of the opinion that *Fiſhes* were not generated by *Copulation*, but that the *Female* ſwimming before did ſcatter her *Spawn*, which the *Male* following her did impregnate, by *pouring* his *Milt* upon them. But this is a miſtake, for *Fiſhes* do *copulate*, which would be altogether in vain, in caſe the foreſaid opinion were true. Beſides how can we conceive that the *Spawn* or *Eggs* of the *Female Fiſhes*, ſhould be ſprinkled with the *Milt* of the *Males*, ſeeing that it would by mixing with the *water* loſe all its virtue. Neither can we build much upon *ARISTOTLES Authority* in this Caſe, foraſmuch as he doth not prove it by any *Experiment*. And in his *3d Book de Animal. Cap.* 7. he owns the thing to be doubtful. *Fiſhes* therefore are *generated* by *Copulation* as all other *Oviparous Animals* are: but to what purpoſe would this *Copulation* be, if the *Male* doth not by his Emiſſion render the *Eggs* of the *Female* fruitful? Beſides, it is obſerved that the *Males* abound with *Milt* at the ſame time that the *Females* abound with *Spawn* or *Eggs*, and that then is the time of their *Copulation*. And it is at the ſame time that the *Males* follow the *Females*, not that they may beſprinkle the ſcattered *Eggs*, but that by their repeated *Copulation*, they may impregnate other of the *Females Eggs* that are ready to be *Spawn'd*: as we ſee that to the ſame end a *Cock* doth often tread the *Hen*: for ſeeing that *Fiſhes*, above other *Animals*, do abound in *Eggs*, they can never all of them be impregnated by one act of *Copulation*. From this way of *Generation* we are to except the *Dolphin* and the *Whale*, which are not *Oviparous*, but bring forth *living Births*, and therefore their way of *Copulation* is different, and their *Breaſts* are filled with *Milk*, contrary to the nature of other *Fiſhes*.

IV. *Many Monſters are found amongſt Fiſhes.* Amongſt *Fiſhes* there be many that are called *Monſtrous*, as the *Hippopotamus* or the River *Horſe*, becauſe it reſembles a *Horſe*, yet not ſo much in *Figure*, as in its *Bulk*. For it hath *Ears* like a *Bear*, and a *Mouth* wider than that of a *Lion*, with very great *Eyes*, and a very ſhort *Neck*, or none at all; it hath the *Tail* of a *Swine*, with ſhort *Feet*, and a divided *Hoof* like a *Hog*. *ARISTOTLE* deſcribes this *Animal Lib.* 2. *Hiſt. Animal.* thus; The *River-horſe*, ſaith he, which *Egypt* brings forth, hath the *Mane* of a *Horſe*, a round *Hoof* like a *Pipe* or *Tube*, a flat *Snout*, and an *Anckle* like thoſe that divide the *Hoof* in two, *Teeth* ſomewhat prominent and ſticking out, the *Tail* of a *Swine*, the *Voice* of a *Horſe*, the bigneſs or bulk of an *Aſs*; the thickneſs of his *Hide* being ſuch, that they make *Hunting-ſtaffs* of it; and all the inward parts of it reſembling thoſe of an *Aſs* or *Horſe*; which is the account *PLINY* gives us from *Ariſtotle*. The *Sea-calf* is alſo accounted a *Sea-monſter*, for it differs from all other *Fiſhes* in the ſhape of its *Body*, inſomuch that *ARISTOTLE* ranks it amongſt 4 footed *Beaſts*. This Monſter hath ſhort *Arms*, without any *Elbow*; and for the reſt hath ſome reſemblance with our *Bodies*: It conſiſts of many *Bones*, and is covered with a thick *Hide*, full of dark couloured *Hairs*, drawing towards an *Aſh-colour*: the *Head* of it is but little with reſpect to its *Body*, and its *Neck* is long, which it can ſtretch out, and draw in at its pleaſure; it hath no *Ears*, but inſtead thereof only ſome open *holes*; its lower *Jaw* reſembles that of a *Wolf*, but the upper is much broader than thoſe of the ſame *Animal*; his *Noſtrils* are very like that of a *Calf*, his *Teeth* like thoſe of a *Wolf*, and his *Eyes* are of a changeable and uncertain *colour*. A *Thornback* alſo is a very deformed

and

and monſtrous *Fiſh*, but being ſo commonly known, there is no need to inſiſt upon the Deſcription thereof.

V. *The* Peripateticks *following their Maſter, deny all Reſpiration to Fiſhes.*

Foraſmuch as *Reſpiration* is ordained by *Nature* for the *Cooling* of the *Blood*, and to ſend away the *vapours* and ſmutty ſteams proceeding from the *Body*, which would otherwiſe ſtop the *Blood* from entring into the left *Ventricle* of the *Heart*, if they were not emitted out; it hath been a queſtion controverted amongſt the *Antients*, whether *Fiſhes* and other *Animals* that want *Lungs* do breath or no. This is commonly denied by the *Perepateticks* upon their *Maſters* Authority, who by no means will allow any *Reſpiration* in *Fiſhes*.

VI. *Fiſhes breathe by the drawing in, and letting out of their Breath.*

But our Modern *Philoſophers* and *Phyſicians*, tho' they cannot allow *Fiſhes* ſuch a *Reſpiration* as is performed by the Contraction and Dilatation of the *Midrif*, and *Lungs*, ſince they take for granted that *Fiſhes* (except *Whales* and *Dolphins*) have no *Lungs*, yet neither do they deny them ſuch a *Reſpiration* as conſiſts in the drawing in of *Air* or the like *Halituous Matter*, in order to the cooling of their *Blood*. *Pliny* joins with this opinion, *Lib.* 9. *Cap.* 7. *becauſe*, ſaith he, *inſtead of Lungs they have other Organs for Breathing, and inſtead of Blood ſome other Equivalent humour.* Neither do we want reaſon wherewith to back this opinion; for the end of *Reſpiration* is the cooling of the *Heart*, and the cheriſhing and refreſhing of the *Vital Spirits:* now both of theſe are neceſſary to the preſervation of the Life of *Fiſhes*. Beſides, why were *Gills* given to *Fiſhes*, but that through them the *Water*, either alone by it ſelf, or mingled with the *Air*, might be conveighed to the *Heart*, and afterwards caſt out again? But who will not be convinced that *Fiſhes* muſt take in the *Air* by *Reſpiration*, when we find that they die without it? For if *Fiſhes* be ſhut up in a *Veſſel* with a narrow *Mouth*, full of *Water*, they may be kept alive there for many *Months*, if the mouth of it be kept open, but if it be ſhut up they die immediately, which would never be if they did not ſtand in need of *Air*, or if *Water* alone were ſufficient for the cooling of their *Heart*.

VII. *The Reſpiration of Fiſhes proved by Experiment.*

And what is very obſervable herein, is that as ſoon as the *Veſſel* is ſtopt the *Fiſh* get themſelves up to the top of the *Water*, to take in ſome *Air*, which they do not do whilſt the *Veſſel* is open, but play up and down the *Veſſel*. Wherefore *RONDELETIUS* in his 4*th. Book of* Fiſhes, *Cap.* 9. ſaith, that the greateſt *Fiſhes*, and thoſe that have *Lungs* do draw in the *Air* together with the *Water*; and caſt it out again by the ſame *Pipe*, whereby they draw in their Breath: and in this manner do *Whales*, *Dolphins* and *Whirlpools* (a *Fiſh* ſo called) draw their *Breath*. Others perform this *Reſpiration* by the *Lungs*, only without the aſſiſtance of a *Pipe* to caſt out the *Water*, as *Sea Tortiſes* or *Tortles*, and thoſe of *Rivers* and *Lakes*; as alſo *Sea-Calves*, who have wide *Noſtrils*, and a very ſtrait *Windpipe*, by which means they *ſpout* out the *Water* again through their *Noſtrils*, but retain the *Air*. All other *Fiſhes* that have either open or cloſed *Gills*, do with them draw in the *Air*, and at the ſame time caſt out the Water. *Oyſters* which are covered only with a very thin *Skin*, ſeem to breath through the *Pores* thereof. And in a Word, all *Animals* living in the *Waters*, according as their *heat* is more intenſe or remiſs, or according as their *Spirits* are more or leſs copious, ſo they have a ſeveral way of *Reſpiration*.

VIII. *The Life of all Animals is preſerved by the Air.*

Neither indeed is there any *Animal* in the Univerſe, which is not preſerved by the *Air*, as is manifeſt from the *Pneumatick Engine* of Mr. *BOYL*, in which whatſoever *Animals* are put, excepting only *Oyſters* and *Crabs*, die immediately. The ſame thing is yet more evident in *Inſects*, in whoſe *Rings* 2 *Holes* are diſcernible; which when they are ſtopt with *Oil* or any other *glewy* or *clammy Liquor*, ſo that the *Air* cannot have its free entrance, the *Animal* preſently begins to languiſh, and after ſome Convulſive Motions expires.

IX. *Why a Man cannot breathe under water.*

But you will object with *ARISTOTLE*, that if the *Air* do penetrate the *Water*, and reacheth to the very heart of *Fiſhes*; why then for the ſame reaſon a *Man* may not as well fetch his *Breath* under *Water*?

I Anſwer, that the cauſe thereof is, becauſe *Man* living in the *Air*, doth continually attract it very copiouſly, whereas that portion of *Air* which is in the *Pores* of the *Water*, is very inconſiderable if compared with that which *Men* naturally take in, and therefore is not ſufficient to anſwer that end. Moreover, for want of *Air* the *Water* is drawn into the *Lungs*, and there being no way to caſt it out, becauſe of other *Water* ſtill coming in, it oppreſſeth the *Heart*, and choaks a *Man*. Whereas *Fiſhes* are furniſht with *Gills*, by the help whereof they caſt out the *Water*, nor ſuffer it to come to their inwards, but the *Air* only, whereby the heat of their *Heart* is allayed and their *Vital Spirits* preſerved.

X. *How Fiſhes ſwim.*

The *Swimming* of *Fiſhes*, doth ſomewhat reſemble the *Flying* of *Birds*: for their *Fins* are inſtead of *Wings*, as alſo their *Tail*. Theſe conſiſt of *Membranes*, joyned together by long *Fibres*, and which can be diſtended or contracted and turned every way.

XI. *What inſtruments the Fiſhes uſe to move themſelves in ſwimming.*

There are in all *Fiſhes*, *Bladders* full of *Air*, which according as they are compreſt or dilated, ſo the *Fiſhes* are poiſed on the *waters*. For it hath been obſerved that a *Fiſh*, whoſe *Airy Bladder* had been broken in the empty Recipient of the *Pneumatical Pump*, could never, during a whole Months time, that it lived in a *Fiſh-pond*, riſe to the top of the *water*, but was fain to keep at the bottom of it. According therefore as *Fiſhes* do contract or dilate the ſaid *Bladder*, ſo they encreaſe or diminiſh the bulk of their *Body*, and accordingly alſo do diminiſh or increaſe their *weight*; and by this means they can either dive to the bottom of the *water*, or mount to the top of it. Much after the ſame manner as *Glaſs Bubbles*, or *Figures* hanging in a *Glaſs Tube* full of *water* are made to go down to the bottom, or to come up to the top at pleaſure.

XII. *What uſe the Fiſhes make of their Tails.*

A *Fiſh* by moving of her *Tail* advanceth ſwiftly, and reſts when that motion ceaſeth; ſo that the ſhaking or turning of her *Tail* is the chief cauſe of her *motion*; for when ſhe ſhoots forwards directly with her *Belly*, ſhe turns the other half of her *Body* ſideways, and whilſt ſhe ſtrongly beats the *water* with her *Tail*, ſhe at the ſame time moves her body forward, much after the ſame manner as a *Boat*, which the *Oar* drives forwards, whilſt it obliquely ſtrikes the *water* that is behind it. A *Fiſhes Tail* alſo performs the uſe of a *Helm*, by turning the *Fiſhes* courſe to the Right or Left.

Thus

VIII.
The Life of all Animals is preserved by the Air.

IX.
Why a Man cannot breathe under water.

How Fishes swim.

XI.
What instruments the Fishes use to move themselves in swimming.

XII.
What use the Fisher make of their Tail.

To M.r Iohn Ieffreys only Son and Heyre of Iohn Ieffreys of Llywell in Brecknock shire, and of the Citty of London Esqr, by Elizabeth his wife.

This Plate is humbly Dedicated by Richard Blome.

Figure 61. Thus by Example, the *Fiſh* A B C, that is about to move it ſelf, turns its *Tail* D F C, to the Right G, and that ſo, that whilſt the part moved B C, turns about its *Center* B, it doth not continue ſtrait, as the Ray of a *Circle*; but bends it ſelf 2 ſeveral ways towards B, *viz.* by advancing her ſide F towards the Right-ſide G, and by turning the utmoſt part of her *Tail* D to the Left, by which means the *VVater* does but little reſiſt her. Afterwards, her *Tail* turning again by the force of the *Muſcles*, it drives the *VVater* from G towards F, as an *Oar* would do: Whence it follows, that the *Fiſh* muſt advance from C to A, and then its *Tail* being again moved from C to H, as we have ſaid that it was moved from F to G; and being afterwards turned again, it drives the *VVater* from H towards C, and by this means makes the *Fiſh* advance in a ſtrait Line from C to A; by the repeating of which *motions* of her *Tail*, the Fiſh continues *ſwimming* along.

XIII. *Of Flying Fiſhes.* Amongſt *Fiſhes* there are ſome that *fly*; as the *Sea-Swallow*, and the *Sea-Hawk*, ſo called, which have *fins* joyned to their *Gills* of that length, that they reach almoſt to their *Tails*. Theſe ſometimes fly in ſuch vaſt Shoals in the *Air*, as PLINY tells us, that they encumber *Veſſels* in their Courſe, and ſometimes make them ſink. But they never fly high in the *Air*, but keep cloſe to the Surface of the *VVater*; ſo that ſome queſtion, whether the *Sea-Hawks* fly or ſwim. They continue thus hovering in the *Air* as long as their *Fins* are wet; and as ſoon as they are dry, fall down again into the *VVater*.

CHAP. XXII.

Of Inſects.

I. *Four kinds of Bloodleſs Animals.* ARISTOTLE reckons up 4 kinds of *Bloodleſs Animals*: Such as are *ſoft*, as the *Polypus* or *Pourcoutel*, the *Cuttle-fiſh*, *&c.* Such as are cover'd with a hard Shell, and difficult to be broken; as the *Crab*, *Lobſter*, *&c.* Such as are cover'd with a Shell that is *brittle* and eaſily broken; as *Cockles*, *Perwinkles*, and other ſmall *Shell Fiſhes*; and of theſe there is ſo great a variety, with reſpect to *figure* and *colour*, that they cannot all of them be reckon'd up. And, Laſtly, *Inſects*, ſo called from the Interſections and Diviſions of their *Bodies*; which alſo are ſtyled by ALBERTUS MAGNUS, *Annulata*, as conſiſting of ſeveral *Rings*.

II. *The great variety of Inſects, with relation to the place wherein they live.* The Variety of *Inſects* is very great, with reſpect to their *Food*, the *quality* of their *Bodies*, and the *Place* in which they live. As to the *Place*, *Hairy* and *Red VVorms* are generated in the *Snow*: *Fire-flies*, which ſome ſuppoſe to be *Crickets*, in the *Fire*. Which I have ſpoke of in my *Hiſtory of Nature*, in the *Part* that treats of *Animals*. In the *Sea*, the *Sea Scolopendra*, and *VVater-Flea*: In *Freſh-waters*, *Leeches*, *Horſe-Leeches*, *&c.* In the *Earth*, *Earth-VVorms*; between the *Barks of Trees*, *VVood-Lice*; in *Fig-trees*, a certain Worm called *Ceraſſes*; in the *Service-tree*, Red and Hairy *VVorms*; in *Vines*, the Worms called *Butyri*, *&c.*

III. *The difference of Inſects, with reſpect to their Parts.* As to their Parts, ſome *Inſects* have no *feet*, others have. All *VVorms* are without *feet*, as well thoſe which are generated in the *Earth*, as *Earth-VVorms*; as thoſe that breed in the *Bodies* of *Animals*, eſpecially in their *Guts*. The *VVeevil*, that breeds in *Corn*, another that is found in *Beans*, *&c.* Amongſt thoſe that have *feet*, ſome have 6; as the *Piſmire*, the ſtinking *Bug*, the *Flea* and *Louſe*: Others have 8 *feet*; as the *Scorpion* and *Spider*: Some 12; as that of *Canker-worms*, which is called the *Geometrician*, becauſe it hath 6 *feet* in the fore-part of his *Body*, and as many in the hinder-part, and raiſeth up his Back in the form of a *Bow* or *Arch*, going like one that meaſures *Land*: Some have 14 *feet*; as all other ſort of *Canker-worms*, which in the fore-part of their *Bodies* have 6 *feet*, and 8 in the hinder part.

IV. *Of the Generation of Inſects.* As to the *Generation* of *Inſects*. The general Opinion formerly hath been, that they were not produced by a true *Generation*, but deriv'd their Pedigree from the *Corruption* of *Animals*, or other things. But *Experience* hath informed us of the contrary: For if we put a piece of *Fleſh* into a *Bottle*, and then ſtop it; the Fleſh ſhut up there will never breed any *VVorms*; but if we leave the *Bottle* unſtopt, it will be full of *Worms* in leſs than 4 days, in the Summer time. We find alſo, that *Butter-flies*, after *Copulation*, do lay a vaſt number *Eggs*, whence *Canker-worms* are hatched.

V. *All Inſects proceed from Eggs.* So that we may rationally conclude, that all thoſe *Animals* which ſeem to breed of themſelves, and are found in *Cheeſe*, in *Fruits*, in *Trees*, in *Flowers*, and in *Men*, are the product either of *Eggs*, or ſuch like *Seed*, left by other *Animals*. The production and proceſs of which, may be fully illuſtrated by the *Generation* of a *Canker-worm*. For *Canker-worms*, as all other *Worms*, are generated from a *Seed*, or from the *Eggs* of *Flies* or *Butter-flies*, which by the *heat* of the *Sun* are hatched into *Worms*; which, after they have changed their *Skins* ſeveral times, turn to *Canker-worms*, and then to *Aurelia's* or *Bodies* without motion, cover'd with a *Shell*, and in which no diſtinction of *Parts* appears; and theſe again are turned into *Butter-flies*, or *Flies*. For it ſometimes happens, that from the ſame *Canker-worms* and *Worms*, *Aurelia's* do proceed; whereof ſome are turned into many *Flies*, and others into ſingle *Butter-flies*. Out of a *Worm* therefore a *Canker-worm* is formed; becauſe, as a *Plant* doth not immediately bring forth *branches*, *flowers*, *leaves* and *fruit*, but by degrees, and each of theſe in their due Seaſon; ſo theſe *Worms*, by degrees, arrive to a further meaſure of perfection. For certain it is, that theſe *Worms* do often change their *Skins*. A *Canker-worm* therefore is changed into an *Aurelia*; becauſe the Trunk of its *Body* being ſwoln, and its *Members* almoſt formed, it ſo happens that all his Coats and Coverings begin to grow dry, and fall away of themſelves; as *Flowers* fall from *Trees*, and *Feathers* from *Birds*; which when the *Aurelia* perceives, it either wraps it ſelf in a Leaf, or with a glutinous Liquor proceeding out of its own *Body*, it moſt artificially weaves a ſtrong Covering for her ſelf; where it continues ſhut up, as in an *Egg*, till it receive new *Members*, *Head* and *Wings*, and ſo become turned to a *Butter-fly*.

VI. *Flies and other Inſects, proceed from Worms.* And the ſame is to be ſaid of all other *Inſects*, that have *Wings*. For *Flies* proceeding from *Eggs* or *Seeds*, by ſome Changes as have now been mentioned, do attain to the Perfection of their Nature; for firſt they are *Worms*, then they turn to *Aurelia's*, and out of them *Flies* do proceed.

ceed. For as a *Canker-worm* is to a *Butter-fly*, the ſame reſpect or relation a *Worm* hath to a *Fly*. And ſo likewiſe *Lice*, *Fleas*, *Bugs*, and other ſuch like *Inſects*, are generated of *Eggs* or *Nits*, or of other *Inſects* already produced. For all thoſe *Animals* which are commonly ſaid to be generated out of *putrid Matter*, that is the Corruption of other things, are produced by *Copulation*; as we ſee that *Flies* do Copulate when *Auguſt* is paſt, and thereupon they bring forth not *Worms*, but *Eggs*, which are found in great abundance upon the *Leaves of Trees*, in the appearance of a *black ſmutty Matter*; which afterwards, by the *Heat* of the *Sun* are hatched into *Worms*, but ſuch as are immoveable, and anſwering to the *Aurelia's* of the *Canker-worms*, which afterwards are changed into *Flies*.

VII. *How Canker-Worms become changed into Butter-flies.*

This *Metamorphoſis* is not ſo difficult to conceive, if we ſuppoſe that thoſe Parts which ſeem to be produc'd anew, are only made viſible, as having before been hid. For when *Canker-worms*, by Example, become *Butter-flies*, it is eaſie to conceive, that the *wings* and *feet* they get, and which makes them appear to have been changed into new kinds of *Things*, are not newly produc'd Parts, by obtaining of a new *form*, which they had not before; but that theſe Parts were indeed before, and only wanted a ſufficient Magnitude to render them *viſible*. After the ſame manner as it happens to *Plants*, where the *flowers* and *fruits* do not unfold themſelves, but by degrees, and ſome time after the *Leaves*; tho' all theſe Parts be at once actually together in the *Plant*, before they appear to be there. *Inſects* therefore, as well as other *Animals*, are generated by the Coition of *Male* and *Female*; which latter lays *Eggs*, out of which afterwards their Young are hatched by the *heat* of the *Sun*.

VIII. *How the Eggs of Inſects are preſerved in the Winter Seaſon.*

But here it may be demanded, How theſe *Eggs*, whence we have ſaid that *Canker-worms* and *Flies* are hatched, are preſerved all the *Winter* over, ſo as that the next *Year* they may produce *Animals*. ALDROVANDUS, in his Treatiſe *De Inſectis*, ſuppoſeth that thoſe *Eggs* only are preſerved, which are in thoſe Leaves that are hid in the Cavities of the *Barks* of *Trees*, where they cannot ſuffer any damage from the Injuries of the *Air* or *Weather*. Thus I my ſelf, *ſaith he*, have obſerved *Eggs* faſtned to the hinder part of *Fig-Leaves*, whence, towards the End of *Auguſt*, little *Canker-worms* did proceed. They were wrapt up in a thin *Downy ſubſtance*, to preſerve them from being hurt by the *Ambient body*; which *Canker-worms* afterwards falling down, were not daſh'd againſt the Ground, but continued hanging in the *Air*, like *Spiders*, by a very fine *Thread*. When they lay their *Eggs* on the Under-ſide of *Leaves*, they do ſo fold the ſaid *Leaves* that no *Rain* can hurt them, making as it were a Covert over them. I have alſo twice taken notice, that a *Canker-worm*, which I found amongſt *Cabbage-Leaves*, did firſt lay *yellow Eggs*, wrapt up in a thin *Downy matter*; which, after ſhe had laid them, became changed into an *Aurelia* of the ſame Colour, as ſhe had before when yet a *Canker-worm*, *viz. yellow*, *green* and *black*; and, which ſeem'd ſtrange to me, afterwards *flying Animals* proceeded from theſe *Eggs*, ſo very ſmall, that they could ſcarcely be diſcerned by the *Eye*; ſuch as are commonly found in the *Bladders* that are on the *Leaves* of the *Elm-tree*. *So far he.* Tho' there be ſome *Country-men* that tell us, That theſe *Eggs* are not only kept between the *Barks* of *Trees*, but that many *Leaves* fill'd with the *Eggs* of *Butter-flies*, are many times found hid in the *Earth*, where they are preſerved all the *Winter*, till by the *heat* of the *Sun*, at the return of *Spring*, they be hatched into *Inſects*.

CHAP. XXIII.

Of the Death and Deſtruction of Animals.

I. *Of three kinds of Death.*

AS in the *Firſt Chapter of this Part* we reduc'd the Notion of *Life* to 3 Heads; ſo here, that we may underſtand how *Animals* may be ſaid either to *dye* or *periſh*, 3 ſorts of *death* or dying are to be diſtinguiſh'd. Firſt, There is a *Death* of *Simple Annihilation*, which is oppos'd to the *Life* of *Simple Exiſtence*: Secondly, *Ceſſation from Operation*, which is the *Death* that is oppos'd to the *Life* of *Actuous Exiſtence*: And, Laſtly, the *Separation*, or *Diſſolution of one part from the other*, which is oppos'd to the *Life* of *Exiſtence* with another. By the *firſt* manner of *Death*, thoſe things *dye*, which by ceaſing to *exiſt* altogether, fall into nothing: Things *dye* the *ſecond* kind of *Death*, when they ceaſe to *act*: And the *third* way, when their Parts are ſeparated, and *exiſt* diſtinctly from one another. But foraſmuch as no *Subſtance* can be annihilated, it remains only for us to enquire, how *Animals* come to ceaſe from all Operation, and how the connection of their Parts comes to be diſſolved.

II. *The Death and Periſhing of Animals is deſigned by Nature, as well as their Generation.*

But before I come to Treat of theſe, I ſhall firſt lay down this Truth, That *Death* is as much the intention and deſign of *Nature*, as *Life* is. For who will ſay, that *Corruption* is leſs Natural, than *Generation*? For tho' nothing ſeems to *dye* without reluctance, and ſome force put upon it; yet is not *Corruption* therefore to be accounted leſs *Natural* or diſagreeing with the *Laws* of *Nature*. For tho' *Corruption* be contrary to particular Nature, as procuring its *Deſtruction*; yet is it very conſentaneous to *Univerſal Nature*, which never undertakes the *Generation* of any thing, without the fore-going *Corruption* of another, as not being able to *create*, or to *produce* a thing out of *Nothing*. Wherefore ſeeing, that the Beauty and Perfection of the *World* conſiſts in Variety; and that it is much more for the Dignity of the *World*, that many things in proceſs of time ſhould appear and act their Parts on this great *Theatre*, than to repreſent always one and the ſame *Face* of things: The *Divine Wiſdom* hath ſo order'd it, that Old things ſhould make way for New ones; and that thoſe things, which for ſome time have acted their Parts on the *Stage* of the *World*, ſhould withdraw to make room for others. But if any one ſhall think it a hard caſe for him to leave this *World*, let him conſider, that he himſelf could never have enter'd this *World*, but by others making room for him: For if all our Anceſtors had been *Immortal*, they would have been increaſed to that number, that there would have been no place left for their Poſterity.

Having

III. *When and how Death happens to Animals.* Having ſaid thus much to comfort us, and make the ſtate of our *Mortality* more tolerable; we now aſſert that *Death* happens to *Animals* by the extinguiſhing of the *Fire*, that is in their *Hearts*. For in the *Hearts* of all *Animals*, as long as they are *alive*, there is a kind of *Continual Heat*, which we before call'd a kind of *Fire* that is *hot* without *ſhining*, and which *Phyſicians* do own to be the *Bodily Principle* of all *motion* in the Members of *Animals*. And therefore no wonder, if this being once extinct, *Life*, *Senſe* and *Motion* be likewiſe deſtroyed.

IV. *How this Heat comes to be weakned in the Body of Animals.* For tho' this *Native Heat* be ſtrong and efficacious at the beginning, yet in the proceſs of Age it loſeth ſtrength, and grows weaker and weaker; ſo that *Animals*, after they are come to their full growth, are at a ſtand, and ſoon after their ſtrength decays; and at laſt, by the defect of this *Heat* they *dye*; as the *flame* of a *Wick*, for want of *Oil* is extinguiſh'd. But yet there is a difference betwixt the *flame* of a *Lamp*, and the *Life* of *Animals*; becauſe the former is continued, as long as it is ſupplied with *Oil*: But the *Life* of *Animals* cannot be maintained by perpetual *Aliment*, becauſe *Animals* dye not for want of *Aliment*; but becauſe their *Heat* grows ſo weak, that it can no longer change the *Food* into the Subſtance of the *Body*. And therefore *Phyſicians* tell us, that the *Heat* which Nature hath afforded us, for the Maintenance and Support of our *Bodies*, doth conſpire their deſtruction. For tho' it preſerves us, foraſmuch as by feeding upon *Moiſture*, it affords ſtrength and vigour to our *Members*; yet at the ſame time it alſo lays the foundation of our Deſtruction, whilſt by continual conſuming of our *Moiſture* it ſelf becomes debilitated, without reſtoring, as much as it doth conſume: And accordingly it follows, that when the *Moiſture* is conſumed, the *Body* muſt conſume and waſte likewiſe, and the *Heat* it ſelf be extinguiſh'd.

V. *Why the utmoſt parts of the Body firſt grow cold in thoſe that are ready to dye.* Now that *Death* proceeds from the decay of *Heat*, daily Experience teacheth us in Dying perſons: For we find that the Extream parts of their *Body* firſt begins to grow *cold*, till at laſt their *Breaſt* and *Heart* it ſelf be deprived of it. For ſince the *Heat* which is diſperſt through the whole *Body*, proceeds from the *Arteries*, inaſmuch as by thinning the *Blood* that is in them, it generates thoſe *Spirits* which communicate *Motion* to all the Parts of *Man*'s *Body*; it muſt of neceſſity follow, that when the *motion* of the *Arteries* and *Heart* grows weak and languiſhing, this Weakneſs muſt firſt affect the *Capillary Veins*, as being both ſmall and weak, and at the greateſt diſtance from the *Heart*, the Fountain of *Heat*.

VI. *An Objection from the motion of Animals, after their Heart is taken out their Bodies.* It may be you will Object here, That ſome *Animals*, after that their *Heart* hath been taken out of their *Bodies*, have notwithſtanding performed the *functions* of *Life*. ARISTOTLE alledgeth the Example of a *Tortoiſe*, which when his *Heart* is taken out, doth nevertheleſs walk about, though be be but ſmall, and of a weak and ſlow *Body*. Some *Hiſtorians* alſo make mention of ſome perſons, who have ſpoke after that their *Heart* hath been pluck'd out of ther *Bodies*. Now, whence could theſe *Actions* or *Words* proceed, if the *Heart*, by its *heat*, were the ſole *Principle* of all *Bodily motion*, and if it were the firſt thing living, and the laſt that *dies*?
